We prove some common fixed point theorems for two pairs of weakly compatible mappings satisfying a rational type contractive condition in the framework of complex valued metric spaces. The proved results generalize and extend some of the known results in the literature.

1. Introduction and Preliminaries

The famous Banach contraction principle states that if \((X, d)\) is a complete metric space and \(T : X \rightarrow X\) is a contraction mapping (i.e., \(d(Tx, Ty) \leq kd(x, y)\) for all \(x, y \in X\), where \(k\) is a nonnegative number such that \(k < 1\)), then \(T\) has a unique fixed point. This principle is one of the cornerstones in the development of nonlinear analysis. Fixed point theorems have applications not only in the different branches of mathematics, but also in economics, chemistry, biology, computer science, engineering, and others. Due to its importance, generalizations of Banach’s contraction principle have been investigated heavily by several authors. Fixed point and common fixed point theorems for different types of nonlinear contractive mappings have been investigated extensively by various researchers (see [1–35] and references cited therein).

Recently, Azam et al. [1] introduced the complex valued metric space, which is more general than the well-known metric spaces. Many researchers have obtained fixed point, common fixed point, coupled fixed point, and coupled common fixed point results in partially ordered metric spaces, complex valued metric spaces, and other spaces. In this paper, we prove some common fixed point theorems for two pairs of weakly mappings satisfying a contractive condition of rational type in the framework of complex valued metric spaces. The proved results generalize and extend some of the results in the literature.

To begin with, we recall some basic definitions, notations, and results.

The following definitions of Azam et al. [1] are needed in the sequel.

Let \(C\) be the set of complex numbers, and let \(z_1, z_2 \in C\). Define a partial order \(\leq\) on \(C\) as follows:

\[z_1 \leq z_2 \iff \text{Re}(z_1) \leq \text{Re}(z_2), \quad \text{Im}(z_1) \leq \text{Im}(z_2).\]  

(1)

It follows that \(z_1 \leq z_2\) if one of the following conditions is satisfied:

(1) \(\text{Re}(z_1) = \text{Re}(z_2),\) and \(\text{Im}(z_1) < \text{Im}(z_2);\)
(2) \(\text{Re}(z_1) < \text{Re}(z_2),\) and \(\text{Im}(z_1) = \text{Im}(z_2);\)
(3) \(\text{Re}(z_1) < \text{Re}(z_2),\) and \(\text{Im}(z_1) < \text{Im}(z_2);\)
(4) \(\text{Re}(z_1) = \text{Re}(z_2),\) and \(\text{Im}(z_1) = \text{Im}(z_2).\)

In particular, we will write \(z_1 \preceq z_2\) if \(z_1 \neq z_2\) and one of (1), (2), and (3) is satisfied, and we will write \(z_1 < z_2\) if only (3) is satisfied.
Note. We obtained that the following statements hold:

(i) \(a, b \in \mathbb{R}\) and \(a \leq b \Rightarrow az \leq bz\), for all \(z \in \mathbb{C}\);
(ii) \(0 \leq z_1 \neq z_2 \Rightarrow |z_1| < |z_2|\);
(iii) \(z_1 \leq z_2\) and \(z_2 < z_3\) imply \(z_1 < z_3\).

**Definition 1.** Let \(X\) be a nonempty set. Suppose that the mapping \(d : X \times X \to \mathbb{C}\) satisfies the following conditions:

(i) \(0 \leq d(x, y)\) for all \(x, y \in X\) and \(d(x, y) = 0\) if and only if \(x = y\);
(ii) \(d(x, y) = d(y, x)\) for all \(x, y \in X\);
(iii) \(d(x, y) \leq d(x, z) + d(z, y)\) for all \(x, y, z \in X\).

Then, \(d\) is called a complex valued metric on \(X\), and \((X, d)\) is called a complex valued metric space.

**Example 2.** Let \(X = \mathbb{C}\). Define a mapping \(d : X \times X \to \mathbb{C}\) by
\[
d(z_1, z_2) = e^k|z_1 - z_2|,
\]
where \(k \in [0, \pi/2]\). Then, \((X, d)\) is a complex valued metric space.

A point \(x \in X\) is called an interior point of a set \(A \subseteq X\) whenever there exists \(0 < r \in \mathbb{R}\) such that \(B(x, r) = \{y \in X : d(x, y) < r\} \subseteq A\). A subset \(A\) in \(X\) is called open, whenever each point of \(A\) is an interior point of \(A\). The family \(F = \{B(x, r) : x \in X, 0 < r\}\) is a subbasis for a Hausdorff topology on \(X\).

