The purpose of this paper is to propose an iterative algorithm for equilibrium problem and a class of strictly pseudononspreading mappings which is more general than the class of nonspreading mappings studied recently in Kurokawa and Takahashi (2010). We explored an auxiliary mapping in our theorems and proofs and under suitable conditions, some weak and strong convergence theorems are proved. The results presented in the paper extend and improve some recent results announced by some authors.

1. Introduction and Preliminaries

Throughout this paper, we assume that H is a real Hilbert space and C is a nonempty and closed convex subset of H . In the sequel, we denote by “ $x_n \rightarrow x$ ” and “ $x_n \rightharpoonup x$ ” the strong and weak convergence of $\{x_n\}$, respectively. Denote by $F(T)$ the set of fixed points of a mapping T .

Definition 1. Let $T : C \rightarrow C$ be a mapping.

(1) T is said to be nonexpansive, if $\|Tx - Ty\| \leq \|x - y\|$, $\forall x, y \in C$.

(2) T is said to be quasinonexpansive, if $F(T)$ is nonempty and

$$\|Tx - p\| \leq \|x - p\|, \quad \forall x \in C, p \in F(T). \quad (1)$$

(3) T is said to be nonspreading [1, 2], if

$$2\|Tx - Ty\|^2 \leq \|Tx - y\|^2 + \|Ty - x\|^2, \quad \forall x, y \in C. \quad (2)$$

It is easy to prove that $T : C \rightarrow C$ is nonspreading if and only if

$$\|Tx - Ty\|^2 \leq \|x - y\|^2 + 2\langle x - Tx, y - Ty \rangle \quad \forall x, y \in C. \quad (3)$$

(4) $T : C \rightarrow H$ is said to be k -strictly pseudononspreading in the terminology of Browder-Petryshyn [3], if there exists $k \in [0, 1)$ such that

$$\|Tx - Ty\|^2 \leq \|x - y\|^2 + k\|x - Tx - (y - Ty)\|^2 + 2\langle x - Tx, y - Ty \rangle \quad \forall x, y \in C. \quad (4)$$

Remark 2. (1) If $T : C \rightarrow C$ is a nonspreading mapping with $F(T) \neq \emptyset$, then T is quasinonexpansive and $F(T)$ is closed and convex.

(2) Clearly every nonspreading mapping is k -strictly pseudononspreading with $k = 0$, but the inverse is not true. This can be seen from the following example.

Example 3. Let $\mathcal{R}$ denote the set of all real numbers. Let $T : \mathcal{R} \rightarrow \mathcal{R}$ be a mapping defined by

$$Tx = \begin{cases} x, & x \in (-\infty, 0), \\ -2x, & x \in [0, \infty). \end{cases} \quad (5)$$

It is easy to see that T is a k -strictly pseudononspreading mapping with $k \in [0, 1)$, but it is not nonspreading (see, [4]).

Definition 4. (1) Let $T : H \rightarrow H$ be a mapping. $I - T$ is said to be *demiclosed at 0*, if for any sequence $\{x_n\} \subset H$ with $x_n \rightharpoonup x^*$ and $\|(I - T)x_n\| \rightarrow 0$, we have $x^* = Tx^*$.

(2) A Banach space E is said to have *Opial's property*, if for any sequence $\{x_n\} \subset E$ with $x_n \rightharpoonup x^*$, we have

$$\liminf_{n \rightarrow \infty} \|x_n - x^*\| < \liminf_{n \rightarrow \infty} \|x_n - y\|, \quad \forall y \in E \text{ with } y \neq x^*. \quad (6)$$

It is well known that each Hilbert space processes opial property.

(3) A mapping $S : C \rightarrow C$ is said to be *semicompact*, if for any bounded sequence $\{x_n\} \subset C$ with $\lim_{n \rightarrow \infty} \|x_n - Sx_n\| = 0$, then there exists a subsequence $\{x_{n_i}\} \subset \{x_n\}$ such that $\{x_{n_i}\}$ converges strongly to some point $x^* \in C$.

