This paper investigates the following $p(x)$ -Laplacian equations with exponential nonlinearities: $-\Delta_{p(x)}u + \rho(x)e^{f(x,u)} = 0$ in Ω , $u(x) \rightarrow +\infty$ as $d(x, \partial\Omega) \rightarrow 0$, where $-\Delta_{p(x)}u = -\operatorname{div}(|\nabla u|^{p(x)-2}\nabla u)$ is called $p(x)$ -Laplacian, $\rho(x) \in C(\Omega)$. The asymptotic behavior of boundary blow-up solutions is discussed, and the existence of boundary blow-up solutions is given.

1. Introduction

The study of differential equations and variational problems with nonstandard $p(x)$ -growth conditions is a new and interesting topic. On the background of this class of problems, we refer to [1–3]. Many results have been obtained on this kind of problems, for example, [4–18]. On the regularity of weak solutions for differential equations with nonstandard $p(x)$ -growth conditions, we refer to [4, 5, 8]. On the existence of solutions for $p(x)$ -Laplacian equation Dirichlet problems in bounded domain, we refer to [7, 9, 15, 18]. In this paper, we consider the following $p(x)$ -Laplacian equations with exponential nonlinearities

$$\begin{aligned} -\Delta_{p(x)}u + \rho(x)e^{f(x,u)} &= 0, \quad \text{in } \Omega, \\ u(x) &\longrightarrow +\infty, \quad \text{as } d(x, \partial\Omega) \longrightarrow 0, \end{aligned} \tag{P}$$

where $-\Delta_{p(x)}u = -\operatorname{div}(|\nabla u|^{p(x)-2}\nabla u)$ and $\Omega = B(0, R) \subset \mathbb{R}^N$ is a bounded radial domain ($B(0, R) = \{x \in \mathbb{R}^N \mid |x| < R\}$). Our aim is to give the asymptotic behavior and the existence of boundary blow-up solutions for problem (P).

Throughout the paper, we assume that $p(x)$, $\rho(x)$, and $f(x, u)$ satisfy the following.

(H₁) $p(x) \in C^1(\overline{\Omega})$ is radial and satisfies

$$1 < p^- \leq p^+ < +\infty, \quad \text{where } p^- = \inf_{\Omega} p(x), \quad p^+ = \sup_{\Omega} p(x). \quad (1.1)$$

(H₂) $f(x, u)$ is radial with respect to x , $f(x, \cdot)$ is increasing, and $f(x, 0) = 0$ for any $x \in \Omega$.

(H₃) $f : \Omega \times \mathbb{R} \rightarrow \mathbb{R}$ is continuous and satisfies

$$|f(x, t)| \leq C_1 + C_2|t|^{\gamma(x)}, \quad \forall (x, t) \in \Omega \times \mathbb{R}, \quad (1.2)$$

where C_1, C_2 are positive constants and $0 \leq \gamma \in C(\overline{\Omega})$.

(H₄) $\rho(x) \in C(\Omega)$ is a radial nonnegative function, and there exists a constant $\sigma \in [R/2, R)$ such that

$$\rho_0(R-r)^{-\beta(r)} \leq \rho(r) \leq \rho_1(R-r)^{-\beta_1(r)} \quad \text{for } r \in [\sigma, R) \text{ uniformly,} \quad (1.3)$$

where ρ_0 and ρ_1 are positive constants and $\beta(r)$ and $\beta_1(r)$ are Lipschitz continuous on $[\sigma, R]$, which satisfy $\beta(r) \leq \beta_1(r) < p(r)$ for any $r \in [\sigma, R]$.

The operator $-\Delta_{p(x)}u = -\operatorname{div}(|\nabla u|^{p(x)-2}\nabla u)$ is called $p(x)$ -Laplacian. Specifically, if $p(x) \equiv p$ (a constant), (P) is the well-known p -Laplacian problem. If $f(x, u)$ can be represented as $h(x)f(u)$, on the boundary blow-up solutions for the following p -Laplacian equations (p is a constant):

$$-\Delta_p u + h(x)f(u) = 0, \quad \text{in } \Omega, \quad (1.4)$$

we refer to [19–26], and the following generalized Keller-Osserman condition is crucial

$$\int_1^\infty \frac{1}{(F(t))^{1/p}} dt < +\infty, \quad \text{where } F(t) = \int_0^t f(s) ds, \quad (1.5)$$

but the typical form of $p(x)$ -Laplacian equation is

$$-\Delta_{p(x)}u + |u|^{q(x)-2}u = 0, \quad \text{in } \Omega, \quad (1.6)$$

and there are some differences between the results of (1.4) and (1.6) (see [16]).

On the boundary blow-up solutions for the following p -Laplacian equations with exponential nonlinearities (p is a constant):

$$-\Delta_p u + e^{h(x)f(u)} = 0, \quad \text{in } \Omega, \quad (1.7)$$

we refer to [20–22], but the results on the boundary blow-up solutions for $p(x)$ -Laplacian equations are rare (see [16]).

In [16], the present author discussed the existence and asymptotic behavior of boundary blow-up solutions for the following $p(x)$ -Laplacian equations:

$$\begin{aligned} -\Delta_{p(x)} u + f(x, u) &= 0, \quad \text{in } \Omega, \\ u(x) &\longrightarrow +\infty, \quad \text{as } d(x, \partial\Omega) \longrightarrow 0, \end{aligned} \quad (1.8)$$

on the condition that $f(x, \cdot)$ satisfies polynomial growth condition.

If $p(x)$ is a function, the typical form of (P) is the following:

$$-\Delta_{p(x)} u + \rho(x) e^{|u|^{q(x)-2} u} = 0, \quad (1.9)$$

and the method to construct subsolution and supersolution in [16] cannot give the exact asymptotic behavior of solutions for (P). Our results partially generalized the results of [20–22].

Because of the nonhomogeneity of $p(x)$ -Laplacian, $p(x)$ -Laplacian problems are more complicated than those of p -Laplacian ones (see [10]); another difficulty of this paper is that $f(x, u)$ cannot be represented as $h(x)f(u)$.

2. Preliminary

In order to deal with $p(x)$ -Laplacian problems, we need some theories on the spaces $L^{p(x)}(\Omega)$, $W^{1,p(x)}(\Omega)$ and properties of $p(x)$ -Laplacian, which we will use later (see [6, 11]). Let

$$L^{p(x)}(\Omega) = \left\{ u \mid u \text{ is a measurable real-valued function, } \int_{\Omega} |u(x)|^{p(x)} dx < \infty \right\}. \quad (2.1)$$

We can introduce the norm on $L^{p(x)}(\Omega)$ by

$$|u|_{p(x)} = \inf \left\{ \lambda > 0 \mid \int_{\Omega} \left| \frac{u(x)}{\lambda} \right|^{p(x)} dx \leq 1 \right\}. \quad (2.2)$$

The space $(L^{p(x)}(\Omega), |\cdot|_{p(x)})$ becomes a Banach space. We call it generalized Lebesgue space. The space $(L^{p(x)}(\Omega), |\cdot|_{p(x)})$ is a separable, reflexive, and uniform convex Banach space (see [6, Theorems 1.10, 1.14]).

The space $W^{1,p(x)}(\Omega)$ is defined by

$$W^{1,p(x)}(\Omega) = \left\{ u \in L^{p(x)}(\Omega) \mid |\nabla u| \in L^{p(x)}(\Omega) \right\}, \quad (2.3)$$

and it can be equipped with the norm

$$\|u\| = |u|_{p(x)} + |\nabla u|_{p(x)}, \quad \forall u \in W^{1,p(x)}(\Omega). \quad (2.4)$$

$W_0^{1,p(x)}(\Omega)$ is the closure of $C_0^\infty(\Omega)$ in $W^{1,p(x)}(\Omega)$. $W^{1,p(x)}(\Omega)$ and $W_0^{1,p(x)}(\Omega)$ are separable, reflexive, and uniform convex Banach spaces (see [6, Theorem 2.1]).

