ANALYSIS OF A MATHEMATICAL MODEL RELATED TO CZOCHELSKI CRYSTAL GROWTH

PETR KNOBLOCH AND LUTZ TOBISKA

ABSTRACT. This paper is devoted to the study of a stationary problem consisting of the Boussinesq approximation of the Navier–Stokes equations and two convection–diffusion equations for the temperature and concentration, respectively. The equations are considered in 3D and a velocity–pressure formulation of the Navier–Stokes equations is used. The problem is complicated by nonstandard boundary conditions for velocity on the liquid–gas interface where tangential surface forces proportional to surface gradients of temperature and concentration (Marangoni effect) and zero normal component of the velocity are assumed. The velocity field is coupled through this boundary condition and through the buoyancy term in the Navier–Stokes equations with both the temperature and concentration fields. In this paper a weak formulation of the problem is stated and the existence of a weak solution is proved. For small data, the uniqueness of the solution is established.

1. INTRODUCTION

In this paper we investigate the solvability of a stationary three-dimensional mathematical model describing the processes in the melt during a silicon single crystal pulling by the Czochralski method. The main feature of the Czochralski method (cf. e.g. [3, 13, 15]) is that the grown single crystal is pulled from its melt which is situated in a crucible (cf. Fig. 1). The device is rotationally symmetrical and, during the pulling, both the crucible and the crystal perform rotational motions around the symmetry axis and, at the same time, motions in the vertical direction which correspond to the crystal growth velocity and maintain the melt free surface in a constant position. The crystal growth velocity is usually considerably smaller than the typical

Figure 1 Cross-section through the melt and crystal in a Czochralski apparatus.

velocities in the melt. The crucible is made of vitreous silica which leads to a contamination of the melt by oxygen.

The region occupied by the melt is assumed to be known a priori and will be denoted by Ω in the following. The boundary $\partial\Omega$ of Ω comprises the crucible wall Γ^W , the melt free surface Γ^{LG} and the interface Γ^{LS} between the melt and the growing crystal (cf. Fig. 1). The mathematical model then consists of the following partial differential equations defined in Ω and boundary conditions prescribed on $\partial\Omega$:

$$\left. \begin{aligned} -\Delta \mathbf{v} + \alpha_5 (\nabla \mathbf{v}) \mathbf{v} + \alpha_5 \nabla p &= \alpha_1 \mathbf{f}_1(\theta) + \alpha_2 \mathbf{f}_2(c), \\ \operatorname{div} \mathbf{v} &= 0, \\ -\Delta \theta + \alpha_6 \mathbf{v} \cdot \nabla \theta &= 0, \\ -\Delta c + \alpha_7 \mathbf{v} \cdot \nabla c &= 0, \end{aligned} \right\} \text{ in } \Omega \quad \begin{aligned} (1.1) \\ (1.2) \\ (1.3) \\ (1.4) \end{aligned}$$

$$\mathbf{v} = \mathbf{v}_b, \quad \theta = \theta_b, \quad c = c_b \quad \text{on } \Gamma^W, \quad (1.5)$$

$$(\mathbf{I} - \mathbf{n} \otimes \mathbf{n})(\nabla \mathbf{v} + \nabla \mathbf{v}^T) \mathbf{n} = -\alpha_3 \nabla_s \theta - \alpha_4 \nabla_s c, \quad \left. \begin{aligned} (1.6) \end{aligned} \right\} \text{ on } \Gamma^{LG}$$

$$\mathbf{v} \cdot \mathbf{n} = 0, \quad -\frac{\partial \theta}{\partial \mathbf{n}} = \varphi_1(\theta), \quad c = c_b, \quad \left. \begin{aligned} (1.7) \end{aligned} \right\} \text{ on } \Gamma^{LG}$$

$$\mathbf{v} = \mathbf{v}_b, \quad \theta = \theta_b, \quad -\frac{\partial c}{\partial \mathbf{n}} = (\mathbf{v}_b \cdot \mathbf{n}) \varphi_2(c) \quad \text{on } \Gamma^{LS}. \quad (1.8)$$

We use the following notations: $\mathbf{v}$ is the velocity, p is the pressure, θ is the temperature, c is the oxygen concentration, $\mathbf{I}$ is the identity tensor, $\mathbf{n}$ is the unit outward normal vector to $\partial\Omega$, and ∇_s denotes the surface gradient (in this paper, $\nabla_s \cdot = (\mathbf{I} - \mathbf{n} \otimes \mathbf{n})(\nabla \cdot)|_{\partial\Omega}$). The constants $\alpha_1, \dots, \alpha_7$ and the functions $\mathbf{f}_1, \mathbf{f}_2, \varphi_1, \varphi_2, \mathbf{v}_b, \theta_b, c_b$ will be specified in the next section.

The equations (1.1)–(1.4) can be derived from general balance laws for linear momentum, mass, energy, and mass of a constituent, respectively. The equations (1.1) and (1.2) represent the Boussinesq approximation of the Navier–Stokes equations. Among the boundary conditions, the most

interesting one is the boundary condition (1.6) describing the so-called Marangoni effect, i.e. the fact that surface tension variations due to temperature and concentration gradients induce tangential surface forces on the melt free surface. A detailed derivation and explanation of the model (1.1)–(1.8) can be found in [8]. The solvability of a rotationally symmetrical case of (1.1)–(1.8) defined in a simplified geometry and taking into account magnetic forces was investigated in [4]. The formulation of (1.1)–(1.8) used in [4] requires to apply weighted Sobolev spaces, but on the other hand, it considerably simplifies the treatment of (1.2) and (1.6).

Remark 1.1. The constants $\alpha_1, \dots, \alpha_7$ have the following physical meanings:

$$\alpha_1 = \frac{Gr_\theta}{Re}, \quad \alpha_2 = \frac{Gr_c}{Re}, \quad \alpha_3 = \frac{Ma_\theta}{Re Pr}, \quad \alpha_4 = \frac{Ma_c}{Re Pr},$$

$$\alpha_5 = Re, \quad \alpha_6 = Re Pr, \quad \alpha_7 = Re Sc,$$

where Re is the Reynolds number, Pr is the Prandtl number, Sc is the Schmidt number, Gr is the Grashof number (Gr_θ for temperature, Gr_c for concentration), and Ma is the Marangoni number (Ma_θ for temperature, Ma_c for concentration). The usual definitions of the functions $\mathbf{f}_1, \mathbf{f}_2, \varphi_1, \varphi_2$ are

$$\begin{aligned} \mathbf{f}_1(\theta) &= -\theta \mathbf{e}_g, & \mathbf{f}_2(c) &= -c \mathbf{e}_g, \\ \varphi_1(\theta) &= Bi(\theta - \theta_{amb}) + Rd \left\{ (\theta + \tilde{\theta})^4 - (\theta_{inf} + \tilde{\theta})^4 \right\}, \\ \varphi_2(c) &= Re Sc (k_0 - 1) (c + \tilde{c}) \end{aligned}$$

for θ and c belonging to some *bounded* intervals (θ_1, θ_2) and (c_1, c_2) , respectively. Outside these bounded intervals, the functions $\mathbf{f}_1, \mathbf{f}_2, \varphi_1, \varphi_2$ have no physical meaning and can be defined arbitrarily. In the above relations, $\mathbf{e}_g$ is a unit vector in the direction of the gravity, Bi is the Biot number, Rd is the radiation number, and k_0 is the segregation coefficient.

Let us mention the most important difficulties arising when investigating the weak solvability of (1.1)–(1.8). The first difficulty comes from the fact that full Dirichlet boundary conditions are prescribed only on a part of the boundary whereas, on the remaining part, only the normal component of the velocity is known a priori. That also causes difficulties in case of the Navier–Stokes equations since all methods used in the literature for proving their solvability are based on the assumption that there exists a *divergence-free* function $\tilde{\mathbf{v}}_b$ satisfying the Dirichlet boundary conditions for the velocity such that the integral $\int_\Omega \tilde{\mathbf{v}}_b \cdot (\nabla \tilde{\mathbf{v}}) \tilde{\mathbf{v}} \, dx$ is, in some sense, small (cf. e.g. (4.29), (4.35)). It is known that such assumption is fulfilled if full Dirichlet boundary conditions for the velocity are prescribed on the whole boundary and the flux through each connected component of the boundary vanishes (cf. [7, p. 287, Lemma 2.3]). However, in the case considered here, the existence of a suitable function $\tilde{\mathbf{v}}_b$ is an open problem. That means that, in case of non-homogenous mixed boundary conditions of the mentioned type, which often occur in various applications, it is not known how to prove the solvability

of the stationary incompressible Navier–Stokes equations in general and it is rather surprising that such a fundamental problem still remains unsolved.

Another difficulty consists in the nonstandard boundary condition (1.6) for the velocity on Γ^{LG} . Here, a suitable generalization in form of a linear functional defined on a subspace of $H^{\frac{1}{2}}(\partial\Omega)^3$ has to be constructed for the occurring surface gradients of temperature and concentration. This generalization should be also appropriate for a numerical solution of (1.1)–(1.8) by means of the finite element method.

Finally, the investigations of (1.1)–(1.8) are complicated by the coupling between the equation (1.1) and the equations (1.3) and (1.4) which is realized through the buoyancy terms in (1.1) and through the boundary condition (1.6). In Theorem 4.5, we shall prove that the solvability does not depend on the magnitude of the constants in the coupling terms. Therefore, it suffices to prove the solvability only for those cases when these constants are small, which is, of course, much easier.

The plan of the paper is as follows. In Section 2, we formulate assumptions on the problem (1.1)–(1.8) and introduce some notations. In Section 3, we construct the mentioned generalization of the surface gradient, derive a weak formulation and show the equivalence between classical solutions and smooth weak solutions. In Section 4, we establish an equivalent operator formulation and prove the solvability of the weak formulation by applying the Leray–Schauder principle. The Leray–Schauder principle allows us to make a weaker assumption on the Dirichlet boundary condition v_b for the velocity than usually made in the literature. Further, we prove that, for small data, the weak solution is unique.

2. ASSUMPTIONS AND NOTATIONS

We use the notation $W^{k,p}(\Omega)$, where $k = 0, 1, \dots$ and $p \in \langle 1, \infty \rangle$, to denote the Sobolev space of functions whose generalized derivatives up to the order k belong to the space $L^p(\Omega)$ (cf. [1, 10]). The corresponding norm and seminorm are denoted by $\|\cdot\|_{k,p,\Omega}$ and $|\cdot|_{k,p,\Omega}$, respectively. For $p = 2$, the second index is dropped and we use the notations $H^k(\Omega) \equiv W^{k,2}(\Omega)$, $\|\cdot\|_{k,\Omega}$, and $|\cdot|_{k,\Omega}$. The subspace of $H^1(\Omega)$ consisting of functions with zero traces is denoted by $H_0^1(\Omega)$ and the space of continuous linear functionals defined on $H_0^1(\Omega)$ by $H^{-1}(\Omega)$. In addition, we introduce the space $H^{\frac{1}{2}}(\partial\Omega) \equiv \gamma(H^1(\Omega))$, where $\gamma : H^1(\Omega) \rightarrow L^2(\partial\Omega)$ is the trace operator. The spaces $C^k(\Omega)$, $k = 0, 1, \dots, \infty$, consist of functions having continuous derivatives up to the order k in Ω , and the spaces $C_0^k(\Omega)$ consist of functions $v \in C^k(\Omega)$ with $\text{supp } v \subset \Omega$. The space of functions $v \in L^2(\Omega)$ satisfying $\int_{\Omega} v \, dx = 0$ is denoted by $L_0^2(\Omega)$.

We assume that $\Omega \subset \mathbb{R}^3$ is a bounded domain with a Lipschitz-continuous boundary $\partial\Omega$ and that the sets Γ^W , Γ^{LG} and Γ^{LS} are open in $\partial\Omega$, disjoint and such that $\text{meas}_2(\Gamma^W) > 0$, $\text{meas}_2(\Gamma^{LG}) > 0$, $\text{meas}_2(\Gamma^{LS}) > 0$ and $\partial\Omega = \overline{\Gamma^W \cup \Gamma^{LG} \cup \Gamma^{LS}}$. In addition, we suppose that there exists an

extension $\mathbf{m} \in W^{1,4}(\Omega)^3$ of the unit outward normal vector to Γ^{LG} , i.e., $\mathbf{m}|_{\Gamma^{LG}} = \mathbf{n}|_{\Gamma^{LG}}$.

Remark 2.1. The assumption on the existence of the extension $\mathbf{m}$ is made because of the treatment of the surface gradients in the boundary condition (1.6). It can be shown that this assumption is satisfied if Γ^{LG} is a $C^{1,1}$ surface and if there exists a finite number of local Cartesian coordinate systems providing a description of $\partial\Omega$ (cf. [10, p. 14]) with the property that, in each of these coordinate systems, the projection of the respective part of Γ^{LG} into the (x_1, x_2) -plane is a set with a Lipschitz-continuous boundary. In this case, we even have $\mathbf{m} \in W^{1,\infty}(\mathbb{R}^3)^3$. Another sufficient condition for the existence of $\mathbf{m} \in W^{1,\infty}(\mathbb{R}^3)^3$ is the existence of a domain $\tilde{\Omega}$ with a $C^{1,1}$ boundary satisfying $\Gamma^{LG} \subset \partial\tilde{\Omega}$.

