1. Introduction

Let $E$ be a real normed space with dual $E^*$. The normalized duality mapping $J$ from $E$ to $2^E$ is defined by

$$Jx := \{x^* \in E^*: \langle x, x^* \rangle = \|x\|^2, \|x\| = \|x^*\|\},$$

(1)

where $\langle \cdot, \cdot \rangle$ denotes the generalized duality pairing. It is well known (see, e.g., [1]) that if $E^*$ is strictly convex, then $J$ is single-valued and if $E = H$ is a Hilbert space, then $J$ is the identity mapping. In the sequel, we shall denote the single-valued normalized duality mapping by $j$.

A mapping $T$ with domain $D(T)$, and range $R(T)$, in $E$ is called a strict contraction or simply a contraction if and only if there exists $\gamma_0 \in [0, 1)$ such that for all $x, y \in D(T)$,

$$\|T(x) - T(y)\| \leq \gamma_0 \|x - y\|,$$

(2)

and $T$ is called nonexpansive if and only if for all $x, y \in D(T)$,

$$\|Tx - Ty\| \leq \|x - y\|.$$

(3)

A point $x \in D(T)$ is called a fixed point of an operator $T$ if and only if $Tx = x$. The set of fixed points of an operator $T$ is denoted by $Fix(T)$, that is, $Fix(T) := \{x \in D(T) : Tx = x\}$.

The most important generalization of the class of nonexpansive mappings is, perhaps, the class of pseudocontractive mappings. These mappings are intimately connected with the important class of nonlinear accretive operators. This connection will be made precise in what follows.

A mapping $T$ with domain $D(T)$, and range $R(T)$, in $E$ is called pseudocontractive if and only if for all $x, y \in D(T)$, the following inequality holds:

$$\|x - y\| \leq \|(1 + r) (x - y) - r (Tx - Ty)\|,$$

(4)

for all $r > 0$. As a consequence of a result of Kato [2], the pseudocontractive mappings can also be defined in terms of the normalized duality mappings as follows: the mapping $T$ is called pseudocontractive if and only if for all $x, y \in D(T)$, there exists $j(x - y) \in J(x - y)$ such that

$$\langle Tx - Ty, j(x - y) \rangle \leq \|x - y\|^2.$$

(5)

It now follows trivially from (5) that every nonexpansive mapping is pseudocontractive. We note immediately that the class of pseudocontractive mappings is larger than that of nonexpansive mappings. For examples of pseudocontractive mappings which are not nonexpansive, the reader may see [1].

To see the connection between the pseudocontractive mappings and the accretive mappings, we introduce the following definition: a mapping $A$ with domain, $D(A)$, and range, $R(A)$, in $E$ is called accretive if and only if for all $x, y \in D(A)$, the following inequality is satisfied:

$$\|x - y\| \leq \|x - y + r (Ax - Ay)\|,$$

(6)
for all \( r > 0 \). Again, as a consequence of Kato [2], it follows that \( A \) is accretive if and only if for all \( x, y \in D(A) \), there exists \( f(x - y) \in J(x - y) \) such that

\[
\langle Ax - Ay, j(x - y) \rangle \geq 0.
\]

(7)

The operator \( A \) is called \( \eta \)-inverse strongly accretive if and only if there exists \( \eta \in (0, 1) \) such that for all \( x, y \in D(A) \), there exists \( f(x - y) \in J(x - y) \) such that

\[
\langle Ax - Ay, j(x - y) \rangle \geq \eta \|Ax - Ay\|^2.
\]

(8)

It is easy to see from inequalities (4) and (6) that an operator \( A \) is accretive if and only if the mapping \( T := (I - A) \) is pseudocontractive. Consequently, the fixed point theory for pseudocontractive mappings is intimately connected with the mapping theory of accretive operators. For the importance of accretive operators and their connections with evolution equations, the reader may consult any of the references [1, 3].

Due to the above connection, fixed point theory of pseudocontractive mappings became a flourishing area of intensive research for several authors. It is of interest to note that if \( E = H \) is a Hilbert space, accretive (\( \eta \)-strongly accretive) operators coincide with the monotone (\( \eta \)-strongly monotone) operators, where an operator \( A \) with domain, \( D(A) \), and range, \( R(A) \), in \( H \) is called monotone if and only if for all \( x, y \in D(A) \), we have that

\[
\langle Ax - Ay, x - y \rangle \geq 0,
\]

(9)

and \( A \) is called \( \eta \)-inverse strongly monotone if and only if for all \( x, y \in D(A) \),

\[
\langle Ax - Ay, x - y \rangle \geq \eta \|Ax - Ay\|^2.
\]

(10)

A bounded linear operator \( A \) with domain, \( D(A) \), and range, \( R(A) \), in a Hilbert space \( H \) is called a strongly positive operator if and only if there exists a constant \( \gamma > 0 \) such that for all \( x \in H \), \( \langle Ax, x \rangle \geq \gamma \|x\|^2 \).

Let \( C \) be a closed convex nonempty subset of a real Hilbert space \( H \) with inner product \( \langle \cdot, \cdot \rangle \) and norm \( \| \cdot \| \). Let \( f : C \times C \to \mathbb{R} \) be a bifunction and \( \Phi : C \to \mathbb{R} \cup \{+\infty\} \) be a proper extended real valued function, where \( \mathbb{R} \) denotes the set of real numbers. Let \( \Theta : C \to H \) be a nonlinear monotone mapping. The generalized mixed equilibrium problem (GMEP) for \( f, \Phi, \) and \( \Theta \) is to find \( u^* \in C \) such that

\[
f(u^*, y) + \Phi(y) - \Phi(u^*) + \langle \Theta u^*, y - u^* \rangle \geq 0 \quad \forall y \in C.
\]

(11)

The set of solutions for GMEP (11) is denoted by

\[
GMEP(f, \Phi, \Theta) = \{u \in C : f(u, y) + \Phi(y) - \Phi(u) + \langle \Theta u, y - u \rangle \geq 0 \quad \forall y \in C \}.
\]

(12)

If \( \Phi \equiv \Theta \equiv 0 \) in (11), then (11) reduces to the classical equilibrium problem (EP), that is, the problem of finding \( u^* \in C \) such that

\[
f(u^*, y) \geq 0 \quad \forall y \in C,
\]

(13)

and GMEP(\( f, 0, 0 \)) is denoted by EP(\( f \)), where

\[
EP(f) = \{u \in C : f(u, y) \geq 0 \quad \forall y \in C \}.
\]

(14)

If \( f \equiv \Phi \equiv 0 \) in (11), then GMEP (11) reduces to the classical variational inequality problem and GMEP(\( 0, 0, \Theta \)) is denoted by VI(\( \Theta, C \)), where

\[
VI(\Theta, C) = \{u \in C : \langle \Theta u, y - u \rangle \geq 0 \quad \forall y \in C \}.
\]

(15)

If \( f \equiv \Theta \equiv 0 \), then GMEP (11) reduces to the following minimization problem:

\[
\text{find } u^* \in C \text{ such that } \Phi(y) \geq \Phi(u^*) \quad \forall y \in C,
\]

(16)

and GMEP(\( 0, \Phi, 0 \)) is denoted by Argmin(\( \Phi \)), where

\[
\text{Argmin}(\Phi) = \{u \in C : \Phi(u) \leq \Phi(y) \quad \forall y \in C \}.
\]

(17)

If \( \Theta \equiv 0 \), then (11) becomes the mixed equilibrium problem (MEP) and GMEP(\( f, \Phi, 0 \)) is denoted by MEP(\( f, \Phi \)), where

\[
\text{MEP}(f, \Phi) = \{u \in C : f(u, y) + \Phi(y) - \Phi(u) \geq 0 \quad \forall y \in C \}.
\]

(18)

If \( \Phi \equiv 0 \), then (11) reduces to the generalized equilibrium problem (GEP) and GMEP(\( f, 0, \Theta \)) is denoted by GEP(\( f, \Theta \)), where

\[
\text{GEP}(f, \Theta) = \{u \in C : f(u, y) + \langle \Theta u, y - u \rangle \geq 0 \quad \forall y \in C \}.
\]

(19)

The generalized mixed equilibrium problem (GMEP) includes special cases as the monotone inclusion problems, saddle point problems, variational inequality problems, minimization problems, optimization problems, vector equilibrium problems, and Nash equilibria in noncooperative games. Furthermore, there are several other problems, for example, the complementarity problems and fixed point problems, which can also be written in the form of the generalized mixed equilibrium problem. In other words, the generalized mixed equilibrium problem is a unifying model for several problems arising from engineering, physics, statistics, computer science, optimization theory, operations research, economics, and countless other fields. For the past 20 years or so, many existence results have been published for various equilibrium problems (see, e.g., [4–6]).

Iterative approximation of fixed points and zeros of nonlinear operators has been studied extensively by many authors to solve nonlinear operator equations as well as variational inequality problems and their generalizations (see, e.g., [7–24]). Most published results on nonexpansive mappings (e.g.)
focus on the iterative approximation of their fixed points or approximation of common fixed points of a given family of this class of mappings.

Let $C$ be a closed convex nonempty subset of $H$, let $T : C \to C$ be a nonexpansive mapping such that $\text{Fix}(T) \neq \emptyset$. Given that $u \in C$ and a real sequence $\{\alpha_n\}_{n \geq 0}$ in the interval $(0, 1)$, let a sequence $\{x_n\}_{n \geq 0}$ be defined by

$$x_0 \in C, \quad x_{n+1} = \alpha_n u + (1 - \alpha_n) T x_n, \quad n \geq 0. \quad (21)$$

Under appropriate conditions on the iterative parameter $\{\alpha_n\}_{n \geq 0}$, it was shown by Bauschke [25], Halpern [26], Lions [27], and Wittmann [28] that $\{x_n\}_{n \geq 0}$ converges strongly to $P_{\text{Fix}(T)} u$, the projection of $u$ to the fixed point set, $F(T)$, of $T$.