If $u \in W_{\text{loc}}^{1,p(x)}(\Omega) \cap C(\Omega)$, u is called a blow-up solution of (P) when it satisfies

$$\int_Q |\nabla u|^{p(x)-2} \nabla u \nabla q \, dx + \int_Q \rho(x) f(x, u) q \, dx = 0, \quad \forall q \in W_0^{1,p(x)}(Q), \quad (2.5)$$

for any domain $Q \Subset \Omega$, and $\max(k - u, 0) \in W_0^{1,p(x)}(\Omega)$ for every positive integer k .

Let $W_{0,\text{loc}}^{1,p(x)}(\Omega) = \{u \mid \text{there is an open domain } Q \Subset \Omega \text{ such that } u \in W_0^{1,p(x)}(Q)\}$, and define $A : W_{\text{loc}}^{1,p(x)}(\Omega) \cap C(\Omega) \rightarrow (W_{0,\text{loc}}^{1,p(x)}(\Omega))^*$ as

$$\langle Au, \varphi \rangle = \int_\Omega \left(|\nabla u|^{p(x)-2} \nabla u \nabla \varphi + \rho(x) e^{f(x,u)} \varphi \right) dx, \quad \forall u \in W_{\text{loc}}^{1,p(x)}(\Omega) \cap C(\Omega), \quad \forall \varphi \in W_{0,\text{loc}}^{1,p(x)}(\Omega). \quad (2.6)$$

Lemma 2.1 (see [9, Theorem 3.1]). *Let $h \in W^{1,p(x)}(\Omega) \cap C(\Omega)$, and $X = h + W_0^{1,p(x)}(\Omega) \cap C(\Omega)$. Then, $A : X \rightarrow (W_{0,\text{loc}}^{1,p(x)}(\Omega))^*$ is strictly monotone.*

Letting $g \in (W_{0,\text{loc}}^{1,p(x)}(\Omega))^*$, if $\langle g, \varphi \rangle \geq 0$, for all $\varphi \in W_{0,\text{loc}}^{1,p(x)}(\Omega)$ with $\varphi \geq 0$ a.e. in Ω , then denote $g \geq 0$ in $(W_{0,\text{loc}}^{1,p(x)}(\Omega))^*$; correspondingly, if $-g \geq 0$ in $(W_{0,\text{loc}}^{1,p(x)}(\Omega))^*$, then denote $g \leq 0$ in $(W_{0,\text{loc}}^{1,p(x)}(\Omega))^*$.

Definition 2.2. Let $u \in W_{\text{loc}}^{1,p(x)}(\Omega) \cap C(\Omega)$. If $Au \geq 0$ ($Au \leq 0$) in $(W_{0,\text{loc}}^{1,p(x)}(\Omega))^*$, then u is called a weak supersolution (weak subsolution) of (P).

Copying the proof of [14], we have the following.

Lemma 2.3 (comparison principle). *Let $u, v \in W_{\text{loc}}^{1,p(x)}(\Omega) \cap C(\Omega)$ satisfy*

$$Au - Av \geq 0, \quad \text{in } (W_0^{1,p(x)}(\Omega))^*. \quad (2.7)$$

Let $\varphi(x) = \min\{u(x) - v(x), 0\}$. If $\varphi(x) \in W_0^{1,p(x)}(\Omega)$ (i.e., $u \geq v$ on $\partial\Omega$), then $u \geq v$ a.e. in Ω .

Lemma 2.4 (see [8, Theorem 1.1]). *Under the conditions (H_1) and (H_3) , if $u \in W^{1,p(x)}(\Omega)$ is a bounded weak solution of $-\Delta_{p(x)} u + \rho(x) e^{f(x,u)} = 0$ in Ω , then $u \in C_{\text{loc}}^{1,\vartheta}(\Omega)$, where $\vartheta \in (0, 1)$ is a constant.*

3. Asymptotic Behavior of Boundary Blow-Up Solutions

If u is a radial solution for (P), then (P) can be transformed into

$$\begin{aligned} \left(r^{N-1} |u'|^{p(r)-2} u' \right)' &= r^{N-1} \rho(r) e^{f(r,u)}, \quad r \in (0, R), \\ u(0) &= u_0, \quad u'(0) = 0, \quad u'(r) \geq 0, \quad \text{for } 0 < r < R. \end{aligned} \quad (3.1)$$

It means that $u(r)$ is increasing.

Theorem 3.1. *If $f(r, u)$ satisfies*

$$f(r, u) \geq \alpha u^s \quad (\text{as } u \rightarrow +\infty) \text{ for } r \in [\sigma, R) \text{ uniformly,} \quad (3.2)$$

where σ is defined in (H_4) and α and s are positive constants, then there exists a supersolution $\Phi_1(x)$ which satisfies $\Phi_1(x) \rightarrow +\infty$ (as $d(x, \partial\Omega) \rightarrow 0$), such that for every solution u of problem (P), one has $u(x) \leq \Phi_1(x)$.

Proof. Define the function $g(r, a, \lambda)$ on $[0, R_\lambda)$ as

$$g(r, a, \lambda) = \begin{cases} \left(a \ln \frac{1}{(R-r)^{1-\theta} - \lambda} \right)^{1/s} + k, & R_0 \leq r < R_\lambda, \\ k - \int_r^{R_0} \left[\frac{a^{1/s}(1-\theta)(R-R_0)^{-\theta}}{s((R-R_0)^{1-\theta} - \lambda)} \left(\ln \frac{1}{(R-R_0)^{1-\theta} - \lambda} \right)^{(1/s)-1} \right]^{(p(R_0)-1)/(p(t)-1)} \\ \quad \times \left[\frac{(R_0)^{N-1}}{t^{N-1}} \sin \varepsilon(t - \sigma) \right]^{1/(p(t)-1)} dt \\ \quad + \left(a \ln \frac{1}{(R-R_0)^{1-\theta} - \lambda} \right)^{1/s}, & \sigma < r < R_0, \\ k - \int_\sigma^{R_0} \left[\frac{a^{1/s}(1-\theta)(R-R_0)^{-\theta}}{s((R-R_0)^{1-\theta} - \lambda)} \left(\ln \frac{1}{(R-R_0)^{1-\theta} - \lambda} \right)^{(1/s)-1} \right]^{(p(R_0)-1)/(p(t)-1)} \\ \quad \times \left[\frac{(R_0)^{N-1}}{t^{N-1}} \sin \varepsilon(t - \sigma) \right]^{1/(p(t)-1)} dt \\ \quad + \left(a \ln \frac{1}{(R-R_0)^{1-\theta} - \lambda} \right)^{1/s}, & r \leq \sigma, \end{cases} \quad (3.3)$$

where $\theta < \beta(R)/p(R)$, $a > (1/\alpha)\sup_{|x|\geq R_0} p(x)$ are constants, $R_0 \in (\sigma, R)$, $R - R_0$ is small enough, parameter $\lambda \in [0, (R - R_0)^{1-\theta}/2]$, R_λ satisfies $(R - R_\lambda)^{1-\theta} - \lambda = 0$, $\varepsilon = \pi/2(R_0 - \sigma)$

$$\begin{aligned} k = & \left[\frac{2p^+((1+s)/s + 1/(1-\theta)) + |\beta|^+/(1-\theta)}{\alpha} \ln \frac{2}{(R - R_0)^{(1-\theta)}} \right]^{1/s} \\ & + \int_{\sigma}^{R_0} \left[\frac{2a^{1/s}(1-\theta)}{s(R - R_0)} \left(\ln \frac{2}{(R - R_0)^{1-\theta}} \right)^{(1/s)-1} \right]^{(p(R_0)-1)/(p(t)-1)} \\ & \times \left[\frac{(R_0)^{N-1}}{t^{N-1}} \sin \varepsilon(t - \sigma) \right]^{1/(p(t)-1)} dt. \end{aligned} \quad (3.4)$$

Obviously, for any positive constant a , we have $g(r, a, \lambda) \in C^1[0, R_\lambda]$.

