We prove a blow-up criterion for local strong solutions to a simplified hydrodynamic flow modeling the compressible, nematic liquid crystal materials in a bounded domain.

1. Introduction

Let $\Omega \subset \mathbb{R}^3$ be a bounded domain with smooth boundary $\partial\Omega$. We consider the following simplified version of Ericksen-Leslie system modeling the hydrodynamic flow of compressible nematic liquid crystals:

$$\partial_t \rho + \operatorname{div}(\rho u) = 0, \quad (1)$$

$$\begin{aligned} \partial_t(\rho u) + \operatorname{div}(\rho u \otimes u) + \nabla p(\rho) - \mu \Delta u \\ - (\lambda + \mu) \nabla \operatorname{div} u = -\Delta d \cdot \nabla d, \end{aligned} \quad (2)$$

$$\begin{aligned} \partial_t d + u \cdot \nabla d = \Delta d + |\nabla d|^2 d, \\ |d| = 1 \quad \text{in } \Omega \times (0, \infty), \end{aligned} \quad (3)$$

$$u = 0, \quad d = d_0(x) \quad \text{on } \partial\Omega \times (0, \infty), \quad (4)$$

$$\begin{aligned} (\rho, u, d)(x, 0) = (\rho_0, u_0, d_0)(x), \\ |d_0| = 1, \quad x \in \Omega \subset \mathbb{R}^3. \end{aligned} \quad (5)$$

Here ρ is the density of the fluid, u is the fluid velocity, d represents the macroscopic average of the nematic liquid crystal orientation field, and $p(\rho) := a\rho^\gamma$ is the pressure with positive constants $a > 0$ and $\gamma > 1$. Two real constants μ and λ are the shear viscosity and the bulk viscosity coefficients of the fluid, respectively, which are assumed to satisfy the following physical condition:

$$\mu > 0, \quad 3\lambda + 2\mu \geq 0. \quad (6)$$

Equations (1) and (2) are the well-known compressible Navier-Stokes system with the external force $-\Delta d \cdot \nabla d$. Equation (3) is the well-known heat flow of harmonic map when $u = 0$.

Recently, Huang et al. [1] prove the following local-in-time well-posedness.

Proposition 1. Let $\rho_0 \in W^{1,q}$ for some $q \in (3, 6]$ and $\rho_0 \geq 0$ in Ω , $u_0 \in H^2$, $d_0 \in H^3$ and $|d_0| = 1$ in Ω . If, in addition, the compatibility condition

$$\begin{aligned} -\mu \Delta u_0 - (\lambda + \mu) \nabla \operatorname{div} u_0 - \nabla p(\rho_0) - \Delta d_0 \cdot \nabla d_0 = \sqrt{\rho_0} g \\ \text{for some } g \in L^2(\Omega) \end{aligned} \quad (7)$$

holds, then there exist $T_0 > 0$ and a unique strong solution (ρ, u, d) to the problem (1)–(5).

Based on the above proposition, Huang et al. [2] prove the regularity criterion

$$\int_0^T (\|\mathcal{D}(u)\|_{L^\infty} + \|\nabla d\|_{L^\infty}^2) dt < \infty \quad (8)$$

to the problem (1)–(3), (5) with the boundary condition

$$u = 0 = \frac{\partial d}{\partial \nu} \quad \text{on } \partial\Omega \times (0, \infty) \quad (9)$$

or

$$u \cdot \nu = \operatorname{curl} u \times \nu = \frac{\partial d}{\partial \nu} = 0 \quad \text{on } \partial\Omega \times (0, \infty). \quad (10)$$

Here,

$$\mathcal{D}(u) := \frac{1}{2} (\nabla u + {}^t \nabla u), \quad (11)$$

where ν is the unit outward normal vector to $\partial\Omega$.

