We present two iterative schemes with errors which are proved to be strongly convergent to a common element of the set of fixed points of a countable family of relatively nonexpansive mappings and the set of fixed points of nonexpansive mappings in the sense of Lyapunov functional in a real uniformly smooth and uniformly convex Banach space. Using the result we consider strong convergence theorems for variational inequalities and equilibrium problems in a real Hilbert space and strong convergence theorems for maximal monotone operators in a real uniformly smooth and uniformly convex Banach space.

1. Introduction

Let \(E\) be a real Banach space, and \(E^\ast\) the dual space of \(E\). The function \(\phi : E \to E^\ast\) is denoted by

\[
\phi(y, x) = \|y\|^2 - 2\langle y, Jx \rangle + \|x\|^2
\]

(1.1)

for all \(x, y \in E\), where \(J\) is the normalized duality mapping from \(E\) to \(E\). Let \(C\) be a closed convex subset of \(E\), and let \(T\) be a mapping from \(C\) into itself. We denote by \(F(T)\) the set of fixed points of \(T\). A point \(p\) in \(C\) is said to be an asymptotic fixed point of \(T\) if \(C\) contains a sequence \(\{x_n\}\) which converges weakly to \(p\) such that the strong \(\lim_{n \to \infty} (x_n - Tx_n)\) equals 0. The set of asymptotic fixed points of \(T\) will be denoted by \(\hat{F}(T)\). A mapping \(T\) from \(C\) into itself is called nonexpansive if \(\|Tx - Ty\| \leq \|x - y\|\) for all \(x, y \in C\) and nonexpansive with respect to the Lyapunov functional \([2]\) if \(\phi(Tx, Ty) \leq \phi(x, y)\) for all \(x, y \in C\) and it is
called relatively nonexpansive [3–6] if $\tilde{F}(T) = F(T)$ and $\phi(p, Tx) \leq \phi(p, x)$ for all $x \in C$ and $p \in F(T)$. The asymptotic behavior of relatively nonexpansive mapping was studied in [3–6].

There are many methods for approximating fixed points of a nonexpansive mapping. In 1953, Mann [7] introduced the iteration as follows: a sequence $\{x_n\}$ is defined by

$$x_{n+1} = \alpha_n x_n + (1 - \alpha_n)Tx_n,$$  

(1.2)

where the initial guess element $x_0 \in C$ is arbitrary and $\{\alpha_n\}$ is a real sequence in $[0,1]$. Mann iteration has been extensively investigated for nonexpansive mappings. One of the fundamental convergence results was proved by Reich [1]. In an infinite-dimensional Hilbert space, Mann iteration can yield only weak convergence (see [8, 9]). Attempts to modify the Mann iteration method (1.2) so that strong convergence is guaranteed have recently been made. Nakajo and Takahashi [10] proposed the following modification of Mann iteration method (1.2) for nonexpansive mapping $T$ in a Hilbert space: in particular, they studied the strong convergence of the sequence $\{x_n\}$ generated by

$$x_0 = x \in C,$$

$$y_n = \alpha_n x_n + (1 - \alpha_n)Tx_n,$$

(1.3)

$$C_n = \{z \in C : \|z - y_n\| \leq \|z - x_n\|\},$$

$$Q_n = \{z \in C : \langle x_n - z, x_n - x_n \rangle \geq 0\},$$

$$x_{n+1} = P_{C_n \cap Q_n}x, \quad n = 0, 1, 2, \ldots,$$

where $\{\alpha_n\} \subset [0,1]$ and $P_{C_n \cap Q_n}$ is the metric projection from $C$ onto $C_n \cap Q_n$.

Recently, Takahashi et al. [11] extended iteration (1.6) to obtain strong convergence to a common fixed point of a countable family of nonexpansive mappings; let $C$ be a nonempty closed convex subset of a Hilbert space $H$. Let $\{T_n\}$ and $\mathcal{T}$ be families of nonexpansive mappings of $C$ into itself such that $\emptyset \neq F(\mathcal{T}) = \bigcap_{n=1}^\infty F(T_n)$ and let $x_0 \in H$. Suppose that $\{T_n\}$ satisfies the NST-condition (I) with $\mathcal{T}$; that is, for each bounded sequence $\{z_n\} \subset C, \lim_{n \to \infty} \|z_n - T_nz_n\| = 0$ implies that $\lim_{n \to \infty} \|z_n - T_nz_n\| = 0$ for all $T \in \mathcal{T}$. For $x_1 = P_Cx_0$, define a sequence $\{x_n\}$ of $C$ as follows:

$$y_n = \alpha_n x_n + (1 - \alpha_n)T_n x_n,$$

$$C_n = \{z \in C : \|z - y_n\| \leq \|z - x_n\|\},$$

(1.4)

$$Q_n = \{z \in C : \langle x_n - z, x_0 - x_n \rangle \geq 0\},$$

$$u_{n+1} = P_{C_n \cap Q_n}x_0, \quad n \in \mathbb{N},$$

where $0 \leq \alpha_n \leq \alpha < 1$. Then, $\{u_n\}$ converges strongly to $z_0 = P_{F(T)}x_0$.

On the other hand, Halpern [12] introduced the following iterative scheme for approximating a fixed point of $T$:

$$x_{n+1} = \alpha_n x + (1 - \alpha_n)Tx_n$$  

(1.5)
for all \( n \in \mathbb{N} \), where \( x_1 = x \in C \) and \( \{ \alpha_n \} \) is a sequence of \([0, 1] \). Strong convergence of this type of iterative sequence has been widely studied; for instance, see [13, 14] and the references therein. In 2006, Martinez-Yanes and Xu [15] have adapted Nakajo and Takahashi’s [10] idea to modify the process (1.5) for a nonexpansive mapping \( T \) in a Hilbert space:

\[
x_0 = x \in C,
\]

\[
y_n = \alpha_n x_0 + (1 - \alpha_n)Tx_n,
\]

\[
C_n = \left\{ z \in C : \| y_n - z \|^2 \leq \| x_n - z \|^2 + \alpha_n \left( \| x_0 \|^2 + 2(x_n - x_0, z) \right) \right\}, \quad \text{(1.6)}
\]

\[
Q_n = \{ z \in C : (x_n - z, x_0 - x_n) \geq 0 \},
\]

\[
x_{n+1} = P_{C_n \cap Q_n}x_0, \quad n = 0, 1, 2, \ldots,
\]

where \( P_{C_n \cap Q_n} \) is the metric projection from \( C \) onto \( C_n \cap Q_n \). They proved that if \( \{ \alpha_n \} \in (0, 1) \) and \( \lim_{n \to \infty} \alpha_n = 0 \), then the sequence \( \{ x_n \} \) generated by (1.6) converges strongly to \( T_y(x) \).