Marino and Xu [11], proved that the iteration scheme given by

$$x_0 \in H, \quad x_{n+1} = \alpha_n y f(x_n) + (1 - \alpha_n) A x_n, \quad n \geq 0 \quad (22)$$

converges strongly to a unique solution $x^* \in \text{Fix}(T)$ of the variational inequality

$$\langle (y f - A) x^* , y - x^* \rangle \leq 0 \quad \forall y \in \text{Fix}(T), \quad (23)$$

which is the optimality condition for the minimization problem

$$\min_{x \in \text{Fix}(T)} \left\{ \frac{1}{2} \langle Ax, x \rangle - h(c) \right\}, \quad (24)$$

where $h$ is a potential function for $y f$ (i.e., $h'(x) = y f(x)$ for all $x \in H$); provided $f : H \to H$ is a strict contraction, $T : H \to H$ is nonexpansive and the iterative parameter $\{\alpha_n\}_{n \geq 0}$ that satisfies appropriate conditions.

In [29], Yamada introduced the following hybrid iterative method:

$$x_0 \in H, \quad x_{n+1} = T x_n - \mu \lambda_n A (T x_n), \quad n \geq 0, \quad (25)$$

where $T$ is nonexpansive, $A$ is $L$-Lipschitzian and an $\eta$-strongly monotone operator. He proved that if $\mu$ and $\{\lambda_n\}_{n \geq 1}$ satisfy appropriate conditions, then (25) converges strongly to a unique solution $x^* \in \text{Fix}(T)$ of the variational inequality

$$\langle Ax^*, y - x^* \rangle \geq 0, \quad \forall y \in \text{Fix}(T).$$

Tian [30] introduced the following iterative method:

$$x_0 \in H, \quad x_{n+1} = \alpha_n y f(x_n) + (1 - \alpha_n) A x_n, \quad n \geq 0, \quad (26)$$

and proved that if $f : H \to H$ is a contraction, $A : H \to H$ is an $\eta$-strongly monotone mapping, $T : H \to H$ a nonexpansive mapping and the parameter $\{\alpha_n\}_{n \geq 1}$ satisfies appropriate conditions, then the sequence $\{x_n\}_{n \geq 1}$ converges strongly to a unique solution $x^* \in \text{Fix}(T)$ of the variational inequality

$$\langle (y f - A) x^* , y - x^* \rangle \leq 0 \quad \forall y \in \text{Fix}(T). \quad (27)$$

Let $C$ be a convex nonempty subset of a real Banach space. Let $\{T_j\}_{j \geq 1}$ be a countable infinite family of nonexpansive mappings of $C$ into itself and let $\{\lambda_j\}_{j \geq 1}$ be a sequence of real numbers such that $\lambda_j \in (0, 1)$ for all $j \in \mathbb{N}$. For all $n \in \mathbb{N}$, define a mapping $W_n : C \to C$ by

$$U_{n+1} := I, \quad U_{n+1} := \lambda_n T_n U_{n+1} + (1 - \lambda_n) I,$$

$$U_{n+1} := \lambda_n T_n U_{n+1} + (1 - \lambda_n) I, \quad \vdots \quad (28)$$

The mapping $W_n, n \in \mathbb{N}$ is called the $W$-mapping generated by the countable infinite family $\{T_j\}_{j \geq 1}$ of nonexpansive mappings (see, e.g., [31]).

In [32], Yao et al. studied the following problem. Let $H$ be a real Hilbert space. Consider the iterative scheme

$$x_1 \in H, \quad x_{n+1} = \alpha_n y f(x_n) + \beta_n x_n + ((1 - \beta_n) I - \alpha_n A) W_n x_n, \quad (29)$$

where $y > 0$ is some constant, $f : H \to H$ is a given contractive mapping, and $A$ is a strongly positive bounded linear operator on $H$. Assuming that $F := \bigcap_{i=1}^{\infty} \text{Fix}(T_i) \neq \emptyset$, and under appropriate conditions on the iterative parameters, Yao et al. proved that the sequence $\{x_n\}_{n \geq 1}$ generated by (29) converges strongly to $x^* \in F$, where $x^*$ is a unique solution of the variational inequality

$$\langle (A - y f) x^* , y - x^* \rangle \geq 0 \quad \forall y \in F. \quad (30)$$

Colao and Marino [33] proved that if $\{x_n\}_{n \geq 1}$ and $\{u_n\}_{n \geq 1}$ are sequences generated by $x_1 \in H$ and

$$G(u_n, y) + \frac{1}{r_n} \langle y - u_n, u_n - x_n \rangle \geq 0 \quad \forall y \in H; \quad (31)$$

and proved that if $f : H \to H$ is a contraction, $A : H \to H$ is an $\eta$-strongly monotone mapping, $T : H \to H$ a nonexpansive mapping and the parameter $\{\alpha_n\}_{n \geq 1}$ satisfies appropriate conditions, then the sequence $\{x_n\}_{n \geq 1}$ converges strongly to a unique solution $x^* \in \text{Fix}(T)$ of the variational inequality

$$\langle (A - y f) x^* , y - x^* \rangle = 0 \quad \forall y \in \bigcap_{j=1}^{\infty} \text{Fix}(T_j) \cap \text{EP}(G), \quad (32)$$

which is also a unique solution of the variational inequality

$$\langle (A - y f) x^* , y - x^* \rangle \geq 0 \quad \forall y \in \bigcap_{j=1}^{\infty} \text{Fix}(T_j) \cap \text{EP}(G).$$

(32)
Let \( C \) be a nonempty closed and convex subset of real Hilbert space \( H \). Let \( T : C \to C \) be a continuous pseudocontractive mapping; \( A : C \to H \) be a continuous monotone mapping; \( B : H \to H \) an inverse strongly monotone mapping. For each \( n \in \mathbb{N} \), let \( T_n \) and \( F_n \) be defined for each \( x \in H \) by

\[
T_n := \left\{ z \in C : \langle y - z, Tz \rangle \leq 0, \forall y \in C \right\},
\]

\[
F_n := \left\{ z \in C : \langle y - z, Az \rangle \leq 0, \forall y \in C \right\}.
\]

(33)

Let \( \{x_n\}_{n=1}^{\infty} \) be a sequence generated iteratively by \( x_1 \in C, \)

\[
y_n = F_n x_n, \]

\[
x_{n+1} = \alpha_n f(x_n) + \delta_n x_n + \left( (1 - \alpha_n) I - \alpha_n B \right) T_n y_n, \quad n \geq 1,
\]

(34)

(\text{where } \alpha_n, \delta_n, r_n, \text{ and } y \text{ satisfy appropriate conditions},) then it was recently proved by Channarpan and Kumam [34] that the sequence \( \{x_n\}_{n=1}^{\infty} \) defined by (34) converges strongly to an element \( z \in \text{Fix}(T) \cap VI(C, A) \), which is a unique solution of the variational inequality

\[
\langle (B - y f) z, x - z \rangle \geq 0 \quad \forall x \in \text{Fix}(T) \cap VI(C, A).
\]

(35)

In this paper, motivated by the results of the authors mentioned above, it is our aim to prove strong convergence of a new iterative sequence to a common element of the solution set of a generalized mixed equilibrium problem; the null space of an inverse strongly monotone operator; the set of common fixed points of a countable infinite family of nonexpansive mappings; the set of fixed points of a continuous pseudocontractive mapping. Moreover, the element is also a unique solution of a variational inequality problem and optimality condition for a certain minimization problem. Our theorems generalize improve and unify several recently announced results.

2. Preliminary

In what follows, we shall make use of the following lemmas.

**Lemma 1** (see, e.g., [31]). Let \( C \) be a closed convex nonempty subset of a strictly convex real Banach space. Let \( \{T_j\}_{j \geq 1} \) be a countable infinite family of nonexpansive mappings of \( C \) into itself such that \( \bigcap_{j=1}^{\infty} \text{Fix}(T_j) \neq \emptyset \) and let \( \{\lambda_j\}_{j \geq 1} \) be a real sequence such that \( 0 < \lambda_j \leq b < 1 \) for all \( j \in \mathbb{N} \), for some constant \( b \in (0, 1) \). Then, \( \text{Fix}(W) = \bigcap_{j=1}^{\infty} \text{Fix}(T_j) = \bigcap_{n=1}^{\infty} \text{Fix}(F_n) \).

**Lemma 2** (see, e.g., [31]). Let \( C \) be a closed convex nonempty subset of a strictly convex real Banach space. Let \( \{T_j\}_{j \geq 1} \) be a countable infinite family of nonexpansive mappings of \( C \) into itself such that \( \bigcap_{j=1}^{\infty} \text{Fix}(T_j) \neq \emptyset \) and let \( \{\lambda_j\}_{j \geq 1} \) be a real sequence such that \( 0 < \lambda_j \leq b < 1 \) for all \( j \in \mathbb{N} \), for some constant \( b \in (0, 1) \). Then, \( \text{Fix}(W) = \bigcap_{j=1}^{\infty} \text{Fix}(T_j) = \bigcap_{n=1}^{\infty} \text{Fix}(F_n) \).