Lemma 5 (see [5]). *Let E be a uniformly convex Banach space and let $B_r(0) := \{x \in E : \|x\| \leq r\}$ be a closed ball with center 0 and radius $r > 0$. For any given sequence $\{x_1, x_2, \dots, x_n, \dots\} \subset B_r(0)$ and any given number sequence $\{\lambda_1, \lambda_2, \dots, \lambda_n, \dots\}$ with $\lambda_i \geq 0$, $\sum_{i=1}^{\infty} \lambda_i = 1$, there exists a continuous strictly increasing and convex function $g : [0, 2r] \rightarrow [0, \infty)$ with $g(0) = 0$ such that for any $i, j \in \mathcal{N}$, $i < j$ the following holds:*

$$\left\| \sum_{n=1}^{\infty} \lambda_n x_n \right\|^2 \leq \sum_{n=1}^{\infty} \lambda_n \|x_n\|^2 - \lambda_i \lambda_j g(\|x_i - x_j\|). \quad (7)$$

Lemma 6. *Let H be a real Hilbert space, C be a nonempty and closed convex subset of H , and let $T : C \rightarrow C$ be a k -strictly pseudononspreading mapping.*

(i) *If $F(T) \neq \emptyset$, then it is closed and convex.*

(ii) *$(I - T)$ is demiclosed at origin.*

Lemma 7. *Let $T : C \rightarrow C$ be a k -strictly pseudononspreading mapping with $k \in [0, 1)$. Denote by $T_\beta := \beta I + (1 - \beta)T$, where $\beta \in [k, 1)$, then*

(i) $F(T) = F(T_\beta)$;

(ii) *the following inequality holds:*

$$\|T_\beta x - T_\beta y\|^2 \leq \|x - y\|^2 + \frac{2}{1 - \beta} \langle x - T_\beta x, y - T_\beta y \rangle, \quad (8)$$

$$\forall x, y \in C;$$

(iii) T_β is a quasinonexpansive mapping, that is,

$$\|T_\beta x - p\|^2 \leq \|x - p\|^2, \quad \forall x \in C, p \in F(T). \quad (9)$$

Proof. The conclusion (i) is obvious. Now we prove the conclusion (ii). Since T is k -strictly pseudononspreading, for any $x, y \in C$ we have

$$\begin{aligned} \|T_\beta x - T_\beta y\|^2 &= \|\beta(x - y) + (1 - \beta)(Tx - Ty)\|^2 \\ &= \beta\|x - y\|^2 + (1 - \beta)\|Tx - Ty\|^2 \end{aligned}$$

$$\begin{aligned} &- \beta(1 - \beta)\|x - Tx - (y - Ty)\|^2 \\ &\leq \beta\|x - y\|^2 + (1 - \beta) \\ &\quad \times \{\|x - y\|^2 + k\|x - Tx - (y - Ty)\|^2 \\ &\quad + 2\langle x - Tx, y - Ty \rangle\} \\ &- \beta(1 - \beta)\|x - Tx - (y - Ty)\|^2 \\ &= \|x - y\|^2 + 2(1 - \beta)\langle x - Tx, y - Ty \rangle \\ &- (1 - \beta)(\beta - k)\|x - Tx - (y - Ty)\|^2 \\ &\leq \|x - y\|^2 + 2(1 - \beta)\langle x - Tx, y - Ty \rangle \\ &= \|x - y\|^2 + \frac{2}{(1 - \beta)} \langle x - T_\beta x, y - T_\beta y \rangle. \end{aligned} \quad (10)$$

Take $y \in F(T)$ in (8), then $y \in F(T_\beta)$. Hence, conclusion (iii) is proved.

This completes the proof. $\square$

In the sequel, we assume that $\phi : C \times C \rightarrow \mathcal{R}$ is a bifunction satisfying the following conditions:

(A1) $\phi(x, x) = 0, \forall x \in C$;

(A2) ϕ is monotone, that is, $\phi(x, y) + \phi(y, x) \leq 0, \forall x, y \in C$;

(A3) $\lim_{t \downarrow 0} \phi(tz + (1 - t)x, y) \leq \phi(x, y), \forall x, y, z \in C$;

(A4) for each $x \in C, y \mapsto \phi(x, y)$ is convex and lower semicontinuous.

Recalled that the “so-called” *equilibrium problem* for a bifunction function ϕ is to find a point $x^* \in C$, such that

$$\phi(x^*, y) \geq 0, \quad \forall y \in C. \quad (11)$$

Lemma 8 (see [6, 7]). *Let C be a nonempty and closed convex subset of a Hilbert space H and let $\phi : C \times C \rightarrow \mathcal{R}$ be a bi-function satisfying conditions: (A1), (A2), (A3), and (A4). Then, for any $r > 0$ and $x \in C$, there exists $z \in C$ such that*

$$\phi(z, y) + \frac{1}{r} \langle y - z, z - x \rangle \geq 0, \quad \forall y \in C. \quad (12)$$

Furthermore, if for given $r > 0$, we define a mapping $T_r : C \rightarrow C$ by

$$T_r x := \left\{ z \in C : \phi(z, y) + \frac{1}{r} \langle y - z, z - x \rangle \geq 0, \forall y \in C \right\}, \quad (13)$$

then the following hold:

(1) T_r is single-valued;

(2) T_r is firmly nonexpansive, that is, $\|T_r x - T_r y\|^2 \leq \langle T_r x - T_r y, x - y \rangle$;

(3) $F(T_r) = \Omega$, where Ω is the set of solutions of the equilibrium problem (11);

(4) Ω is a closed and convex subset of C .