The ideas to generalize the process (1.3) and (1.6) from Hilbert space to Banach space have been studied by many authors. Matsushita and Takahashi [6], Qin and Su [16], and Plubtieng and Ungchittrakool [17] generalized the process (1.3) and (1.6) and proved the strong convergence theorems for relatively nonexpansive mappings in a uniformly convex and uniformly smooth Banach space; see, for instance, [2, 6, 16, 18–22] and the references therein.

Recently, Nakajo et al. [18] introduced the following condition. Let \( C \) be a nonempty closed convex subset of a Hilbert space \( H \), let \( \{ T_n \} \) be a family of mappings of \( C \) into itself with \( F := \bigcap_{n=1}^\infty F(T_n) \neq \emptyset \), and let \( \omega_w(z_n) \) denote the set of all weak subsequential limits of a bounded sequence \( \{ z_n \} \) in \( C \). \( \{ T_n \} \) is said to satisfy the NST-condition (II) if, for every bounded sequence \( \{ z_n \} \) in \( C \),

\[
\lim_{n \to \infty} \| z_n - T_n z_n \| = 0 \text{ implies } \omega_w(z_n) \subseteq F. \quad \text{(1.7)}
\]

Very recently, Nakajo et al. [19] introduced the more general condition so-called the NST*-condition, \( \{ T_n \} \) is said to satisfy the NST*-condition if, for every bounded sequence \( \{ z_n \} \) in \( C \),

\[
\lim_{n \to \infty} \| z_n - T_n z_n \| = \lim_{n \to \infty} \| z_n - z_{n+1} \| = 0 \text{ implies } \omega_w(z_n) \subseteq F. \quad \text{(1.8)}
\]

It follows directly from the definitions above that if \( \{ T_n \} \) satisfies the NST-condition (I), then \( \{ T_n \} \) satisfies the NST*-condition.

Motivated and inspired by Wei and Cho [2], in this paper, we introduce two iterative schemes (3.1) and (3.14) and use the NST*-condition for a countable family of relatively nonexpansive mappings to obtain the strong convergence theorems for finding a common element of the set of fixed points of a countable family of relatively nonexpansive mappings and the set of fixed points of nonexpansive mappings in the sense of Lyapunov functional in a real uniformly smooth and uniformly convex Banach space. Using this result, we also discuss the problem of strong convergence concerning variational inequality, equilibrium, and nonexpansive mappings in Hilbert spaces. Moreover, we also apply our convergence...
to the maximal monotone operators in Banach spaces. The results obtained in this paper improve and extend the corresponding result of Matsushita and Takahashi [6], Qin and Su [16], Wei and Cho [2], Wei and Zhou [22], and many others.

2. Preliminaries

Let $E$ be a real Banach space with norm $\| \cdot \|$ and let $E^*$ be the dual of $E$. For all $x \in E$ and $x^* \in E^*$, we denote the value of $x^*$ at $x$ by $\langle x, x^* \rangle$. We denote the strong convergence and the weak convergence of a sequence $\{x_n\}$ to $x$ in $E$ by $x_n \to x$ and $x_n \rightharpoonup x$, respectively. We also denote the weak* convergence of a sequence $\{x^*_n\}$ to $x^*$ in $E^*$ by $x^*_n \rightharpoonup^* x^*$. An operator $T \subset E \times E^*$ is said to be monotone if $\langle x - y, x^* - y^* \rangle \geq 0$ whenever $(x, x^*), (y, y^*) \in T$. We denote the set $\{x \in E : 0 \in Tx\}$ by $T^{-1}0$. A monotone $T$ is said to be maximal if its graph $G(T) = \{(x, y) : y \in Tx\}$ is not properly contained in the graph of any other monotone operator. If $T$ is maximal monotone, then the solution set $T^{-1}0$ is closed and convex.

The normalized duality mapping $J$ from $E$ to $E^*$ is defined by

$$Jx = \left\{ x^* \in E^* : \langle x, x^* \rangle = \| x \|^2 = \| x^* \|^2 \right\}$$

for $x \in E$. By Hahn-Banach theorem, $J(x)$ is nonempty; see [23] for more details. A Banach space $E$ is said to be strictly convex if $\| (x + y) / 2 \| < 1$ for all $x, y \in E$ with $\| x \| = \| y \| = 1$ and $x \neq y$. It is also said to be uniformly convex if, for each $\varepsilon \in (0, 2]$, there exists $\delta > 0$ such that $\| x + y \| / 2 \leq \delta$ for $x, y \in E$ with $\| x \| = \| y \| = 1$ and $\| x - y \| \geq \varepsilon$. Let $S(E) = \{x \in E : \| x \| = 1\}$ be the unit sphere of $E$. Then the Banach space $E$ is said to be smooth provided that

$$\lim_{t \to 0} \frac{\| x + ty \| - \| x \|}{t}$$

exists for each $x, y \in S(E)$. It is also said to be uniformly smooth if the limit is attained uniformly for $x, y \in S(E)$. It is well known that if $E$ is smooth, strictly convex, and reflexive, then the duality mapping $J$ is single valued, one-to-one, and onto.

Let $E$ be a smooth, strictly convex, and reflexive Banach space and let $C$ be a nonempty closed convex subset of $E$. Throughout this paper, we denote by $\phi$ the function defined by

$$\phi(y, x) = \| y \|^2 - 2 \langle y, Jx \rangle + \| x \|^2, \quad \forall x, y \in C.$$  \hspace{1cm} (2.3)

It is obvious from the definition of the function $\phi$ that $(\| x \| - \| y \|)^2 \leq \phi(y, x) \leq (\| y \|^2 + \| x \|^2)$ for all $x, y \in E$. 

Following Alber [24], the generalized projection $P_C$ from $E$ onto $C$ is defined by

$$P_C(x) = \arg \min_{y \in C} \phi(y, x), \quad \forall x \in E. \quad (2.4)$$

If $E$ is a Hilbert space, then $\phi(y, x) = \|y - x\|^2$ and $P_C$ is the metric projection of $H$ onto $C$.

We need the following lemmas for the proof of our main results.

**Lemma 2.1** (Kamimura and Takahashi [25]). Let $E$ be a uniformly convex and smooth Banach space and let $\{x_n\}$ and $\{y_n\}$ be sequences in $E$ such that either $\{x_n\}$ or $\{y_n\}$ is bounded. If $\lim_{n \to \infty} \phi(x_n, y_n) = 0$, then $\lim_{n \to \infty} \|x_n - y_n\| = 0$.