**Lemma 3** (see [31]). Let \( C \) be a closed convex nonempty subset of a strictly convex real Banach space. Let \( \{T_j\}_{j \geq 1} \) be a countable infinite family of nonexpansive mappings of \( C \) into itself such that \( \bigcap_{j=1}^{\infty} \text{Fix}(T_j) \neq \emptyset \) and let \( \{\lambda_j\}_{j \geq 1} \) be a real sequence such that \( 0 < \lambda_j \leq b < 1 \) for all \( j \in \mathbb{N} \), for some constant \( b \in (0, 1) \). Suppose that \( W_n : C \to C \) is given by (28) for all \( n \in \mathbb{N} \), then

\[
\|W_n x - W_{n+1} x\| \leq 2 \sum_{j=1}^{\infty} \lambda_j \|x - p\|, \quad \forall x \in C, \quad p \in \bigcap_{j=1}^{\infty} \text{Fix}(T_j).
\]

(37)

**Lemma 4**. Let \( H \) be a real Hilbert space, then the following inequality holds:

\[
\|x + y\|^2 \leq \|x\|^2 + 2 \langle y, x + y \rangle \quad \forall x, y \in H.
\]

(38)

**Lemma 5** (see, e.g., [35–37]). Let \( \{\lambda_n\}_{n=0}^{\infty} \) be a sequence of nonnegative real numbers satisfying the following condition:

\[
\lambda_{n+1} \leq (1 - \alpha_n) \lambda_n + \sigma_n, \quad n \geq 0,
\]

(39)

where \( \{\alpha_n\}_{n=0}^{\infty} \) and \( \{\sigma_n\}_{n=0}^{\infty} \) are sequences of real numbers such that \( \{\sigma_n\}_{n=0}^{\infty} \subset [0, 1] \), \( \sum_{n=0}^{\infty} \alpha_n = \alpha_n = +\infty \). Suppose that \( \sigma_n = o(\alpha_n), \quad n \geq 0 \) (i.e., \( \lim_{n \to \infty} \sigma_n/\alpha_n = 0 \)) or \( \sum_{n=0}^{\infty} |\sigma_n| < +\infty \) or \( \limsup_{n \to \infty} |\sigma_n/\alpha_n| = 0 \), then \( \lambda_n \to 0 \) as \( n \to \infty \).

**Lemma 6** (see, e.g., Suzuki [38]). Let \( \{t_n\}_{n=0}^{\infty} \) and \( \{y_n\}_{n=0}^{\infty} \) be two bounded sequences in a real Banach space such that \( y_{n+1} = \beta_n y_n + (1 - \beta_n) y_n \), for all \( n \geq 0 \), where \( \beta_n \geq 0 \) is a real sequence satisfying the condition \( 0 < \liminf_{n \to \infty} \beta_n \leq \limsup_{n \to \infty} \beta_n < 1 \). Suppose that

\[
\limsup_{n \to \infty} \|t_n - t_{n+1}\| = 0,
\]

(40)

then \( \lim_{n \to \infty} \|t_n - y_n\| = 0 \).

**Lemma 7** (see Zegeye [39]). Let \( C \) be a nonempty closed convex subset of a real Hilbert space \( H \). Let \( T' : H \to H \) be a continuous pseudomonotone mapping, then for all \( r > 0 \) and \( x \in H \), there exists \( z \in C \) such that

\[
\langle y - z, T' z \rangle - \frac{1}{r} \langle y - z, (1 + r) z - x \rangle \leq 0 \quad \forall y \in C.
\]

(41)

**Lemma 8** (see Zegeye [39]). Let \( C \) be a nonempty closed convex subset of a real Hilbert space \( H \). Let \( T' : C \to C \) be a continuous pseudomonotone mapping, then for all \( r > 0 \) and \( x \in H \), define a mapping \( F_r : H \to C \) by

\[
F_r x = \left\{ z \in C : \langle y - z, T' z \rangle - \frac{1}{r} \langle y - z, (1 + r) z - x \rangle \leq 0 \forall y \in C \right\},
\]

(42)
then the following hold:

1. $F_r$ is single-valued;
2. $F_r$ is firmly nonexpansive type mapping, that is, for all $x, y \in H$,
   \[ \|F_rx - F_ry\|^2 \leq (F_rx - F_ry, x - y); \]  
   \[ (43) \]
3. Fix($F_r$) is closed and convex; and Fix($F_r$) = Fix($T$) for all $r > 0$.

In the sequel, we shall require that the bifunction $f : C \times C \to \mathbb{R}$ satisfies the following conditions:

(A1) $f(x, x) = 0$ for all $x \in C$;

(A2) $f$ is monotone, in the sense that $f(x, y) + f(y, x) \leq 0$ for all $x, y \in C$;

(A3) $\limsup_{t \to 0} f(tx + (1-t)y, y) \leq f(x, y)$ for all $x, y, z \in C$;

(A4) the function $y \mapsto f(x, y)$ is convex and lower semicontinuous for all $x \in C$.

Lemma 9 (Compare with Lemma 2.4 of [5]). Let $C$ be a closed convex nonempty subset of a real Hilbert space $H$. Let $f : C \times C \to \mathbb{R}$ be a bifunction satisfying conditions (A1)-(A4); $\Theta : C \to H$ a continuous monotone mapping and $\Phi : C \to \mathbb{R} \cup \{+\infty\}$ a proper lower semicontinuous convex function. Then, for all $r > 0$ and $x \in H$ there exists $u \in C$ such that

\[ f(u, y) + \Theta(u) - \Phi(u) + \langle \Theta u, y - u \rangle \geq \frac{1}{r} \langle y - u, u - x \rangle \geq 0 \quad \forall y \in K. \]  
   \[ (44) \]

Moreover, if for all $x \in H$ we define a mapping $G_r : H \to 2^C$ by

\[ G_r(x) = \left\{ u \in C : f(u, y) + \Theta(u) - \Phi(u) + \langle \Theta u, y - u \rangle \geq 0, \forall y \in C \right\}, \]  
   \[ (45) \]

then the following hold:

1. $G_r$ is single-valued for all $r > 0$;
2. $G_r$ is firmly nonexpansive, that is, for all $x, z \in H$,
   \[ \|G_rx - G_rz\|^2 \leq \langle G_rx - G_raz, x - z \rangle; \]  
   \[ (46) \]
3. Fix($G_r$) = GMEP($f, \Phi, \Theta$) for all $r > 0$;
4. GMEP($f, \Phi, \Theta$) is closed and convex.

Let $C$ be a closed convex nonempty subset of a uniformly convex real Banach space $E$, where $E$ is called uniformly convex if and only if the modulus of convexity

\[ \delta_E(\epsilon) = \inf \left\{ 1 - \frac{1}{2} \| x + y \| : \| x \| \leq 1, \| y \| \leq 1, \| x - y \| \geq \epsilon \right\}. \]  
   \[ (47) \]
is positive for all $\epsilon \in (0, 2]$. Given a bounded sequence $\{x_n\}_{n \geq 1}$ in $C$, define

\[ r_m(y) := \sup \{ \| x_k - y \| : k \geq m \}, \quad y \in E. \]  
   \[ (48) \]
It is well known (see, e.g., [40]) that there exists unique $c_m \in C$ such that

\[ r_m(c_m) = \inf \{ r_m(y) : y \in C \} = r_m \quad \forall m \in \mathbb{N}. \]  
   \[ (49) \]
Clearly, $r_{m+1} \leq r_m$ and $0 \leq r_m$ for all $m \in \mathbb{N}$, so that

\[ \lim_{m \to \infty} r_m = \inf_{m \in \mathbb{N}} r_m. \]  

It is known (see [40]) that if $\lim_{m \to \infty} r_m = 0$, then the sequence $\{x_n\}_{n \geq 1}$ converges.

Definition 10 (see [40]). If the sequence $\{c_m\}_{m \geq 1}$ converges, then $c_0 = \lim_{m \to \infty} c_m$ is called the asymptotic center of $\{x_n\}_{n \geq 1}$ (with respect to $C$). Equivalently (see, e.g., [22]), $c_0 \in C$ is called the asymptotic center of $\{x_n\}_{n \geq 1}$ (with respect to $C$) if and only if

\[ \limsup_{n \to \infty} \| x_n - c_0 \| = \inf \limsup_{z \to c_0} \| x_n - z \|. \]  
   \[ (50) \]

Lemma 11 (see Theorem 1 of Edelstein [40]). Let $C$ be a closed convex nonempty subset of a uniformly convex real Banach space $E$. Let $\{x_n\}_{n \geq 1}$ be a bounded sequence in $C$ and $\{c_m\}_{m \geq 1}$ be as in (49), then $\epsilon = \lim_{m \to \infty} c_m$ exists. In other words, the asymptotic center $c$ of the sequence $\{x_n\}_{n \geq 1}$ (with respect to $C$) exists and is unique.

3. Main Results

Lemma 12. Let $C$ be a nonempty closed convex subset of a real Hilbert space $H$. Let $T : C \to C$ be a continuous pseudocontractive mapping. For $r > 0$, let $F_r : H \to C$ be the mapping in Lemma 8, then for any $x \in H$ and for any $p, q > 0$,

\[ \| F_px - F_qx \| \leq \frac{|p - q|}{p} \left( \| F_px \| + \| x \| \right). \]  
   \[ (51) \]

\[ \langle y - F_px, T'F_px \rangle - \frac{1}{p} \langle y - F_px, (1 + p) F_px - x \rangle \leq 0, \]  
   \[ (52) \]

\[ \langle y - F_qx, T'F_qx \rangle - \frac{1}{q} \langle y - F_qx, (1 + q) F_qx - x \rangle \leq 0. \]  
   \[ (53) \]

So, we obtain (in particular) for $y = F_px$ in (52) and $y = F_px$ in (53) that

\[ \langle F_qx - F_px, T'F_px \rangle \]
\[ - \frac{1}{p} \langle F_qx - F_px, (1 + p) F_px - x \rangle \leq 0, \]  
   \[ (54) \]

\[ \langle F_px - F_qx, T'F_qx \rangle \]
\[ - \frac{1}{q} \langle F_px - F_qx, (1 + q) F_qx - x \rangle \leq 0, \]  
   \[ (55) \]
respectively. Adding (54) and (55) gives
\[-\left\langle F_q x - F_p x, T F_q x - T' F_p x \right\rangle - \left\langle F_q x - F_p x, \frac{(1+p) F_p x - x - (1+q) F_q x - x}{p} \right\rangle \leq 0. \tag{56}\]

Using the fact that $T'$ is pseudocontractive, we obtain from (56) that
\[-\left\langle F_q x - F_p x, F_q x - F_p x \right\rangle - \left\langle F_q x - F_p x, \frac{(1+p) F_p x - x - (1+q) F_q x - x}{q} \right\rangle \leq 0. \tag{57}\]

This implies that
\[\left\langle F_q x - F_p x, F_q x - F_p x \right\rangle + \left\langle F_q x - F_p x, \frac{(1+p) F_p x - x - (1+q) F_q x - x}{q} \right\rangle \geq 0. \tag{58}\]