We make the following assumptions on the data of the problem (1.1)–(1.8):

$$\alpha_1, \alpha_2, \dots, \alpha_7 \in \mathbb{R}^+, \quad (2.1)$$

$$\mathbf{f}_1, \mathbf{f}_2 \in C^1(\mathbb{R})^3, \quad |\mathbf{f}_1'(x)| \leq 1, \quad |\mathbf{f}_2'(x)| \leq 1 \quad \forall x \in \mathbb{R}, \quad (2.2)$$

$$\varphi_1, \varphi_2 \in C^1(\mathbb{R}), \quad (2.3)$$

$$\exists K_1, L_1: \quad |\varphi_1(x)| \leq K_1, \quad |\varphi_1'(x)| \leq L_1 \quad \forall x \in \mathbb{R}, \quad (2.4)$$

$$\exists K_2, L_2: \quad |\varphi_2(x)| \leq K_2, \quad |\varphi_2'(x)| \leq L_2 \quad \forall x \in \mathbb{R}, \quad (2.5)$$

$$\mathbf{v}_b \in H^{\frac{1}{2}}(\partial\Omega)^3, \quad \theta_b \in H^{\frac{1}{2}}(\partial\Omega), \quad c_b \in H^{\frac{1}{2}}(\partial\Omega), \quad (2.6)$$

$$\mathbf{v}_b \cdot \mathbf{n} = 0 \text{ on } \Gamma^{LG}, \quad \mathbf{v}_b \cdot \mathbf{n} \geq 0 \text{ on } \Gamma^{LS}, \quad \int_{\partial\Omega} \mathbf{v}_b \cdot \mathbf{n} \, d\sigma = 0. \quad (2.7)$$

Generally, the condition $\mathbf{v}_b \cdot \mathbf{n} \geq 0$ on Γ^{LS} is a technical assumption needed for proving both the existence and the uniqueness of the weak solution. In the case of the Czochralski method, however, this assumption is a natural condition which expresses that the crystal is really growing and not melting. The last condition in (2.7), representing the global balance of mass, immediately follows from (1.2) and is therefore a necessary condition for the solvability of the problem (1.1)–(1.8). From the physical point of view, the assumptions (2.1)–(2.7) do not present any loss of generality (cf. Remark 1.1).

Finally, let us introduce some function spaces which we shall need in the following sections. The spaces are defined in regard to the Dirichlet boundary

conditions in (1.5)–(1.8) and to the equation (1.2):

$$\begin{aligned}
\mathbf{V} &= \{ \mathbf{v} \in H^1(\Omega)^3 \mid \operatorname{div} \mathbf{v} = 0, \quad \mathbf{v} = \mathbf{0} \text{ on } \Gamma^W \cup \Gamma^{LS}, \\
&\quad \mathbf{v} \cdot \mathbf{n} = 0 \text{ on } \Gamma^{LG} \}, \\
\widetilde{\mathbf{V}} &= \{ \mathbf{v} \in H_0^1(\Omega)^3 \mid \operatorname{div} \mathbf{v} = 0 \}, \\
\mathbf{W} &= \{ \mathbf{v} \in H^1(\Omega)^3 \mid \mathbf{v} = \mathbf{0} \text{ on } \Gamma^W \cup \Gamma^{LS}, \quad \mathbf{v} \cdot \mathbf{n} = 0 \text{ on } \Gamma^{LG} \}, \\
\widetilde{\mathbf{W}} &= \{ \mathbf{v} \in H^1(\Omega)^3 \mid \mathbf{v} = \mathbf{0} \text{ on } \Gamma^W \cup \Gamma^{LS} \}, \\
\Theta &= \{ \theta \in H^1(\Omega) \mid \theta = 0 \text{ on } \Gamma^W \cup \Gamma^{LS} \}, \\
\mathcal{C} &= \{ c \in H^1(\Omega) \mid c = 0 \text{ on } \Gamma^W \cup \Gamma^{LG} \}, \\
X &= \mathbf{V} \times \Theta \times \mathcal{C}, \\
\widehat{X} &= H^1(\Omega)^3 \times H^1(\Omega) \times H^1(\Omega).
\end{aligned}$$

3. WEAK FORMULATION

To derive a weak formulation of (1.1)–(1.8), we first assume that the functions $\mathbf{v}$, p , θ and c are a classical solution of our problem. We multiply the equations (1.1)–(1.4) by arbitrary functions $\mathbf{w} \in \mathbf{W} \cap C^\infty(\overline{\Omega})^3$, $\lambda \in L_0^2(\Omega) \cap C^\infty(\overline{\Omega})$, $\eta \in \Theta \cap C^\infty(\overline{\Omega})$ and $q \in \mathcal{C} \cap C^\infty(\overline{\Omega})$, respectively, integrate them over Ω , use the identities

$$\begin{aligned}
-\mathbf{w} \cdot \Delta \mathbf{v} &= \frac{1}{2} (\nabla \mathbf{v} + \nabla \mathbf{v}^T) \cdot (\nabla \mathbf{w} + \nabla \mathbf{w}^T) - \operatorname{div}[(\nabla \mathbf{v} + \nabla \mathbf{v}^T) \mathbf{w}] + \\
&\quad + \mathbf{w} \cdot \nabla(\operatorname{div} \mathbf{v}), \quad (3.1)
\end{aligned}$$

$$\mathbf{w} \cdot \nabla p = \operatorname{div}(p \mathbf{w}) - p \operatorname{div} \mathbf{w}, \quad (3.2)$$

$$-\eta \Delta \theta = \nabla \theta \cdot \nabla \eta - \operatorname{div}(\eta \nabla \theta), \quad (3.3)$$

$$-q \Delta c = \nabla c \cdot \nabla q - \operatorname{div}(q \nabla c), \quad (3.4)$$

apply the Gauss integral theorem (cf. [5, p. 33]) and substitute the Neumann boundary conditions and the condition (1.2). Then we obtain

$$\begin{aligned}
&\frac{1}{2} \int_{\Omega} (\nabla \mathbf{v} + \nabla \mathbf{v}^T) \cdot (\nabla \mathbf{w} + \nabla \mathbf{w}^T) dx + \alpha_5 \int_{\Omega} \mathbf{w} \cdot (\nabla \mathbf{v}) \mathbf{v} dx - \\
&\quad - \alpha_5 \int_{\Omega} p \operatorname{div} \mathbf{w} dx = \alpha_1 \int_{\Omega} \mathbf{w} \cdot \mathbf{f}_1(\theta) dx + \alpha_2 \int_{\Omega} \mathbf{w} \cdot \mathbf{f}_2(c) dx - \\
&\quad - \alpha_3 \int_{\Gamma^{LG}} \mathbf{w} \cdot \nabla_s \theta d\sigma - \alpha_4 \int_{\Gamma^{LG}} \mathbf{w} \cdot \nabla_s c d\sigma, \quad (3.5)
\end{aligned}$$

$$\int_{\Omega} \lambda \operatorname{div} \mathbf{v} dx = 0, \quad (3.6)$$

$$\int_{\Omega} \nabla \theta \cdot \nabla \eta dx + \alpha_6 \int_{\Omega} \eta \mathbf{v} \cdot \nabla \theta dx = - \int_{\Gamma^{LG}} \eta \varphi_1(\theta) d\sigma, \quad (3.7)$$

$$\int_{\Omega} \nabla c \cdot \nabla q dx + \alpha_7 \int_{\Omega} q \mathbf{v} \cdot \nabla c dx = - \int_{\Gamma^{LS}} q (\mathbf{v}_b \cdot \mathbf{n}) \varphi_2(c) d\sigma. \quad (3.8)$$

Thus, any classical solution of (1.1)–(1.8) satisfies the relations (3.5)–(3.8) and, on the other hand, it can be shown (cf. the proof of Theorem 3.3) that any functions $\mathbf{v} \in C^2(\overline{\Omega})^3$, $p \in C^1(\overline{\Omega})$, $\theta, c \in C^2(\overline{\Omega})$ satisfying both the

Dirichlet boundary conditions from (1.5)–(1.8) and the relations (3.5)–(3.8) (for any $\mathbf{w}$, λ , η , q of the above type) are a classical solution of (1.1)–(1.8). Hence, the new formulation (3.5)–(3.8) is equivalent to the classical formulation (1.1)–(1.8). However, this new formulation makes it possible to introduce more general solutions in a natural way. In fact, all terms with the exception of the two last ones in (3.5) are well defined for functions $\mathbf{v}$, $\mathbf{w}$, p , λ , θ , η , c , q belonging to the Sobolev spaces $H^1(\Omega)^3$, $L^2(\Omega)$ and $H^1(\Omega)$, respectively. Therefore, it remains to generalize the surface integrals of the type

$$\int_{\Gamma^{LG}} \mathbf{w} \cdot \nabla_s \zeta \, d\sigma$$

for functions $\mathbf{w} \in \mathbf{W}$ and $\zeta \in H^1(\Omega)$. First let us prove the following lemma.

Lemma 3.1. *Let $\mathbf{m} \in W^{1,4}(\Omega)^3$ be any extension of the normal vector $\mathbf{n}|_{\Gamma^{LG}}$. Given $\zeta \in H^1(\Omega)$ and $\mathbf{w} \in H^1(\Omega)^3$, we define*

$$d(\zeta, \mathbf{w}) = \int_{\Omega} \nabla \zeta \cdot [\mathbf{w} \operatorname{div} \mathbf{m} - \mathbf{m} \operatorname{div} \mathbf{w} + (\nabla \mathbf{w}) \mathbf{m} - (\nabla \mathbf{m}) \mathbf{w}] \, dx. \quad (3.9)$$

Then $d : H^1(\Omega) \times H^1(\Omega)^3 \rightarrow \mathbb{R}$ is a continuous bilinear mapping satisfying

$$d(\zeta, \mathbf{w}) = \int_{\partial\Omega} [\mathbf{n} \times (\mathbf{w} \times \mathbf{m})] \cdot \nabla \zeta \, d\sigma \quad \forall \zeta \in H^2(\Omega), \mathbf{w} \in H^1(\Omega)^3 \quad (3.10)$$

and

$$d(\zeta, \mathbf{w}) = 0 \quad \forall \zeta \in H^1(\Omega), \mathbf{w} \in H_0^1(\Omega)^3. \quad (3.11)$$

Proof. Since $W^{1,4}(\Omega) \subset C(\overline{\Omega})$ and $H^1(\Omega) \subset L^4(\Omega)$ (cf. [10, p. 72, Theorem 3.8] and [10, p. 69, Theorem 3.4]), the terms in the square brackets in (3.9) are elements of $L^2(\Omega)^3$ and hence the mapping d is well defined. Using the Hölder inequality, we obtain

$$|d(\zeta, \mathbf{w})| \leq |\zeta|_{1,\Omega} \{ (3 + 3^{\frac{3}{4}}) \|\mathbf{w}\|_{0,4,\Omega} \|\mathbf{m}\|_{1,4,\Omega} + (1 + \sqrt{3}) \|\mathbf{w}\|_{1,\Omega} \|\mathbf{m}\|_{0,\infty,\Omega} \}$$

and hence it follows from the Sobolev imbedding theorems that

$$|d(\zeta, \mathbf{w})| \leq C(\Omega) \|\mathbf{m}\|_{1,4,\Omega} |\zeta|_{1,\Omega} \|\mathbf{w}\|_{1,\Omega} \quad \forall \zeta \in H^1(\Omega), \mathbf{w} \in H^1(\Omega)^3, \quad (3.12)$$

which implies the continuity of d .

Let us assume for a moment that $\mathbf{m} \in C^\infty(\bar{\Omega})^3$. Then we have for any $\zeta \in C^\infty(\bar{\Omega})$ and $\mathbf{w} \in C^\infty(\bar{\Omega})^3$

$$\begin{aligned}
 d(\zeta, \mathbf{w}) &= \sum_{i,j=1}^3 \int_{\Omega} \frac{\partial \zeta}{\partial x_i} \frac{\partial}{\partial x_j} (w_i m_j) - \frac{\partial \zeta}{\partial x_i} \frac{\partial}{\partial x_j} (m_i w_j) \, dx = \\
 &= \sum_{i,j=1}^3 \int_{\Omega} \frac{\partial}{\partial x_j} \left[\frac{\partial \zeta}{\partial x_i} w_i m_j - \frac{\partial \zeta}{\partial x_i} m_i w_j \right] \, dx = \\
 &= \int_{\Omega} \operatorname{div} [\mathbf{m} (\mathbf{w} \cdot \nabla \zeta) - \mathbf{w} (\mathbf{m} \cdot \nabla \zeta)] \, dx = \\
 &= \int_{\Omega} \operatorname{div} [(\mathbf{w} \times \mathbf{m}) \times \nabla \zeta] \, dx = \\
 &= \int_{\partial \Omega} [(\mathbf{w} \times \mathbf{m}) \times \nabla \zeta] \cdot \mathbf{n} \, d\sigma = \int_{\partial \Omega} [\mathbf{n} \times (\mathbf{w} \times \mathbf{m})] \cdot \nabla \zeta \, d\sigma. \quad (3.13)
 \end{aligned}$$

According to the trace theorems (cf. [10, p. 84, Theorem 4.2]), the right-hand side of (3.13) is defined for any $\mathbf{m} \in W^{1,4}(\Omega)^3$, $\zeta \in H^2(\Omega)$, $\mathbf{w} \in H^1(\Omega)^3$ and it is bounded by $\tilde{C}(\Omega) \|\mathbf{m}\|_{1,4,\Omega} \|\zeta\|_{2,\Omega} \|\mathbf{w}\|_{1,\Omega}$. Since $C^\infty(\bar{\Omega})$ is dense in all the spaces $W^{1,4}(\Omega)$, $H^2(\Omega)$ and $H^1(\Omega)$, we obtain the property (3.10).