When $\Omega = \mathbb{R}^3$, Huang and Wang [3] show the following regularity criterion:

$$\|\rho\|_{L^\infty(0,T;L^\infty)} + \|u\|_{L^{s_1}(0,T;L^{r_1})} + \|\nabla d\|_{L^{s_2}(0,T;L^{r_2})} < \infty, \quad (12)$$

with r_i and s_i satisfying

$$\frac{2}{s_i} + \frac{3}{r_i} = 1, \quad 3 < r_i \leq \infty, \quad i = 1, 2. \quad (13)$$

When the term $|\nabla d|^2 d$ in (3) is replaced by $d - |d|^2 d$, the problem (1)–(5) has been studied by L. M. Liu and X. G. Liu [4]; they proved the following regularity criterion:

$$\int_0^T (\|\nabla u\|_{L^2}^4 + \|\nabla u\|_{L^\infty}) dt < \infty. \quad (14)$$

The aim of this paper is to study the regularity criterion of local strong solutions to the problem (1)–(5). We will prove

Theorem 2. *Let the assumptions in Proposition 1 hold true. If (12) holds true with $0 < T < \infty$, then the solution (ρ, u, d) can be extended beyond $T > 0$.*

Remark 3. Theorem 2 is also true for the boundary condition (9). But it is an open problem to prove (12) when the homogeneous Dirichlet boundary condition $u = 0$ is replaced by

$$u \cdot \nu = 0, \quad \text{curl } u \times \nu = 0 \quad \text{on } \partial\Omega \times (0, \infty). \quad (15)$$

2. Proof of Theorem 2

Since (ρ, u, d) is the local strong solution, we only need to prove a priori estimates.

First, testing (2) and (3) by u and $\Delta d + |\nabla d|^2 d$, respectively, and adding the resulting equations together, we see that

$$\begin{aligned} & \frac{d}{dt} \int \left(\frac{1}{2} \rho |u|^2 + \frac{1}{2} |\nabla d|^2 + \frac{a\rho^\gamma}{\gamma-1} \right) dx \\ & + \int \left(\mu |\nabla u|^2 + (\lambda + \mu) (\text{div } u)^2 + |\Delta d + |\nabla d|^2 d|^2 \right) dx = 0, \end{aligned} \quad (16)$$

which gives

$$\begin{aligned} & \int (\rho |u|^2 + |\nabla d|^2) dx \\ & + \int_0^T \int (|\nabla u|^2 + |\Delta d + |\nabla d|^2 d|^2) dx dt \leq C. \end{aligned} \quad (17)$$

We decompose the velocity u into two parts: $u = v + w$, where $v(t) \in H_0^1(\Omega) \cap H^2(\Omega)$ satisfies

$$\mu \Delta v + (\lambda + \mu) \nabla \text{div } v = \nabla p(\rho), \quad (18)$$

and thus $w(t) \in H_0^1(\Omega) \cap H^2(\Omega)$ satisfies

$$\mu \Delta w + (\lambda + \mu) \nabla \text{div } w = \rho \dot{u} + \Delta d \cdot \nabla d, \quad (19)$$

where we used $\dot{u} := \partial_t u + u \cdot \nabla u$ to denote the material derivative of u . Then, together with the standard $W^{1,p}$ theory and H^2 theory for elliptic systems, we obtain

$$\begin{aligned} \|\nabla v\|_{L^6} & \leq C \|\rho(p)\|_{L^6}, \\ \|\nabla w\|_{L^6} + \|\nabla^2 w\|_{L^2} & \leq C \|\rho \dot{u}\|_{L^2} + C \|\Delta d \nabla d\|_{L^2}. \end{aligned} \quad (20)$$