**Lemma 2.2** (Alber [24], Kamimura and Takahashi [25]). Let $C$ be a nonempty closed convex subset of a smooth, strictly convex, and reflexive Banach space $E$. Then

$$\phi(x, P_C y) + \phi(P_C y, y) \leq \phi(x, y), \quad \forall x \in C, \ y \in E. \quad (2.5)$$

**Lemma 2.3** (Alber [24], Kamimura and Takahashi [25]). Let $C$ be a nonempty closed convex subset of a smooth, strictly convex, and reflexive Banach space $E$, let $x \in E$, and let $x_0 \in C$. Then

$$x_0 = P_C x \iff \langle z - x_0, Jx_0 - Jx \rangle \geq 0, \quad \forall z \in C. \quad (2.6)$$

**Lemma 2.4** (Matsushita and Takahashi [6]). Let $C$ be a nonempty closed convex subset of a smooth, strictly convex, and reflexive Banach space $E$, and let $T$ be a relatively nonexpansive mapping from $C$ into itself. Then $F(T)$ is closed and convex.

**Lemma 2.5** (see [2]). Let $E$ be a real smooth and uniformly convex Banach space. If $S : E \to E$ is a mapping which is nonexpansive with respect to the Lyapunov functional, then $F(S)$ is convex and closed subset of $E$.

### 3. Main Results

In this section, by using the NST*-condition, we proved two strong convergence theorems for finding a common element of the set of fixed points of a countable family of relatively nonexpansive mappings and the set of fixed points of nonexpansive mappings in the sense of Lyapunov functional in a real uniformly smooth and uniformly convex Banach space.

**Theorem 3.1.** Let $E$ be a real uniformly smooth and uniformly convex Banach space, let $C$ be a nonempty closed convex subset of $E$, and let $S : C \to C$ be nonexpansive with respect to the Lyapunov functional and weakly sequentially continuous. Let $\{T_n\}$ be a family of relatively nonexpansive
mappings of $C$ into itself such that $F := \bigcap_{n=1}^{\infty} F(T_n) \cap F(S) \neq \emptyset$ and satisfy the NST*-condition. Then the sequence $\{x_n\}$ generated by

\begin{align*}
x_0 &\in C, \\
y_n &\in T_n(x_n + e_n), \\
z_n &\in J^{-1}(\alpha_n Jx_n + (1 - \alpha_n)Jy_n), \\
u_n &\in Sz_n, \\
H_n &\in \{z \in C : \phi(z, u_n) \leq \phi(z, z_n) \leq \alpha_n \phi(z, x_n) + (1 - \alpha_n)\phi(z, x_n + e_n)\}, \\
W_n &\in \{z \in C : (z - x_n, Jx_0 - Jx_n) \leq 0\}, \\
x_{n+1} &\in PH_n \cap W_n, \quad n = 0, 1, 2, \ldots
\end{align*}

converges strongly to $P_F x_0$ provided that

(i) $\{\alpha_n\} \subset [0, 1]$ with $\alpha_n \leq 1 - \beta$ for some $\beta \in (0, 1)$;

(ii) the error sequence is $\{e_n\} \subset C$ such that $\|e_n\| \to 0$ as $n \to \infty$.

Proof. We split the proof into five steps.

Step 1 (Both $H_n$ and $W_n$ are closed and convex subset of $C$). Noting the facts that

\begin{align*}
\phi(z, z_n) &\leq \alpha_n \phi(z, x_n) + (1 - \alpha_n)\phi(z, x_n + e_n) \iff \|z_n\|^2 - \alpha_n\|x_n\|^2 - (1 - \alpha_n)\|x_n + e_n\|^2 \\
&\leq 2\langle z, Jz_n - \alpha_n Jx_n - (1 - \alpha_n)J(x_n + e_n) \rangle, \\
\phi(z, u_n) &\leq \phi(z, z_n) \iff \|z_n\|^2 - \|u_n\|^2 \geq 2\langle z, Jz_n - Ju_n \rangle,
\end{align*}

we can easily know that $H_n$ is closed and convex subset of $E$. It is obvious that $W_n$ is also a closed and convex subset of $E$.

Step 2 ($F := (\bigcap_{n=1}^{\infty} F(T_n)) \cap F(S) \subseteq H_n \cap W_n$ for all $n \in \mathbb{N} \cup \{0\}$). To observe this, take $p \in F$. Then it follows from the convexity of $\|\cdot\|^2$ that

\begin{align*}
\phi(p, u_n) &= \phi(Sp, Sz_n) \leq \phi(p, z_n) \\
&= \|p\|^2 - 2\langle p, \alpha_n Jx_n + (1 - \alpha_n)Jy_n \rangle + \|\alpha_n Jx_n + (1 - \alpha_n)Jy_n\|^2 \\
&\leq \|p\|^2 - 2\alpha_n \langle p, Jx_n \rangle - 2(1 - \alpha_n)\langle p, Jy_n \rangle + \alpha_n\|x_n\|^2 + (1 - \alpha_n)\|y_n\|^2 \\
&= \alpha_n \phi(p, x_n) + (1 - \alpha_n)\phi(p, y_n) \\
&= \alpha_n \phi(p, x_n) + (1 - \alpha_n)\phi(p, T_n(x_n + e_n)) \\
&\leq \alpha_n \phi(p, x_n) + (1 - \alpha_n)\phi(p, x_n + e_n)
\end{align*}
Abstract and Applied Analysis

for all \( n \in \mathbb{N} \cup \{0\} \). Hence \( F \subset H_n \) for all \( n \in \mathbb{N} \cup \{0\} \). On the other hand, it is clear that \( p \in W_0 = C \). Then \( p \in H_0 \cap W_0 \) and \( x_1 = P_{H_0 \cap W_0} x_0 \) is well defined. Suppose that \( p \in W_{n-1} \) for some \( n \geq 1 \). Then \( p \in H_{n-1} \cap W_{n-1} \) and \( x_n = P_{H_{n-1} \cap W_{n-1}} x_0 \) is well defined. It follows from Lemma 2.3 that

\[
\langle p - x_n, Jx_0 - Jx_n \rangle = \langle p - P_{H_{n-1} \cap W_{n-1}} x_0, Jx_0 - JP_{H_{n-1} \cap W_{n-1}} x_0 \rangle \leq 0,
\]

which implies that \( p \in W_n \). Therefore \( p \in H_n \cap W_n \), and hence \( x_{n+1} = P_{H_n \cap W_n} x_0 \) is well defined. Then by induction, the sequence \( \{x_n\} \) generated by (3.1) is well defined, for each \( n \geq 0 \). Moreover \( F \subset H_n \cap W_n \) for each nonnegative integer \( n \).