Now, due to (3.10), we have $d(\zeta, \mathbf{w}) = 0 \, \forall \, \zeta \in H^2(\Omega)$, $\mathbf{w} \in H_0^1(\Omega)^3$, which implies (3.11) using the density of $H^2(\Omega)$ into $H^1(\Omega)$. ■

Theorem 3.1. *Let $\zeta \in H^1(\Omega)$ and $\mathbf{z} \in \gamma(\widetilde{\mathbf{W}}) \subset H^{\frac{1}{2}}(\partial\Omega)^3$ be given. Let $\mathbf{w} \in H^1(\Omega)^3$ be an arbitrary function satisfying $\gamma(\mathbf{w}) = \mathbf{z}$ and let us set*

$$\langle d_s(\zeta), \mathbf{z} \rangle = d(\zeta, \mathbf{w}). \quad (3.14)$$

Then (3.14) defines a continuous linear mapping $d_s : H^1(\Omega) \rightarrow [\gamma(\widetilde{\mathbf{W}})]'$ which does not depend on the choice of the extension $\mathbf{m}$ in the definition of the mapping d . Moreover, for $\zeta \in H^2(\Omega)$, we have

$$\langle d_s(\zeta), \gamma(\mathbf{w}) \rangle = \int_{\Gamma^{LG}} \mathbf{w} \cdot \nabla_s \zeta \, d\sigma \quad \forall \, \mathbf{w} \in \widetilde{\mathbf{W}}. \quad (3.15)$$

The constant

$$C_s = \sup_{\substack{\zeta \in H^1(\Omega), \zeta \neq 0, \\ \mathbf{w} \in \mathbf{W}, \mathbf{w} \neq 0}} \frac{|\langle d_s(\zeta), \gamma(\mathbf{w}) \rangle|}{|\zeta|_{1,\Omega} \|\mathbf{w}\|_{1,\Omega}}$$

is finite and depends only on Γ^{LG} and Ω .

Proof. It follows from (3.11) that, for a given $\zeta \in H^1(\Omega)$, the value $d(\zeta, \mathbf{w})$ does not depend on the choice of the function $\mathbf{w} \in H^1(\Omega)^3$ satisfying $\gamma(\mathbf{w}) = \mathbf{z}$ and, therefore, the mapping d_s is defined by (3.14) unambiguously. Defining by

$$\|\mathbf{z}\|_{\frac{1}{2}, \partial\Omega} = \inf_{\substack{\mathbf{w} \in H^1(\Omega)^3, \\ \gamma(\mathbf{w}) = \mathbf{z}}} \|\mathbf{w}\|_{1,\Omega}$$

a norm in $H^{\frac{1}{2}}(\partial\Omega)^3$, we obtain by (3.11) and (3.12)

$$|\langle d_s(\zeta), \mathbf{z} \rangle| = \inf_{\substack{\mathbf{w} \in H^1(\Omega)^3, \\ \gamma(\mathbf{w}) = \mathbf{z}}} |d(\zeta, \mathbf{w})| \leq C(\Omega) \|\mathbf{m}\|_{1,4,\Omega} |\zeta|_{1,\Omega} \|\mathbf{z}\|_{\frac{1}{2},\partial\Omega}.$$

Thus, we have

$$\|d_s(\zeta)\|_{[\gamma(\widetilde{\mathbf{W}})]'} \leq C(\Omega) \|\mathbf{m}\|_{1,4,\Omega} |\zeta|_{1,\Omega} \quad \forall \zeta \in H^1(\Omega),$$

which means that the mapping d_s is continuous.

By (3.10), we obtain

$$\langle d_s(\zeta), \gamma(\mathbf{w}) \rangle = \int_{\Gamma^{LG}} [\mathbf{n} \times (\mathbf{w} \times \mathbf{n})] \cdot \nabla \zeta \, d\sigma \quad \forall \zeta \in H^2(\Omega), \mathbf{w} \in \widetilde{\mathbf{W}}. \quad (3.16)$$

Using the density of $H^2(\Omega)$ into $H^1(\Omega)$, we observe that, for any $\zeta \in H^1(\Omega)$ and $\mathbf{w} \in \widetilde{\mathbf{W}}$, the value $\langle d_s(\zeta), \gamma(\mathbf{w}) \rangle$ is independent of the choice of $\mathbf{m}$.

Since, for any $\mathbf{w} \in \widetilde{\mathbf{W}}$, we have $\mathbf{n} \times (\mathbf{w} \times \mathbf{n}) = (\mathbf{I} - \mathbf{n} \otimes \mathbf{n}) \mathbf{w}$ in each point of Γ^{LG} and since $\nabla_s \zeta = (\mathbf{I} - \mathbf{n} \otimes \mathbf{n}) \gamma(\nabla \zeta)$ for any $\zeta \in H^2(\Omega)$, the relation (3.15) follows from (3.16).

According to the Friedrichs inequality (cf. [10, p. 20, Theorem 1.9]), $|\cdot|_{1,\Omega}$ is a norm on $\mathbf{W}$, equivalent to $\|\cdot\|_{1,\Omega}$, and hence the constant C_s is finite by (3.12). ■

Thus, we see that the functional $d_s(\zeta)$ is a reasonable generalization of the surface gradient on Γ^{LG} for functions $\zeta \in H^1(\Omega)$ and hence, replacing the last two integrals in (3.5) by $-\alpha_3 \langle d_s(\theta), \gamma(\mathbf{w}) \rangle - \alpha_4 \langle d_s(c), \gamma(\mathbf{w}) \rangle$, we can define a weak formulation of (1.1)–(1.8). First, however, let us introduce the following notations:

$$\begin{aligned} a_1(\mathbf{v}, \mathbf{w}) &= \frac{1}{2} \int_{\Omega} (\nabla \mathbf{v} + \nabla \mathbf{v}^T) \cdot (\nabla \mathbf{w} + \nabla \mathbf{w}^T) \, dx, \\ a_2(\theta, \eta) &= \int_{\Omega} \nabla \theta \cdot \nabla \eta \, dx, \quad b(\mathbf{v}, \lambda) = - \int_{\Omega} \lambda \operatorname{div} \mathbf{v} \, dx, \\ b_1(\mathbf{u}, \mathbf{v}, \mathbf{w}) &= \int_{\Omega} \mathbf{w} \cdot (\nabla \mathbf{v}) \mathbf{u} \, dx, \quad b_2(\mathbf{v}, \theta, \eta) = \int_{\Omega} \eta \mathbf{v} \cdot \nabla \theta \, dx, \\ \langle F_1(\theta), \mathbf{w} \rangle &= \int_{\Omega} \mathbf{w} \cdot \mathbf{f}_1(\theta) \, dx, \quad \langle F_2(c), \mathbf{w} \rangle = \int_{\Omega} \mathbf{w} \cdot \mathbf{f}_2(c) \, dx, \\ \langle \Phi_1(\theta), \eta \rangle &= - \int_{\Gamma^{LG}} \eta \varphi_1(\theta) \, d\sigma, \quad \langle \Phi_2(c), \boldsymbol{\xi} \rangle = - \int_{\Gamma^{LS}} (\boldsymbol{\xi} \cdot \mathbf{n}) \varphi_2(c) \, d\sigma, \end{aligned}$$

where $\mathbf{u}, \mathbf{v}, \mathbf{w} \in H^1(\Omega)^3$, $c, \theta, \eta \in H^1(\Omega)$, $\lambda \in L^2(\Omega)$ and $\boldsymbol{\xi} \in L^2(\partial\Omega)^3$.

Definition 3.1. Let $\tilde{v}_b \in H^1(\Omega)^3$, $\tilde{\theta}_b, \tilde{c}_b \in H^1(\Omega)$ be arbitrary functions satisfying

$$\tilde{v}_b|_{\Gamma W \cup \Gamma^{LS}} = \mathbf{v}_b, \quad \tilde{v}_b \cdot \mathbf{n}|_{\Gamma^{LG}} = 0, \quad \tilde{\theta}_b|_{\partial\Omega} = \theta_b, \quad \tilde{c}_b|_{\partial\Omega} = c_b. \quad (3.17)$$

Then the functions $\mathbf{v}, p, \theta, c$ are a *weak solution* of the problem (1.1)–(1.8) if

$$\mathbf{v} \in H^1(\Omega)^3, \quad p \in L_0^2(\Omega), \quad \theta \in H^1(\Omega), \quad c \in H^1(\Omega), \quad (3.18)$$

$$\mathbf{v} - \tilde{v}_b \in \mathbf{W}, \quad \theta - \tilde{\theta}_b \in \Theta, \quad c - \tilde{c}_b \in \mathcal{C} \quad (3.19)$$

and

$$\begin{aligned} a_1(\mathbf{v}, \mathbf{w}) + \alpha_5 b_1(\mathbf{v}, \mathbf{v}, \mathbf{w}) + \alpha_5 b(\mathbf{w}, p) = \\ = \alpha_1 \langle \mathbf{F}_1(\theta), \mathbf{w} \rangle + \alpha_2 \langle \mathbf{F}_2(c), \mathbf{w} \rangle - \\ - \alpha_3 \langle d_s(\theta), \gamma(\mathbf{w}) \rangle - \alpha_4 \langle d_s(c), \gamma(\mathbf{w}) \rangle \quad \forall \mathbf{w} \in \mathbf{W}, \end{aligned} \quad (3.20)$$

$$b(\mathbf{v}, \lambda) = 0 \quad \forall \lambda \in L_0^2(\Omega), \quad (3.21)$$

$$a_2(\theta, \eta) + \alpha_6 b_2(\mathbf{v}, \theta, \eta) = \langle \Phi_1(\theta), \eta \rangle \quad \forall \eta \in \Theta, \quad (3.22)$$

$$a_2(c, q) + \alpha_7 b_2(\mathbf{v}, c, q) = \langle \Phi_2(c), q \mathbf{v}_b \rangle \quad \forall q \in \mathcal{C}. \quad (3.23)$$

Remark 3.1. The weak solution does not depend on the particular choice of the functions $\tilde{\mathbf{v}}_b$, $\tilde{\theta}_b$ and $\tilde{c}_b$ satisfying (3.17).

Remark 3.2. In view of (3.21) and (2.7), we have $b(\mathbf{v}, \lambda) = 0 \quad \forall \lambda \in L^2(\Omega)$ and hence any weak solution satisfies the condition $\operatorname{div} \mathbf{v} = 0$.

Remark 3.3. Since the pressure p is determined by (1.1), resp. by (3.20), up to an arbitrary additive constant, we consider only pressures with zero mean value.

Remark 3.4. If Γ^{LG} is plane, then, in (3.20), the bilinear form a_1 can be replaced by

$$\int_{\Omega} \nabla \mathbf{v} \cdot \nabla \mathbf{w} \, dx.$$

The reason is that, for a plane Γ^{LG} , any functions $\mathbf{v}, \mathbf{w} \in C^2(\bar{\Omega})^3$ with $\mathbf{v} \cdot \mathbf{n} = \mathbf{w} \cdot \mathbf{n} = 0$ on Γ^{LG} satisfy $\mathbf{w} \cdot (\nabla \mathbf{v})^T \mathbf{n} = 0$ on Γ^{LG} , which makes it possible to use the identity

$$-\mathbf{w} \cdot \Delta \mathbf{v} = \nabla \mathbf{v} \cdot \nabla \mathbf{w} - \operatorname{div}[(\nabla \mathbf{v})^T \mathbf{w}]$$

instead of the identity (3.1). Let us mention that, for a plane Γ^{LG} with a normal vector $\bar{\mathbf{n}}$, the formula (3.9) can be simplified to

$$d(\zeta, \mathbf{w}) = \bar{\mathbf{n}} \cdot \int_{\Omega} [(\nabla \mathbf{w})^T - (\operatorname{div} \mathbf{w}) \mathbf{I}] \nabla \zeta \, dx \quad \forall \zeta \in H^1(\Omega), \quad \mathbf{w} \in H^1(\Omega)^3.$$

The following two theorems show that the weak solution really is a meaningful generalization of the classical solution.

Theorem 3.2. *Any classical solution of the problem (1.1)–(1.8) is a weak solution of this problem.*

Proof. Let $\mathbf{v}, p, \theta, c$ be a classical solution of (1.1)–(1.8). Then, for any $\mathbf{w} \in C^\infty(\bar{\Omega})^3$, it follows from (1.1), (1.2), (1.6), (3.1) and (3.2) that

$$\begin{aligned} a_1(\mathbf{v}, \mathbf{w}) + \alpha_5 b_1(\mathbf{v}, \mathbf{v}, \mathbf{w}) + \alpha_5 b(\mathbf{w}, p) = \alpha_1 \langle \mathbf{F}_1(\theta), \mathbf{w} \rangle + \\ + \alpha_2 \langle \mathbf{F}_2(c), \mathbf{w} \rangle - \alpha_3 \int_{\Gamma^{LG}} \mathbf{w} \cdot \nabla_s \theta \, d\sigma - \alpha_4 \int_{\Gamma^{LG}} \mathbf{w} \cdot \nabla_s c \, d\sigma - \\ - \alpha_5 \int_{\partial\Omega} p \mathbf{w} \cdot \mathbf{n} \, d\sigma + \int_{\Gamma^W \cup \Gamma^{LS}} \mathbf{w} \cdot (\nabla \mathbf{v} + \nabla \mathbf{v}^T) \mathbf{n} \, d\sigma + \\ + \int_{\Gamma^{LG}} (\mathbf{w} \cdot \mathbf{n}) \mathbf{n} \cdot (\nabla \mathbf{v} + \nabla \mathbf{v}^T) \mathbf{n} \, d\sigma. \end{aligned} \quad (3.24)$$

Since $C^\infty(\overline{\Omega})^3$ is a dense subspace of $H^1(\Omega)^3$, we deduce that (3.24) holds for any $\mathbf{w} \in H^1(\Omega)^3$. Particularly, for $\mathbf{w} \in \mathbf{W}$, the last three integrals in (3.24) vanish and we obtain (3.20). The relations (3.22) and (3.23) can be obtained analogously and (3.21) immediately follows from (1.2). ■

Theorem 3.3. *Let $\mathbf{v}$, p , θ , c be a weak solution of the problem (1.1)–(1.8) and let us assume that $\mathbf{v} \in C^2(\overline{\Omega})^3$, $p \in C^1(\overline{\Omega})$, $\theta, c \in C^2(\overline{\Omega})$. Then the functions $\mathbf{v}$, p , θ , c are a classical solution of the problem (1.1)–(1.8).*