Testing (3) by $\Delta \partial_t d$ and using (4), (20), (3), and the identity $0 = \Delta(d \partial_t d) = d \Delta \partial_t d + \partial_t d \Delta d + 2 \nabla d \partial_t d$, we derive

$$\begin{aligned} & \frac{1}{2} \frac{d}{dt} \int |\Delta d|^2 dx + \int |\nabla \partial_t d|^2 dx \\ & = \int (u \cdot \nabla d - |\nabla d|^2 d) \Delta \partial_t d dx \\ & = - \int \nabla (u \cdot \nabla d) \nabla \partial_t d dx - \int |\nabla d|^2 (d \Delta \partial_t d) dx \\ & = - \int (u \nabla^2 d + \nabla u \cdot \nabla d) \nabla \partial_t d dx \\ & \quad + \int |\nabla d|^2 (\partial_t d \Delta d + 2 \nabla d \nabla \partial_t d) dx \\ & = - \int (u \cdot \nabla^2 d + \nabla u \cdot \nabla d) \nabla \partial_t d dx \\ & \quad + \int |\nabla d|^2 (\Delta d + |\nabla d|^2 d - u \cdot \nabla d) \Delta d dx \\ & \quad + 2 \int |\nabla d|^2 \nabla d \nabla \partial_t d dx \\ & \leq \|u\|_{L^{r_1}} \|\nabla^2 d\|_{L^{2r_1/(r_1-2)}} \|\nabla \partial_t d\|_{L^2} \\ & \quad + \|\nabla d\|_{L^{r_2}} \|\nabla u\|_{L^{2r_2/(r_2-2)}} \|\nabla \partial_t d\|_{L^2} \\ & \quad + C \|\nabla d\|_{L^{r_2}}^2 \|\Delta d\|_{L^{2r_2/(r_2-2)}} + C \|u\|_{L^{r_1}}^2 \|\Delta d\|_{L^{2r_1/(r_1-2)}}^2 \\ & \quad + \epsilon \|\nabla \partial_t d\|_{L^2}^2 \\ & \leq C \epsilon \|\nabla \partial_t d\|_{L^2}^2 + C \|u\|_{L^{r_1}}^{s_1} \|\nabla^2 d\|_{L^2}^2 \\ & \quad + C \|\nabla d\|_{L^{r_2}}^{s_2} \|\nabla u\|_{L^2}^2 + \epsilon \|\nabla u\|_{L^6}^2 \\ & \quad + C \|\nabla d\|_{L^{r_2}}^{s_2} \|\Delta d\|_{L^2}^2 + \epsilon \|d\|_{H^3}^2 + C \\ & \leq C \epsilon \|\nabla \partial_t d\|_{L^2}^2 + C \epsilon \|d\|_{H^3}^2 + C \epsilon \|\rho \dot{u}\|_{L^2}^2 \\ & \quad + C \|\nabla d\|_{L^{r_2}}^{s_2} (\|\Delta d\|_{L^2}^2 + \|\nabla u\|_{L^2}^2) \\ & \quad + C \|u\|_{L^{r_1}}^{s_1} \|\nabla^2 d\|_{L^2}^2 + C \end{aligned} \quad (21)$$

for any $0 < \epsilon < 1$, where we have used the Hölder inequality

$$\|\nabla u\|_{L^{2r_1/(r_1-2)}} \leq C \|\nabla u\|_{L^2}^{1-(3/r_1)} \|\nabla u\|_{L^6}^{3/r_1} \quad (22)$$

and the Gagliardo-Nirenberg inequality

$$\begin{aligned} \|\nabla^2 d\|_{L^{2r_2/(r_2-2)}} &\leq C \|\nabla^2 d\|_{L^2}^{1-(3/r_2)} \|d\|_{H^3}^{3/r_2}, \\ \|\nabla u\|_{L^6} &\leq \|\nabla v\|_{L^6} + \|\nabla w\|_{L^6} \\ &\leq C + \|\nabla w\|_{L^6}. \end{aligned} \quad (23)$$