Equivalently, we obtain
\[\left\langle F_q x - F_p x, \frac{F_p x - x}{p} - \frac{F_q x - x}{q} \right\rangle \geq 0. \tag{59}\]

This implies that
\[0 \leq \left\langle F_p x - F_q x, F_p x - x - \frac{q}{p} (F_p x - x) \right\rangle = \left\langle F_p x - F_q x, F_p x - F_p x + F_p x - x - \frac{q}{p} (F_p x - x) \right\rangle = \left\langle F_p x - F_q x, F_p x - F_p x + \left(1 - \frac{q}{p}\right) (F_p x - x) \right\rangle \leq -\|F_p x - F_q x\|^2 + \left|1 - \frac{q}{p}\right| \|F_p x - F_q x\| \times (\|F_p x\| + \|x\|). \tag{60}\]

Thus,
\[\|F_p x - F_q x\| \leq \frac{|p - q|}{p} (\|F_p x\| + \|x\|). \tag{61}\]

**Lemma 13.** Let $C$ be a closed convex nonempty subset of a real Hilbert space $H$. Let $f : C \times C \to \mathbb{R}$ be a bifunction satisfying conditions (A1)–(A4); $\Theta : C \to H$ a monotone mapping and $\Phi : C \to \mathbb{R} \cup \{+\infty\}$ a proper lower semicontinuous convex function. Let $r > 0$ and let $G_r$ be the mapping in Lemma 9, then for all $p, q > 0$ and for all $x \in H$, one has that
\[\|G_p x - G_q x\| \leq \frac{|p - q|}{p} (\|G_p x\| + \|x\|). \tag{62}\]

**Proof.** We observe that
\[f \left( G_p x, y \right) + \Phi \left( y \right) - \Phi \left( G_q x \right) + \left\langle \Theta \left( G_p x \right), y - G_p x \right\rangle + \frac{1}{p} \left\langle y - G_p x, G_p x - x \right\rangle \geq 0 \quad \forall y \in H, \tag{63}\]
\[f \left( G_q x, y \right) + \Phi \left( y \right) - \Phi \left( G_q x \right) + \left\langle \Theta \left( G_q x \right), y - G_q x \right\rangle + \frac{1}{q} \left\langle y - G_q x, G_q x - x \right\rangle \geq 0 \quad \forall y \in H. \tag{64}\]

In particular, we obtain from (63) and (64) (resp.) that
\[f \left( G_p x, G_q x \right) + \Phi \left( G_q x \right) - \Phi \left( G_p x \right) + \left\langle \Theta \left( G_p x \right), G_q x - G_p x \right\rangle + \frac{1}{p} \left\langle y - G_p x, G_p x - x \right\rangle \geq 0, \tag{65}\]
\[f \left( G_q x, G_p x \right) + \Phi \left( G_p x \right) - \Phi \left( G_q x \right) + \left\langle \Theta \left( G_q x \right), G_p x - G_q x \right\rangle + \frac{1}{q} \left\langle y - G_q x, G_q x - x \right\rangle \geq 0. \tag{66}\]

Adding (65) (and using the monotonicity of $f$ and $\Theta$), we get that
\[0 \leq \left\langle G_p x - G_q x, \frac{G_q x - x}{q} - \frac{G_p x - x}{p} \right\rangle. \tag{67}\]

This implies that
\[0 \leq \left\langle G_p x - G_q x, G_p x - x - \frac{q}{p} (G_p x - x) \right\rangle = \left\langle G_p x - G_q x, G_p x - G_p x + G_p x - x - \frac{q}{p} (G_p x - x) \right\rangle = \left\langle G_p x - G_q x, G_p x - G_p x + \left(1 - \frac{q}{p}\right) (G_p x - x) \right\rangle \leq -\|G_p x - G_q x\|^2 + \left|1 - \frac{q}{p}\right| \|G_p x - G_q x\| \times \|G_p x - G_q x\| (\|G_p x\| + \|x\|). \tag{68}\]

Thus,
\[\|G_p x - G_q x\| \leq \frac{|p - q|}{p} (\|G_p x\| + \|x\|). \tag{69}\]

**Lemma 14.** Let $\{a_n\}_{n \geq 1}$ be a bounded sequence of nonnegative real numbers, then
\[\limsup_{n \to \infty} a_n^2 = \left( \limsup_{n \to \infty} a_n \right)^2. \tag{69}\]
Proof. It is well known that for any two bounded sequences \( \{u_n\}_{n \geq 1} \) and \( \{v_n\}_{n \geq 1} \) of nonnegative real numbers, we have that
\[
\limsup_{n \to \infty} u_n v_n \leq \limsup_{n \to \infty} u_n \times \limsup_{n \to \infty} v_n.
\]
(70)

It then follows that for any bounded sequence \( \{a_n\}_{n \geq 1} \) of nonnegative terms,
\[
\limsup_{n \to \infty} a_n^2 \leq \left( \limsup_{n \to \infty} a_n \right)^2.
\]
(71)

To complete our proof, we show that
\[
\limsup_{n \to \infty} a_n^2 \geq \left( \limsup_{n \to \infty} a_n \right)^2.
\]
(72)

Now, let \( \{a_{n_j}\}_{j \geq 1} \) be a subsequence of \( \{a_n\}_{n \geq 1} \) such that \( \limsup_{n \to \infty} a_n = \lim_{j \to \infty} a_{n_j} \), then by the continuity of the function \( f : \mathbb{R} \to \mathbb{R} \) given by \( f(t) = t^2 \), we obtain that
\[
\left( \limsup_{n \to \infty} a_n \right)^2 = \left( \limsup_{j \to \infty} a_{n_j} \right)^2 = \limsup_{n \to \infty} a_{n_j}^2 \leq \limsup_{n \to \infty} a_n^2.
\]
(73)

The last inequality follows from the fact that \( \limsup_{n \to \infty} a_n^2 \) equals \( \sup S \), where \( S \) is the set of all subsequential limits of \( \{a_n\}_{n \geq 1} \). This completes the proof.

Remark 15. We must note that Lemma 14 holds trivially if the sequence \( \{a_n\}_{n \geq 1} \) was an unbounded sequence of nonnegative real numbers.

Remark 16. In the sequel, we shall make the following assumptions: \( H \) is a real Hilbert space; \( T_j : H \to H \) is a continuous pseudocontractive mapping; \( T_j : H \to H \), \( j = 1, 2, 3, \ldots \) is a countable infinite family of nonexpansive mappings; \( f : H \times H \to \mathbb{R} \) is a bifunction satisfying conditions (A1)–(A4); \( \Phi : H \to \mathbb{R} \cup \{+\infty\} \) a proper lower semicontinuous convex function; \( \Theta : H \to H \) a continuous monotone mapping; \( u \in H \) is a fixed vector; \( A : H \to H \) is a strongly positive bounded linear operator with coefficient \( \gamma \); \( B : H \to H \) is an \( \eta \)-inverse strongly monotone mapping. The sequences \( \{r_n\}_{n \geq 1}, \{\alpha_n\}_{n \geq 1}, \{\beta_n\}_{n \geq 1}, \) and \( \{\lambda_n\}_{n \geq 1} \) are real sequences such that \( r_n > 0 \) for all \( n \in \mathbb{N} \), \( \lim_{n \to \infty} r_n = r_0 > 0 \); \( 0 < \alpha_n < 1 \) for all \( n \in \mathbb{N} \), \( \lim_{n \to \infty} \alpha_n = 0 \); \( 0 < \beta_n < 1 \) for all \( n \in \mathbb{N} \), \( 0 < \liminf_{n \to \infty} \beta_n \leq \limsup_{n \to \infty} \beta_n < 1 \); \( 0 < \lambda_n \leq b < 1 \) for all \( n \in \mathbb{N} \) and for some constant \( b \in (0, 1) \), \( \xi \) is a real constant such that \( 0 < \xi < 2\eta \); \( \Omega = \text{Fix}(T) \cap \text{GMEP}(f, \Phi, \Theta) \cap B^{-1}(0) \cap \bigcap_{j \geq 1} \text{Fix}(T_j) \neq \emptyset \). For \( r > 0, F_r \) and \( G_r \) are as in Lemmas 8 and 9, respectively.

We shall study the strong convergence of the sequence \( \{x_n\}_{n \geq 1} \) generated iteratively from arbitrary \( x_1 \in H \) by the iteration process
\[
x_{n+1} = \alpha_n u + \beta_n x_n + \left( (1 - \beta_n) I - \alpha_n A \right) W_n (I - \xi B) F_r G_r x_n, \quad n \geq 1
\]
(74)
to a unique solution \( x' \in \Omega \) of the variational inequality
\[
\left\langle u - Ax', x - x' \right\rangle \leq 0 \quad \forall x \in \Omega.
\]
(75)

Lemma 17. Suppose that the conditions of Remark 16 are satisfied, then \( \{x_n\}_{n \geq 1} \) defined by (74) is bounded.