When $R_0 < r < R_\lambda < R$, we have

$$\begin{aligned} g' = g'(r, a, \lambda) &= \frac{a^{1/s}}{s} \left(\ln \frac{1}{(R-r)^{1-\theta} - \lambda} \right)^{(1/s)-1} \frac{(1-\theta)(R-r)^{-\theta}}{(R-r)^{1-\theta} - \lambda}, \\ |g'|^{p(r)-2} g' &= \left[\frac{(1-\theta)a^{1/s}}{s} \right]^{p(r)-1} \left(\ln \frac{1}{(R-r)^{1-\theta} - \lambda} \right)^{((1/s)-1)(p(r)-1)} \frac{(R-r)^{-\theta(p(r)-1)}}{\left[(R-r)^{1-\theta} - \lambda \right]^{p(r)-1}}, \\ \left(r^{N-1} |g'|^{p(r)-2} g' \right)' &= r^{N-1} \left[\frac{(1-\theta)a^{1/s}}{s} \right]^{p(r)-1} \left(\ln \frac{1}{(R-r)^{1-\theta} - \lambda} \right)^{((1/s)-1)(p(r)-1)} \\ &\quad \times \frac{(p(r)-1)(R-r)^{-\theta p(r)}}{\left[(R-r)^{1-\theta} - \lambda \right]^{p(r)}} [(1-\theta) + \Pi(r)], \end{aligned} \quad (3.5)$$

where

$$\begin{aligned} \Pi(r) = & \frac{\left\{ r^{N-1} [(1-\theta)a^{1/s}/s]^{p(r)-1} \right\}'}{(p(r)-1)r^{N-1} [(1-\theta)a^{1/s}/s]^{p(r)-1}} \frac{(R-r)^{1-\theta} - \lambda}{(R-r)^{1-\theta}} (R-r) + \frac{((1/s)-1)(1-\theta)}{\left(\ln \left(1 / \left((R-r)^{1-\theta} - \lambda \right) \right) \right)} \\ & + \frac{(R-r)^{1-\theta} - \lambda}{(R-r)^{1-\theta}} (R-r) \frac{((1/s)-1)p'(r)}{(p(r)-1)} \ln \left[\ln \frac{1}{(R-r)^{1-\theta} - \lambda} \right] \\ & + \frac{\theta p'(r)}{(p(r)-1)} \frac{(R-r)^{1-\theta} - \lambda}{(R-r)^{1-\theta}} (R-r) \ln \frac{1}{(R-r)} \\ & + \theta \frac{(R-r)^{1-\theta} - \lambda}{(R-r)^{1-\theta}} + \frac{-p'(r)}{p(r)-1} (R-r) \frac{(R-r)^{1-\theta} - \lambda}{(R-r)^{1-\theta}} \ln \left[(R-r)^{1-\theta} - \lambda \right]. \end{aligned} \quad (3.6)$$

If $(R - R_0)$ is small enough, it is easy to see that

$$|\Pi(r)| \leq \ln \frac{1}{(R-r)^{1-\theta} - \lambda}, \quad \text{for } \lambda \in \left[0, \frac{(R-R_0)^{1-\theta}}{2}\right] \text{ uniformly,} \quad (3.7)$$

and then

$$\begin{aligned} \left(r^{N-1} |g'|^{p(r)-2} g'\right)' &\leq r^{N-1} \left[\frac{(1-\theta)a^{1/s}}{s} \right]^{p(r)-1} \left(\ln \frac{1}{(R-r)^{1-\theta} - \lambda} \right)^{((1/s)-1)(p(r)-1)+1} \\ &\quad \times \frac{(p(r)-1)(R-r)^{-\theta p(r)}}{\left[(R-r)^{1-\theta} - \lambda\right]^{p(r)}}, \quad \forall r \in (R_0, R_\lambda). \end{aligned} \quad (3.8)$$

Thus, when $0 < R - R_0$ is small enough, from (3.5) and (3.8), for $\lambda \in [0, (R - R_0)^{1-\theta}/2]$ uniformly, we have

$$\begin{aligned} &\left(r^{N-1} |g'|^{p(r)-2} g'\right)' \\ &\leq 2r^{N-1} \left[\frac{(1-\theta)a^{1/s}}{s} \right]^{p(r)-1} \left(\ln \frac{1}{(R-r)^{1-\theta} - \lambda} \right)^{((1/s)-1)(p(r)-1)+1} \frac{(p(r)-1)(R-r)^{-\theta p(r)}}{\left[(R-r)^{1-\theta} - \lambda\right]^{p(r)}} \\ &\leq r^{N-1} \rho(r) \left(\frac{1}{(R-r)^{1-\theta} - \lambda} \right)^{\alpha a} = r^{N-1} \rho(r) e^{\alpha g^s} \leq r^{N-1} \rho(r) e^{f(r,g)}, \quad \forall r \in (R_0, R_\lambda). \end{aligned} \quad (3.9)$$

Thus, when $0 < R - R_0$ is small enough, the following inequality is valid for $\lambda \in [0, (R - R_0)^{1-\theta}/2]$ uniformly:

$$\left(r^{N-1} |g'|^{p(r)-2} g'\right)' \leq r^{N-1} \rho(r) f(r, g), \quad \forall r \in (R_0, R_\lambda). \quad (3.10)$$

Obviously, if $R - R_0$ is small enough, then $g \geq [(2p^+((s+1)/s + 1/(1-\theta)) + |\beta|^+/(1-\theta))/\alpha] \ln(2/(R - R_0)^{1-\theta})]^{1/s}$ is large enough. Since $\lambda \in [0, (R - R_0)^{1-\theta}/2]$,

$$\begin{aligned}
& \left(r^{N-1} |g'|^{p(r)-2} g' \right)' \\
&= \varepsilon(R_0)^{N-1} \left[\frac{a^{1/s}(1-\theta)(R-R_0)^{-\theta}}{s((R-R_0)^{1-\theta} - \lambda)} \left(\ln \frac{1}{(R-R_0)^{1-\theta} - \lambda} \right)^{(1/s)-1} \right]^{(p(R_0)-1)} \cos(\varepsilon(r-\sigma)) \\
&\leq \varepsilon(R_0)^{N-1} \left[\frac{a^{1/s}(1-\theta)(R-R_0)^{-\theta}}{s(1/2)(R-R_0)^{1-\theta}} \left(\ln \frac{2}{(R-R_0)^{1-\theta}} \right)^{(1/s)+1} \right]^{(p(R_0)-1)} \\
&\leq \varepsilon(R_0)^{N-1} \left[\frac{2a^{1/s}(1-\theta)}{s(R-R_0)} \left(\frac{2}{(R-R_0)^{1-\theta}} \right)^{(1/s)+1} \right]^{(p(R_0)-1)} \\
&\leq \varepsilon(R_0)^{N-1} \left[\frac{2a^{1/s}(1-\theta)}{s} \left(\frac{2}{R-R_0} \right)^{((s+1)/s)(1-\theta)+1} \right]^{p^+} \\
&\leq r^{N-1} \rho(r) e^{\alpha g^s} \leq r^{N-1} \rho(r) e^{f(r,g)}, \quad \sigma < r < R_0.
\end{aligned} \tag{3.11}$$