By the H^3 theory of the elliptic equations, it follows from (3) that

$$\begin{aligned} \|d\|_{H^3} &\leq C(1 + \|\nabla \Delta d\|_{L^2}) \\ &\leq C(1 + \|\nabla(\partial_t d + u \cdot \nabla d - |\nabla d|^2 d)\|_{L^2}) \\ &\leq C(1 + \|\nabla \partial_t d\|_{L^2} + \|u\|_{L^{r_1}} \|\nabla^2 d\|_{L^{2r_1/(r_1-2)}} \\ &\quad + \|\nabla d\|_{L^{r_2}} \|\nabla u\|_{L^{2r_2/(r_2-2)}} + \|\nabla d\|_{L^{r_2}} \|\nabla^2 d\|_{L^{2r_2/(r_2-2)}}) \\ &\leq C(1 + \|\nabla \partial_t d\|_{L^2} + \epsilon \|d\|_{H^3} \\ &\quad + \|u\|_{L^{r_1}}^{s_1/2} \|\nabla^2 d\|_{L^2} + \epsilon \|\nabla u\|_{L^6} \\ &\quad + \|\nabla d\|_{L^{r_2}}^{s_2/2} \|\nabla u\|_{L^2} + \|\nabla d\|_{L^{r_2}}^{s_2/2} \|\Delta d\|_{L^2}), \end{aligned} \quad (24)$$

which yields

$$\begin{aligned} \|d\|_{H^3} &\leq C(1 + \|\nabla \partial_t d\|_{L^2} + \|u\|_{L^{r_1}}^{s_1/2} \|\nabla^2 d\|_{L^2} \\ &\quad + \|\nabla d\|_{L^{r_2}}^{s_2/2} \|\nabla u\|_{L^2} + \|\nabla d\|_{L^{r_2}}^{s_2/2} \|\Delta d\|_{L^2}). \end{aligned} \quad (25)$$

Testing (2) by $\partial_t u$ and setting $M(d) := \nabla d \odot \nabla d - (1/2)|\nabla d|^2 \mathbb{I}_3$, we find that

$$\begin{aligned} &\frac{1}{2} \frac{d}{dt} \int (\mu |\nabla u|^2 + (\lambda + \mu) (\operatorname{div} u)^2) dx + \int \rho |\dot{u}|^2 dx \\ &\quad - \frac{d}{dt} \int p \operatorname{div} u dx - \frac{d}{dt} \int M(d) : \nabla u dx \\ &= \int \rho \dot{u} \cdot (u \cdot \nabla u) dx - \int \partial_t p \operatorname{div} u dx \\ &\quad - \int \partial_t M(d) : \nabla u dx \\ &\leq \|\rho \dot{u}\|_{L^2} \|u\|_{L^{r_1}} \|\nabla u\|_{L^{2r_1/(r_1-2)}} \\ &\quad + C \|\nabla d\|_{L^{r_2}} \|\nabla u\|_{L^{2r_2/(r_2-2)}} \|\nabla \partial_t d\|_{L^2} - \int p_t \operatorname{div} u dx. \end{aligned} \quad (26)$$

Now we deal with the last term.

First, (1) implies that

$$\partial_t p + \operatorname{div}(pu) + (\gamma - 1)p \operatorname{div} u = 0. \quad (27)$$

Using (27) and (20), we have

$$\begin{aligned} - \int \partial_t p \operatorname{div} u dx &= - \int \partial_t p \operatorname{div} v dx - \int \partial_t p \operatorname{div} w dx \\ &= \int \nabla \partial_t p v dx + \int \operatorname{div}(pu) \operatorname{div} w dx \\ &\quad + (\gamma - 1) \int p \operatorname{div} u \operatorname{div} w dx \\ &= - \frac{d}{dt} \int \left(\frac{\mu}{2} |\nabla v|^2 + \frac{\lambda + \mu}{2} (\operatorname{div} v)^2 \right) dx \\ &\quad - \int pu \nabla \operatorname{div} w dx \\ &\quad + (\gamma - 1) \int p \operatorname{div} u \operatorname{div} w dx \\ &\leq - \frac{d}{dt} \int \left(\frac{\mu}{2} |\nabla u|^2 + \frac{\lambda + \mu}{2} (\operatorname{div} u)^2 \right) dx \\ &\quad + C \|\sqrt{\rho} u\|_{L^2} \|\nabla \operatorname{div} w\|_{L^2} \\ &\quad + C \|\operatorname{div} u\|_{L^2} \|\operatorname{div} w\|_{L^2}. \end{aligned} \quad (28)$$