Proof. Observe that for all \( x, y \in H \),
\[
\| (x - \xi Bx) - (y - \xi By) \|^2
\]
\[
= \|x - y - \xi (Bx - By)\|^2
\]
\[
= \|x - y\|^2 - 2\xi \langle Bx - By, x - y \rangle + \xi^2 \|Bx - By\|^2
\]
\[
\leq \|x - y\|^2 - 2\xi \eta \|Bx - By\|^2 + \xi^2 \|Bx - By\|^2
\]
\[
= \xi (2\eta - \xi) \|Bx - By\|^2.
\]
(76)

Thus, since \( 0 < \xi < 2\eta \), we get from (76) that
\[
\| (x - \xi Bx) - (y - \xi By) \| \leq \| x - y \| \quad \forall x, y \in H.
\]
(77)

It thus follows that for \( p \in \Omega \),
\[
\| (I - \xi B) F_r G_r x_n - p \| \leq \| (I - \xi B) F_r G_r x_n - (I - \xi B) p \|^2
\]
\[
= \| (I - \xi B) F_r G_r x_n - (I - \xi B) p \|^2
\]
\[
\leq \| F_r G_r x_n - p \|^2 \leq \| x_n - p \|^2.
\]
(78)

Next, we may (without loss of generality) assume that \( \alpha_n < \| A \|^{-1} (1 - \beta_n) \) for all \( n \in \mathbb{N} \) since \( \lim_{n \to \infty} \alpha_n = 0 \). So, for each \( x \in H \) such that \( \| x \| = 1 \), we have
\[
\langle (1 - \beta_n) I - \alpha_n A, x \rangle \leq 0
\]
\[
= (1 - \beta_n) - \alpha_n \langle Ax, x \rangle
\]
\[
\geq (1 - \beta_n) - \alpha_n \| A \|
\]
\[
> (1 - \beta_n) - \| A \|^{-1} (1 - \beta_n) \| A \| = 0.
\]
(79)

Thus, we have that for all \( n \in \mathbb{N} \), the operator \( (1 - \beta_n) I - \alpha_n A \) is a positive bounded linear operator, so that
\[
\| (1 - \beta_n) I - \alpha_n A \| = \sup_{\| x \| = 1} \| (1 - \beta_n) I - \alpha_n A, x \rangle \leq 0
\]
\[
= \sup_{\| x \| = 1} (1 - \beta_n - \alpha_n \langle Ax, x \rangle)
\]
\[
\leq 1 - \beta_n - \alpha_n \eta.
\]
(80)
Therefore, for \( p \in \Omega \), we obtain from (74) using (78) and (80)  
that

\[
\|x_{n+1} - p\| = \|\alpha_n u + \beta_n x_n + ((1 - \beta_n) I - \alpha_n A) x_n\| 
\times W_n(I - \xi B) F_{\alpha_n} G_{\beta_n} x_n - p
\]

\[
= ((1 - \beta_n) I - \alpha_n A) W_n(I - \xi B) F_{\alpha_n} G_{\beta_n} x_n - p 
+ \alpha_n (u - Ap) + \beta_n (x_n - p) 
\]

\[
\leq (1 - \beta_n - \alpha_n) \|W_n(I - \xi B) F_{\alpha_n} G_{\beta_n} x_n - p\| 
+ \beta_n \|x_n - p\| + \alpha_n \|u - Ap\|
\]

\[
\leq (1 - \alpha_n) \|x_n - p\| + \alpha_n \|u - Ap\|.
\]

(81)

It is thus easy to show by mathematical induction (using (81)) that

\[
\|x_n - p\| \leq \max \left\{ \|x_1 - p\|, \frac{1}{\gamma} \|u - Ap\| \right\}.
\]

(82)

So, \( \{x_n\}_{n \geq 1} \) is bounded. Consequently, \( \{W_n(I - \xi B) F_{\alpha_n} G_{\beta_n} x_n\}_{n \geq 1}, \{I - \xi B\} F_{\alpha_n} G_{\beta_n} x_n\}_{n \geq 1}, \{F_{\alpha_n} G_{\beta_n} x_n\}_{n \geq 1} \) and \( \{G_{\beta_n} x_n\}_{n \geq 1} \) are all bounded.

Lemma 18. Let \( \{x_n\}_{n \geq 1} \) be given by (74). Suppose that conditions of Remark 16 are satisfied, then

\[
\lim_{n \to \infty} \|x_{n+1} - x_n\| = 0.
\]

(83)

Proof. Set  
\[
t_{n+1} = \frac{1}{1 - \beta_{n+1} x_{n+1} - \beta_n x_n}.
\]

Thus,

\[
t_{n+1} - t_n = \frac{1}{1 - \beta_{n+1} x_{n+1} - \beta_n x_n} - \frac{1}{1 - \beta_n} (x_{n+1} - \beta_n x_n)
\]

\[
= \frac{1}{1 - \beta_{n+1}} \left( \alpha_{n+1} u + [(1 - \beta_{n+1}) I - \alpha_{n+1} A] x_{n+1} \right) 
\times W_{n+1}(I - \xi B) F_{\alpha_{n+1}} G_{\beta_{n+1}} x_{n+1}
\]

\[
- \frac{1}{1 - \beta_n} \left( \alpha_n u + [(1 - \beta_n) I - \alpha_n A] x_n \right) 
\times W_n(I - \xi B) F_{\alpha_n} G_{\beta_n} x_n
\]

\[
= \frac{\alpha_{n+1}}{1 - \beta_{n+1}} \left( (u - A W_{n+1} (I - \xi B) F_{\alpha_{n+1}} G_{\beta_{n+1}} x_{n+1}) - (u - A W_n (I - \xi B) F_{\alpha_n} G_{\beta_n} x_n) \right)
\]

\[
+ \frac{\alpha_n}{1 - \beta_n} \left( (u - A W_n (I - \xi B) F_{\alpha_n} G_{\beta_n} x_n) \right)
\]

\[
+ W_{n+1}(I - \xi B) F_{\alpha_{n+1}} G_{\beta_{n+1}} x_{n+1} - W_n(I - \xi B) F_{\alpha_n} G_{\beta_n} x_n
\]

\[
- W_{n+1}(I - \xi B) F_{\alpha_{n+1}} G_{\beta_{n+1}} x_{n+1} - W_n(I - \xi B) F_{\alpha_n} G_{\beta_n} x_n.
\]

(84)

Thus, for \( p \in \Omega \) (using (84), Lemmas 3, 13, and 12), we obtain (for some constant \( M_0 > 0 \)) the following:
\[ + 2 \sum_{j=1}^{n} \alpha_j \| F_{r_j} G_{x_n} x_n - p \| + \frac{r_{m-1} - r_m}{r_n} \]
\[ \times \left[ \left( \| F_{r_j} G_{x_n} x_n \| + 2 \| G_{x_n} x_n \| + \| x_n \| \right) \right]. \tag{85} \]

Since \( 0 < \lambda_n < b < 1 \) for all \( n \in \mathbb{N} \) and for some constant \( b \in (0, 1) \), it is thus easy to see that \( \lim_{n \to \infty} \prod_{j=1}^{n} \lambda_j = 0 \). So, we obtain from (85) that
\[ \limsup_{n \to \infty} \left( \| F_{t_{m-1}} - t_{n} \| - \| x_{n+1} - x_n \| \right) \leq 0. \tag{86} \]

Lemma 6 therefore gives
\[ \lim_{n \to \infty} \| t_n - x_n \| = 0, \tag{87} \]
but
\[ x_{n+1} - x_n = \left( 1 - \beta_n \right) (t_n - x_n). \tag{88} \]

Hence,
\[ \lim_{n \to \infty} \| x_{n+1} - x_n \| = 0. \tag{89} \]
\[ \square \]

**Lemma 19.** Let \( \{x_n\}_{n \geq 1} \) be given by (74). Suppose conditions of Remark 16 are satisfied, then
\[ \lim_{n \to \infty} \left\| W_n (I - \xi B) F_{r_n} G_{r_n} x_n - x_n \right\| \]
\[ = \lim_{n \to \infty} \left\| x_n - F_{r_n} G_{r_n} x_n \right\| \]
\[ = \lim_{n \to \infty} \left\| B F_{r_n} G_{r_n} x_n \right\| \tag{90} \]
\[ = \lim_{n \to \infty} \left\| W_n (I - \xi B) F_{r_n} G_{r_n} x_n - F_{r_n} G_{r_n} x_n \right\| \]
\[ = \lim_{n \to \infty} \left\| x_n - G_{r_n} x_n \right\| = 0. \]

**Proof.** Observe that for some constant \( M_1 > 0 \),
\[ \left\| x_n - W_n (I - \xi B) F_{r_n} G_{r_n} x_n \right\| \]
\[ \leq \left\| x_n - x_{n+1} \right\| + \left\| x_{n+1} - W_n (I - \xi B) F_{r_n} G_{r_n} x_n \right\| \]
\[ = \left\| x_n - x_{n+1} \right\| \]
\[ + \left[ \alpha_n u + \beta_n x_n + \left( 1 - \beta_n \right) A x_n \right] \times W_n (I - \xi B) F_{r_n} G_{r_n} x_n \]
\[ - W_n (I - \xi B) F_{r_n} G_{r_n} x_n \]
\[ \leq \left\| x_{n+1} - x_n \right\| \]
\[ + \alpha_n \left\| u - AW_n (I - \xi B) F_{r_n} G_{r_n} x_n \right\| \]
\[ + \beta_n \left\| x_n - W_n (I - \xi B) F_{r_n} G_{r_n} x_n \right\| \]
\[ \leq \left\| x_{n+1} - x_n \right\| + \alpha_n \| u - AW_n (I - \xi B) F_{r_n} G_{r_n} x_n \| \]
\[ + \beta_n \left\| x_n - W_n (I - \xi B) F_{r_n} G_{r_n} x_n \right\| \]
\[ \leq \left\| x_{n+1} - x_n \right\| + \alpha_n M_1 \]
\[ + \beta_n \left\| x_n - W_n (I - \xi B) F_{r_n} G_{r_n} x_n \right\|. \tag{91} \]

So, we obtain from (91) that
\[ \left\| W_n (I - \xi B) F_{r_n} G_{r_n} x_n - x_n \right\| \]
\[ \leq \frac{1}{1 - \beta_n} \left( \left\| x_n - x_{n+1} \right\| + \alpha_n M_1 \right). \tag{92} \]

Using (89) and the fact that \( \lim_{n \to \infty} \alpha_n = 0 \), we obtain from (92) that
\[ \lim_{n \to \infty} \left\| W_n (I - \xi B) F_{r_n} G_{r_n} x_n - x_n \right\| = 0. \tag{93} \]

Next, observe that for fixed \( p \in \Omega \) and using (2) of Lemma 9, we obtain the following:
\[ \left\| G_{r_n} x_n - p \right\|^2 \leq \left( x_n - p, x_n - p \right) \]
\[ = \frac{1}{2} \left[ \left\| G_{r_n} x_n - p \right\|^2 + \left\| x_n - p \right\|^2 \right. \]
\[ - \left. \left\| x_n - G_{r_n} x_n \right\|^2 \right] \tag{94} \]
so that
\[ \left\| G_{r_n} x_n - p \right\|^2 \leq \left\| x_n - p \right\|^2 \tag{95} \]