Proof. For any $\mathbf{w} \in \mathbf{W} \cap C^\infty(\overline{\Omega})^3$, we obtain by (3.20), (3.1), (3.2), Theorem 3.1 and Remark 3.2

$$\begin{aligned} \int_{\Omega} \mathbf{w} \cdot [-\Delta \mathbf{v} + \alpha_5 (\nabla \mathbf{v}) \mathbf{v} + \alpha_5 \nabla p - \alpha_1 \mathbf{f}_1(\theta) - \alpha_2 \mathbf{f}_2(c)] \, dx = \\ = - \int_{\Gamma^{LG}} \mathbf{w} \cdot [(\nabla \mathbf{v} + \nabla \mathbf{v}^T) \mathbf{n} + \alpha_3 \nabla_s \theta + \alpha_4 \nabla_s c] \, d\sigma. \end{aligned} \quad (3.25)$$

Particularly, (3.25) holds for any $\mathbf{w} \in C_0^\infty(\Omega)^3$ with a vanishing right-hand side and since the terms in the square brackets are continuous, we infer that the functions $\mathbf{v}$, p , θ , c fulfil the differential equation (1.1) in the classical sense. Then it follows from (3.25) that

$$\begin{aligned} \int_{\Gamma^{LG}} \mathbf{w} \cdot [(\mathbf{I} - \mathbf{n} \otimes \mathbf{n})(\nabla \mathbf{v} + \nabla \mathbf{v}^T) \mathbf{n} + \alpha_3 \nabla_s \theta + \alpha_4 \nabla_s c] \, d\sigma = 0 \\ \forall \mathbf{w} \in \widetilde{\mathbf{W}} \cap C^\infty(\overline{\Omega})^3, \end{aligned}$$

where we used the fact that $(\mathbf{I} - \mathbf{m} \otimes \mathbf{m}) \mathbf{w} \in \mathbf{W} \, \forall \mathbf{w} \in \widetilde{\mathbf{W}}$ and $(\mathbf{I} - \mathbf{n} \otimes \mathbf{n}) \nabla_s = \nabla_s$. Again, the terms in the square brackets are continuous and hence we deduce that the Neumann boundary condition (1.6) is also fulfilled in the classical sense. The validity of the equations (1.3) and (1.4) and of the Neumann boundary condition in (1.7) can be proven in the same fashion. For proving the Neumann boundary condition in (1.8), we have to apply Proposition 1.1 from [10, p. 56], since $\mathbf{n}|_{\Gamma^{LS}}$ is not continuous in general. The fulfilment of the Dirichlet boundary conditions immediately follows from (3.19). ■

4. EXISTENCE AND UNIQUENESS OF THE WEAK SOLUTION

In this section, we investigate the existence and uniqueness of the weak solutions of the problem (1.1)–(1.8). First, in Theorem 4.1, we show that the pressure can be eliminated from the weak formulation (3.19)–(3.23) and we can confine ourselves to investigations for the functions $\mathbf{v}$, θ and c . Then we construct an operator formulation which enables to perform a proof of the weak solvability for small values of the constants $\alpha_1, \dots, \alpha_4$ applying the Leray–Schauder principle. Using a simple scaling argument, we extend this existence result to arbitrarily large constants $\alpha_1, \dots, \alpha_4$. Finally, we show that the weak solution is unique for small data.

Theorem 4.1. *Let $\tilde{\mathbf{v}}_b \in H^1(\Omega)^3$, $\tilde{\theta}_b, \tilde{c}_b \in H^1(\Omega)$ be arbitrary functions satisfying*

$$\operatorname{div} \tilde{\mathbf{v}}_b = 0, \quad \tilde{\mathbf{v}}_b|_{\Gamma^W \cup \Gamma^{LS}} = \mathbf{v}_b, \quad \tilde{\mathbf{v}}_b \cdot \mathbf{n}|_{\Gamma^{LG}} = 0, \quad \tilde{\theta}_b|_{\partial\Omega} = \theta_b, \quad \tilde{c}_b|_{\partial\Omega} = c_b \quad (4.1)$$

and let $\mathbf{v} \in H^1(\Omega)^3$, $\theta, c \in H^1(\Omega)$ be any functions satisfying

$$\mathbf{v} - \tilde{\mathbf{v}}_b \in \mathbf{V}, \quad \theta - \tilde{\theta}_b \in \Theta, \quad c - \tilde{c}_b \in \mathcal{C} \quad (4.2)$$

and

$$\begin{aligned} a_1(\mathbf{v}, \mathbf{w}) + \alpha_5 b_1(\mathbf{v}, \mathbf{v}, \mathbf{w}) &= \alpha_1 \langle \mathbf{F}_1(\theta), \mathbf{w} \rangle + \alpha_2 \langle \mathbf{F}_2(c), \mathbf{w} \rangle - \\ &\quad - \alpha_3 \langle d_s(\theta), \gamma(\mathbf{w}) \rangle - \alpha_4 \langle d_s(c), \gamma(\mathbf{w}) \rangle \quad \forall \mathbf{w} \in \mathbf{V}, \end{aligned} \quad (4.3)$$

$$a_2(\theta, \eta) + \alpha_6 b_2(\mathbf{v}, \theta, \eta) = \langle \Phi_1(\theta), \eta \rangle \quad \forall \eta \in \Theta, \quad (4.4)$$

$$a_2(c, q) + \alpha_7 b_2(\mathbf{v}, c, q) = \langle \Phi_2(c), q \mathbf{v}_b \rangle \quad \forall q \in \mathcal{C}. \quad (4.5)$$

Then there exists a unique function $p \in L_0^2(\Omega)$ such that the functions $\mathbf{v}$, p , θ , c are a weak solution of the problem (1.1)–(1.8).

Proof. Setting

$$\begin{aligned} \langle \mathbf{f}, \mathbf{w} \rangle &= -a_1(\mathbf{v}, \mathbf{w}) - \alpha_5 b_1(\mathbf{v}, \mathbf{v}, \mathbf{w}) + \alpha_1 \langle \mathbf{F}_1(\theta), \mathbf{w} \rangle + \\ &\quad + \alpha_2 \langle \mathbf{F}_2(c), \mathbf{w} \rangle - \alpha_3 \langle d_s(\theta), \gamma(\mathbf{w}) \rangle - \alpha_4 \langle d_s(c), \gamma(\mathbf{w}) \rangle, \end{aligned}$$

we have $\mathbf{f} \in H^{-1}(\Omega)^3$ (cf. also the following lemmas) and $\langle \mathbf{f}, \mathbf{w} \rangle = 0 \quad \forall \mathbf{w} \in \tilde{\mathbf{V}}$. Therefore, according to [7, p. 22, Lemma 2.1], there exists a unique $p \in L_0^2(\Omega)$ satisfying

$$\langle \mathbf{f}, \mathbf{w} \rangle = \alpha_5 b(\mathbf{w}, p) \quad \forall \mathbf{w} \in H_0^1(\Omega)^3. \quad (4.6)$$

Now, given $\mathbf{w} \in \mathbf{W}$, there exist functions $\mathbf{w}_1 \in \mathbf{V}$, $\mathbf{w}_2 \in H_0^1(\Omega)^3$ such that $\mathbf{w} = \mathbf{w}_1 + \mathbf{w}_2$ (cf. [7, p. 24, Lemma 2.2]). Using (4.3), we infer that $\langle \mathbf{f}, \mathbf{w}_1 \rangle = 0$ and, according to (4.6), we have $\langle \mathbf{f}, \mathbf{w}_2 \rangle = \alpha_5 b(\mathbf{w}_2, p) = \alpha_5 b(\mathbf{w}, p)$. Therefore, $\langle \mathbf{f}, \mathbf{w} \rangle = \alpha_5 b(\mathbf{w}, p)$ for any $\mathbf{w} \in \mathbf{W}$ and hence (3.20) holds. ■

Remark 4.1. Note that, for $\tilde{\mathbf{v}}_b$, $\tilde{\theta}_b$, $\tilde{c}_b$ defined by (4.1), any solution of (3.19)–(3.23) satisfies (4.2)–(4.5). Thus, the solvability of (4.2)–(4.5) also is a necessary condition for the solvability of the weak formulation (3.19)–(3.23).

Now, let us study some properties of the spaces $\mathbf{V}$, Θ , $\mathcal{C}$ and X introduced in Section 2.

Lemma 4.1. *The spaces $\mathbf{V}$, Θ and $\mathcal{C}$ are separable Hilbert spaces for the scalar products $a_1(\cdot, \cdot)$ and $a_2(\cdot, \cdot)$, respectively, and the space X is a separable Hilbert space for the scalar product*

$$(\mathbf{U}, \mathbf{W})_X = a_1(\mathbf{v}, \mathbf{w}) + a_2(\theta, \eta) + a_2(c, q),$$

where $\mathbf{U} = (\mathbf{v}, \theta, c)$, $\mathbf{W} = (\mathbf{w}, \eta, q)$ and $\mathbf{U}, \mathbf{W} \in X$. The norm $\|\mathbf{U}\|_X \equiv \sqrt{(\mathbf{U}, \mathbf{U})_X}$ is equivalent to the norm $\|\mathbf{v}\|_{1,\Omega} + \|\theta\|_{1,\Omega} + \|c\|_{1,\Omega}$, i.e., there exist constants C_1 and C_2 depending only on Γ^W , Γ^{LG} and Ω such that

$$C_1 \|\mathbf{U}\|_X \leq \|\mathbf{v}\|_{1,\Omega} + \|\theta\|_{1,\Omega} + \|c\|_{1,\Omega} \leq C_2 \|\mathbf{U}\|_X \quad \forall \mathbf{U} \equiv (\mathbf{v}, \theta, c) \in X. \quad (4.7)$$

For any sequence $\mathbf{U}_n \equiv (\mathbf{v}_n, \theta_n, c_n) \in X$, $n \in \mathbb{N}$, and any $\mathbf{U} \equiv (\mathbf{v}, \theta, c) \in X$, we have

$$\mathbf{U}_n \rightharpoonup \mathbf{U} \text{ in } X \iff \mathbf{v}_n \rightharpoonup \mathbf{v} \text{ in } H^1(\Omega)^3, \quad \theta_n \rightharpoonup \theta, \quad c_n \rightharpoonup c \text{ in } H^1(\Omega). \quad (4.8)$$

Proof. Using the Friedrichs and Korn inequalities (cf. [10, p. 20, Theorem 1.9] and [11, p. 97, Lemma 3.1]), we deduce that the bilinear forms a_1 and a_2 are scalar products on the respective spaces and that the norms induced by these scalar products are equivalent to the norm $\|\cdot\|_{1,\Omega}$. Thus, for proving that the spaces $\mathbf{V}$, Θ and $\mathcal{C}$ are Hilbert spaces for the mentioned scalar products, it suffices to show that these spaces are closed subspaces of $H^1(\Omega)^3$ and $H^1(\Omega)$, respectively, with respect to the norm $\|\cdot\|_{1,\Omega}$. Consider any $\mathbf{u} \in H^1(\Omega)^3$ and assume that there exists a sequence $\{\mathbf{u}_n\}_{n=1}^\infty \subset \mathbf{V}$ such that $\|\mathbf{u} - \mathbf{u}_n\|_{1,\Omega} \rightarrow 0$ for $n \rightarrow \infty$. Then we have for any $\zeta \in C_0^\infty(\Omega)$

$$\left| \int_{\Omega} \zeta \operatorname{div} \mathbf{u} \, dx \right| = \left| \int_{\Omega} \zeta \operatorname{div}(\mathbf{u} - \mathbf{u}_n) \, dx \right| \leq \sqrt{3} \|\zeta\|_{0,\Omega} \|\mathbf{u} - \mathbf{u}_n\|_{1,\Omega} \rightarrow 0,$$

which implies that $\operatorname{div} \mathbf{u} = 0$ (cf. [10, p. 56, Proposition 1.1]). The continuity of the trace operator gives $\gamma(\mathbf{u}_n) \rightarrow \gamma(\mathbf{u})$ in $L^2(\partial\Omega)^3$ and also $\gamma(\mathbf{u}_n) \cdot \mathbf{n} \rightarrow \gamma(\mathbf{u}) \cdot \mathbf{n}$ in $L^2(\Gamma^{LG})$. Thus, $\mathbf{u} \in \mathbf{V}$, which means that the space $\mathbf{V}$ is closed. For the spaces Θ and $\mathcal{C}$, we can proceed analogously. Clearly, any subspace of a separable metric space is separable and since the space $H^1(\Omega)$ is separable (cf. [10, p. 64, Proposition 2.3]), the spaces $\mathbf{V}$, Θ , $\mathcal{C}$ and, consequently, X are separable Hilbert spaces.

Finally, let us prove the validity of (4.8). According to the Riesz representation theorem (cf. [12, p. 245, Theorem 4.81–C]), we have: $U_n \rightharpoonup U$ in $X \Leftrightarrow (U_n - U, W)_X \rightarrow 0 \, \forall W \in X \Leftrightarrow a_1(\mathbf{v}_n - \mathbf{v}, \mathbf{w}) \rightarrow 0 \, \forall \mathbf{w} \in \mathbf{V}$, $a_2(\theta_n - \theta, \eta) \rightarrow 0 \, \forall \eta \in \Theta$, $a_2(c_n - c, q) \rightarrow 0 \, \forall q \in \mathcal{C} \Leftrightarrow \mathbf{v}_n \rightharpoonup \mathbf{v}$ in $\mathbf{V}$, $\theta_n \rightharpoonup \theta$ in Θ , $c_n \rightharpoonup c$ in $\mathcal{C}$. Since $[H^1(\Omega)^3]^\prime \subset \mathbf{V}'$ and $[H^1(\Omega)]^\prime \subset \Theta'$, $\mathcal{C}'$ and since, by the Hahn–Banach theorem (cf. [12, p. 186, Theorem 4.3–A]), any functional belonging to $\mathbf{V}'$, Θ' or $\mathcal{C}'$ can be extended to a functional belonging to $[H^1(\Omega)^3]^\prime$ or $[H^1(\Omega)]^\prime$, respectively, we obtain the equivalence (4.8). ■

In the following lemma, we shall use the fact that, according to the Sobolev imbedding theorems and the trace theorems (cf. [10, pp. 69 and 84]), there exist finite constants

$$C_3 = \sup_{u \in H^1(\Omega), u \neq 0} \frac{\|u\|_{0,4,\Omega}}{\|u\|_{1,\Omega}}, \quad C_4 = \sup_{u \in H^1(\Omega), u \neq 0} \frac{\|u\|_{0,4,\partial\Omega}}{\|u\|_{1,\Omega}}$$

which depend only on Ω .