**Step 3** (\( \{x_n\} \) is bounded sequence of \( C \)). In fact, for all \( p \in F \subset H_n \cap W_n \subset W_n \), it follows from Lemma 2.2 that

\[
\phi(p, P_{W_n} x_0) + \phi(P_{W_n} x_0, x_0) \leq \phi(p, x_0).
\]

By the definition of \( W_n \) and Lemma 2.2, we note that \( x_n = P_{W_n} x_0 \) and hence

\[
\phi(p, x_n) + \phi(x_n, x_0) \leq \phi(p, x_0).
\]

Therefore \( \{x_n\} \) is bounded.

**Step 4** (\( \omega_{\mu}(x_n) \subset F \). From the facts \( x_n = P_{W_n} x_0, x_{n+1} \in W_n \), and Lemma 2.2, we have

\[
\phi(x_{n+1}, x_n) + \phi(x_n, x_0) \leq \phi(x_{n+1}, x_0).
\]

Therefore, \( \lim_{n \to \infty} \phi(x_n, x_0) \) exists. Then \( \phi(x_{n+1}, x_n) \to 0 \), which implies from Lemma 2.1 that \( \|x_{n+1} - x_n\| \to 0 \) as \( n \to \infty \). Since \( x_{n+1} \in H_n \), we have

\[
\phi(x_{n+1}, u_n) \leq \phi(x_{n+1}, z_n) \leq \alpha_n \phi(x_{n+1}, x_n) + (1 - \alpha_n) \phi(x_{n+1}, x_n + e_n).
\]

Note that

\[
\phi(x_{n+1}, x_n + e_n) - \phi(x_{n+1}, x_n) = \|x_n + e_n\|^2 - \|x_n\|^2 + 2(x_n, Jx_n - J(x_n + e_n)).
\]

Since \( J \) is uniform continuous on each bounded subset of \( E \) and \( \|e_n\| \to 0 \), we have \( \phi(x_{n+1}, x_n + e_n) \to 0 \) as \( n \to \infty \). This implies that \( \phi(x_{n+1}, u_n) \to 0 \) and \( \phi(x_{n+1}, z_n) \to 0 \) as \( n \to \infty \). Using Lemma 2.1, we obtain \( \lim_{n \to \infty} \|x_{n+1} - (x_n + e_n)\| = 0 \), \( \lim_{n \to \infty} \|x_{n+1} - z_n\| = 0 \), and \( \lim_{n \to \infty} \|x_{n+1} - u_n\| = 0 \). Since both \( J : E \to E^* \) and \( J^{-1} : E^* \to E \) are uniformly continuous on bounded subsets, it follows that \( \lim_{n \to \infty} \|x_n - y_n\| = 0 \).
Put $v_n := x_n + e_n$ for all $n \in \mathbb{N} \cup \{0\}$. Since $\{x_n\}$ is bounded and $\|e_n\| \to 0$, we have $\{v_n\}$ is bounded. Note that

$$\|v_{n+1} - v_n\| = \|(x_{n+1} + e_{n+1}) - (x_n + e_n)\|$$

$$\leq \|x_{n+1} - (x_n + e_n)\| + \|e_{n+1}\|,$$  

(3.10)

for all $n \in \mathbb{N} \cup \{0\}$. It implies that $\lim_{n \to \infty} \|v_{n+1} - v_n\| = \lim_{n \to \infty} \|v_n - T_n v_n\| = 0$. Therefore, we have $\omega_w(v_n) \subset \bigcap_{n=1}^{\infty} F(T_n)$ since $\{T_n\}$ satisfies NST*-condition. Note that $\|v_n - x_n\| = \|(x_n + e_n) - x_n\| = \|e_n\| \to 0$ as $n \to \infty$. Hence, we also have $\omega_w(x_n) \subset \bigcap_{n=1}^{\infty} F(T_n)$.

On the other hand, from Step 3, we know that $\omega_w(x_n) \neq \emptyset$. Then, for all $q \in \omega_w(x_n)$, there exists a subsequence $\{x_{n_i}\}$ of $\{x_n\}$ such that $x_{n_i} \to q$ as $i \to \infty$. Therefore, $u_n \to q$ and $z_{n_i} \to q$ as $i \to \infty$. Since $S : C \to C$ is weakly continuous and $u_n = S z_{n_i}$, we have $q \in F(S)$. Hence $\omega_w(x_n) \subset F := (\bigcap_{n=1}^{\infty} F(T_n)) \cap F(S)$.

**Step 5** ($x_n \to q^* = P_I x_0$, as $n \to \infty$). Let $\{x_n\}$ be any subsequence of $\{x_n\}$ which weakly converges to $q \in F$. Since $x_{n+1} = P_{H_n \cap W_n} x_0$ and $q^* \in F \subset H_n \cap W_n$, we have $\phi(x_{n+1}, x_0) \leq \phi(q^*, x_0)$. Then,

$$\phi(x_n, q^*) = \phi(x_n, x_0) + \phi(x_0, q^*) - 2\langle x_n - x_0, J q^* - J x_0 \rangle$$

$$\leq \phi(q^*, x_0) + \phi(x_0, q^*) - 2\langle x_n - x_0, J q^* - J x_0 \rangle,$$

(3.11)

which yields

$$\limsup_{j \to \infty} \phi(x_{n_j}, q^*) \leq \phi(q^*, x_0) + \phi(x_0, q^*) - 2\langle q - x_0, J q^* - J x_0 \rangle = -2\langle q^* - q, J q^* - J x_0 \rangle \leq 0.$$  

(3.12)

Hence $\phi(x_{n_j}, q^*) \to 0$ as $j \to \infty$. It follows from Lemma 2.1 that $x_{n_j} \to q^*$ as $j \to \infty$. Therefore, $x_n \to q^* = P_I x_0$ as $n \to \infty$. This completes the proof.

**Corollary 3.2** (see Matsushita and Takahashi [6]). Let $E$ be a real uniformly smooth and uniformly convex Banach space, let $C$ be a nonempty closed convex subset of $E$, let $T$ be a relatively nonexpansive mappings of $C$ into itself, and let $\{\alpha_n\}$ be a sequence of real numbers such that $0 \leq \alpha_n < 1$ and $\limsup_{n \to \infty} \alpha_n < 1$. Suppose that $\{x_n\}$ is given by

$$x_0 = x \in C,$$

$$y_n = f^{-1}(\alpha_n J x_n + (1 - \alpha_n) J T x_n),$$

$$H_n = \{z \in C : \phi(z, y_n) \leq \phi(z, x_n)\},$$

$$W_n = \{z \in C : \langle x_n - z, J x_0 - J x_n \rangle \geq 0\},$$

$$x_{n+1} = \Pi_{H_n \cap W_n} x_0, \quad n = 0, 1, 2, \ldots,$$

(3.13)
where $J$ is the duality mapping on $E$. If $F(T)$ is nonempty, then $\{x_n\}$ converges strongly to $P_F(x)$, where $P_F$ is the generalized projection from $C$ onto $F(T)$.