Furthermore, using (2) of Lemma 8, we obtain
\[ \left\| F_{r_n} G_{r_n} x_n - p \right\|^2 \]
\[ \leq \left( F_{r_n} G_{r_n} x_n - p, F_{r_n} G_{r_n} x_n - p \right) \]
\[ = \frac{1}{2} \left[ \left\| F_{r_n} G_{r_n} x_n - p \right\|^2 + \left\| G_{r_n} x_n - p \right\|^2 \right. \]
\[ - \left. \left\| G_{r_n} x_n - F_{r_n} G_{r_n} x_n \right\|^2 \right] \tag{96} \]
so that
\[ \left\| F_{r_n} G_{r_n} x_n - p \right\|^2 \leq \left\| G_{r_n} x_n - p \right\|^2 \tag{97} \]
Moreover, using the recursion formula (74), Lemma 4, and convexity of $\|\cdot\|_2$, we have

$$\|x_{n+1} - p\|^2 = \|\alpha_n u + \beta_n x_n + [(1 - \beta_n) I - \alpha_n A]x_n - p\|^2$$

$$\leq \beta_n \|x_n - p\|^2 + (1 - \beta_n) \times \|W_n (I - \xi B) F_{r_n} G_{r_n} x_n - p\|^2$$

$$+ 2\alpha_n \left\langle u - AW_n (I - \xi B) \times F_{r_n} G_{r_n} x_n, x_{n+1} - p \right\rangle$$

(98)

Thus, using (76) and (97), we obtain from (98) the following:

$$\|x_{n+1} - p\|^2 \leq \|(I - \xi B) F_{r_n} G_{r_n} x_n - p\|^2$$

$$+ \frac{\beta_n}{1 - \beta_n} (2 \|x_{n+1} - p\| + \|x_{n+1} - x_n\|)$$

$$\times \|x_{n+1} - x_n\| + \frac{2\alpha_n}{1 - \beta_n}$$

$$\times \left\langle u - AW_n (I - \xi B) F_{r_n} G_{r_n} x_n, x_{n+1} - p \right\rangle$$

(99)

So, from (99), we have (for some real constant $M_2 > 0$)

$$\|x_n - F_{r_n} G_{r_n} x_n\|^2 + \xi (2\eta - \xi) \|BF_{r_n} G_{r_n} x_n\|^2$$

$$\leq \|x_n - p\|^2 - \|x_{n+1} - p\|^2 + \frac{\beta_n}{1 - \beta_n}$$

$$\times (2 \|x_{n+1} - p\| + \|x_{n+1} - x_n\|)$$

$$\times \|x_{n+1} - x_n\| + \frac{2\alpha_n}{1 - \beta_n}$$

$$\times \left\langle u - AW_n (I - \xi B) F_{r_n} G_{r_n} x_n, x_{n+1} - p \right\rangle$$

$$\leq (\alpha_n + \|x_{n+1} - x_n\|) M_2.$$  

(100)

From (100), we have

$$\lim_{n \to \infty} \left\langle u - AW_n (I - \xi B) F_{r_n} G_{r_n} x_n, x_{n+1} - p \right\rangle = 0.$$  

(101)

and since $\xi (2\eta - \xi) > 0$, then using (101) and applying sandwich theorem, we obtain

$$\lim_{n \to \infty} \|x_n - F_{r_n} G_{r_n} x_n\| = 0,$$  

(102)

$$\lim_{n \to \infty} \|BF_{r_n} G_{r_n} x_n\| = 0.$$  

(103)

Furthermore, observe that

$$\|W_n (I - \xi B) F_{r_n} G_{r_n} x_n - F_{r_n} G_{r_n} x_n\|$$

$$\leq \|W_n (I - \xi B) F_{r_n} G_{r_n} x_n - x_n\| + \|x_n - F_{r_n} G_{r_n} x_n\|.$$  

(104)

Hence, using (93), (102), (103), and (104), we have

$$\lim_{n \to \infty} \left\|W_n (I - \xi B) F_{r_n} G_{r_n} x_n - F_{r_n} G_{r_n} x_n\right\| = 0.$$  

(105)
Besides, we obtain from the second line of inequality (99) (using (95) and the fact that \( F_r \) is firmly nonexpansive; thus nonexpansive) that for some constant \( M' > 0 \),

\[
\|x_{n+1} - p\|^2 \\
\leq \|F_r x_n - p\|^2 \\
+ \beta_n (2\|x_{n+1} - p\| + \|x_{n+1} - x_n\|) \\
\times \|x_{n+1} - x_n\| + \frac{2\alpha_n}{1 - \beta_n} \\
\times \langle u - AW_n (I - \xi B) F_r x_n, x_{n+1} - p \rangle \\
\leq \|G_n x_n - p\|^2 + \|[x_{n+1} - x_n] + \alpha_n\| M' \\
\leq \|x_n - p\|^2 \\
- \|x_n - G_n x_n\|^2 + \|[x_{n+1} - x_n] + \alpha_n\| M' .
\]

So, we obtain from (106) that for some constant \( M'' > 0 \),

\[
\|x_n - G_n x_n\| \\
\leq \|x_n - p\|^2 \\
- \|x_{n+1} - p\|^2 + \|[x_{n+1} - x_n] + \alpha_n\| M' \\
\leq \|x_{n+1} - x_n\| M'' + \|[x_{n+1} - x_n] + \alpha_n\| M' .
\]

Hence, \( \lim_{n \to \infty} \|x_n - G_n x_n\| = 0 \).

\( \square \)

**Lemma 20.** Let \( \{x_n\}_{n \geq 1} \) be given by (74). Suppose that conditions of Remark 16 hold, then

\[
\lim_{n \to \infty} \|W_n (I - \xi B) F_r x_n - (I - \xi B) F_r x_n\| = 0 .
\]

**Proof.** Let \( p \in \Omega \), then we obtain

\[
\|F_r (x - p)\|^2 \\
= \|F_r (x - p)\|^2 \\
= \|F_r x - (\xi BF_r x - p)\|^2 \\
= \|F_r (x - p)\|^2 .
\]

This inequality implies the following:

\[
\|F_r x_n - p\|^2 \\
\leq \|x_n - p\|^2 - \|F_r x_n - (I - \xi B) F_r x_n\|^2 \\
+ 2 \|F_r x_n - (I - \xi B) F_r x_n\| \times \|BF_r x_n\|^2 \\
\leq \|x_n - x_{n+1}\|^2 + 2 \|x_{n+1} - p\| \\
\times \|x_{n+1} - x_n\| + \|x_{n+1} - p\|^2 \\
- \|F_r x_n - (I - \xi B) F_r x_n\|^2 \\
+ 2 \|F_r x_n - (I - \xi B) F_r x_n\| \\
\times \|BF_r x_n\|^2 .
\]

But from the first line of inequality (99), we have

\[
\|x_{n+1} - p\|^2 \\
= \frac{1}{2} \left( \|F_r x_n - (\xi BF_r x_n - (p - \xi Bp))\|^2 \\
+ \|F_r x_n - (p - \xi Bp)\|^2 \\
- \|F_r x_n - (\xi BF_r x_n - (p - \xi Bp))\|^2 \\
- (I - \xi B) F_r x_n - p)\|^2 \right] \\
\leq \frac{1}{2} \left[ \|F_r x_n - p\|^2 \\
+ \|F_r x_n - (p - \xi Bp)\|^2 \\
- \|F_r x_n - (\xi BF_r x_n - (p - \xi Bp))\|^2 \\
- (I - \xi B) F_r x_n - p)\|^2 \right] \\
\times (u - AW_n (I - \xi B) F_r x_n, x_{n+1} - p) .
\]
So, for some real constant $M_2 > 0$, we obtain from (111) that
\[
\|x_{n+1} - p\|^2 \leq \|(I - \xi B) F_{r_n} G_{r_n} x_n - p\|^2 \\
+ (\alpha_n + \|x_{n+1} - x_n\|) M_2.
\] (112)

Using (112) in (110) and rearranging terms, we obtain (for some real constant $M_3 > 0$) that
\[
\|F_{r_n} G_{r_n} x_n - (I - \xi B) F_{r_n} G_{r_n} x_n\|^2 \\
\leq \left(\alpha_n + \|x_{n+1} - x_n\| + \|BF_{r_n} G_{r_n} x_n\|\right) M_3.
\] (113)

So, (113) implies that
\[
\lim_{n \to \infty} \|F_{r_n} G_{r_n} x_n - (I - \xi B) F_{r_n} G_{r_n} x_n\| = 0.
\] (114)

Hence,
\[
\|F_{r_n} G_{r_n} x_n - x_n\| \\
\leq \|F_{r_n} G_{r_n} x_n - (I - \xi B) F_{r_n} G_{r_n} x_n\| \\
+ \|x_n - (I - \xi B) F_{r_n} G_{r_n} x_n\| \\
\leq \lim_{n \to \infty} \|F_{r_n} G_{r_n} x_n - x_n\| \\
+ \lim_{n \to \infty} \|x_n - (I - \xi B) F_{r_n} G_{r_n} x_n\|.
\] (115)

The last inequality implies that
\[
\lim_{n \to \infty} \|W_n (I - \xi B) F_{r_n} G_{r_n} x_n - (I - \xi B) F_{r_n} G_{r_n} x_n\| = 0.
\] (116)

**Lemma 21.** Let $\{x_n\}_{n \geq 1}$ be given by (74) and let $x^* \in \Omega$ be the unique solution of the variational inequality (75). Suppose that conditions of Remark 16 hold, then
\[
\limsup_{n \to \infty} \left\langle u - Ax^*, x_n - x^* \right\rangle \leq 0.
\] (117)

**Proof.** Let $\{x_j\}_{j \geq 1}$ be a subsequence of $\{x_n\}_{n \geq 1}$ such that
\[
\limsup_{n \to \infty} \left\langle u - Ax^*, x_n - x^* \right\rangle = \lim_{j \to \infty} \left\langle u - Ax^*, x_j - x^* \right\rangle.
\] (118)

Since every real Hilbert space $H$ is a uniformly convex real Banach space and $\{x_n\}_{n \geq 1}$ is a bounded sequence in $H$, then we obtain by Lemma 11 that there exists a unique $x^* \in H$ such that $x^*$ is the asymptotic center of the sequence $\{x_n\}_{j \geq 1}$.