Thus,

$$\left(r^{N-1} |g'|^{p(r)-2} g' \right)' \leq r^{N-1} \rho(r) e^{f(r,g)}, \quad \sigma < r < R_0. \tag{3.12}$$

Obviously,

$$\left(r^{N-1} |g'|^{p(r)-2} g' \right)' = 0 \leq r^{N-1} \rho(r) e^{f(r,g)}, \quad 0 \leq r < \sigma. \tag{3.13}$$

Since $g(x, a, \lambda) = g(|x|, a, \lambda)$ is a C^1 function on $B(0, R_\lambda)$, if $0 < R - R_0$ is small enough (R_0 depends on R, p, s, α), from (3.10), (3.12), and (3.13), for any $\lambda \in [0, (R - R_0)^{1-\theta}/2]$, we can see that $g(|x|, a, \lambda)$ is a supersolution for (P) on $B(0, R_\lambda)$, and then $g(|x|, a, 0)$ is a supersolution for (P).

Defining the function $g_m(|x|, a - \epsilon) = g(r, a - \epsilon, 1/m)$ on $[0, R_{1/m})$, where $a - \epsilon > (1/\alpha) \sup_{|x| \geq R_0} p(x)$, then $g_m(|x|, a - \epsilon)$ is a supersolution for (P) on $B(0, R - (1/m))$. If u is a solution for (P), according to the comparison principle, we get that $g_m(|x|, a - \epsilon) \geq u(x)$ for any $x \in B(0, R_{1/m})$. For any $x \in B(0, R) \setminus B(0, R_0)$, we have $g_m(|x|, a - \epsilon) \geq g_{m+1}(|x|, a - \epsilon)$, when m is large enough. Thus

$$u(x) \leq \lim_{m \rightarrow +\infty} g_m(|x|, a - \epsilon), \quad \forall x \in B(0, R) \setminus B(0, R_0). \tag{3.14}$$

When $d(x, \partial\Omega) > 0$ is small enough, we have

$$\lim_{m \rightarrow +\infty} g_m(|x|, a - \epsilon) < \left(a \ln \frac{1}{(R-r)^{1-\theta}} \right)^{1/s} + k \leq g(|x|, a, 0). \quad (3.15)$$

According to the comparison principle, we get that $g(|x|, a, 0) \geq u(x)$, for all $x \in B(0, R)$; then $\Phi_1(x) = \Phi_1(|x|) = g(|x|, a, 0)$ is a radial upper control function of all of the solutions for (P), and $\Phi_1(x) = \Phi_1(|x|)$ is a radial supersolution for (P). The proof is completed. $\square$

Theorem 3.2. *If $f(r, u)$ satisfies*

$$\begin{aligned} f(r, u) &\longrightarrow -\infty \quad (\text{as } u \longrightarrow -\infty) \text{ for } r \in [\sigma, R] \text{ uniformly,} \\ f(r, u) &\leq \delta u^s \quad (\text{as } u \longrightarrow +\infty) \text{ for } r \in [\sigma, R] \text{ uniformly,} \end{aligned} \quad (3.16)$$

where σ is defined in (H_4) and δ and s are positive constants, then there exists a subsolution $\Phi_2(x)$ which satisfies $\Phi_2(x) \rightarrow +\infty$ (as $d(x, \partial\Omega) \rightarrow 0$), such that for every solution $u(x)$ for problem (P), one has $u(x) \geq \Phi_2(x)$.

Proof. We will prove this theorem in the following two cases.

(i) $\beta_1(R) > 0$.

(ii) $\beta_1(R) \leq 0$.

Case 1 ($\beta_1(R) > 0$). Let z_1 be a radial solution of

$$-\Delta_{p(x)} z_1(x) = -\mu, \quad \text{in } \Omega_1 = B(0, \sigma), \quad z_1 = 0, \quad \text{on } \partial\Omega_1, \quad (3.17)$$

where $\mu > 2(\max_{r \in [0, R_0]} \rho(r) + 1)^{2(p^+-1)/(p^--1)}$ is a positive constant. We denote $z_1 = z_1(r) = z_1(|x|)$. Then, z_1 satisfies

$$\begin{aligned} -\left(r^{N-1} |z_1'|^{p(r)-2} z_1'\right)' &= -r^{N-1} \mu, \quad z_1(\sigma) = 0, \quad z_1'(0) = 0, \\ z_1' &= \left|\frac{r\mu}{N}\right|^{1/(p(r)-1)}, \quad z_1 = -\int_r^\sigma \left|\frac{r\mu}{N}\right|^{1/(p(r)-1)} dr. \end{aligned} \quad (3.18)$$

Denote $h_b(r, \lambda)$ on $[\sigma, R_0]$ as

$$\begin{aligned} h_b(r, \lambda) &= \int_r^{R_0} \left\{ \frac{(R_0)^{N-1}}{t^{N-1}} \frac{t - \sigma}{R_0 - \sigma} \left[\frac{b(1-\theta)(R-R_0)^{-\theta}}{s((R-R_0)^{1-\theta} + \lambda)} \left(b \ln \frac{1}{(R-R_0)^{1-\theta} + \lambda} \right)^{(1/s)-1} \right]^{p(R_0)-1} \right. \\ &\quad \left. + \frac{(\sigma)^{N-1}}{t^{N-1}} \frac{R_0 - t}{R_0 - \sigma} \left| \frac{\sigma\mu}{N} \right| \right\}^{1/(p(t)-1)} dt. \end{aligned} \quad (3.19)$$

It is easy to see that

$$\begin{aligned} -h'_b(\sigma, \lambda) &= z'_1(\sigma) = \left| \frac{\sigma\mu}{N} \right|^{1/(p(\sigma)-1)}, \\ -h'_b(R_0, \lambda) &= \frac{b(1-\theta)(R-R_0)^{-\theta}}{s((R-R_0)^{1-\theta} + \lambda)} \left(b \ln \frac{1}{(R-R_0)^{1-\theta} + \lambda} \right)^{(1/s)-1}. \end{aligned} \quad (3.20)$$

Define the function $v(r, b, \lambda)$ on $[0, R]$ as

$$v(r, b, \lambda) = \begin{cases} \left(b \ln \frac{1}{(R-r)^{1-\theta} + \lambda} \right)^{1/s} - k^*, & R_0 \leq r < R, \\ \left(b \ln \frac{1}{(R-R_0)^{1-\theta} + \lambda} \right)^{1/s} - k^* - h_b(r, \lambda), & \sigma < r < R_0, \\ -\int_r^\sigma \left| \frac{r\mu}{N} \right|^{1/(p(r)-1)} dr + \left(b \ln \frac{1}{(R-R_0)^{1-\theta} + \lambda} \right)^{1/s} - k^* - h_b(\sigma, \lambda), & r \leq \sigma, \end{cases} \quad (3.21)$$

where $\theta \in (\beta_1(R)/p(R), 1)$, $b \in (0, (1/\delta)\inf_{|x| \geq R_0} p(x))$ are constants, $R_0 \in (\sigma, R)$, $R-R_0$ is small enough, parameter $\lambda \in [0, (R-R_0)^{1-\theta}/2]$, and

$$k^* = M + \left(b \ln \frac{1}{(R-R_0)^{1-\theta}} \right)^{1/s}, \quad (3.22)$$

where M satisfies

$$(\sigma)^{N-1} \frac{1}{R_0 - \sigma} \geq r^{N-1} \rho(r) e^{f(r, y)}, \quad \forall y \leq -M, \quad \forall r \in [0, R_0]. \quad (3.23)$$

Obviously, for any positive constant b , $v(r, b, \lambda) \in C^1[0, R]$.