**Proof.** Suppose that $F(T) \neq \emptyset$ and put $T_n \equiv T$, $S \equiv I$, and $\epsilon_n = 0$ for all $n \in \mathbb{N} \cup \{0\}$. Let $\{z_n\}$ be a bounded sequence in $C$ with $\lim_{n \to \infty} \|z_n - Tz_n\| = 0$ and let $z \in \omega_w(z_n)$. Then there exists a subsequence $\{z_{n_k}\}$ of $\{z_n\}$ such that $z_{n_k} \rightharpoonup z$. It follows directly from the definition of $T$ that $z \in F(T) = F(T)$. Hence $T$ satisfies NST-condition; by Theorem 3.1, $\{x_n\}$ converges strongly to $P_T(x)$.

**Theorem 3.3.** Let $E$ be a real uniformly smooth and uniformly convex Banach space, let $C$ be a nonempty closed convex subset of $E$, and let $S : C \to C$ be nonexpansive with respect to the Lyapunov functional and weakly sequentially continuous. Let $\{T_n\}$ be a family of relatively nonexpansive mappings of $C$ into itself such that $F := \bigcap_{n=1}^{\infty} F(T_n) \cap F(S) \neq \emptyset$ and satisfy the NST-condition. Then the sequence $\{x_n\}$ generated by

$$x_0 \in C,$$

$$y_n = T_n(x_n + e_n),$$

$$z_n = J^{-1}(\alpha_n Jx_0 + (1 - \alpha_n) Jy_n),$$

$$u_n = Sz_n,$$

$$H_n = \{z \in C : \phi(z, u_n) \leq \phi(z, z_n) \leq \alpha_n \phi(z, x_0) + (1 - \alpha_n) \phi(z, x_n + e_n)\},$$

$$W_n = \{z \in C : \langle z - x_n, Jx_0 - Jx_n \rangle \leq 0\},$$

$$x_{n+1} = P_{H_n \cap W_n} x_0$$

converges strongly to $P_T(x_0)$ provided that

(i) $\{\alpha_n\} \subset [0, 1]$ is a sequence such that $\alpha_n \to 0$ as $n \to \infty$;

(ii) the error sequence is $\{e_n\} \subset E$ such that $\|e_n\| \to 0$ as $n \to \infty$.

**Proof.** By slightly modifying the corresponding proof in Theorem 3.1, we can easily obtain the result. \hfill \square

Setting $T_n \equiv T$, $S \equiv I$, and $e_n = 0$ for all $n \in \mathbb{N} \cup \{0\}$ in Theorem 3.3, we obtain the following corollary.

**Corollary 3.4** (see Qin and Su [16]). Let $E$ be a real uniformly smooth and uniformly convex Banach space, and let $C$ be a nonempty closed convex subset of $E$. Let $T$ be a relatively nonexpansive mappings of $C$ into itself, and let $\{\alpha_n\}$ be a sequence in $(0, 1)$ and $\lim_{n \to \infty} \alpha_n = 0$. Define a sequence $\{x_n\}$ in $C$ by

$$x_0 \in C,$$

$$y_n = J^{-1}(\alpha_n Jx_0 + (1 - \alpha_n) Jx_n),$$

$$C_n = \{z \in C : \phi(z, y_n) \leq \alpha_n \phi(z, x_0) + (1 - \alpha_n) \phi(z, x_n)\},$$

$$Q_n = \{z \in C : \langle x_n - z, Jx_0 - Jx_n \rangle \geq 0\},$$

$$x_{n+1} = \Pi_{C_n \cap Q_n} x_0, \quad n = 0, 1, 2, \ldots,$$
where \( J \) is the duality mapping on \( E \). If \( F(T) \) is nonempty, then \( \{x_n\} \) converges strongly to \( P_{F(T)} x \), where \( P_{F(T)} \) is the generalized projection from \( C \) onto \( F(T) \).

4. Applications to the Variational Inequality Problem, Equilibrium Problem, and Fixed Points Problem of Nonexpansive Mappings in a Real Hilbert Space

In this section, using Theorems 3.1 and 3.3, we prove the strong convergence theorems for finding a common element of the set of fixed points of nonexpansive mapping, the solution set of the variational inequality problems, and the solution set of an equilibrium problems in a Hilbert space.

4.1. Common Solutions of a Fixed Point Problem and a Variational Inequality Problem

Let \( C \) be a nonempty closed convex subset of a real Hilbert space \( H \) and let \( A \) be a mapping of \( C \) into \( H \). A classical variational inequality problem, denoted by \( \text{VI}(C, A) \), is to find an element \( u^* \in C \) such that \( \langle u - u^*, Au^* \rangle \geq 0 \) for all \( u \in C \). It is known that for \( \lambda > 0 \), \( x \in C \) is a solution of the variational inequality of \( A \) if and only if \( x = P_C(I - \lambda A)x \), where \( P_C \) is the metric projection from \( H \) onto \( C \). We denote by \( N_C(v) \) the normal cone for \( C \) at a point \( v \in C \), that is, \( N_C(v) = \{w \in H : \langle w, v - u \rangle \geq 0 \text{ for all } u \in C\} \). Define \( f : H \to H \) by

\[
f(v) = \begin{cases} 
  Av + N_C(v), & \forall v \in C, \\
  \emptyset, & \text{otherwise.} 
\end{cases} \tag{4.1}
\]

Then \( f \) is maximal monotone and \( f^{-1}0 = \text{VI}(C, A) \) (see [26]). A mapping \( A : C \to H \) is called \( \alpha \)-inverse strongly monotone if there exists an \( \alpha > 0 \) such that

\[
\langle Au - Av, u - v \rangle \geq \alpha \|Au - Av\|^2, \quad \forall u, v \in C. \tag{4.2}
\]

It is well known that if \( 0 < \lambda < 2\alpha \), then \( P_C(I - \lambda A) \) is nonexpansive of \( C \) into itself.

**Lemma 4.1** (see [27]). Let \( C \) be a nonempty closed convex subset of a real Hilbert space \( H \) and let \( A \) be \( \alpha \)-inverse strongly monotone mapping of \( C \) into \( H \). Let \( \{\lambda_n\} \subset (0, 2\alpha) \) and let \( P_C \) be a metric projection from \( H \) onto \( C \). Let \( T_n = P_C(I - \lambda_n A) \), for all \( n \in \mathbb{N} \). Then \( \{T_n\} \) is a sequence of nonexpansive mappings and satisfies NST-condition.