Lemma 4.2. *The trilinear form b_1 is continuous on $[H^1(\Omega)^3]^3$ and satisfies the inequalities*

$$|b_1(\mathbf{u}, \mathbf{v}, \mathbf{w})| \leq \sqrt{3} \|\mathbf{v}\|_{1,\Omega} \|\mathbf{u}\|_{0,4,\Omega} \|\mathbf{w}\|_{0,4,\Omega} \quad \forall \mathbf{u}, \mathbf{v}, \mathbf{w} \in H^1(\Omega)^3, \quad (4.9)$$

$$\begin{aligned} |b_1(\mathbf{v}, \mathbf{v}, \mathbf{w}) - b_1(\widehat{\mathbf{v}}, \widehat{\mathbf{v}}, \mathbf{w})| &\leq \sqrt{3} C_4^2 \|\widehat{\mathbf{v}}\|_{1,\Omega} \|\mathbf{v} - \widehat{\mathbf{v}}\|_{0,\partial\Omega} \|\mathbf{w}\|_{1,\Omega} + \\ &\quad + \sqrt[4]{3} C_3 \left[\|\mathbf{v}\|_{1,\Omega} + (1 + \sqrt{3}) \|\widehat{\mathbf{v}}\|_{1,\Omega} \right] \|\mathbf{v} - \widehat{\mathbf{v}}\|_{0,4,\Omega} \|\mathbf{w}\|_{1,\Omega} \\ &\quad \forall \mathbf{v}, \widehat{\mathbf{v}}, \mathbf{w} \in H^1(\Omega)^3. \end{aligned} \quad (4.10)$$

Moreover,

$$b_1(\mathbf{u}, \mathbf{v}, \mathbf{w}) = \int_{\partial\Omega} (\mathbf{w} \cdot \mathbf{v}) (\mathbf{u} \cdot \mathbf{n}) d\sigma - b_1(\mathbf{u}, \mathbf{w}, \mathbf{v})$$

$$\forall \mathbf{u}, \mathbf{v}, \mathbf{w} \in H^1(\Omega)^3, \operatorname{div} \mathbf{u} = 0. \quad (4.11)$$

The trilinear form b_2 is continuous on $H^1(\Omega)^3 \times H^1(\Omega) \times H^1(\Omega)$ and satisfies the inequalities

$$|b_2(\mathbf{v}, \theta, \eta)| \leq \sqrt[4]{3} |\theta|_{1,\Omega} \|\eta\|_{0,4,\Omega} \|\mathbf{v}\|_{0,4,\Omega}$$

$$\forall \mathbf{v} \in H^1(\Omega)^3, \theta, \eta \in H^1(\Omega), \quad (4.12)$$

$$|b_2(\mathbf{v}, \theta, \eta) - b_2(\widehat{\mathbf{v}}, \widehat{\theta}, \widehat{\eta})| \leq \sqrt{3} C_4^2 \|\widehat{\mathbf{v}}\|_{1,\Omega} \|\theta - \widehat{\theta}\|_{0,\partial\Omega} \|\eta\|_{1,\Omega} +$$

$$+ C_3 \left[\sqrt[4]{3} \|\mathbf{v} - \widehat{\mathbf{v}}\|_{0,4,\Omega} |\theta|_{1,\Omega} + (1 + \sqrt{3}) \|\theta - \widehat{\theta}\|_{0,4,\Omega} \|\widehat{\mathbf{v}}\|_{1,\Omega} \right] \|\eta\|_{1,\Omega}$$

$$\forall \mathbf{v}, \widehat{\mathbf{v}} \in H^1(\Omega)^3, \theta, \widehat{\theta}, \eta \in H^1(\Omega). \quad (4.13)$$

Moreover,

$$b_2(\mathbf{v}, \theta, \eta) = \int_{\partial\Omega} \eta \theta \mathbf{v} \cdot \mathbf{n} d\sigma - b_2(\mathbf{v}, \eta, \theta)$$

$$\forall \mathbf{v} \in H^1(\Omega)^3, \operatorname{div} \mathbf{v} = 0, \quad \eta, \theta \in H^1(\Omega). \quad (4.14)$$

Proof. Using the imbedding $H^1(\Omega) \subset L^4(\Omega)$ (cf. [10, p. 69]) and applying the Hölder inequality, we obtain (4.9). For proving the inequalities (4.10) and (4.11), we use the identities

$$\mathbf{w} \cdot [(\nabla \mathbf{v}) \mathbf{v} - (\nabla \widehat{\mathbf{v}}) \widehat{\mathbf{v}}] = \mathbf{w} \cdot (\nabla \mathbf{v}) (\mathbf{v} - \widehat{\mathbf{v}}) - (\mathbf{v} - \widehat{\mathbf{v}}) \cdot (\nabla \mathbf{w}) \widehat{\mathbf{v}} -$$

$$- (\mathbf{v} - \widehat{\mathbf{v}}) \cdot \mathbf{w} \operatorname{div} \widehat{\mathbf{v}} + \operatorname{div} [\widehat{\mathbf{v}} (\mathbf{w} \cdot (\mathbf{v} - \widehat{\mathbf{v}}))] ,$$

$$\mathbf{w} \cdot (\nabla \mathbf{v}) \mathbf{u} = \operatorname{div}((\mathbf{w} \cdot \mathbf{v}) \mathbf{u}) - \mathbf{v} \cdot (\nabla \mathbf{w}) \mathbf{u} - \mathbf{w} \cdot \mathbf{v} \operatorname{div} \mathbf{u}$$

and the Gauss integral theorem. In case of the trilinear form b_2 , we can proceed in the same fashion. ■

Lemma 4.3. Choose any $\mathbf{U}, \widehat{\mathbf{U}}, \mathbf{W} \in \widehat{X}$, $\mathbf{U} = (\mathbf{v}, \theta, c)$, $\widehat{\mathbf{U}} = (\widehat{\mathbf{v}}, \widehat{\theta}, \widehat{c})$, $\mathbf{W} = (\mathbf{w}, \eta, q)$, and denote

$$a(\mathbf{U}, \mathbf{W}) = \alpha_5 b_1(\mathbf{v}, \mathbf{v}, \mathbf{w}) + \alpha_6 b_2(\mathbf{v}, \theta, \eta) + \alpha_7 b_2(\mathbf{v}, c, q) -$$

$$- \alpha_1 \langle \mathbf{F}_1(\theta), \mathbf{w} \rangle - \alpha_2 \langle \mathbf{F}_2(c), \mathbf{w} \rangle - \langle \Phi_1(\theta), \eta \rangle - \langle \Phi_2(c), q \rangle.$$

Then there exists a constant C independent of $\mathbf{U}, \widehat{\mathbf{U}}$ and $\mathbf{W}$ such that

$$|a(\mathbf{U}, \mathbf{W})| \leq C (1 + \|\mathbf{U}\|_{\widehat{X}} + \|\mathbf{U}\|_{\widehat{X}}^2) \|\mathbf{W}\|_{\widehat{X}}, \quad (4.15)$$

$$|a(\mathbf{U}, \mathbf{W}) - a(\widehat{\mathbf{U}}, \mathbf{W})| \leq C (1 + \|\mathbf{U}\|_{\widehat{X}} + \|\widehat{\mathbf{U}}\|_{\widehat{X}}) (\|\mathbf{v} - \widehat{\mathbf{v}}\|_{0,4,\Omega} +$$

$$+ \|\theta - \widehat{\theta}\|_{0,4,\Omega} + \|c - \widehat{c}\|_{0,4,\Omega} + \|\mathbf{v} - \widehat{\mathbf{v}}\|_{0,\partial\Omega} +$$

$$+ \|\theta - \widehat{\theta}\|_{0,\partial\Omega} + \|c - \widehat{c}\|_{0,\partial\Omega}) \|\mathbf{W}\|_{\widehat{X}}, \quad (4.16)$$

where $\|\mathbf{U}\|_{\widehat{X}} = \|\mathbf{v}\|_{1,\Omega} + \|\theta\|_{1,\Omega} + \|c\|_{1,\Omega}$.

Proof. According to the Taylor formula and (2.2), we have

$$|\mathbf{f}_1(\theta)| \leq |\mathbf{f}_1(0)| + \sqrt{3} |\theta|, \quad |\mathbf{f}_2(c)| \leq |\mathbf{f}_2(0)| + \sqrt{3} |c|$$

and hence it follows from the Hölder inequality that the mappings F_1 and F_2 are well defined and that

$$|\langle F_1(\theta), \mathbf{w} \rangle| \leq (\|\mathbf{f}_1(0)\|_{0,\Omega} + \sqrt{3}\|\theta\|_{0,\Omega}) \|\mathbf{w}\|_{0,\Omega}, \quad (4.17)$$

$$|\langle F_2(c), \mathbf{w} \rangle| \leq (\|\mathbf{f}_2(0)\|_{0,\Omega} + \sqrt{3}\|c\|_{0,\Omega}) \|\mathbf{w}\|_{0,\Omega}. \quad (4.18)$$

Further, using (2.4) and (2.5), we infer that the mappings Φ_1 and Φ_2 are well defined too and that

$$\begin{aligned} |\langle \Phi_1(\theta), \eta \rangle| &\leq K_1 \|\eta\|_{0,1,\partial\Omega}, \\ |\langle \Phi_2(c), q \mathbf{v}_b \rangle| &\leq K_2 \|\mathbf{v}_b \cdot \mathbf{n}\|_{0,\Gamma^{LS}} \|q\|_{0,\partial\Omega}. \end{aligned} \quad (4.19)$$

Thus, applying the trace theorems and Lemma 4.2, we obtain (4.15). Using (2.2)–(2.5), the Taylor formula and the Hölder inequality, we deduce that

$$|\langle F_1(\theta), \mathbf{w} \rangle - \langle F_1(\hat{\theta}), \mathbf{w} \rangle| \leq \sqrt{3} \|\theta - \hat{\theta}\|_{0,\Omega} \|\mathbf{w}\|_{0,\Omega}, \quad (4.20)$$

$$|\langle F_2(c), \mathbf{w} \rangle - \langle F_2(\hat{c}), \mathbf{w} \rangle| \leq \sqrt{3} \|c - \hat{c}\|_{0,\Omega} \|\mathbf{w}\|_{0,\Omega}, \quad (4.21)$$

$$|\langle \Phi_1(\theta), \eta \rangle - \langle \Phi_1(\hat{\theta}), \eta \rangle| \leq L_1 \|\theta - \hat{\theta}\|_{0,\partial\Omega} \|\eta\|_{0,\partial\Omega}, \quad (4.22)$$

$$\begin{aligned} |\langle \Phi_2(c), q \mathbf{v}_b \rangle - \langle \Phi_2(\hat{c}), q \mathbf{v}_b \rangle| &\leq \\ &\leq L_2 \|\mathbf{v}_b \cdot \mathbf{n}\|_{0,4,\Gamma^{LS}} \|c - \hat{c}\|_{0,\partial\Omega} \|q\|_{0,4,\partial\Omega} \end{aligned} \quad (4.23)$$

and (4.16) again follows applying the trace theorems and Lemma 4.2. ■

Theorem 4.2. *Let $\tilde{\mathbf{v}}_b \in H^1(\Omega)^3$, $\tilde{\theta}_b, \tilde{c}_b \in H^1(\Omega)$ be any functions satisfying (4.1) and let us denote $\hat{\mathbf{U}}_b = (\tilde{\mathbf{v}}_b, \tilde{\theta}_b, \tilde{c}_b)$. Then there exist operators A , $L : X \rightarrow X$ such that, for any $U \in X$,*

$$A(U) + LU = 0 \iff (\mathbf{v}, \theta, c) \equiv U + \hat{\mathbf{U}}_b \text{ is a solution of (4.2)–(4.5)}. \quad (4.24)$$

The operator A is compact, strongly continuous and satisfies for any $U \equiv (\tilde{\mathbf{v}}, \tilde{\theta}, \tilde{c}) \in X$ and any $W \equiv (\mathbf{w}, \eta, q) \in X$

$$\begin{aligned} |(A(U), W)_X - \alpha_5 b_1(\tilde{\mathbf{v}}, \tilde{\mathbf{v}}, \mathbf{w}) - \alpha_6 b_2(\tilde{\mathbf{v}}, \tilde{\theta}, \eta) - \alpha_7 b_2(\tilde{\mathbf{v}}, \tilde{c}, q)| &\leq \\ &\leq C(1 + \|U\|_X) \|W\|_X, \end{aligned} \quad (4.25)$$

$$\begin{aligned} (A(U), U)_X &\geq -\alpha_5 b_1(\tilde{\mathbf{v}}, \tilde{\mathbf{v}}, \tilde{\mathbf{v}}_b) - \\ &\quad - \sqrt[4]{3} C_2 C_3 (\alpha_6 \|\tilde{\theta}_b\|_{0,4,\Omega} + \alpha_7 \|\tilde{c}_b\|_{0,4,\Omega}) \|U\|_X^2 - \\ &\quad - (\alpha_1 + \alpha_2) \sqrt{3} C_2^2 \|U\|_X^2 - C \|U\|_X, \end{aligned} \quad (4.26)$$

where C is independent of U and W . The operator L is linear and continuous and satisfies for any $U \in X$

$$\begin{aligned} [1 - (\alpha_3 + \alpha_4) C_s C_2] \|U\|_X &\leq \|LU\|_X \leq \\ &\leq [1 + (\alpha_3 + \alpha_4) C_s C_2] \|U\|_X, \end{aligned} \quad (4.27)$$

$$\begin{aligned} [1 - (\alpha_3 + \alpha_4) C_s C_2] \|U\|_X^2 &\leq (LU, U)_X \leq \\ &\leq [1 + (\alpha_3 + \alpha_4) C_s C_2] \|U\|_X^2. \end{aligned} \quad (4.28)$$

Proof. For $U, W \in X$, $U = (\tilde{\mathbf{v}}, \tilde{\theta}, \tilde{c})$, $W = (\mathbf{w}, \eta, q)$, let us denote

$$\begin{aligned}\tilde{a}(U, W) &= a(U + \hat{U}_b, W) + a_1(\tilde{\mathbf{v}}_b, \mathbf{w}) + a_2(\tilde{\theta}_b, \eta) + a_2(\tilde{c}_b, q) + \\ &\quad + \alpha_3 \langle d_s(\tilde{\theta}_b), \gamma(\mathbf{w}) \rangle + \alpha_4 \langle d_s(\tilde{c}_b), \gamma(\mathbf{w}) \rangle, \\ l(U, W) &= (U, W)_X + \alpha_3 \langle d_s(\tilde{\theta}), \gamma(\mathbf{w}) \rangle + \alpha_4 \langle d_s(\tilde{c}), \gamma(\mathbf{w}) \rangle.\end{aligned}$$

Then, according to Lemmas 4.3, 3.1 and 4.1, we have $\tilde{a}(U, \cdot)$, $l(U, \cdot) \in X'$ for any $U \in X$ and hence it follows from the Riesz representation theorem that there exist uniquely determined operators $A, L : X \rightarrow X$ satisfying

$$(A(U), W)_X = \tilde{a}(U, W), \quad (L U, W)_X = l(U, W) \quad \forall U, W \in X.$$

Clearly, the operator L is linear and the equivalence (4.24) holds.