By computation, when $r \in (R_0, R)$, we have

$$\begin{aligned} v' &= v'(r, b, \lambda) = \frac{b^{1/s}}{s} \left(\ln \frac{1}{(R-r)^{1-\theta} + \lambda} \right)^{1/s-1} \frac{(1-\theta)(R-r)^{-\theta}}{(R-r)^{1-\theta} + \lambda}, \\ |v'|^{p(r)-2} v' &= \left[\frac{(1-\theta)b^{1/s}}{s} \right]^{p(r)-1} \left(\ln \frac{1}{(R-r)^{1-\theta} + \lambda} \right)^{(1/s-1)(p(r)-1)} \frac{(R-r)^{-\theta(p(r)-1)}}{[(R-r)^{1-\theta} + \lambda]^{p(r)-1}}, \end{aligned}$$

$$\begin{aligned}
\left(r^{N-1}|v'|^{p(r)-2}v'\right)' &= r^{N-1} \left[\frac{(1-\theta)b^{1/s}}{s} \right]^{p(r)-1} \left(\ln \frac{1}{(R-r)^{1-\theta} + \lambda} \right)^{(1/s-1)(p(r)-1)} \\
&\quad \times \frac{(p(r)-1)(R-r)^{-\theta(p(r)-1)-1}}{\left[(R-r)^{1-\theta} + \lambda\right]^{p(r)-1}} (\theta + \Lambda(r)),
\end{aligned} \tag{3.24}$$

where

$$\begin{aligned}
\Lambda(r) &= \frac{\left\{ r^{N-1} [(1-\theta)b^{1/s}/s]^{p(r)-1} \right\}'}{(p(r)-1)r^{N-1} [(1-\theta)b^{1/s}/s]^{p(r)-1}} (R-r) + \frac{(1/s-1)(1-\theta)}{\left(\ln \left(1 / \left((R-r)^{1-\theta} + \lambda \right) \right) \right) \left[(R-r)^{1-\theta} + \lambda \right]} \\
&\quad \times (R-r)^{1-\theta} + \frac{(1/s-1)p'(r)}{(p(r)-1)} (R-r) \ln \left[\ln \frac{1}{(R-r)^{1-\theta} + \lambda} \right] + \frac{\theta p'(r)}{(p(r)-1)} (R-r) \ln \frac{1}{(R-r)} \\
&\quad + \frac{(1-\theta)}{\left[(R-r)^{1-\theta} + \lambda \right]} (R-r)^{1-\theta} + \frac{-p'(r)}{p(r)-1} (R-r) \ln \left[(R-r)^{1-\theta} + \lambda \right].
\end{aligned} \tag{3.25}$$

By computation, when $R - R_0$ is small enough, for $\lambda \in [0, (R - R_0)^{1-\theta}/2]$ uniformly, we have

$$\begin{aligned}
&\left(r^{N-1}|v'|^{p(r)-2}v'\right)' \\
&\geq r^{N-1} \left[\frac{(1-\theta)b^{1/s}}{s} \right]^{p(r)-1} \left(\ln \frac{1}{(R-r)^{1-\theta} + \lambda} \right)^{(1/s-1)(p(r)-1)} \\
&\quad \times \frac{(p(r)-1)(R-r)^{-\theta(p(r)-1)-1}}{\left[(R-r)^{1-\theta} + \lambda\right]^{p(r)-1}} \theta \left(1 - \frac{1}{2} \right) \\
&\geq \frac{\theta}{2} r^{N-1} \left[\frac{(1-\theta)b^{1/s}}{s} \right]^{p(r)-1} \left(\ln \frac{1}{(R-r)^{1-\theta} + \lambda} \right)^{(1/s-1)(p(r)-1)} \\
&\quad \times \frac{(p(r)-1)(R-r)^{-\theta(p(r)-1)-1}}{\left[(R-r)^{1-\theta} + \lambda\right]^{p(r)-1}} (R-r)^{1-\theta} \\
&\geq \frac{\theta}{2} r^{N-1} \left[\frac{(1-\theta)b^{1/s}}{s} \right]^{p(r)-1} \left(\ln \frac{1}{(R-r)^{1-\theta} + \lambda} \right)^{(1/s-1)(p(r)-1)} \frac{(p(r)-1)(R-r)^{-\theta p(r)}}{\left[(R-r)^{1-\theta} + \lambda\right]^{p(r)}} \\
&\geq r^{N-1} \rho_1 (R-r)^{-\beta_1(r)} e^{\delta v^s} \\
&\geq r^{N-1} \rho(r) e^{f(r,v)}, \quad \forall r \in (R_0, R).
\end{aligned} \tag{3.26}$$

Then, for $\lambda \in [0, (R - R_0)^{1-\theta}/2]$ uniformly, we have

$$\left(r^{N-1}|v'|^{p(r)-2}v'\right)' \geq r^{N-1}\rho(r)e^{f(r,v)}, \quad \forall r \in (R_0, R). \quad (3.27)$$

When $R - R_0$ is small enough, for all $r \in (\sigma, R_0)$, since $v \leq -M$, it is easy to see that

$$\begin{aligned} \left(r^{N-1}|v'|^{p(r)-2}v'\right)' &\geq \left(r^{N-1}|h'|^{p(r)-2}h'\right)' \\ &= (R_0)^{N-1} \frac{1}{R_0 - \sigma} \left[\frac{b(1-\theta)(R-R_0)^{-\theta}}{s((R-R_0)^{1-\theta} + \lambda)} \left(b \ln \frac{1}{(R-R_0)^{1-\theta} + \lambda} \right)^{1/s-1} \right]^{p(R_0)-1} \\ &\quad - (\sigma)^{N-1} \frac{1}{R_0 - \sigma} \left| \frac{\sigma\mu}{N} \right| \\ &\geq (\sigma)^{N-1} \frac{1}{R_0 - \sigma} \\ &\geq r^{N-1}\rho(r)e^{f(r,v)}, \end{aligned} \quad (3.28)$$

Then,

$$\left(r^{N-1}|v'|^{p(r)-2}v'\right)' \geq r^{N-1}\rho(r)e^{f(r,v)}, \quad \forall r \in (\sigma, R_0). \quad (3.29)$$

Obviously,

$$\left(r^{N-1}|v'|^{p(r)-2}v'\right)' = r^{N-1}\mu \geq r^{N-1}\rho(r)e^{f(r,v)}, \quad \forall r \in (0, \sigma). \quad (3.30)$$

Combining (3.27), (3.29), and (3.30), when $R - R_0$ is large enough, for any $\lambda \in [0, (R - R_0)^{1-\theta}/2]$, one can see that $v(r, a, \lambda)$ is a subsolution for (P).

Define the function $v_m(r, b + \epsilon)$ on $B(0, R)$ as

$$v_m(r, b + \epsilon) = v_m\left(r, b + \epsilon, \frac{1}{m}\right), \quad (3.31)$$

where ϵ is a small enough positive constant such that $(b + \epsilon) < (1/\delta)\inf_{|x| \geq R_0} p(x)$.