By using Lemma 4.1 and Theorem 3.1 with \( e_n = 0 \), for all \( n \in \mathbb{N} \cup \{0\} \), we obtain the following theorem.

**Theorem 4.2.** Let \( C \) be a nonempty closed convex subset of a real Hilbert space \( H \) and let \( A \) be \( \alpha \)-inverse strongly monotone mapping of \( C \) into \( H \). Let \( S \) be a nonexpansive mapping of \( C \) into itself
such that $F := F(S) \cap VI(C, A) \neq \emptyset$. Let $P_C$ be a metric projection from $H$ onto $C$. Then the sequence \( \{x_n\} \) generated by

\[
x_0 \in C, \\
y_n = \alpha_n x_n + (1 - \alpha_n) P_C(x_n - \lambda_n A x_n), \\
z_n = S y_n, \\
H_n = \{ z \in C : \|z - z_n\| \leq \|z - x_n\| \}, \\
W_n = \{ z \in C : \langle z - x_n, x_0 - x_n \rangle \leq 0 \}, \\
x_{n+1} = P_{H_n \cap W_n} x_0, \quad n = 0, 1, 2, \ldots
\]

converges strongly to $P_F x_0$ provided that

(i) \( \{\alpha_n\} \subset [0, 1] \) with $\alpha_n \leq 1 - \beta$ for some $\beta \in (0, 1)$;

(ii) \( \{\lambda_n\} \subset [a, b] \) for some $a, b \in (0, 2\alpha)$ with $a \leq b$.

Next, by using Lemma 4.1 and Theorem 3.3 with $e_n = 0$, for all $n \in \mathbb{N} \cup \{0\}$, we obtain the following theorem.

**Theorem 4.3.** Let $C$ be a nonempty closed convex subset of a real Hilbert space $H$ and let $A$ be $\alpha$-inverse strongly monotone mapping of $C$ into $H$. Let $S$ be a nonexpansive mapping of $C$ into itself such that $F := F(S) \cap VI(C, A) \neq \emptyset$. Let $P_C$ be a metric projection from $H$ onto $C$. Then the sequence \( \{x_n\} \) generated by

\[
x_0 \in C, \\
y_n = \alpha_n x_0 + (1 - \alpha_n) P_C(x_n - \lambda_n A x_n), \\
z_n = S y_n, \\
H_n = \left\{ z \in C : \|z - z_n\|^2 \leq \|z - x_n\|^2 + \alpha_n \left( \|x_0\|^2 + 2 \langle x_n - x_0, v \rangle \right) \right\}, \\
W_n = \{ z \in C : \langle z - x_n, x_0 - x_n \rangle \leq 0 \}, \\
x_{n+1} = P_{H_n \cap W_n} x_0, \quad n = 0, 1, 2, \ldots
\]

converges strongly to $P_F x_0$ provided that

(i) \( \{\alpha_n\} \subset [0, 1] \) is a sequence such that $\alpha_n \rightarrow 0$ as $n \rightarrow \infty$;

(ii) \( \{\lambda_n\} \subset [a, b] \) for some $a, b \in (0, 2\alpha)$ with $a \leq b$.

**4.2. Common Solutions of a Fixed Point Problem and an Equilibrium Problem**

Let $C$ be a nonempty closed convex subset of $H$ and let $F$ be a bifunction of $C \times C$ into $\mathbb{R}$, where $\mathbb{R}$ is the set of real numbers. The equilibrium problem for $F : C \times C \rightarrow \mathbb{R}$ is to find $x \in C$ such that

\[
F(x, y) \geq 0, \quad \forall y \in C.
\]
The set of solutions of (4.5) is denoted by $EP(F)$. Numerous problems in physics, optimization, and economics reduce to find a solution of (4.5). In 1997, Combettes and Hirstoaga [15] introduced an iterative scheme of finding the best approximation to the initial data when $EP(F)$ is nonempty and proved a strong convergence theorem.

For solving the equilibrium problem for a bifunction $F : C \times C \rightarrow \mathbb{R}$, let us assume that $F$ satisfies the following conditions:

(A1) $F(x, x) = 0$ for all $x \in C$;

(A2) $F$ is monotone, that is, $F(x, y) + F(y, x) \leq 0$ for all $x, y \in C$;

(A3) for each $x, y, z \in C$,

$$
\lim_{t \rightarrow 0} F((tz + (1 - t)x), y) \leq F(x, y);
$$

(A4) for each $x \in C$, $y \mapsto F(x, y)$ is convex and lower semicontinuous.

The following lemma appears implicitly in [15, 28].

**Lemma 4.4** (see [15, 28]). Let $C$ be a nonempty closed convex subset of $H$ and let $F$ be a bifunction of $C \times C$ into $\mathbb{R}$ satisfying (A1)–(A4). Let $r > 0$ and $x \in H$. Then, there exists $z \in C$ such that

$$
F(z, y) + \frac{1}{r}(y - z, z - x) \geq 0, \quad \forall y \in C. \quad (4.7)
$$

Define a mapping $T_r : H \rightarrow C$ as follows:

$$
T_r(x) = \left\{ z \in C : F(z, y) + \frac{1}{r}(y - z, z - x) \geq 0, \quad \forall y \in C \right\} \quad (4.8)
$$

for all $z \in H$. Then, the following holds:

(1) $T_r$ is single-valued;

(2) $T_r$ is firmly nonexpansive, that is, for any $x, y \in H$,

$$
\|T_r x - T_r y\|^2 \leq \langle T_r x - T_r y, x - y \rangle; \quad (4.9)
$$

(3) $F(T_r) = EP(F)$;

(4) $EP(F)$ is closed and convex.

**Lemma 4.5** (see [27]). Let $C$ be a nonempty closed convex subset of a real Hilbert space $H$. Let $f$ be a bifunction from $C \times C$ into $\mathbb{R}$ satisfying (A1)–(A4) and $EP(f) \neq \emptyset$. If $\{r_n\}$ is a sequence in $(0, \infty)$ satisfying $\lim \inf_{n \rightarrow \infty} r_n > 0$, then $\{T_{r_n}\}$ is a family of firmly nonexpansive mappings of $H$ into $C$ and satisfies NST-condition.
The following theorem follows directly from Lemma 4.5 and Theorem 3.1.