We first show that $x^* \in \Omega$. Recall that $r_0 = \lim_{n \to \infty} r_n$ and that by Lemma 1, $Wx := \lim_{n \to \infty} W_n x$ exists for all $x \in H$ and by Lemma 2 that $\text{Fix}(W) = \bigcap_{j \geq 1} \text{Fix}(T_j)$; thus,
\[
\|x_n - Wx^*\| \\
\leq \|x_{n+1} - x_n\| \\
+ \alpha_n \|u + \beta_n x_n + (1 - \beta_n) I - \alpha_n A\| \\
\times \|W_n (I - \xi B) F_{r_n} G_{r_n} x_n - Wx^*\| \\
\leq \|x_{n+1} - x_n\| + \beta_n \|x_n - Wx^*\| + (1 - \beta_n) \\
\times \left(\|W_n (I - \xi B) F_{r_n} G_{r_n} x_n - W_n x_n\| \\
+ \|W_n x_n - W_n x^*\| + \|W_n x^* - Wx^*\|\right) \\
+ \alpha_n \|u - AW_n (I - \xi B) F_{r_n} G_{r_n} x_n\| \\
\leq \|x_{n+1} - x_n\| + \beta_n \|x_n - Wx^*\| \\
+ (1 - \beta_n) \left(\|I - \xi B) F_{r_n} G_{r_n} x_n - x_n\| \\
+ \|x_n - x^*\| + \|W_n x^* - Wx^*\|\right) \\
+ \alpha_n \|u - AW_n (I - \xi B) F_{r_n} G_{r_n} x_n\|.
\] (119)

Thus, we obtain from (119) that
\[
\|x_n - Wx^*\| \\
\leq \frac{1}{1 - \beta_n} \|x_{n+1} - x_n\| \\
+ \|I - \xi B) F_{r_n} G_{r_n} x_n - x_n\| \\
+ \|x_n - x^*\| + \|W_n x^* - Wx^*\| \\
+ \frac{\alpha_n}{1 - \beta_n} \|u - AW_n (I - \xi B) F_{r_n} G_{r_n} x_n\|.
\] (120)

so that
\[
\limsup_{j \to \infty} \|x_j - Wx^*\| \leq \limsup_{j \to \infty} \|x_j - x^*\|.
\] (121)

This implies by Definition 10 (with $C = H$) and uniqueness of $x^*$ that $Wx^* = x^*$; that is, $x^* \in \bigcap_{j \geq 1} \text{Fix}(T_j)$. 

Next,

\[ \left\| x_{n_j} - F_{r_n} x^* \right\| \]

\[ \leq \left\| x_{n_j+1} - x_{n_j} \right\| 
+ \alpha_{n_j} u + \beta_{n_j} x_{n_j} + \left( 1 - \beta_{n_j} \right) \left( I - \alpha_{n_j} A \right) 
\times W_{n_j} \left( I - \xi B \right) F_{r_n} G_{r_n} x_{n_j} - F_{r_n} x^* \]

\[ \leq \left\| x_{n_j+1} - x_{n_j} \right\| + \beta_{n_j} \left\| x_{n_j} - F_{r_n} x^* \right\| + \left( 1 - \beta_{n_j} \right) 
\times \left( \left\| W_{n_j} \left( I - \xi B \right) F_{r_n} G_{r_n} x_{n_j} - F_{r_n} G_{r_n} x_{n_j} \right\| 
+ \left\| F_{r_n} G_{r_n} x_{n_j} - F_{r_n} x^* \right\| 
+ \left\| F_{r_n} x^* - F_{r_n} x^* \right\| \right) 
+ \alpha_{n_j} \left\| u - AW_{n_j} \left( I - \xi B \right) F_{r_n} G_{r_n} x_{n_j} \right\| 
\leq \left\| x_{n_j+1} - x_{n_j} \right\| + \beta_{n_j} \left\| x_{n_j} - F_{r_n} x^* \right\| + \left( 1 - \beta_{n_j} \right) 
\times \left( \left\| W_{n_j} \left( I - \xi B \right) F_{r_n} G_{r_n} x_{n_j} - F_{r_n} G_{r_n} x_{n_j} \right\| 
+ \left\| G_{r_n} x_{n_j} - x_{n_j} \right\| + \left\| x_{n_j} - x^* \right\| 
+ \frac{r_{n_j} - r_0}{r_0} \left\| \left\| F_{r_n} x^* \right\| + \left\| x^* \right\| \right\| \right) 
+ \alpha_{n_j} \left\| u - AW_{n_j} \left( I - \xi B \right) F_{r_n} G_{r_n} x_{n_j} \right\|. \quad (122) \]

so that from (122), we obtain

\[ \left\| x_{n_j} - F_{r_n} x^* \right\| \]

\[ \leq \frac{1}{1 - \beta_{n_j}} \left\| x_{n_j+1} - x_{n_j} \right\| 
+ \left\| W_{n_j} \left( I - \xi B \right) F_{r_n} G_{r_n} x_{n_j} - F_{r_n} G_{r_n} x_{n_j} \right\| 
+ \left\| G_{r_n} x_{n_j} - x_{n_j} \right\| + \left\| x_{n_j} - x^* \right\| 
+ \frac{r_{n_j} - r_0}{r_0} \left\| \left\| F_{r_n} x^* \right\| + \left\| x^* \right\| \right\| \times \frac{\alpha_{n_j}}{1 - \beta_{n_j}} \left\| u - AW_{n_j} \left( I - \xi B \right) F_{r_n} G_{r_n} x_{n_j} \right\|. \quad (123) \]

Thus,

\[ \limsup_{n \to \infty} \left\| x_{n_j} - F_{r_n} x^* \right\| \leq \limsup_{n \to \infty} \left\| x_{n_j} - x^* \right\|. \quad (124) \]

So, by Definition 10, we obtain that $F_{r_n} x^* = x^* \iff T' x^* = x^*$, that is, $x^* \in \text{Fix}(T')$.

Moreover,

\[ \left\| x_{n_j} - G_r x^* \right\| \]

\[ \leq \left\| x_{n_j+1} - x_{n_j} \right\| 
+ \left\| \alpha_{n_j} u + \beta_{n_j} x_{n_j} \right\| + \left( 1 - \beta_{n_j} \right) \left\| W_{n_j} \left( I - \xi B \right) F_{r_n} G_{r_n} x_{n_j} - G_r x^* \right\| 
\leq \left\| x_{n_j+1} - x_{n_j} \right\| + \beta_{n_j} \left\| x_{n_j} - G_r x^* \right\| + \left( 1 - \beta_{n_j} \right) 
\times \left( \left\| W_{n_j} \left( I - \xi B \right) F_{r_n} G_{r_n} x_{n_j} - F_{r_n} G_{r_n} x_{n_j} \right\| 
+ \left\| G_{r_n} x_{n_j} - x_{n_j} \right\| + \left\| x_{n_j} - x^* \right\| 
+ \frac{r_{n_j} - r_0}{r_0} \left\| \left\| F_{r_n} x^* \right\| + \left\| x^* \right\| \right\| \right) 
+ \alpha_{n_j} \left\| u - AW_{n_j} \left( I - \xi B \right) F_{r_n} G_{r_n} x_{n_j} \right\| 
\leq \left\| x_{n_j+1} - x_{n_j} \right\| + \beta_{n_j} \left\| x_{n_j} - G_r x^* \right\| + \left( 1 - \beta_{n_j} \right) 
\times \left( \left\| W_{n_j} \left( I - \xi B \right) F_{r_n} G_{r_n} x_{n_j} - F_{r_n} G_{r_n} x_{n_j} \right\| 
+ \left\| G_{r_n} x_{n_j} - x_{n_j} \right\| + \left\| x_{n_j} - x^* \right\| 
+ \frac{r_{n_j} - r_0}{r_0} \left\| \left\| G_r x^* \right\| + \left\| x^* \right\| \right\| \right) 
+ \alpha_{n_j} \left\| u - AW_{n_j} \left( I - \xi B \right) F_{r_n} G_{r_n} x_{n_j} \right\|. \quad (125) \]
Thus, we obtain from (125) that

\[
\|x_n - G_{r_0} x^*\| \leq \frac{1}{1 - \beta_n} \|x_{n+1} - x_n\| + \|W_n (I - \xi B) F_{r_n} G_{r_n} x_n - F_{r_n} G_{r_n} x_n\| + \|x_n - G_{r_n} x_n\| + \frac{\alpha_n}{1 - \beta_n} \|u - AW_n (I - \xi B) F_{r_n} G_{r_n} x_n\|. 
\]

(126)

Thus,

\[
\limsup_{j \to \infty} \|x_n - G_{r_0} x^*\| \leq \limsup_{j \to \infty} \|x_n - x^*\|. 
\]

(127)

Definition 10 again implies that \(G_{r_n} x^* = x^*\). Hence \(x^* \in \text{GMEP}(f, \Phi, \Theta)\).