Inserting (28) into (26) and using (20), we have

$$\begin{aligned} &\frac{1}{2} \frac{d}{dt} \int (\mu |\nabla u|^2 + (\lambda + \mu) (\operatorname{div} u)^2) dx \\ &\quad + \frac{d}{dt} \int \left(\frac{\mu}{2} |\nabla v|^2 + \frac{\lambda + \mu}{2} (\operatorname{div} v)^2 \right) dx \\ &\quad - \frac{d}{dt} \int p \operatorname{div} u dx - \frac{d}{dt} \int M(d) : \nabla u dx \\ &\quad + \int \rho |\dot{u}|^2 dx \\ &\leq \|\rho \dot{u}\|_{L^2} \|u\|_{L^{r_1}} \|\nabla u\|_{L^{2r_1/(r_1-2)}} \\ &\quad + C \|\nabla d\|_{L^{r_2}} \|\nabla u\|_{L^{2r_2/(r_2-2)}} \|\nabla \partial_t d\|_{L^2} \\ &\quad + C \|\nabla \operatorname{div} w\|_{L^2} + C \|\operatorname{div} u\|_{L^2}^2 + C \\ &\leq \epsilon \int \rho |\dot{u}|^2 dx + C \|u\|_{L^{r_1}}^{s_1} \|\nabla u\|_{L^2}^2 + \epsilon \|\nabla u\|_{L^6}^2 \\ &\quad + C \|\nabla d\|_{L^{r_2}}^{s_2} \|\nabla u\|_{L^2}^2 + \epsilon \|\nabla \partial_t d\|_{L^2}^2 \\ &\quad + C \|\nabla d\|_{L^{r_2}}^{s_2} \|\Delta d\|_{L^2}^2 + C \|\operatorname{div} u\|_{L^2}^2 + C \\ &\leq C \epsilon \int \rho |\dot{u}|^2 dx + C \epsilon \|\nabla \partial_t d\|_{L^2}^2 + C \|u\|_{L^{r_1}}^{s_1} \|\nabla u\|_{L^2}^2 \\ &\quad + C \|\nabla d\|_{L^{r_2}}^{s_2} (\|\nabla u\|_{L^2}^2 + \|\Delta d\|_{L^2}^2) + C. \end{aligned} \quad (29)$$

Combining (21), (25), and (29), taking ϵ small enough, and using the Gronwall inequality, we conclude that

$$\begin{aligned} &\|u\|_{L^\infty(0,T;H^1)} + \|d\|_{L^\infty(0,T;H^2)} + \|d\|_{L^2(0,T;H^3)} \\ &\quad + \|\sqrt{\rho} \dot{u}\|_{L^2(0,T;L^2)} \leq C. \end{aligned} \quad (30)$$

Now by the same calculations as those in [3, 5], we prove that

$$\begin{aligned}
 & \|\rho\|_{L^\infty(0,T;W^{1,q})} + \|\partial_t \rho\|_{L^\infty(0,T;L^q)} \leq C, \\
 & \|\sqrt{\rho} \partial_t u\|_{L^\infty(0,T;L^2)} + \|\partial_t u\|_{L^2(0,T;H^1)} \leq C, \\
 & \|u\|_{L^\infty(0,T;H^2)} + \|u\|_{L^2(0,T;W^{2,q})} \leq C, \\
 & \|d\|_{L^\infty(0,T;H^3)} \leq C, \\
 & \|\partial_t d\|_{L^\infty(0,T;H^1)} \leq C.
 \end{aligned} \tag{31}$$

This completes the proof.