A point \(x \in X\) is called a limit point of \(A\), whenever for every \(0 < r \in \mathbb{R}\), \(B(x, r) \cap (A \setminus X) \neq \emptyset\). A subset \(B \subseteq X\) is called closed, whenever each limit point of \(B\) belongs to \(B\).

Let \(\{x_n\}\) be a sequence in \(X\) and \(x \in X\). If for every \(c \in \mathbb{C}\), with \(0 < c\), there is \(n_0 \in \mathbb{N}\) such that for all \(n > n_0\), \(d(x_n, x) < c\), then \(x\) is called the limit of \(\{x_n\}\), and we write \(\lim_{n \to \infty} x_n = x\).

If for every \(c \in \mathbb{C}\), with \(0 < c\), there is an \(n_0 \in \mathbb{N}\) such that for all \(n > n_0\), \(d(x_{n_0}, x_{n+n}) < c\), then \(\{x_n\}\) is called a Cauchy sequence in \((X, d)\). If every Cauchy sequence is convergent in \((X, d)\), then \((X, d)\) is called a complete complex valued metric space.

**Lemma 3** (see [1]). Let \((X, d)\) be a complex valued metric space and \(\{x_n\}\) a sequence in \(X\). Then, \(\{x_n\}\) converges to \(x\) if and only if \(\lim_{n \to \infty} d(x_n, x) = 0\).

**Lemma 4** (see [1]). Let \((X, d)\) be a complex valued metric space and \(\{x_n\}\) a sequence in \(X\). Then, \(\{x_n\}\) is a Cauchy sequence if and only if \(\lim_{n \to \infty} d(x_n, x_{m+n}) = 0\).

Let \(M\) be a nonempty subset of a metric space \((X, d)\). Let \(S\) and \(T\) be mappings from a metric space \((X, d)\) into itself. A point \(x \in M\) is a common fixed (resp., coincidence) point of \(S\) and \(T\) if \(x = Sx = Tx\) (resp., \(Sx = Tx\)). The set of fixed points (resp., coincidence points) of \(S\) and \(T\) is denoted by \(F(S, T)\) (resp., \(C(S, T)\)).

In 1986, Jungck [22] introduced the more generalized commuting mappings in metric spaces, called compatible mappings, which also are more general than the concept of weakly commuting mappings (i.e., the mappings \(S, T : X \to X\) are said to be weakly commuting if \(d(STx, TSx) \leq d(Sx, Tx)\) for all \(x \in X\)) introduced by Sessa [28].

**Definition 5.** Let \(S\) and \(T\) be mappings from a metric space \((X, d)\) into itself. The mappings \(S\) and \(T\) are said to be compatible if
\[
\lim_{n \to \infty} d(STx_n, TSx_n) = 0
\]
whenever \(\{x_n\}\) is a sequence in \(X\) such that \(\lim_{n \to \infty} Sx_n = \lim_{n \to \infty} Tx_n = z\) for some \(z \in X\).

In general, commuting mappings are weakly commuting, and weakly commuting mappings are compatible, but the converses are not necessarily true, and some examples can be found in [22–24].

**Definition 6.** The mappings \(S\) and \(T\) are said to be weakly compatible if they commute at coincidence points of \(S\) and \(T\).

**Definition 7.** Let \(T, S : X \to X\) be two self-mappings of a complex valued metric space \((X, d)\). The pair \((T, S)\) is said to satisfy the \((E.A.)\) property (see [35]) if there exists a sequence \(\{x_n\}\) in \(X\) such that \(\lim_{n \to \infty} Tx_n = \lim_{n \to \infty} Sx_n = t\), for some \(t \in X\).

Pathak et al. [27] showed that weakly compatibility and \((E.A.)\) property are independent of each other.

**Definition 8.** The self mappings \(T\) and \(S\) from \(X\) to \(X\) are said to satisfy the common limit in the range of \(S\) property (CLR$_S$ property) (see [31]) if \(\lim_{n \to \infty} Tx_n = \lim_{n \to \infty} Sx_n = Sx\), for some \(x \in X\).

Some recent papers related to \((CLR)\) property and the complex valued metric spaces can be found in [1, 3, 27, 31–35] and references cited therein.

### 2. Main Results

#### 2.1. Common Fixed Point Theorem Using \((E.A.)\) Property

In this section, we prove some common fixed point theorems using \((E.A.)\) property in the complex valued metric spaces.