For any $m = 1, 2, \dots$, we can see that $v_m(r, b + \epsilon) \in C^1([0, R])$ is a subsolution for (P) on $B(R_0, R)$. According to the comparison principle, we get that $v_m(r, b + \epsilon) \leq u(x)$ for any $x \in B(0, R)$. For any $x \in B(0, R) \setminus B(0, R_0)$, we have $v_m(|x|, b + \epsilon) \leq v_{m+1}(|x|, b + \epsilon)$. Thus

$$u(x) \geq \lim_{m \rightarrow +\infty} v_m(|x|, b + \epsilon), \quad \forall x \in B(0, R) \setminus B(0, R_0). \quad (3.32)$$

When $d(x, \partial\Omega)$ is small enough, we have $\lim_{m \rightarrow +\infty} v_m(|x|, b + \epsilon) > v(|x|, b, 0)$.

According to the comparison principle, we get that $v(|x|, b, 0) \leq u(x)$, $\forall x \in B(0, R)$; then $\Phi_2(x) = \Phi_2(|x|) = v(|x|, b, 0)$ is a radial lower control function of all of the solutions for (P), and $\Phi_2(x)$ is a radial subsolution for (P).

Case 2 ($\beta_1(R) \leq 0$). Let $\mu > 2(\max_{r \in [0, R_0]} \rho(r) + 1)^{2(p^+-1)/(p^--1)}$ be a positive constant. Denote $\varpi_b(r, \lambda)$ on $[\sigma, R_0]$ as

$$\begin{aligned} \varpi_b(r, \lambda) = \int_r^{R_0} \left\{ \frac{(R_0)^{N-1}}{t^{N-1}} \frac{t - \sigma}{R_0 - \sigma} \left[\frac{b}{s(R + \lambda - R_0)} \left(b \ln(R + \lambda - R_0)^{-1} \right)^{1/s-1} \right]^{p(R_0)-1} \right. \\ \left. + \frac{(\sigma)^{N-1}}{t^{N-1}} \frac{R_0 - t}{R_0 - \sigma} \left| \frac{\sigma \mu}{N} \right| \right\}^{1/(p(t)-1)} dt. \end{aligned} \quad (3.33)$$

It is easy to see that

$$-\varpi'_b(\sigma, \lambda) = z'_1(\sigma) = \left| \frac{\sigma \mu}{N} \right|^{1/(p(\sigma)-1)}, \quad -\varpi'_b(R_0, \lambda) = \frac{b}{s(R + \lambda - R_0)} \left(b \ln(R + \lambda - R_0)^{-1} \right)^{1/s-1}. \quad (3.34)$$

Define the function $\eta(r, b, \lambda)$ on $B(0, R)$ as

$$\eta(r, b, \lambda) = \begin{cases} \left(b \ln(R + \lambda - r)^{-1} \right)^{1/s} - k^*, & R_0 \leq r < R, \\ \left(b \ln(R + \lambda - R_0)^{-1} \right)^{1/s} - k^* - \varpi_b(r, \lambda), & \sigma < r < R_0, \\ -\int_r^\sigma \left| \frac{r \mu}{N} \right|^{1/(p(r)-1)} dr + \left(b \ln(R + \lambda - R_0)^{-1} \right)^{1/s} - k^* - \varpi_b(\sigma, \lambda), & r \leq \sigma, \end{cases} \quad (3.35)$$

where $b \in (0, (1/\delta) \inf_{|x| \geq R_0} [p(x) - \beta_1(x)])$ is a constant, $R_0 \in (\sigma, R)$, $R - R_0$ is small enough, parameter $\lambda \in [0, (R - R_0)/2]$, and

$$k^* = M + \left(b \ln \frac{1}{R - R_0} \right)^{1/s}, \quad (3.36)$$

where M is defined in (3.23).

Obviously, for any positive constant b , $\eta(r, b, \lambda) \in C^1[0, R)$.

Similar to the proof of Case 1, when $R - R_0$ is small enough, we have

$$\begin{aligned}
& \left(r^{N-1} |\eta'|^{p(r)-2} \eta' \right)' \\
& \geq r^{N-1} \left(\frac{b^{1/s}}{s} \right)^{p(r)-1} (p(r)-1) (R + \lambda - r)^{-p(r)} \left(\ln(R + \lambda - r)^{-1} \right)^{(1/s-1)(p(r)-1)} \left(1 - \frac{1}{2} \right) \\
& \geq r^{N-1} \rho(r) e^{f(r,\eta)}, \quad \forall r \in (R_0, R).
\end{aligned} \tag{3.37}$$

When $R - R_0$ is small enough, for all $r \in (\sigma, R_0)$, from the definition of k^* , it is easy to see that

$$\left(r^{N-1} |\eta'|^{p(r)-2} \eta' \right)' \geq (\sigma)^{N-1} \frac{1}{R_0 - \sigma} \geq r^{N-1} \rho(r) e^{f(r,\eta)}. \tag{3.38}$$

Obviously

$$\left(r^{N-1} |\eta'|^{p(r)-2} \eta' \right)' = r^{N-1} \mu \geq r^{N-1} \rho(r) e^{f(r,\eta)}, \quad \forall r \in (0, \sigma). \tag{3.39}$$

Combining (3.37), (3.38), and (3.39), when $R - R_0$ is large enough, for any $\lambda \in [0, (R - R_0)/2]$, one can see that $\eta(r, a, \lambda)$ is a subsolution for (P).

Define the function $\eta_m(r, b + \varepsilon)$ on $B(0, R)$ as

$$\eta_m(r, b + \varepsilon) = \eta\left(r, b + \varepsilon, \frac{1}{m}\right), \tag{3.40}$$

where ε is a small enough positive constant such that $(b + \varepsilon) < (1/\delta) \inf_{|x| \geq R_0} p(x)$.

We can see that $\eta_m(r, b + \varepsilon) \in C^1[0, R)$ is a subsolution for (P) for any $m = 1, 2, \dots$. According to the comparison principle, we get that $\eta_m(r, b + \varepsilon) \leq u(x)$ for any $x \in B(0, R)$. For any $x \in B(0, R) \setminus B(0, R_0)$, we have $\eta_m(|x|, b + \varepsilon) \leq \eta_{m+1}(|x|, b + \varepsilon)$. Then,

$$u(x) \geq \lim_{m \rightarrow +\infty} \eta_m(|x|, b + \varepsilon), \quad \forall x \in B(0, R) \setminus B(0, R_0). \tag{3.41}$$

When $d(x, \partial\Omega)$ is small enough, we have

$$\lim_{m \rightarrow +\infty} \eta_m(|x|, b + \varepsilon) > \eta(|x|, b, 0). \tag{3.42}$$

According to the comparison principle, we get that $\eta(|x|, b, 0) \leq u(x)$, $\forall x \in B(0, R)$; then $\Phi_2(x) = \Phi_2(|x|) = \eta(|x|, b, 0)$ is a radial lower control function of all of the solutions for (P), and $\Phi_2(x) = \Phi_2(|x|)$ is a radial subsolution for (P). $\square$

Theorem 3.3. *If $f(r, u)$ satisfies*

$$\lim_{u \rightarrow +\infty} \frac{f(r, u)}{u^s} = \delta \quad (\text{as } u \rightarrow +\infty) \text{ for } r \in [\sigma, R) \text{ uniformly,} \quad (3.43)$$

where σ is defined in (H_4) , δ and s are positive constants, $\rho(r) = \rho_0(R-r)^{-\beta(r)}$, where $\beta(R) < p(R)$, then each solution $u(x)$ for (P) satisfies

$$\lim_{|x| \rightarrow R} \frac{u(x)}{\left((p(R)/\delta) \left(\ln 1/(R-|x|)^{1-\theta} \right) \right)^{1/s}} = 1, \quad \text{where } \theta = \frac{\beta(R)}{p(R)}. \quad (3.44)$$

Proof. It is easy to be seen from Theorems 3.1 and 3.2 □

4. The Existence of Boundary Blow-Up Solutions

Theorem 4.1. *If $\inf_{x \in \Omega} p(x) > N$ and $f(r, u)$ satisfies*

$$f(r, u) \geq au^s \quad (\text{as } u \rightarrow +\infty) \text{ for } r \in [\sigma, R) \text{ uniformly,} \quad (4.1)$$

where σ is defined in (H_4) , a and s are positive constants, then (P) possesses a boundary blow-up solution.