Consider any sequence $U_n \equiv (\tilde{\mathbf{v}}_n, \tilde{\theta}_n, \tilde{c}_n) \in X$, $n \in \mathbb{N}$, satisfying $U_n \rightharpoonup U$ in X for some $U \equiv (\tilde{\mathbf{v}}, \tilde{\theta}, \tilde{c}) \in X$. Then, according to (4.16) and (4.7),

$$\begin{aligned}\|A(U) - A(U_n)\|_X &\leq \tilde{C} (1 + \|U\|_X + \|U_n\|_X + \|\hat{U}_b\|_{\hat{X}}) (\|\tilde{\mathbf{v}} - \tilde{\mathbf{v}}_n\|_{0,4,\Omega} + \\ &\quad + \|\tilde{\theta} - \tilde{\theta}_n\|_{0,4,\Omega} + \|\tilde{c} - \tilde{c}_n\|_{0,4,\Omega} + \|\tilde{\mathbf{v}} - \tilde{\mathbf{v}}_n\|_{0,\partial\Omega} + \\ &\quad + \|\tilde{\theta} - \tilde{\theta}_n\|_{0,\partial\Omega} + \|\tilde{c} - \tilde{c}_n\|_{0,\partial\Omega}).\end{aligned}$$

Using (4.8), the compact imbedding $H^1(\Omega) \xrightarrow{c} L^4(\Omega)$ (cf. [10, p. 106, Theorem 6.1]), the compactness and linearity of the trace operator $\gamma : H^1(\Omega) \rightarrow L^2(\partial\Omega)$ (cf. [10, p. 107, Theorem 6.2]) and the fact that any weakly convergent sequence is bounded, we deduce that $A(U_n) \rightarrow A(U)$ in X . Thus, the operator A is strongly continuous and since the space X is (as a Hilbert space) reflexive, the operator A is compact.

The inequality (4.25) follows using (4.9), (4.12), (4.17)–(4.19), Lemma 3.1, the Hölder inequality, the Sobolev imbedding theorems, the trace theorems, and the inequality (4.7). According to (4.11) and (4.14), we have $b_1(\tilde{\mathbf{v}} + \tilde{\mathbf{v}}_b, \tilde{\mathbf{v}}, \tilde{\mathbf{v}}) = 0$, $b_2(\tilde{\mathbf{v}} + \tilde{\mathbf{v}}_b, \tilde{\theta}, \tilde{\theta}) = 0$, $b_2(\tilde{\mathbf{v}} + \tilde{\mathbf{v}}_b, \tilde{c}, \tilde{c}) \geq 0$, $b_1(\tilde{\mathbf{v}}, \tilde{\mathbf{v}}_b, \tilde{\mathbf{v}}) = -b_1(\tilde{\mathbf{v}}, \tilde{\mathbf{v}}, \tilde{\mathbf{v}}_b)$, $b_2(\tilde{\mathbf{v}}, \tilde{\theta}_b, \tilde{\theta}) = -b_2(\tilde{\mathbf{v}}, \tilde{\theta}, \tilde{\theta}_b)$, and $b_2(\tilde{\mathbf{v}}, \tilde{c}_b, \tilde{c}) = -b_2(\tilde{\mathbf{v}}, \tilde{c}, \tilde{c}_b)$ and hence (4.26) follows applying the same techniques as used for deriving (4.25).

The inequalities (4.27) and (4.28) follow using Theorem 3.1 and the inequality (4.7). Since L is linear, its continuity is a consequence of (4.27). ■

Since the solutions of the problem (4.2)–(4.5) do not depend on the particular choice of the functions $\tilde{\mathbf{v}}_b$, $\tilde{\theta}_b$ and $\tilde{c}_b$, we can use the following lemma to reduce the influence of the second term on the right-hand side of (4.26).

Lemma 4.4. *For any $\varepsilon > 0$ and any $\zeta_b \in H^{\frac{1}{2}}(\partial\Omega)$, there exists a function $\tilde{\zeta}_b \in H^1(\Omega)$ such that $\tilde{\zeta}_b|_{\partial\Omega} = \zeta_b$ and $\|\tilde{\zeta}_b\|_{0,4,\Omega} \leq \varepsilon$.*

Proof. See [2, p. 14, Lemma 2.8]. ■

For proving the solvability of the problem (4.2)–(4.5) in case of small constants $\alpha_1, \dots, \alpha_4$, we shall apply the Leray–Schauder principle which is formulated in the following theorem.

Theorem 4.3 (Leray–Schauder Principle). *Let X be a Banach space and let $B : X \rightarrow X$ be a compact operator. Let there exist $R > 0$ such*

that all the solutions of the equations

$$U = \lambda B(U), \quad \lambda \in (0, 1),$$

satisfy $\|U\|_X \leq R$. Then there exists at least one solution of the equation

$$U = B(U).$$

Proof. See [14, p. 245, Theorem 6.A]. ■

Theorem 4.4. Let $\alpha_5 \in \mathbb{R}^+$ and $\mathbf{v}_b \in H^{\frac{1}{2}}(\partial\Omega)^3$ be given and let us assume that $\mathbf{v}_b$ satisfies (2.7) and the following assumption:

$$\begin{aligned} \exists \varepsilon \in (0, 1) \quad \forall \mathbf{v} \in \mathbf{V} \quad \exists \tilde{\mathbf{v}}_b \in H^1(\Omega)^3 : \quad \operatorname{div} \tilde{\mathbf{v}}_b = 0, \\ \tilde{\mathbf{v}}_b|_{\Gamma W \cup \Gamma LS} = \mathbf{v}_b, \quad \tilde{\mathbf{v}}_b \cdot \mathbf{n}|_{\Gamma LG} = 0, \quad b_1(\mathbf{v}, \mathbf{v}, \tilde{\mathbf{v}}_b) \leq \frac{\varepsilon}{\alpha_5} a_1(\mathbf{v}, \mathbf{v}). \end{aligned} \quad (4.29)$$

Then there exists a positive constant M such that the problem (4.2)–(4.5) is solvable for any constants $\alpha_1, \alpha_2, \alpha_3, \alpha_4 \in (0, M)$ and $\alpha_6, \alpha_7 \in \mathbb{R}^+$ and for any functions $\mathbf{f}_1, \mathbf{f}_2, \varphi_1, \varphi_2, \theta_b, c_b$ satisfying the assumptions (2.2)–(2.6).

Proof. Consider any constants $\alpha_5, \alpha_6, \alpha_7 \in \mathbb{R}^+$ and any functions $\mathbf{f}_1, \mathbf{f}_2, \varphi_1, \varphi_2, \mathbf{v}_b, \theta_b, c_b$ satisfying (2.2)–(2.7) and (4.29). Let ε be the constant from the assumption (4.29) and choose any $\vartheta \in (\varepsilon, 1)$. Set

$$M = \frac{1 - \vartheta}{6 C_2 \max\{C_s, \sqrt{3} C_2\}}$$

and consider any constants $\alpha_1, \alpha_2, \alpha_3, \alpha_4 \in (0, M)$. According to [7, p. 24, Lemma 2.2], there exists a function $\tilde{\mathbf{v}}_b \in H^1(\Omega)^3$ satisfying (4.1) and, by Lemma 4.4, there exist functions $\tilde{\theta}_b, \tilde{c}_b \in H^1(\Omega)$ satisfying (4.1) and

$$\sqrt[4]{3} C_2 C_3 (\alpha_6 \|\tilde{\theta}_b\|_{0,4,\Omega} + \alpha_7 \|\tilde{c}_b\|_{0,4,\Omega}) \leq \frac{1 - \vartheta}{3}.$$

Further, let $A, L : X \rightarrow X$ be the operators from Theorem 4.2. According to (4.27), we have $(2 + \vartheta) \|U\|_X \leq 3 \|LU\|_X$ for any $U \in X$ and since L is linear, there exists a continuous linear inverse operator L^{-1} .

Let us assume that the problem (4.2)–(4.5) is not solvable. Then, due to the fact that the operator $L^{-1}A$ is compact, it follows from Theorems 4.2 and 4.3 that the solutions of the equations $U = -\lambda L^{-1}A(U)$, $\lambda \in (0, 1)$, form an unbounded set. Thus, there exist sequences $\{\lambda_n\}_{n=1}^\infty \subset (0, 1)$ and $\{U_n\}_{n=1}^\infty \subset X$ such that, for $n \in \mathbb{N}$,

$$L U_n = -\lambda_n A(U_n) \quad (4.30)$$

and $\|U_n\|_X > n$. Denoting $U_n = (\tilde{\mathbf{v}}_n, \tilde{\theta}_n, \tilde{c}_n)$, we obtain by (4.28) and (4.26)

$$\begin{aligned} \frac{2 + \vartheta}{3} \|U_n\|_X^2 &\leq (L U_n, U_n)_X = -\lambda_n (A(U_n), U_n)_X \leq \\ &\leq \lambda_n \alpha_5 b_1(\tilde{\mathbf{v}}_n, \tilde{\mathbf{v}}_n, \tilde{\mathbf{v}}_b) + \frac{2 - 2\vartheta}{3} \|U_n\|_X^2 + C \|U_n\|_X, \end{aligned}$$

which implies

$$\vartheta \|U_n\|_X^2 \leq \lambda_n \alpha_5 b_1(\tilde{\mathbf{v}}_n, \tilde{\mathbf{v}}_n, \tilde{\mathbf{v}}_b) + C \|U_n\|_X. \quad (4.31)$$

Let us set $\widehat{U}_n = U_n / \|U_n\|_X$ and denote $\widehat{U}_n = (\widehat{v}_n, \widehat{\theta}_n, \widehat{c}_n)$. Since any Hilbert space is reflexive and the sequences $\{\lambda_n\}_{n=1}^\infty$ and $\{\widehat{U}_n\}_{n=1}^\infty$ are bounded, we can assume without loss of generality that there exist $\lambda_0 \in \langle 0, 1 \rangle$ and $\widehat{U} \equiv (\widehat{v}, \widehat{\theta}, \widehat{c}) \in X$ such that $\lambda_n \rightarrow \lambda_0$ and $\widehat{U}_n \rightharpoonup \widehat{U}$ in X . Clearly, $\|\widehat{U}\|_X \leq 1$ (cf. [12, p. 209]). By (4.31), we have

$$\vartheta \leq \lambda_n \alpha_5 b_1(\widehat{v}_n, \widehat{v}_n, \widehat{v}_b) + \frac{C}{n} \quad (4.32)$$

and hence, applying (4.8), (4.10) and the arguments used for proving the strong continuity of A in the proof of Theorem 4.2, we obtain as a limit of (4.32)

$$\vartheta \leq \lambda_0 \alpha_5 b_1(\widehat{v}, \widehat{v}, \widehat{v}_b). \quad (4.33)$$

Consider any $\mathbf{w} \in \mathbf{V}$ and set $W = (\mathbf{w}, 0, 0)$. Then $W \in X$ and it follows from (4.30) that, for any $n \in \mathbb{N}$,

$$\frac{1}{\|U_n\|_X^2} (L U_n, W)_X + \lambda_n \frac{1}{\|U_n\|_X^2} (A(U_n), W)_X = 0.$$

Since the first term on the left-hand side converges to zero, we deduce from (4.25) that $\lambda_n b_1(\widehat{v}_n, \widehat{v}_n, \mathbf{w}) \rightarrow 0$. Thus, using the same arguments as above, we obtain

$$\lambda_0 b_1(\widehat{v}, \widehat{v}, \mathbf{w}) = 0 \quad \forall \mathbf{w} \in \mathbf{V}, \quad (4.34)$$

which means that the inequality (4.33) holds for any $\widehat{v}_b$ satisfying the conditions (4.1). This is, however, not possible since, according to the assumption (4.29), there exists $\widehat{v}_b$ satisfying (4.1) and the inequality $\alpha_5 b_1(\widehat{v}, \widehat{v}, \widehat{v}_b) \leq \varepsilon a_1(\widehat{v}, \widehat{v}) \leq \varepsilon \|\widehat{U}\|_X^2 < \vartheta$. Therefore, the problem (4.2)–(4.5) is solvable. ■

Remark 4.2. The Leray–Schauder principle was already used by Ladyženskaja [9] for proving the weak solvability of the stationary incompressible Navier–Stokes equations. However, the proof given in [9] is not correct. The substantial shortcoming is an incorrect argumentation why the inequality (4.33) is valid for any extension $\widehat{v}_b$ with the same function $\widehat{v}$.