**Theorem 9.** Let \((X, d)\) be a complex valued metric space and \(A, B, S, T : X \to X\) four self-mappings satisfying the following conditions:

(i) \(A(X) \subseteq T(X), B(X) \subseteq S(X)\);
(ii) for all \(x, y \in X\) and \(0 < a < 1\),
\[
d(Ax, By) \leq d(Sx, Ax) d(Sx, By) + d(Ty, By) d(Ty, Ax) \frac{\leq d(Sx, By) + d(Ty, Ax)}{1 + d(Sx, By) + d(Ty, Ax)};
\]
(iii) the pairs \((A, S)\) and \((B, T)\) are weakly compatible;
(iv) one of the pairs \((A, S)\) or \((B, T)\) satisfies \((E.A.)\)-property.
If the range of one of the mappings $S(X)$ or $T(X)$ is a closed subspace of $X$, then the mappings $A$, $B$, $S$, and $T$ have a unique common fixed point in $X$.

**Proof.** First, we suppose that the pair $(B, T)$ satisfies (E.A.) property. Then, by Definition 7 there exists a sequence $\{x_n\}$ in $X$ such that $\lim_{n \to \infty} Bx_n = \lim_{n \to \infty} Tx_n = t$ for some $t \in X$.

Further, since $B(X) \subseteq S(X)$, there exists a sequence $\{y_n\}$ in $X$ such that $Bx_n = Sy_n$. Hence, $\lim_{n \to \infty} Sy_n = t$. We claim that $\lim_{n \to \infty} A_y = t$. Let $\lim_{n \to \infty} A_y = t \neq t$, then putting $x = y_n$, $y = x_n$ in condition (ii), we have

$$d(Ay_n, Bx_n) \leq a \frac{d(Sy_n, Ay_n) d(Sy_n, Bx_n) + d(Tx_n, Bx_n) d(Tx_n, Ay_n)}{1 + d(Sy_n, Bx_n) + d(Tx_n, Ay_n)}. \quad (5)$$

Letting $n \to \infty$, we have

$$d(t, t) \leq a \frac{d(t, t) d(t, t) + d(t, t) d(t, t)}{1 + d(t, t) + d(t, t)}. \quad (6)$$

Then, $|d(t, t)| \leq 0$; hence, $t_1 = t$ and that is, $\lim_{n \to \infty} A_y = \lim_{n \to \infty} Bx_n = t$.

Now suppose that $S(X)$ is a closed subspace of $X$, then $t = Su$ for some $u \in X$. Subsequently, we have

$$\lim_{n \to \infty} A_y = \lim_{n \to \infty} Bx_n = \lim_{n \to \infty} Tx_n = t = Su. \quad (7)$$

We claim that $Au = Su$. Put $x = u$ and $y = x_n$ in contractive condition (ii), and we have

$$d(Au, Bx_n) \leq a \frac{d(Su, Au) d(Su, Bx_n) + d(Tx_n, Bx_n) d(Tx_n, Au)}{1 + d(Su, Bx_n) + d(Tx_n, Au)}. \quad (8)$$

Letting $n \to \infty$ and using (7), we have

$$d(Au, t) \leq a \frac{d(t, Au) d(t, t) + d(t, t) d(t, Au)}{1 + d(t, t) + d(t, Au)}. \quad (9)$$

Then, $|d(Au, t)| \leq 0$, which is contradiction. Hence, $u$ is a coincidence point of $(A, S)$.

Now the weak compatibility of pair $(A, S)$ implies that $ASu = SAu$ or $At = St$.

On the other hand, since $A(X) \subseteq T(X)$, there exists $v$ in $X$ such that $Au = Tv$. Thus, $Au = Su = Tv = t$. Now, we show that $v$ is a coincidence point of $(B, T)$; that is, $BV = Tv = t$. Put $x = u$, $y = v$ in contractive condition (ii), and we have

$$d(Au, Bv) \leq a \frac{d(Su, Au) d(Su, Bv) + d(Tv, Bv) d(Tv, Au)}{1 + d(Su, Bv) + d(Tv, Au)}. \quad (10)$$

or

$$d(t, Bv) \leq a \frac{d(t, t) d(t, Bv) + d(t, Bv) d(t, t)}{1 + d(t, Bv) + d(t, t)}; \quad (11)$$

whence $|d(t, Bv)| \leq 0$, which is a contradiction. Thus, $Bv = t$. Hence, $BV = TV = t$, and $v$ is the coincidence point of $B$ and $T$.