Furthermore, since we have shown that \(G_{r_n} x^* = x^* = F_{r_n} x^*\), then making use of this fact and Lemma 13, we have

\[
\|x_n - (x^* - \xi B x^*)\| \leq \|x_{n+1} - x_n\| + \|x_n - G_{r_n} x_n\| + \alpha_n \|u - AW_n (I - \xi B) F_{r_n} G_{r_n} x_n\|. 
\]

(128)

This implies that

\[
\|x_n - (x^* - \xi B x^*)\| \leq \|x_{n+1} - x_n\| + \beta_n \|x_n - (x^* - \xi B x^*)\| + \left(1 - \beta_n\right) \left(\left\|W_n (I - \xi B) F_{r_n} G_{r_n} x_n\right\| - (I - \xi B) F_{r_n} G_{r_n} x_n\right) + \\|F_{r_n} G_{r_n} x_n - G_{r_n} x_n\|. 
\]

(129)
\[
\|G_{r_n}x^*-G_{r_0}x^*\| \\
+\|F_{r_n}G_{r_n}x^*-F_{r_0}G_{r_0}x^*\| \\
+\alpha_{n_j}\|u-AW_{n_j}(I-\xi B)F_{r_n}G_{r_n}x_n\| \\
\leq \|x_{n+1}-x_n\| + \beta_{n_j}\|x_n-(x^*+\xi Bx^*)\| \\
+\left(1-\beta_{n_j}\right)\left(\|W_{n_j}(I-\xi B)F_{r_n}G_{r_n}x_n\| \\
-\|x_n-x^*\| + \frac{|r_n-r_0|}{r_0} \right) \\
\times \left(\|F_{r_0}G_{r_0}x^*\| + 2\|G_{r_0}x^*\| + \|x^*\|\right) \\
+\alpha_{n_j}\|u-AW_{n_j}(I-\xi B)F_{r_n}G_{r_n}x_n\|. \\
\tag{129}
\]

Inequality (129) thus gives
\[
\|x_{n_j}-(x^*+\xi Bx^*)\| \\
\leq \frac{1}{1-\beta_{n_j}}\|x_{n+1}-x_n\| \\
+\|W_{n_j}(I-\xi B)F_{r_n}G_{r_n}x_n-(I-\xi B)F_{r_n}G_{r_n}x_n\| \\
+\|x_n-x^*\| + 4\|x^*\| \frac{|r_n-r_0|}{r_0} \\
+\frac{\alpha_{n_j}}{1-\beta_{n_j}}\|u-AW_{n_j}(I-\xi B)F_{r_n}G_{r_n}x_n\|. \\
\tag{130}
\]

Thus, we obtain from (130) that
\[
\limsup_{j\to\infty}\|x_{n_j}-(x^*+\xi Bx^*)\| \leq \limsup_{j\to\infty}\|x_{n_j}-x^*\|, \tag{131}
\]

so that Definition 10 again gives \(x^*+\xi Bx^*=x^*\) and this implies that \(x^*\in B^{-1}(0)\). Hence, \(x^*\in \Omega\).

Now, let \(\varepsilon \in (0,1)\) and \(x\in H\) be arbitrary, then, using Lemma 4 we have
\[
\|x_{n_j}-x^* - \varepsilon(x-x^*)\|^2 \\
\leq \|x_{n_j}-x^*\|^2 \\
- 2\varepsilon\left(x-x^*,x_{n_j}-x^* - \varepsilon(x-x^*)\right) \\
= \|x_{n_j}-x^*\|^2 + 2\varepsilon\left(x-x^*,x^* + \varepsilon(x-x^*) - x_{n_j}\right). \tag{132}
\]

Since \(x^*\) is the asymptotic center of \(\{x_{n_j}\}_{j\geq1}\), it is easy to see (using Definition 10 and Lemma 14) that
\[
\limsup_{j\to\infty}\|x_{n_j}-x^*\|^2 \\
\leq \limsup_{j\to\infty}\|x_{n_j}-x^* - \varepsilon(x-x^*)\|^2 \\
\leq \limsup_{j\to\infty}\|x_{n_j}-x^*\|^2 \\
+ 2\varepsilon\limsup_{j\to\infty}\left(x-x^*,x^* + \varepsilon(x-x^*) - x_{n_j}\right). \tag{133}
\]

Thus,
\[
0 \leq \limsup_{j\to\infty}\left(x-x^*,x^* + \varepsilon(x-x^*) - x_{n_j}\right), \tag{134}
\]

But,
\[
\left(x-x^*,x^* - x_{n_j}\right) = \left(x-x^*,x^* + \varepsilon(x-x^*) - x_{n_j}\right) \\
- \varepsilon\|x-x^*\|^2. \tag{135}
\]

So,
\[
\limsup_{j\to\infty}\left(x-x^*,x^* - x_{n_j}\right) \\
= \limsup_{j\to\infty}\left(x-x^*,x^* + \varepsilon(x-x^*) - x_{n_j}\right) - \varepsilon\|x-x^*\|^2 \\
= \limsup_{j\to\infty}\left(x-x^*,x^* + \varepsilon(x-x^*) - x_{n_j}\right) - \varepsilon\|x-x^*\|^2 \\
\geq -\varepsilon\|x-x^*\|^2. \tag{136}
\]

Thus, since \(\varepsilon \in (0,1)\) is arbitrary, we obtain from (136) that
\[
\limsup_{j\to\infty}\left(x-x^*,x^* - x_{n_j}\right) \geq 0 \quad \forall x\in H. \tag{137}
\]
In particular, for \( x = x^* + u - Ax' \in H \) and using the fact that \( x^* \in \Omega \), we obtain from (137) that

\[
0 \leq \limsup_{j \to \infty} \langle u - Ax', x^* - x_n \rangle \\
\leq \langle u - Ax', x^* - x' \rangle + \limsup_{j \to \infty} \langle u - Ax', x - x_n \rangle \\
= \langle u - Ax', x^* - x' \rangle + \lim \langle u - Ax', x - x_n \rangle \\
\leq \lim_{j \to \infty} \langle u - Ax', x - x_n \rangle.
\]

(138)

This implies that

\[
\lim_{j \to \infty} \langle u - Ax', x_n - x' \rangle \leq 0.
\]

(139)

Hence,

\[
\limsup_{n \to \infty} \langle u - Ax', x_n - x' \rangle = \lim_{j \to \infty} \langle u - Ax', x_n - x' \rangle \leq 0.
\]

(140)

\[\square\]

**Theorem 22.** Let \( \{x_n\}_{n=1} \) be given by (74). Suppose that the conditions of Remark 16 are satisfied, then \( \{x_n\}_{n=1} \) converges strongly to \( x \in \Omega \) which is a unique solution of the variational inequality (75).

**Proof.** From the recursion formula (74) and Lemma 4, we have

\[
\|x_{n+1} - x'\|^2 \\
= \|\alpha_n u + [(1 - \beta_n) I - \alpha_n A] \times W_n (I - \xi B) F_n G_n x_n + \beta_n x_n - x'\|^2 \\
= \|[(1 - \beta_n) I - \alpha_n A] \times W_n (I - \xi B) F_n G_n x_n - x'\|^2 \\
+ \beta_n (x_n - x') + \alpha_n (u - Ax') \|^2 \\
\leq \|[(1 - \beta_n) I - \alpha_n A] \times W_n (I - \xi B) F_n G_n x_n - x'\|^2 \\

+ 2\alpha_n \beta_n \langle u - Ax', x_n - x' \rangle \\
\leq (1 - 2\alpha_n \gamma) \|x_n - x'\|^2 \\
+ \alpha_n^2 \|x_n - x'\|^2 + 2\alpha_n \|u - Ax'\|^2 + 2\alpha_n (1 - \beta_n) \times \langle u - Ax', W_n (I - \xi B) F_n G_n x_n - x_n \rangle \\
- 2\alpha_n^2 \langle u - Ax', A (W_n (I - \xi B) F_n G_n x_n - x') \rangle \\
+ 2\alpha_n (1 - \beta_n) \langle u - Ax', x_n - x' \rangle \\
\leq [1 - 2\alpha_n \gamma] \|x_n - x'\|^2 \\
+ \alpha_n \|W_n (I - \xi B) F_n G_n x_n - x_n\| M_4 \\
+ 2\alpha_n \langle u - Ax', x_n - x' \rangle.
\]

(141)
for some real constant $M_4 > 0$. Thus,
\[
\|x_{n+1} - x\|^2 \leq (1 - \delta_n)\|x_n - x\|^2 + \sigma_n, \tag{142}
\]
where $\delta_n := 2\alpha_n y$ and $\sigma_n := \alpha_n(\alpha_n + \|W_n(I - \xi B)F_nG_n x_n - x_n\|M_4 + 2\alpha_n\langle u - Ax', x_n - x'\rangle)$. It is easy to see that $\limsup_{n \to \infty}(\sigma_n/\delta_n) \leq 0$ (using (93), Lemma 21 and the fact that $\lim_{n \to \infty}(\alpha_n) = 0$). Hence, we obtain by Lemma 5 that the sequence $\{x_n\}$ converges strongly to $x' \in \Omega$ which is a unique solution of (75).

Remark 23. Let $f : H \to H$ be a strict contraction, then our method of proof easily carries over to the iteration method $\{x_n\}$ given by $x_1 \in H$,
\[
x_{n+1} = \alpha_n f (x_n) + \beta x_n + ((1 - \beta_n)I - \alpha_n A)W_n (I - \xi B)F_nG_n x_n, \tag{143}
\]
making use of the fact that $f$ is a contraction. Thus, we obtain the following theorem.

Theorem 24. Let $\{x_n\}$ be given by (143). Suppose that the conditions of Remark 16 are satisfied, then $\{x_n\}$ converges strongly to $x \in \Omega$ which is a unique solution of the variational inequality
\[
\langle (A - \gamma f) x', y - x' \rangle \geq 0, \tag{144}
\]
for all $y \in \Omega$, which is the optimality condition for the minimization problem $\min_{x \in \Omega}(1/2)\|Ax - h(x)\|^2$, where $h$ is a potential function for $\gamma f$ (i.e., $h'(x) = \gamma f(x)$ for all $x \in H$), and one recalls that $\Omega = \text{Fix}(T') \cap \text{GMEP}(f, \Theta, \Phi) \cap B^{-1}(0) \cap \bigcap_{j=1}^m \text{Fix}(T_j)$.

Remark 25. Our theorems extend and unify most of the results that have been proved for the class of nonlinear operators studied in this paper. In particular, it is easy to see that Theorem 24 extends, improves, generalizes, and unifies the corresponding results of Yao et al. [32], Colao and Marino [33], and Chamnarnpan and Kuman [34]. Furthermore, the setting of our theorems corrects the problem of well-definedness which might arise in the results of Chamnarnpan and Kuman [34], and our method of proof is of independent interest.