Proof. In order to deal with the existence of boundary blow-up solutions, let us consider the problem

$$\begin{aligned} -\Delta_{p(x)} u + \rho(r) e^{f(x, u)} &= 0, \quad \text{in } \Omega_0, \\ u(x) &= c, \quad \text{for } x \in \partial\Omega_0, \end{aligned} \quad (4.2)$$

where c is a positive constant and $\Omega_0 \Subset \Omega$ is a radial subdomain of Ω . Since $\inf_{x \in \Omega} p(x) > N$, then $W^{1,p(x)}(\Omega_0) \hookrightarrow C^\alpha(\overline{\Omega_0})$, where $\alpha \in (0, 1)$. The relative functional of (4.2) is

$$\varphi = \int_{\Omega_0} \frac{1}{p(x)} |\nabla u(x)|^{p(x)} dx + \int_{\Omega_0} F(x, u) dx, \quad (4.3)$$

where $F(x, u) = \int_0^u e^{f(x, t)} dt$. Since φ is coercive in $X := c + W_0^{1,p(x)}(\Omega_0)$, then φ possesses a nontrivial minimum point u . So, problem (4.2) possesses a weak solution u .

Since $au^s \leq f(r, u) \leq C_1 + C_2|u|^{\gamma(x)}$, from Theorems 3.1 and 3.2, we get that (P) possesses a supersolution $g^*(x)$ and a subsolution $g_*(x)$, which satisfy $g^*(x) \geq g_*(x)$, when $d(x, \partial\Omega)$ (the distance from x to $\partial\Omega$) is small enough. According to the comparison principle, we get that $g^*(x) \geq g_*(x)$ for any $x \in \Omega$.

Denote $D_j = \{x \mid |x| < 1 - 1/(j+1)R\}$ ($j = 1, 2, \dots$). Let us consider the problem

$$\begin{aligned} -\Delta_{p(x)} u_j + \rho(x) e^{f(x, u_j)} &= 0, \quad \text{in } D_j, \\ u_j(x) &= g_*(x), \quad \text{for } x \in \partial D_j, \end{aligned} \quad (4.4)$$

and the relative functional is

$$\varphi = \int_{D_j} \frac{1}{p(x)} |\nabla u_j(x)|^{p(x)} dx + \int_{D_j} \rho(x) F(x, u_j) dx. \quad (4.5)$$

Let $g_{*j}(x) = g_*(x)|_{D_j}$. Since the functional φ is coercive in $X_j = g_{*j}(x) + W_0^{1,p(x)}(D_j)$, then φ has a nontrivial minimum point u_j . Therefore, problem (4.4) has a weak solution u_j .

According to the comparison principle, we get that $g_*(x) \leq u_j(x)$ for any $x \in D_j$ ($j = 1, 2, \dots$). Since $u_j(x) = g_*(x)$ for any $x \in \partial D_j$, then $u_j(x) \leq u_{j+1}(x)$ for any $x \in \partial D_j$ ($j = 1, 2, \dots$). According to the comparison principle, we get that $u_j(x) \leq u_{j+1}(x)$ for any $x \in D_j$ ($j = 1, 2, \dots$).

Since $g^*(x)$ is a supersolution and $g^*(x) \geq g_*(x)$ for any $x \in \Omega$, so we have $u_j(x) = g_*(x) \leq g^*(x)$ for any $x \in \partial D_j$ ($j = 1, 2, \dots$). According to the comparison principle, we get that $u_j(x) \leq g^*(x)$ for any $x \in D_j$ ($j = 1, 2, \dots$).

Since $g^*(x)$ and $g_*(x)$ are locally bounded, from Lemma 2.4, each weak solution of (4.4) is a $C_{\text{loc}}^{1,\alpha}$ function. The $C^{1,\alpha}$ interior regularity result implies that the sequences $\{u_j\}$ and $\{\nabla u_j\}$ are equicontinuous in D_2 , and hence we can choose a subsequence, which we denoted by $\{u_j^1\}$, such that $u_j^1 \rightarrow w_1$ and $\nabla u_j^1 \rightarrow \nabla w_1$ uniformly on D_1 for some $w_1 \in C(D_1)$ and $\nabla w_1 \in (C(D_1))^N$. In fact, $\nabla w_1 = \nabla w_1$ on D_1 , and from the interior $C^{1,\alpha}$ estimate, we conclude that $\nabla w_1 \in (C^\alpha(D_1))^N$ for some $0 < \alpha < 1$. Thus, $w_1 \in W^{1,p(x)}(D_1) \cap C^{1,\alpha}(D_1)$. From the $C^{1,\alpha}$ interior regularity result, we see that $|\nabla u_j|^{p-1} |\nabla \varphi| \leq C |\nabla \varphi|$ on D_1 , and since the function $\xi \rightarrow |\xi|^{p-2} \xi$ is continuous on $\mathbb{R}^N$, it follows that $|\nabla u_j^1(x)|^{p-2} \nabla u_j^1(x) \cdot \nabla \varphi(x) \rightarrow |\nabla w_1(x)|^{p-2} \nabla w_1(x) \cdot \nabla \varphi(x)$ for $x \in D_1$. Thus, by the dominated convergence theorem, we have

$$\int_{D_1} |\nabla u_j^1(x)|^{p-2} \nabla u_j^1(x) \cdot \nabla \varphi(x) dx \rightarrow \int_{D_1} |\nabla w_1(x)|^{p-2} \nabla w_1(x) \cdot \nabla \varphi(x) dx, \quad \forall \varphi \in W_0^{1,p(x)}(D_1). \quad (4.6)$$

Furthermore, since $0 \leq f(u_j^1) \leq f(u_{j+1}^1)$ and $f(u_j^1(x)) \rightarrow f(w_1(x))$ for each $x \in D_1$, by the monotone convergence theorem, we obtain

$$\int_{D_1} \rho e^{f(u_j^1)} q dx \rightarrow \int_{D_1} \rho e^{f(w_1)} q dx, \quad \forall q \in W_0^{1,p(x)}(D_1). \quad (4.7)$$

Therefore, it follows that

$$\int_{D_1} |\nabla w_1(x)|^{p-2} \nabla w_1(x) \cdot \nabla q(x) dx + \int_{D_1} \rho e^{f(w_1)} q dx = 0, \quad \forall q \in W_0^{1,p(x)}(D_1), \quad (4.8)$$

and hence w_1 is a weak solution for $-\Delta_{p(x)} w_1 + \rho e^{f(w_1)} = 0$ on D_1 .