**Theorem 4.6.** Let $C$ be a nonempty closed convex subset of a real Hilbert space $H$ and let $f$ be a bifunction from $C \times C$ into $\mathbb{R}$ satisfying (A1)–(A4). Let $S$ be a nonexpansive mapping of $C$ into itself such that $F := F(S) \cap EP(f) \neq \emptyset$. Then the sequence $\{x_n\}$ generated by

\[
x_0 \in C,
\]

\[u_n \in C \text{ such that } f(u_n, y) + \frac{1}{r_n} \langle y - u_n, u_n - x_n \rangle \geq 0, \quad \forall y \in C,
\]

\[y_n = \alpha_n x_n + (1 - \alpha_n) u_n,
\]

\[z_n = S y_n,
\]

\[H_n = \{z \in C : \|z - z_n\| \leq \|z - x_n\|\},
\]

\[W_n = \{z \in C : \langle z - x_n, x_0 - x_n \rangle \leq 0\},
\]

\[x_{n+1} = P_{H_n \cap W_n} x_0, \quad n = 0, 1, 2, \ldots
\] (4.10)

converges strongly to $P_F x_0$ provided that

(i) $\{\alpha_n\} \subset [0, 1]$ with $\alpha_n \leq 1 - \beta$ for some $\beta \in (0, 1)$;

(ii) $\{r_n\} \subset (0, \infty)$ such that $\lim \inf_{n \to \infty} r_n > 0$.

**Proof.** Put $T_n \equiv T_{r_n}$ and $e_n = 0$ for all $n \in \mathbb{N} \cup \{0\}$. Then, it follows from Lemma 4.5 and Theorem 3.1 that $\{x_n\}$ converges strongly to $P_F x_0$. \(\square\)

Next, by using Lemma 4.5 and Theorem 3.3 with $e_n = 0$, for all $n \in \mathbb{N} \cup \{0\}$, we obtain the following result.

**Theorem 4.7.** Let $C$ be a nonempty closed convex subset of a real Hilbert space $H$ and let $f$ be a bifunction from $C \times C$ into $\mathbb{R}$ satisfying (A1)–(A4). Let $S$ be a nonexpansive mapping of $C$ into itself such that $F := F(S) \cap EP(f) \neq \emptyset$. Then the sequence $\{x_n\}$ generated by

\[
x_0 \in C,
\]

\[u_n \in C \text{ such that } f(u_n, y) + \frac{1}{r_n} \langle y - u_n, u_n - x_n \rangle \geq 0, \quad \forall y \in C,
\]

\[y_n = \alpha_n x_n + (1 - \alpha_n) u_n,
\]

\[z_n = S y_n,
\]

\[H_n = \left\{z \in C : \|z - z_n\|^2 \leq \|z - x_n\|^2 + \alpha_n \left(\|x_0\|^2 + 2 \langle x_n - x_0, v \rangle\right)\right\},
\]

\[W_n = \{z \in C : \langle z - x_n, x_0 - x_n \rangle \leq 0\},
\]

\[x_{n+1} = P_{H_n \cap W_n} x_0, \quad n = 0, 1, 2, \ldots
\] (4.11)
converges strongly to $P_{T}x_0$ provided that

(i) $\{a_n\} \subset [0, 1]$ is a sequence such that $a_n \to 0$ as $n \to \infty$;

(ii) $\{r_n\} \subset (0, \infty)$ such that $\lim \inf_{n \to \infty} r_n > 0$.

5. Applications to Maximal Monotone Operators in Banach Space

In this section, we discuss the problem of strong convergence concerning maximal monotone operators in a real uniformly smooth and uniformly convex Banach space.

Let $E$ be a smooth, strictly convex, and reflexive Banach space and let $T \subset E \times E^*$ be a maximal monotone operator. Then for each $r > 0$ and $x \in E$, there corresponds a unique element $x_r \in D(T)$ satisfying

$$J(x) = J(x_r) + rT(x_r);$$  \hspace{1cm} (5.1)

see [23]. We define the \textit{resolvent} of $T$ by $J_rx = x_r$. In other words, $J_r = (J + rT)^{-1}$ for all $r > 0$. We know that $J_r$ is relatively nonexpansive and $T^{-1}0 = F(J_r)$ for all $r > 0$ (see [6, 23]), where $F(J_r)$ denotes the set of all fixed points of $J_r$. We can also define, for each $r > 0$, the \textit{Yosida approximation} of $T$ by $A_r = \lambda^{-1}(J_r^*J_r)$. We know that $(Jrx, A_rx) \in T$ for all $r > 0$.

\textbf{Lemma 5.1.} Let $E$ be a real uniformly smooth and uniformly convex Banach space and let $T : E \to E^*$ be a maximal monotone operator with $F := T^{-1}0 \neq \emptyset$ and $J_r = (J + rT)^{-1}$ for all $r > 0$. Let $\{T_n\}$ be a sequence of relatively nonexpansive mappings of $E$ into itself defined by $T_n = J_{r_n}$ for all $n \in \mathbb{N} \cup \{0\}$, where $\{r_n\}$ is a sequence in $(0, \infty)$ such that $\lim \inf_{n \geq 0} r_n > 0$. Then, $\{T_n\}$ satisfies the NST-condition.

\textit{Proof.} It easy to see that $\bigcap_{n=0}^{\infty} F(T_n) = \bigcap_{n=0}^{\infty} F(J_{r_n}) = T^{-1}0$. Let $\{v_n\}$ be a bounded sequence in $E$ such that $\lim_{n \to \infty} \|v_n - J_{r_n}v_n\| = 0$ and let $v_0 \in \omega_v(v_n)$. Then, there exists a subsequence $\{v_{n_k}\}$ of $\{v_n\}$ such that $v_{n_k} \to v_0$. By the uniform smoothness of $E$, we have $\lim_{n \to \infty} \|v_n - J_{r_n}v_n\| = 0$. Since $\lim \inf_{n \to \infty} r_n > 0$, we have

$$\lim_{n \to \infty} \|A_{r_n}v_n\| = \lim_{n \to \infty} \frac{1}{r_n} \|v_n - J_{r_n}v_n\| = 0.$$  \hspace{1cm} (5.2)

Let $(u, u^*) \in T$. Then it holds from the monotonicity of $T$ that

$$\langle u - J_{r_{n_k}}v_{n_k}, u^* - A_{r_{n_k}}v_{n_k} \rangle \geq 0$$  \hspace{1cm} (5.3)

for all $k \in \mathbb{N}$. Letting $k \to \infty$, we get $\langle u - v_0, u^* \rangle \geq 0$. Then, the maximality of $T$ implies $v_0 \in T^{-1}0 := \bigcap_{n=1}^{\infty} F(J_{r_n}) = \bigcap_{n=0}^{\infty} F(T_n)$. Hence $\omega_v(v_n) \subset \bigcap_{n=0}^{\infty} F(T_n)$. Therefore, $\{T_n\}$ satisfies the NST-condition.