Further, the weak compatibility of pair $(B, T)$ implies that $BTv = TBv$, or $Bt = Tt$. Therefore, $t$ is a common coincidence point of $A$, $B$, $S$, and $T$.

Now, we show that $t$ is a common fixed point. Put $x = u$ and $y = t$ in contractive condition (ii), and we have

$$d(Bt, t) = d(Au, Bt) \leq a \frac{d(Su, Au) d(Su, Bt) + d(Tt, Bt) d(Tt, Au)}{1 + d(Su, Bt) + d(Tt, Au)}; \quad (12)$$

or $|d(t, Bt)| \leq 0$, which is a contradiction. Thus, $Bt = t$. Hence, $At = Bt = St = Tt = t$.

Similar argument arises if we assume that $T(X)$ is closed subspace of $X$. Similarly, the (E.A.)-property of the pair $(A, S)$ will give a similar result.

For uniqueness of the common fixed point, let us assume that $w$ is another common fixed point of $A, B, S$, and $T$. Then, put $x = u, y = t$ in contractive condition (ii), and we have

$$d(w, t) = d(Aw, Bt) \leq a \frac{d(Su, Aw) d(Su, Bt) + d(Tt, Bt) d(Tt, Aw)}{1 + d(Su, Bt) + d(Tt, Aw)}; \quad (13)$$

or $|d(w, t)| \leq 0$, which is a contradiction. Thus, $w = t$. Hence, $At = Bt = St = Tt = t$, and $t$ is the unique common fixed point of $A, B, S$, and $T$. $\square$

**Remark 10.** (a) Continuity of mappings $A$, $B$, $S$, and $T$ is relaxed in Theorem 9.

(b) Completeness of space $X$ is relaxed in Theorem 9.

If $A = B$ and $S = T$ in Theorem 9, we have the following result.

**Corollary 11.** Let $(X, d)$ be a complex valued metric space and $A, T : X \to X$ self-mappings satisfying the following conditions:

(i) $A(X) \subseteq T(X)$;

(ii) for all $x, y \in X$ and $0 < a < 1$, $d(Ax, Ay) \leq a \frac{d(Tx, Ax) d(Tx, Ay) + d(Ty, Ay) d(Ty, Ax)}{1 + d(Tx, Ay) + d(Ty, Ax)}; \quad (14)$

(iii) the pair $(A, T)$ is weakly compatible;

(iv) the pair $(A, T)$ satisfies (E.A.)-property.

If the range of the mapping $T(X)$ is a closed subspace of $X$, then $A$ and $T$ have a unique common fixed point in $X$. 

Theorem 12. Let \((X, d)\) be a complex valued metric space and \(A, B, S, T : X \to X\) four self-mappings satisfying the following conditions:

(i) \(A(X) \subseteq T(X), B(X) \subseteq S(X)\);

(ii) for all \(x, y \in X\) and \(0 < a < 1\),

\[
d(A(x, y)) \leq a \frac{d(S(x, A(x)) + d(T(y, B(y)))}{1 + d(S(x, A(x)) + d(T(y, B(y)))} \tag{16}
\]

(iii) the pairs \((A, S)\) and \((B, T)\) are weakly compatible.

If the range of one of the mappings \(S(X)\) or \(T(X)\) is a closed subspace of \(X\), then the mappings \(A, B, S, T\) have a unique common fixed point in \(X\).

Proof. Using the same arguments as in Theorem 9, we have the following result.

2.2. Fixed Point Theorem Using \((CLR)\)-Property. In this section, we prove some common fixed point theorems using \((CLR)\)-property in the complex valued metric spaces.

Theorem 13. Let \((X, d)\) be a complex valued metric space and \(A, B, S, T : X \to X\) four self-mappings satisfying the following conditions:

(i) \(A(X) \subseteq T(X), B(X) \subseteq S(X)\);

(ii) for all \(x, y \in X\) and \(0 < a < 1\),

\[
d(A(x, y)) \leq a \frac{d(S(x, A(x)) + d(T(y, B(y)))}{1 + d(S(x, A(x)) + d(T(y, B(y)))} \tag{16}
\]

(iii) the pairs \((A, S)\) and \((B, T)\) are weakly compatible.

If the pair \((A, S)\) satisfies \((CLR^a)\)-property or \((B, T)\) satisfies \((CLR^b)\)-property, then \(A, B, S, T\) have a unique common fixed point in \(X\).