Remark 4.3. Relations analogous to (4.33) and (4.34) can be also obtained when proving the weak solvability of the stationary incompressible Navier–Stokes equations using the contradiction argument developed by Leray (cf. [6, p. 55]). Leray himself considered only problems with Dirichlet boundary conditions $\mathbf{v}_b$ prescribed on the whole boundary $\partial\Omega$ and therefore he could use the fact that $\widehat{v} \in \widetilde{\mathbf{V}}$. Assuming, in addition, that the flux of $\mathbf{v}_b$ through each connected component of $\partial\Omega$ vanishes, he then showed that, in consequence of (4.34) (with $\lambda_0 \neq 0$ and $\mathbf{V}$ replaced by $\widetilde{\mathbf{V}}$), any divergence-free extension $\widehat{v}_b$ of $\mathbf{v}_b$ satisfies $b_1(\widehat{v}, \widehat{v}, \widehat{v}_b) = 0$. In case of mixed boundary conditions for the velocity of the type we deal with, a proof of such a conclusion still remains an open problem.

Remark 4.4. Let $\vartheta, \alpha_1, \dots, \alpha_7$ and $\mathbf{f}_1, \mathbf{f}_2, \varphi_1, \varphi_2, \mathbf{v}_b, \theta_b, c_b$ be defined as in the proof of Theorem 4.4 and let us assume that the assumption (4.29) holds for any $\mathbf{v} \in \mathbf{V}$ with the same function $\tilde{\mathbf{v}}_b$, i.e., that

$$\begin{aligned} \exists \varepsilon \in (0, 1), \tilde{\mathbf{v}}_b \in H^1(\Omega)^3 : \quad \operatorname{div} \tilde{\mathbf{v}}_b = 0, \quad \tilde{\mathbf{v}}_b|_{\Gamma^W \cup \Gamma^{LS}} = \mathbf{v}_b, \\ \tilde{\mathbf{v}}_b \cdot \mathbf{n}|_{\Gamma^{LG}} = 0, \quad b_1(\mathbf{v}, \mathbf{v}, \tilde{\mathbf{v}}_b) \leq \frac{\varepsilon}{\alpha_5} a_1(\mathbf{v}, \mathbf{v}) \quad \forall \mathbf{v} \in \mathbf{V}. \end{aligned} \quad (4.35)$$

Then, according to (4.26) and (4.28), the operator $\tilde{\mathbf{A}} \equiv \mathbf{A} + \mathbf{L}$ satisfies

$$(\tilde{\mathbf{A}}(\mathbf{U}), \mathbf{U})_X \geq (\vartheta - \varepsilon) \|\mathbf{U}\|_X^2 - C \|\mathbf{U}\|_X \quad \forall \mathbf{U} \in X$$

and Theorem 4.4 can be proved by means of Galerkin's method.

Remark 4.5. The validity of (4.29) and (4.35) is known if $\Gamma^{LG} = \emptyset$ and the flux of $\mathbf{v}_b$ through each connected component of $\partial\Omega$ vanishes (cf. [7, p. 287, Lemma 2.3]). Unfortunately, if $\operatorname{meas}_2(\Gamma^{LG}) \neq 0$, such general results are not available. Of course, the assumptions (4.29) and (4.35) are satisfied if α_5 and $\mathbf{v}_b$ are sufficiently small but, in practical cases, this requirement is usually too restrictive. Some sufficient conditions for the validity of (4.29) and (4.35) were derived in [8], however, their fulfilment is generally not easy to verify. Nevertheless, it can be shown that, for a rotationally symmetrical domain Ω corresponding to the Czochralski method (cf. Fig. 1) and for $\mathbf{v}_b$ representing rotational motions of the crucible and the crystal, assumptions (4.29) and (4.35) always hold. This result is very important in context of the Czochralski method since the non-rotational components in the Dirichlet boundary conditions for the velocity can be mostly neglected and it is sufficient to consider them only in the Neumann boundary condition (1.8). That leads to a problem which is solvable under the assumptions from Section 2.

For proving the solvability of (4.2)–(4.5) for large values of $\alpha_1, \dots, \alpha_4$, the following property of the solution set is essential.

Theorem 4.5. *For arbitrary positive real numbers $\alpha_1, \dots, \alpha_7$ and arbitrary functions $\mathbf{f}_1, \mathbf{f}_2, \varphi_1, \varphi_2, \mathbf{v}_b, \theta_b, c_b$ satisfying the assumptions (2.2)–(2.7), let*

$$\mathcal{A}(\alpha_1, \alpha_2, \alpha_3, \alpha_4, \alpha_5, \alpha_6, \alpha_7, \mathbf{f}_1, \mathbf{f}_2, \varphi_1, \varphi_2, \mathbf{v}_b, \theta_b, c_b) \subset \hat{X}$$

be the set of all the solutions of the problem (4.2)–(4.5). Then we have for any positive real numbers $\hat{\theta}, \hat{c}$

$$\begin{aligned} (\mathbf{v}, \theta, c) \in \mathcal{A}(\alpha_1, \alpha_2, \alpha_3, \alpha_4, \alpha_5, \alpha_6, \alpha_7, \mathbf{f}_1, \mathbf{f}_2, \varphi_1, \varphi_2, \mathbf{v}_b, \theta_b, c_b) &\iff \\ \iff (\mathbf{v}, \frac{\theta}{\hat{\theta}}, \frac{c}{\hat{c}}) \in \mathcal{A}(\alpha_1 \hat{\theta}, \alpha_2 \hat{c}, \alpha_3 \hat{\theta}, \alpha_4 \hat{c}, \alpha_5, \alpha_6, \alpha_7, \hat{\mathbf{f}}_1, \hat{\mathbf{f}}_2, \hat{\varphi}_1, \hat{\varphi}_2, \mathbf{v}_b, \frac{\theta_b}{\hat{\theta}}, \frac{c_b}{\hat{c}}), \end{aligned}$$

where

$$\begin{aligned} \hat{\mathbf{f}}_1(x) &= \frac{1}{\hat{\theta}} \mathbf{f}_1(\hat{\theta} x), & \hat{\mathbf{f}}_2(x) &= \frac{1}{\hat{c}} \mathbf{f}_2(\hat{c} x), \\ \hat{\varphi}_1(x) &= \frac{1}{\hat{\theta}} \varphi_1(\hat{\theta} x), & \hat{\varphi}_2(x) &= \frac{1}{\hat{c}} \varphi_2(\hat{c} x). \end{aligned}$$

The functions $\hat{\mathbf{f}}_1, \hat{\mathbf{f}}_2, \hat{\varphi}_1, \hat{\varphi}_2$ satisfy the relations (2.2)–(2.5).

Proof. The statement immediately follows by writing θ and c as $\hat{\theta}(\theta/\hat{\theta})$ and $\hat{c}(c/\hat{c})$, respectively, in (4.2)–(4.5). ■

Now, as a consequence of the two above theorems, we obtain the main result of this paper.

Theorem 4.6. *For any positive constants $\alpha_1, \alpha_2, \dots, \alpha_7$ and for any functions $\mathbf{f}_1, \mathbf{f}_2, \varphi_1, \varphi_2, \mathbf{v}_b, \theta_b, c_b$ satisfying the assumptions (2.2)–(2.7) and (4.29), there exists at least one weak solution of the problem (1.1)–(1.8).*

Proof. Consider any constants $\alpha_1, \alpha_2, \dots, \alpha_7 \in \mathbb{R}^+$ and any functions $\mathbf{f}_1, \mathbf{f}_2, \varphi_1, \varphi_2, \mathbf{v}_b, \theta_b, c_b$ satisfying the assumptions (2.2)–(2.7) and (4.29). Let M be the constant from Theorem 4.4 and set

$$\hat{\theta} = \hat{c} = \frac{M}{2 \max\{\alpha_1, \alpha_2, \alpha_3, \alpha_4\}}.$$

Defining the functions $\hat{\mathbf{f}}_1, \hat{\mathbf{f}}_2, \hat{\varphi}_1, \hat{\varphi}_2$ as in Theorem 4.5, it follows from Theorem 4.4 that the set

$$\mathcal{A}(\alpha_1 \hat{\theta}, \alpha_2 \hat{c}, \alpha_3 \hat{\theta}, \alpha_4 \hat{c}, \alpha_5, \alpha_6, \alpha_7, \hat{\mathbf{f}}_1, \hat{\mathbf{f}}_2, \hat{\varphi}_1, \hat{\varphi}_2, \mathbf{v}_b, \frac{\theta_b}{\hat{\theta}}, \frac{c_b}{\hat{c}})$$

is nonempty. Thus, according to Theorem 4.5, the set

$$\mathcal{A}(\alpha_1, \alpha_2, \alpha_3, \alpha_4, \alpha_5, \alpha_6, \alpha_7, \mathbf{f}_1, \mathbf{f}_2, \varphi_1, \varphi_2, \mathbf{v}_b, \theta_b, c_b)$$

is nonempty as well and hence the problem (4.2)–(4.5) is solvable. The existence of a weak solution of the problem (1.1)–(1.8) now follows from Theorem 4.1. ■

The remainder of the paper is devoted to investigations of the uniqueness of the weak solution. Similarly as for the Navier–Stokes equations, we shall be able to prove the uniqueness for small data. First, let us introduce some notations. In consequence of the trace theorems and the Friedrichs inequality (cf. [10, pp. 84 and 20]) there exist finite constants

$$C_5 = \sup_{u \in \Theta, u \neq 0} \frac{\|u\|_{0,1,\partial\Omega}}{|u|_{1,\Omega}}, \quad C_6 = \sup_{u \in \Theta \cup C, u \neq 0} \frac{\|u\|_{0,\partial\Omega}}{|u|_{1,\Omega}}$$

depending only on Γ^W, Γ^{LG} and Ω . Further, we denote

$$\begin{aligned} \tilde{C}_1 = 4 C_2^2 \Big[& \alpha_1 \|\mathbf{f}_1(0)\|_{0,\Omega} + \alpha_2 \|\mathbf{f}_2(0)\|_{0,\Omega} + (\alpha_1 \sqrt{3} C_2 + \alpha_3 C_s) C_5 K_1 + \\ & + (\alpha_2 \sqrt{3} C_2 + \alpha_4 C_s) C_6 K_2 \|\mathbf{v}_b \cdot \mathbf{n}\|_{0,\Gamma^{LS}} \Big], \end{aligned}$$

$$\tilde{C}_2 = 1 + 8 C_2^2 + 4 \sqrt{3} C_2^2 C_3,$$

$$\tilde{C}_3 = 8 C_2^2 \max\{\alpha_1 \sqrt{3} C_2 + \alpha_3 C_s, \alpha_2 \sqrt{3} C_2 + \alpha_4 C_s\},$$

$$\tilde{C}_4 = 4 \sqrt[4]{3} C_2^2 C_3 \max\{\alpha_6 (\alpha_1 \sqrt{3} C_2 + \alpha_3 C_s), \alpha_7 C_2 (\alpha_2 \sqrt{3} C_2 + \alpha_4 C_s)\},$$

$$\tilde{C}_5 = C_2^2 \max\{\alpha_1 \sqrt{3} + \alpha_3 C_s, \alpha_2 \sqrt{3} + \alpha_4 C_s\}.$$

For proving the uniqueness of a weak solution, we shall need certain a priori estimates which we establish in the following lemma.

Lemma 4.5. *Let there exists $\tilde{\mathbf{v}}_b \in H^1(\Omega)^3$ satisfying (4.35) for some $\varepsilon \in (0, 0.5)$ and let $\tilde{\theta}_b, \tilde{c}_b \in H^1(\Omega)$ be any functions satisfying (3.17) and the inequality*

$$4\sqrt[4]{3}C_2^2C_3 \left[\alpha_6 (\alpha_1\sqrt{3}C_2 + \alpha_3C_s) \|\tilde{\theta}_b\|_{0,4,\Omega} + \alpha_7 (\alpha_2\sqrt{3}C_2 + \alpha_4C_s) \|\tilde{c}_b\|_{0,4,\Omega} \right] < 1. \quad (4.36)$$

Then any weak solution $\mathbf{v}, p, \theta, c$ of the problem (1.1)–(1.8) satisfies

$$\begin{aligned} \|\mathbf{v}\|_{1,\Omega} &\leq \tilde{C}_1 + \tilde{C}_2 (1 + \alpha_5 \|\tilde{\mathbf{v}}_b\|_{0,4,\Omega}) \|\tilde{\mathbf{v}}_b\|_{1,\Omega} + \\ &\quad + (\tilde{C}_3 + \tilde{C}_4 \|\tilde{\mathbf{v}}_b\|_{0,4,\Omega}) (\|\tilde{\theta}_b\|_{1,\Omega} + \|\tilde{c}_b\|_{1,\Omega}), \\ |\theta|_{1,\Omega} &\leq 2|\tilde{\theta}_b|_{1,\Omega} + \alpha_6\sqrt[4]{3}C_3 \|\tilde{\theta}_b\|_{0,4,\Omega} \|\mathbf{v}\|_{1,\Omega} + C_5K_1, \\ |c|_{1,\Omega} &\leq 2|\tilde{c}_b|_{1,\Omega} + \alpha_7\sqrt[4]{3}C_2C_3^2 |\tilde{c}_b|_{1,\Omega} \|\mathbf{v}\|_{1,\Omega} + C_6K_2 \|\mathbf{v}_b \cdot \mathbf{n}\|_{0,\Gamma^{LS}}. \end{aligned}$$