Using Theorem 3.1 and Lemma 5.1, we first obtain the result of [2].

\textbf{Theorem 5.2 (see [2]).} Let $E$ be a real uniformly smooth and uniformly convex Banach space and let $S : E \to E$ be nonexpansive with respect to the Lyapunov functional and weakly sequentially...
continuous. Let \( T : E \to E^* \) be a maximal monotone operator with \( F := T^{-1}0 \cap F(S) \neq \emptyset \) and \( J_r = (J + rT)^{-1}J \) for all \( r > 0 \). Then, sequence \( \{x_n\} \) generated by the following scheme

\[
\begin{align*}
x_0 & \in E, \quad r_0 > 0, \\
y_n & = f_{r_n}(x_n + e_n), \\
z_n & = J^{-1}(\alpha_n f x_n + (1 - \alpha_n)J y_n), \\
u_n & = S_{z_n}, \\
H_n & = \{z \in E : \phi(z, u_n) \leq \phi(z, z_n) \leq \alpha_n \phi(z, x_n) + (1 - \alpha_n)\phi(z, x_n + e_n)\}, \\
W_n & = \{z \in E : \langle z - x_n, J x_n - J x_n \rangle \leq 0\}, \\
x_{n+1} & = P_{H_n \cap W_n} x_n, \quad n = 0, 1, 2, \ldots
\end{align*}
\]

converges strongly to \( P_J x_0 \) provided that

(i) \( \{\alpha_n\} \subset [0, 1] \) with \( \alpha_n \leq 1 - \beta \) for some \( \beta \in (0, 1) \);

(ii) \( \{r_n\} \subset (0, +\infty) \) is a sequence such that \( \liminf_{n \to \infty} r_n > 0 \);

(iii) the error sequence is \( \{e_n\} \subset E \) such that \( \|e_n\| \to 0 \) as \( n \to \infty \).

Proof. Put \( T_n \equiv J_n \) for all \( n \in \mathbb{N} \cup \{0\} \). Hence by using Lemma 5.1 and Theorem 3.1, we obtain the result. \( \square \)

Putting \( S = I \) in Theorem 5.2, we obtain the following corollary.

**Corollary 5.3** (see [22]). Let \( E \) be a real uniformly smooth and uniformly convex Banach space and let \( T : E \to E^* \) be a maximal monotone operator with \( F := T^{-1}0 \cap F(S) \neq \emptyset \) and \( J_r = (J + rT)^{-1}J \) for all \( r > 0 \). Then, sequence \( \{x_n\} \) generated by the following scheme

\[
\begin{align*}
x_0 & \in E, \quad r_0 > 0, \\
y_n & = f_{r_n}(x_n + e_n), \\
z_n & = J^{-1}(\alpha_n f x_n + (1 - \alpha_n)J y_n), \\
u_n & = S_{z_n}, \\
H_n & = \{z \in E : \phi(z, z_n) \leq \alpha_n \phi(z, x_n) + (1 - \alpha_n)\phi(z, x_n + e_n)\}, \\
W_n & = \{z \in E : \langle z - x_n, J x_n - J x_n \rangle \leq 0\}, \\
x_{n+1} & = P_{H_n \cap W_n} x_n, \quad n = 0, 1, 2, \ldots
\end{align*}
\]

converges strongly to \( P_J x_0 \) provided that

(i) \( \{\alpha_n\} \subset [0, 1] \) with \( \alpha_n \leq 1 - \beta \) for some \( \beta \in (0, 1) \);

(ii) \( \{r_n\} \subset (0, +\infty) \) is a sequence such that \( \liminf_{n \to \infty} r_n > 0 \);

(iii) the error sequence is \( \{e_n\} \subset E \) such that \( \|e_n\| \to 0 \) as \( n \to \infty \).

The following theorem follows directly from Lemma 5.1 and Theorem 3.3...
Theorem 5.4 (see [2]). Let $E$ be a real uniformly smooth and uniformly convex Banach space and let $S : E \to E$ be nonexpansive with respect to the Lyapunov functional and weakly sequentially continuous. Let $T : E \to E^*$ be a maximal monotone operator with $F := T^{-1}0 \cap F(S) \neq \emptyset$, and $J_r = (J + rT)^{-1}J$ for all $r > 0$. Then, sequence $\{x_n\}$ generated by the following scheme

$$x_0 \in E, \quad r_0 > 0,$$

$$y_n = f_r(x_n + e_n),$$

$$z_n = J^{-1}(\alpha_n Jx_0 + (1 - \alpha_n)Jy_n),$$

$$u_n = S z_n, \quad (5.6)$$

converges strongly to $P_F x_0$ provided that

(i) $\{\alpha_n\} \subset [0, 1]$ is a sequence such that $\alpha_n \to 0$ as $n \to \infty$;

(ii) $\{r_n\} \subset (0, +\infty)$ is a sequence such that $\liminf_{n \to \infty} r_n > 0$;

(iii) the error sequence is $\{e_n\} \subset E$ such that $\|e_n\| \to 0$ as $n \to \infty$.

Putting $S = I$ in Theorem 5.4, we obtain the following corollary.

Corollary 5.5 (see [22]). Let $E$ be a real uniformly smooth and uniformly convex Banach space, let $C$ be a nonempty closed convex subset of $E$, and let $T : E \to E^*$ be a maximal monotone operator with $F := T^{-1}0 \cap F(S) \neq \emptyset$ and $J_r = (J + rT)^{-1}J$ for all $r > 0$. Then, sequence $\{x_n\}$ generated by the following scheme

$$x_0 \in E, \quad r_0 > 0,$$

$$y_n = f_r(x_n + e_n),$$

$$z_n = J^{-1}(\alpha_n Jx_0 + (1 - \alpha_n)Jy_n),$$

$$H_n = \{z \in E : \phi(z, u_n) \leq \phi(z, z_n) \leq \alpha_n \phi(z, x_0) + (1 - \alpha_n)\phi(z, x_n + e_n)\},$$

$$W_n = \{z \in E : \langle z - x_n, Jx_0 - Jx_n \rangle \leq 0\},$$

$$x_{n+1} = P_{H_n \cap W_n} x_0, \quad n = 0, 1, 2, \ldots \quad (5.7)$$

converges strongly to $P_F x_0$ provided that

(i) $\{\alpha_n\} \subset [0, 1]$ is a sequence such that $\alpha_n \to 0$ as $n \to \infty$;

(ii) $\{r_n\} \subset (0, +\infty)$ is a sequence such that $\liminf_{n \to \infty} r_n > 0$;

(iii) the error sequence is $\{e_n\} \subset E$ such that $\|e_n\| \to 0$ as $n \to \infty$.