Thus, there exists a subsequence of $\{u_j\}$ which we denote it by $\{u_j^1\}$, such that $u_j^1 \rightarrow w_1$ in D_1 (as $j \rightarrow \infty$), where $w_1 \in W^{1,p(x)}(D_1) \cap C^{1,\alpha_1}(D_1)$ and satisfies

$$\int_{D_1} |\nabla w_1|^{p(x)-2} \nabla w_1 \nabla q \, dx + \int_{D_1} \rho(x) e^{f(x,w_1)} q \, dx = 0, \quad \forall q \in W_0^{1,p(x)}(D_1). \quad (4.9)$$

Similarly, we can prove that there exists a subsequence of $\{u_j^1\}$ which we denote by $\{u_j^2\}$, such that $u_j^2 \rightarrow w_2$ in D_2 (as $j \rightarrow \infty$), where $w_2 \in W^{1,p(x)}(D_2) \cap C^{1,\alpha_2}(D_2)$ satisfies $w_1 = w_2|_{D_1}$ and

$$\int_{D_2} |\nabla w_2|^{p(x)-2} \nabla w_2 \nabla q \, dx + \int_{D_2} \rho(x) e^{f(x,w_2)} q \, dx = 0, \quad \forall q \in W_0^{1,p(x)}(D_2). \quad (4.10)$$

Repeating the above steps, we can get a subsequence of $\{u_j^i \mid j = 1, 2, \dots\}$ which we denote by $\{u_j^{i+1} \mid j = 1, 2, \dots\}$ ($i = 1, 2, \dots$) and satisfies the following.

- (1⁰) For any fixed i , $\{u_j^{i+1}\}$ is a subsequence of $\{u_j^i\}$.
- (2⁰) For any fixed i , $u_j^{i+1} \rightarrow w_{i+1}$ in D_{i+1} (as $j \rightarrow \infty$), where $w_{i+1} \in W^{1,p(x)}(D_{i+1}) \cap C^{1,\alpha_{i+1}}(D_{i+1})$ satisfies $w_i = w_{i+1}|_{D_i}$.
- (3⁰) For any fixed i , w_i satisfies

$$\int_{D_i} |\nabla w_i|^{p(x)-2} \nabla w_i \nabla q \, dx + \int_{D_i} \rho(x) e^{f(x,w_i)} q \, dx = 0, \quad \forall q \in W_0^{1,p(x)}(D_i). \quad (4.11)$$

Thus, we can conclude that

- (i) $\{u_j^j\}$ is a subsequence of $\{u_j\}$,
- (ii) there exists a function $w \in W_{\text{loc}}^{1,p(x)}(\Omega) \cap C_{\text{loc}}^{1,\alpha}(\Omega)$ such that $w_i = w|_{D_i}$, and for any $x \in \Omega$, there exists a constant j_x such that when $j \geq j_x$, $u_j^j(x)$ is defined at x , and $\lim_{j \rightarrow \infty} u_j^j(x) = w(x)$,
- (iii)

$$\int_{\Omega} |\nabla w|^{p(x)-2} \nabla w \nabla q \, dx + \int_{\Omega} \rho(x) e^{f(x,w)} q \, dx = 0, \quad \forall q \in W_{0,\text{loc}}^{1,p(x)}(\Omega). \quad (4.12)$$

Obviously, w is a boundary blow-up solution for (P).

This completes the proof. $\square$

In Theorem 4.1, when $\inf_{x \in \Omega} p(x) > N$, the existence of solutions for (P) is given. In the following, we will consider the existence of solutions for (P) in the general case $1 < \inf_{x \in \Omega} p(x) \leq \sup_{x \in \Omega} p(x) < \infty$. We need to do some preparation. Let us consider

$$\begin{aligned} \left(r^{N-1} |u'|^{p(r)-2} u' \right)' &= r^{N-1} \rho(r) e^{f(r,u)}, \quad r \in (0, R_\lambda), \\ u'(0) &= 0, \quad u(R_\lambda) = d, \end{aligned} \quad (\text{I})$$

where $R_\lambda \in (0, R)$ and d is a constant.

Lemma 4.2. *If $\Phi_2(R_\lambda) \leq d \leq \Phi_1(R_\lambda)$, where Φ_1 and Φ_2 are defined in Theorems 3.13.2, respectively, then (4.13) has a solution u satisfying*

$$\Phi_2(r) \leq u(r) \leq \Phi_1(r), \quad \forall r \in [0, R_\lambda]. \quad (4.13)$$

Proof. Denote

$$h(r, u) = \begin{cases} e^{f(r, \Phi_1(r))} + \arctan(u(r) - \Phi_1(r)), & u(r) > \Phi_1(r), \\ e^{f(r, u)}, & \Phi_2(r) \leq u(r) \leq \Phi_1(r), \\ e^{f(r, \Phi_2(r))} + \arctan(u(r) - \Phi_2(r)), & u(r) < \Phi_2(r). \end{cases} \quad (4.14)$$

Let $\rho_E(t) = \rho(|t|)$, and $h_E(t, u) = h(|t|, u)$, for all $t \in [-R_\lambda, R_\lambda]$. Let us consider the even solutions of the following

$$\begin{aligned} \left(|t|^{N-1} |u'|^{p(|t|)-2} u' \right)' &= |t|^{N-1} \rho_E(t) h_E(t, u), \quad t \in (-R_\lambda, R_\lambda), \\ u(-R_\lambda) &= d, \quad u(R_\lambda) = d. \end{aligned} \quad (\text{II})$$

It is easy to see that u is an even solution for (4.15) if and only if u is even and

$$u = d - \int_r^{R_\lambda} \left[|t|^{1-N} \int_0^t |s|^{N-1} \rho(s) h(s, u(s)) ds \right]^{1/(p(t)-1)} dt, \quad \forall r \in [0, R_\lambda]. \quad (4.15)$$

Denote $\Psi(u, \mu) = \mu d - \mu \int_r^{R_\lambda} [|t|^{1-N} \int_0^t |s|^{N-1} \rho(s) h(s, u(s)) ds]^{1/(p(t)-1)} dt$. Similar to the proof of Lemma 2.3 of [18], for any $\mu \in [0, 1]$, it is easy to see that $\Psi(u, \mu)$ is compact continuous and bounded from $C_E^1[0, R_\lambda]$ to $C_E^1[0, R_\lambda]$, where $C_E^1[0, R_\lambda] = \{u \in C^1[0, R_\lambda] \mid u \text{ is even}\}$. Thus, $u = \Psi(u, 1)$ has a solution u in $C_E^1[0, R_\lambda]$ and satisfies $u'(0) = \lim_{r \rightarrow 0^+} u'(r) = 0$. Then, $u(|t|)$ is an even solution for (4.15).

Denote $\Phi_{1,E}(t) = \Phi_1(|t|)$, $\Phi_{2,E}(t) = \Phi_2(|t|)$. From the definitions of Φ_1 and Φ_2 , we can see that $\Phi_1'(0) = 0 = \Phi_2'(0)$; therefore, $\Phi_{1,E}(t)$ and $\Phi_{2,E}(t)$ are supersolution and subsolution for (4.15), respectively.

Since $\Phi_2(R_\lambda) \leq u(R_\lambda) \leq \Phi_1(R_\lambda)$ and $h_E(t, \cdot)$ is increasing, from the comparison principle, we have

$$\Phi_{2,E}(t) \leq u(t) \leq \Phi_{1,E}(t), \quad \forall t \in [-R_\lambda, R_\lambda]. \quad (4.16)$$

It means that u is a solution for (4.13) and u satisfies

$$\Phi_2(r) \leq u(r) \leq \Phi_1(r), \quad \forall r \in [0, R_\lambda]. \quad (4.17)$$

Thus u is a radial solution for (P). This completes the proof. $\square$

Theorem 4.3. *If $f(r, u)$ satisfies*

$$f(r, u) \geq au^s \quad (\text{as } u \rightarrow +\infty) \text{ for } r \in [\sigma, R) \text{ uniformly}, \quad (4.18)$$

where σ is defined in (H_4) and a and s are positive constants, then (P) possesses a boundary blow-up solution.

Proof. From Lemma 4.2, we have that (4.4) has a weak solution $u_j(x) = u_j(|x|) = u_j(r)$. Similar to the proof of Theorem 4.1, we can obtain the existence of solutions for (P). $\square$