Proof. Set $\tilde{\mathbf{v}} = \mathbf{v} - \tilde{\mathbf{v}}_b$, $\tilde{\theta} = \theta - \tilde{\theta}_b$ and $\tilde{c} = c - \tilde{c}_b$. Then we have according to (4.11) and (4.14) (cf. Remark 3.2)

$$\begin{aligned} b_1(\mathbf{v}, \tilde{\mathbf{v}}, \tilde{\mathbf{v}}) &= 0, & b_1(\mathbf{v}, \tilde{\mathbf{v}}_b, \tilde{\mathbf{v}}) &= -b_1(\mathbf{v}, \tilde{\mathbf{v}}, \tilde{\mathbf{v}}_b), \\ b_2(\mathbf{v}, \tilde{\theta}, \tilde{\theta}) &= 0, & b_2(\mathbf{v}, \tilde{\theta}_b, \tilde{\theta}) &= -b_2(\mathbf{v}, \tilde{\theta}, \tilde{\theta}_b), \\ b_2(\mathbf{v}, \tilde{c}, \tilde{c}) &\geq 0, & b_2(\tilde{\mathbf{v}}, \tilde{c}_b, \tilde{c}) &= -b_2(\tilde{\mathbf{v}}, \tilde{c}, \tilde{c}_b) \end{aligned}$$

and hence it follows from (3.20)–(3.23) with $\mathbf{w} = \tilde{\mathbf{v}}$, $\eta = \tilde{\theta}$ and $q = \tilde{c}$ that

$$\begin{aligned} a_1(\tilde{\mathbf{v}}, \tilde{\mathbf{v}}) &= -a_1(\tilde{\mathbf{v}}_b, \tilde{\mathbf{v}}) + \alpha_5 b_1(\mathbf{v}, \tilde{\mathbf{v}}, \tilde{\mathbf{v}}_b) + \alpha_1 \langle F_1(\theta), \tilde{\mathbf{v}} \rangle + \\ &\quad + \alpha_2 \langle F_2(c), \tilde{\mathbf{v}} \rangle - \alpha_3 \langle d_s(\theta), \gamma(\mathbf{v}) \rangle - \alpha_4 \langle d_s(c), \gamma(\mathbf{v}) \rangle, \\ a_2(\tilde{\theta}, \tilde{\theta}) &= -a_2(\tilde{\theta}_b, \tilde{\theta}) + \alpha_6 b_2(\mathbf{v}, \tilde{\theta}, \tilde{\theta}_b) + \langle \Phi_1(\theta), \tilde{\theta} \rangle, \\ a_2(\tilde{c}, \tilde{c}) &\leq -a_2(\tilde{c}_b, \tilde{c}) - \alpha_7 b_2(\mathbf{v}, \tilde{c}_b, \tilde{c}) + \langle \Phi_2(c), \tilde{c} \mathbf{v}_b \rangle = \\ &= -a_2(\tilde{c}_b, \tilde{c}) + \alpha_7 b_2(\tilde{\mathbf{v}}, \tilde{c}, \tilde{c}_b) - \alpha_7 b_2(\tilde{\mathbf{v}}_b, \tilde{c}_b, \tilde{c}) + \langle \Phi_2(c), \tilde{c} \mathbf{v}_b \rangle. \end{aligned}$$

Using (4.35), (4.7), (4.9), (4.12), (4.17)–(4.19), Theorem 3.1 and the Hölder inequality, we deduce that

$$\begin{aligned} \frac{1}{2C_2^2} \|\tilde{\mathbf{v}}\|_{1,\Omega} &\leq 2|\tilde{\mathbf{v}}_b|_{1,\Omega} + \alpha_5\sqrt{3} \|\tilde{\mathbf{v}}_b\|_{0,4,\Omega}^2 + \alpha_1 \|\mathbf{f}_1(0)\|_{0,\Omega} + \\ &\quad + \alpha_2 \|\mathbf{f}_2(0)\|_{0,\Omega} + \sqrt{3} (\alpha_1 \|\theta\|_{0,\Omega} + \alpha_2 \|c\|_{0,\Omega}) + C_s (\alpha_3 |\theta|_{1,\Omega} + \alpha_4 |c|_{1,\Omega}), \\ |\tilde{\theta}|_{1,\Omega} &\leq |\tilde{\theta}_b|_{1,\Omega} + \alpha_6\sqrt[4]{3} \|\tilde{\theta}_b\|_{0,4,\Omega} \|\mathbf{v}\|_{0,4,\Omega} + C_5K_1, \\ |\tilde{c}|_{1,\Omega} &\leq |\tilde{c}_b|_{1,\Omega} + \alpha_7\sqrt[4]{3}C_2C_3 |\tilde{c}_b|_{1,\Omega} \|\mathbf{v}\|_{0,4,\Omega} + C_6K_2 \|\mathbf{v}_b \cdot \mathbf{n}\|_{0,\Gamma^{LS}}, \\ |\tilde{c}|_{1,\Omega} &\leq |\tilde{c}_b|_{1,\Omega} + \alpha_7\sqrt[4]{3} \|\tilde{c}_b\|_{0,4,\Omega} \|\tilde{\mathbf{v}}\|_{0,4,\Omega} + \\ &\quad + \alpha_7\sqrt[4]{3}C_2C_3 |\tilde{c}_b|_{1,\Omega} \|\tilde{\mathbf{v}}_b\|_{0,4,\Omega} + C_6K_2 \|\mathbf{v}_b \cdot \mathbf{n}\|_{0,\Gamma^{LS}} \end{aligned}$$

and the lemma follows using (4.7) and (4.36). ■

Remark 4.6. Functions $\tilde{\theta}_b, \tilde{c}_b$ satisfying (3.17) and (4.36) exist owing to Lemma 4.4.

Theorem 4.7. *Let the assumptions (2.1)–(2.7) be satisfied and let $\alpha_1, \dots, \alpha_7, \mathbf{f}_1(0), \mathbf{f}_2(0), K_1, K_2, L_1, L_2, \mathbf{v}_b, \theta_b, c_b$ be small. Then the problem (1.1)–(1.8) has exactly one weak solution.*

Proof. According to [7, p. 24, Lemma 2.2], there exists a constant C_7 depending only on Ω such that, for any $\mathbf{v}_b \in H^{\frac{1}{2}}(\partial\Omega)^3$ satisfying $\int_{\partial\Omega} \mathbf{v}_b \cdot \mathbf{n} \, d\sigma = 0$, there exists $\tilde{\mathbf{v}}_b \in H^1(\Omega)^3$ possessing the properties

$$\operatorname{div} \tilde{\mathbf{v}}_b = 0, \quad \tilde{\mathbf{v}}_b|_{\partial\Omega} = \mathbf{v}_b \quad \text{and} \quad \|\tilde{\mathbf{v}}_b\|_{1,\Omega} \leq C_7 \|\mathbf{v}_b\|_{\frac{1}{2},\partial\Omega}.$$

From (4.9) and (4.7) (with $\mathbf{U} = (\mathbf{v}, 0, 0)$), it then follows that

$$b_1(\mathbf{v}, \mathbf{v}, \tilde{\mathbf{v}}_b) \leq \sqrt{3} C_2^2 C_3^2 C_7 \|\mathbf{v}_b\|_{\frac{1}{2},\partial\Omega} a_1(\mathbf{v}, \mathbf{v}) \quad \forall \mathbf{v} \in \mathbf{V}.$$

Thus, for α_5 and $\mathbf{v}_b$ sufficiently small, the assumption (4.29) (and also (4.35)) is valid and, owing to Theorem 4.6, there exists at least one weak solution of the problem (1.1)–(1.8).

It remains to prove the uniqueness. Let $\mathbf{v}_1, p_1, \theta_1, c_1$ and $\mathbf{v}_2, p_2, \theta_2, c_2$ be two weak solutions of the problem (1.1)–(1.8). According to (3.20)–(3.23), we have for any $\mathbf{w} \in \mathbf{V}, \eta \in \Theta$ and $q \in \mathcal{C}$

$$\begin{aligned} a_1(\mathbf{v}_1 - \mathbf{v}_2, \mathbf{w}) &= -\alpha_5 b_1(\mathbf{v}_1 - \mathbf{v}_2, \mathbf{v}_1, \mathbf{w}) - \alpha_5 b_1(\mathbf{v}_2, \mathbf{v}_1 - \mathbf{v}_2, \mathbf{w}) + \\ &\quad + \alpha_1 (\langle \mathbf{F}_1(\theta_1), \mathbf{w} \rangle - \langle \mathbf{F}_1(\theta_2), \mathbf{w} \rangle) + \\ &\quad + \alpha_2 (\langle \mathbf{F}_2(c_1), \mathbf{w} \rangle - \langle \mathbf{F}_2(c_2), \mathbf{w} \rangle) - \\ &\quad - \alpha_3 \langle d_s(\theta_1 - \theta_2), \gamma(\mathbf{w}) \rangle - \alpha_4 \langle d_s(c_1 - c_2), \gamma(\mathbf{w}) \rangle, \\ a_2(\theta_1 - \theta_2, \eta) &= -\alpha_6 b_2(\mathbf{v}_1 - \mathbf{v}_2, \theta_1, \eta) - \alpha_6 b_2(\mathbf{v}_2, \theta_1 - \theta_2, \eta) + \\ &\quad + \langle \Phi_1(\theta_1), \eta \rangle - \langle \Phi_1(\theta_2), \eta \rangle, \\ a_2(c_1 - c_2, q) &= -\alpha_7 b_2(\mathbf{v}_1 - \mathbf{v}_2, c_1, q) - \alpha_7 b_2(\mathbf{v}_2, c_1 - c_2, q) + \\ &\quad + \langle \Phi_2(c_1), q \mathbf{v}_b \rangle - \langle \Phi_2(c_2), q \mathbf{v}_b \rangle. \end{aligned}$$

Let us set $\mathbf{w} = \mathbf{v}_1 - \mathbf{v}_2, \eta = \theta_1 - \theta_2$ and $q = c_1 - c_2$ (cf. Remark 3.2). From (4.11) and (4.14), we deduce that

$b_1(\mathbf{v}_2, \mathbf{v}_1 - \mathbf{v}_2, \mathbf{v}_1 - \mathbf{v}_2) = b_2(\mathbf{v}_2, \theta_1 - \theta_2, \theta_1 - \theta_2) = 0, \quad b_2(\mathbf{v}_2, c_1 - c_2, c_1 - c_2) \geq 0$
and hence, using (4.7), (4.9), (4.12), (4.20)–(4.23) and Theorem 3.1, we derive

$$\begin{aligned} \|\mathbf{v}_1 - \mathbf{v}_2\|_{1,\Omega} &\leq \\ &\leq \alpha_5 \sqrt{3} C_2^2 C_3^2 \|\mathbf{v}_1\|_{1,\Omega} \|\mathbf{v}_1 - \mathbf{v}_2\|_{1,\Omega} + \tilde{C}_5 (\|\theta_1 - \theta_2\|_{1,\Omega} + \|c_1 - c_2\|_{1,\Omega}), \\ (1 - C_6^2 L_1) \|\theta_1 - \theta_2\|_{1,\Omega} &\leq \alpha_6 \sqrt[4]{3} C_2^2 C_3^2 \|\theta_1\|_{1,\Omega} \|\mathbf{v}_1 - \mathbf{v}_2\|_{1,\Omega}, \\ (1 - C_2 C_4 C_6 L_2 \|\mathbf{v}_b \cdot \mathbf{n}\|_{0,4,\Gamma^{LS}}) \|c_1 - c_2\|_{1,\Omega} &\leq \\ &\leq \alpha_7 \sqrt[4]{3} C_2^2 C_3^2 \|c_1\|_{1,\Omega} \|\mathbf{v}_1 - \mathbf{v}_2\|_{1,\Omega}. \end{aligned}$$

Thus, for L_1, L_2 and $\mathbf{v}_b$ sufficiently small, we obtain

$$\|\theta_1 - \theta_2\|_{1,\Omega} \leq \alpha_6 2 \sqrt[4]{3} C_2^2 C_3^2 \|\theta_1\|_{1,\Omega} \|\mathbf{v}_1 - \mathbf{v}_2\|_{1,\Omega}, \quad (4.37)$$

$$\|c_1 - c_2\|_{1,\Omega} \leq \alpha_7 2 \sqrt[4]{3} C_2^2 C_3^2 \|c_1\|_{1,\Omega} \|\mathbf{v}_1 - \mathbf{v}_2\|_{1,\Omega} \quad (4.38)$$

and, consequently,

$$\begin{aligned} \|\mathbf{v}_1 - \mathbf{v}_2\|_{1,\Omega} &\leq C_2^2 C_3^2 \times \\ &\times \left[\alpha_5 \sqrt{3} \|\mathbf{v}_1\|_{1,\Omega} + 2 \sqrt[4]{3} \tilde{C}_5 (\alpha_6 \|\theta_1\|_{1,\Omega} + \alpha_7 \|c_1\|_{1,\Omega}) \right] \|\mathbf{v}_1 - \mathbf{v}_2\|_{1,\Omega}. \end{aligned} \quad (4.39)$$

Due to [10, p. 103, Theorem 5.7], there exists a constant C_8 depending only on Ω such that, for any $\zeta_b \in H^{\frac{1}{2}}(\partial\Omega)$, there exists $\tilde{\zeta}_b \in H^1(\Omega)$ satisfying

$$\tilde{\zeta}_b|_{\partial\Omega} = u_b \quad \text{and} \quad \|\tilde{\zeta}_b\|_{1,\Omega} \leq C_8 \|\zeta_b\|_{\frac{1}{2},\partial\Omega}.$$

Thus, according to Lemma 4.5, the sum of the terms in the square brackets in (4.39) is smaller than $1/(C_2^2 C_3^2)$ for $\alpha_1, \dots, \alpha_7, \mathbf{f}_1(0), \mathbf{f}_2(0), K_1, K_2, \mathbf{v}_b, \theta_b, c_b$ sufficiently small. Therefore, $\mathbf{v}_1 = \mathbf{v}_2$ and, due to (4.37) and (4.38), $\theta_1 = \theta_2$ and $c_1 = c_2$. Now, applying Theorem 4.1, we infer that also $p_1 = p_2$ and the proof is completed. ■

Acknowledgment. This research was carried out during a stay of the first author at the Institute of Analysis and Numerics, Otto von Guericke University, Magdeburg, Germany, under the support of the Deutsche Forschungsgemeinschaft (DFG).