Proof. First, we suppose that the pair \((B, T)\) satisfies \((CLR^a)\)-property. Then, by Definition 8, there exists a sequence \(\{x_n\}\) in \(X\) such that

\[
\lim_{n \to \infty} B(x_n) = \lim_{n \to \infty} T(x_n) = Bx,
\tag{17}
\]

for some \(x \in X\).

Further, since \(B(X) \subseteq S(X)\), we have \(Bx = Su\), for some \(u \in X\). We claim that \(Au = Su = t\)(say). Put \(x = u\) and \(y = x_n\) in contractive condition (ii), and we have

\[
d(A(u, Bx_n)) \leq a \frac{d(S(u, Au) + d(T(y, B(y)))}{1 + d(S(u, Au) + d(T(y, B(y)))} \tag{18}
\]

Letting \(n \to \infty\) and using (17), we have

\[
d(Au, Bx) \leq a \frac{d(Su, Au) + d(Bx, Bx)}{1 + d(Su, Au) + d(Bx, Bx)} = \frac{a}{1 + a}.
\tag{19}
\]

Then, \(|d(Au, Bx)| \leq 0\), which is contradiction. Thus, \(Au = Su\). Hence, \(Au = Su = Bx = t\).

Now, the weak compatibility of pair \((A, S)\) implies that, \(ASu = S Su\) or \(At = St\).

Further, since \(A(X) \subseteq T(X)\), there exists \(v\) in \(X\) such that \(Au = Tv\). Thus, \(Au = Su = T v = t\).

Now, we show that \(v\) is a coincidence point of \((B, T)\) that is, \(Bv = T v = t\). Put \(x = u\), \(y = v\) in contractive condition (ii), and we have

\[
d(Au, Bv) \leq a \frac{d(Su, Au) + d(T v, Bv)}{1 + d(Su, Au) + d(T v, Bv)} \tag{20},
\]

or

\[
d(t, Bt) \leq a \frac{d((t, t), Bv) + d((t, t), Bv)}{1 + d(t, Bv) + d((t, t), Bv)}; \tag{21}
\]

whence \(|d(t, Bt)| \leq 0\), which is a contradiction. Thus, \(Bv = t\). Hence, \(Bv = T v = t\), and \(v\) is a coincidence point of \((B, T)\).

Further, the weak compatibility of pair \((B, T)\) implies that \(B T v = B v, \) or \(B T t\). Therefore, \(t\) is a common coincidence point of \(A, B, S, \) and \(T\).

Now, we show that \(t\) is a common fixed point. Put \(x = u\) and \(y = t\) in contractive condition (ii), and we have

\[
d(t, Bt) = d(Au, Bt) \leq a \frac{d(Su, Au) + d(Bt, Bt)}{1 + d(Su, Au) + d(Bt, Bt)} \tag{22},
\]

or \(|d(t, Bt)| \leq 0\), which is a contradiction. Thus, \(Bt = t\). Hence, \(At = Bt = St = T t = t\). The uniqueness of the common fixed point follows easily.

In a similar way, the argument that the pair \((A, S)\) satisfies property \((CLR^a)\) will also give the unique common fixed point of \(A, B, S\) and \(T\). Hence the result follows.

Following the similar steps as in Theorem 13, we have the following result.

Theorem 14. Let \((X, d)\) be a complex valued metric space and \(A, B, S, T : X \to X\) four self-mappings satisfying the following conditions:

(i) \(A(X) \subseteq T(X), B(X) \subseteq S(X)\);

(ii) for all \(x, y \in X\) and \(0 < a < 1\),

\[
d(A(x, y)) \leq a \frac{d(S(x, A(x)) + d(T(y, B(y)))}{1 + d(S(x, A(x)) + d(T(y, B(y)))} \tag{23}
\]

where \(D = d(Sx, By) + d(Ty, Ax)\);

(iii) the pairs \((A, S)\) and \((B, T)\) are weakly compatible.
If the pair \((A, S)\) satisfy \((CLR_A)\) property or \((B, T)\) satisfies \((CLR_B)\) property, then \(A, B, S,\) and \(T\) have a unique common fixed point in \(X\).

**Remark 15.** In this paper, we used the \((E.A.)\) property and \(CLR\) property to claim the existence of common fixed point of some rational type contraction mappings. \((E.A.)\) property requires the condition of closedness of subspace. However, \(CLR\) property never requires any condition on closedness of subspace, continuity of one or more mappings and containment of ranges of involved mappings. So, \(CLR\) property is an interesting auxiliary tool to claim the existence of a common fixed point.