Concerning the weak and strong convergence problem for some kinds of iterative algorithms for nonspreading mappings, k -strictly pseudononspreading mappings and other kind of nonlinear mappings have been considered in Osilike and Isiogugu [4], Igarashi et al. [8], Iemoto and Takahashi [9], Kurokawa and Takahashi [10], and Kim [11–28]. The purpose of this paper is to propose an iterative algorithm for an infinite family of strictly pseudononspreading mappings and equilibrium problem. Under suitable conditions, some weak and strong convergence theorems are proved. The results presented in the paper extend and improve the corresponding results in [4, 8–11].

2. Main Results

Throughout this section, we assume that the following conditions are satisfied.

- (1) H is a real Hilbert spaces, C is a nonempty and close convex subset of H .
- (2) For each $S_i : C \rightarrow C$, $i = 1, 2, \dots$ is a k_i -strictly pseudononspreading mapping with $k := \sup_{i \geq 1} k_i \in (0, 1)$. For given $\beta \in [k, 1)$, denoted by $S_{i,\beta} := \beta I + (1 - \beta)S_i$, for each $i = 1, 2, \dots$, it follows from (8) that

$$\begin{aligned} & \|S_{i,\beta}x - S_{i,\beta}y\|^2 \\ & \leq \|x - y\|^2 \\ & \quad + \frac{2}{1 - \beta} \langle x - S_{i,\beta}x, y - S_{i,\beta}y \rangle, \quad \forall x, y \in C. \end{aligned} \quad (14)$$

- (3) $\phi : C \times C \rightarrow \mathcal{R}$ is a bifunction satisfying the conditions (A1)–(A4). Then it follows from Lemma 8 that the mapping T_r defined by (13) is single valued, $z = T_r x$, $F(T_r) = \Omega$ (where Ω is the solution set of the equilibrium problem (II)), and Ω is a closed and convex subset of C .

We are now in a position to give the following result.

Theorem 9. Let $H, C, \{S_i\}, k, \beta, \{S_{i,\beta}\}, \phi, T_r$, and Ω be the same as above. Let $\{x_n\}$ and $\{u_n\}$ be the sequences defined by

$$\begin{cases} x_1 \in C \text{ chosen arbitrarily,} \\ \phi(u_n, y) + \frac{1}{r_n} \langle y - u_n, u_n - x_n \rangle \geq 0, \quad \forall y \in C, \\ x_{n+1} = \alpha_{0,n}u_n + \sum_{i=1}^{\infty} \alpha_{i,n}S_{i,\beta}u_n, \end{cases} \quad (15)$$

where $\{\alpha_{i,n}\} \subset (0, 1)$ and $\{r_n\}$ satisfy the following conditions:

- (a) $\sum_{i=0}^{\infty} \alpha_{i,n} = 1$, for each $n \geq 1$;
- (b) for each $i \geq 1$, $\liminf_{n \rightarrow \infty} \alpha_{0,n} \alpha_{i,n} > 0$;
- (c) $\{r_n\} \subset (0, \infty)$ and $\liminf_{n \rightarrow \infty} r_n > 0$.
- (I) If $\mathcal{F} := (\bigcap_{i=1}^{\infty} F(S_i)) \cap \Omega \neq \emptyset$, then both $\{x_n\}$ and $\{u_n\}$ converge weakly to some point $x^* \in \mathcal{F}$;

- (II) in addition, if there exists some positive integer m such that S_m is semicompact, then both $\{x_n\}$ and $\{u_n\}$ converge strongly to $x^* \in \mathcal{F}$;

Proof. First, we prove the conclusion (I). The proof is divided into three steps.

Step 1. We prove that the sequences $\{x_n\}$, $\{u_n\}$, $\{S_{i,\beta}u_n\}$, and $\{S_{i,\beta}x_n\}$, $i \geq 1$ all are bounded, and for each $p \in \mathcal{F}$ the limits $\lim_{n \rightarrow \infty} \|x_n - p\|$, $\lim_{n \rightarrow \infty} \|u_n - p\|$ exist and

$$\lim_{n \rightarrow \infty} \|x_n - p\| = \lim_{n \rightarrow \infty} \|u_n - p\|. \quad (16)$$

In fact, it follows from Lemma 8 that $u_n = T_{r_n}x_n$, $p = T_{r_n}p$, and

$$\|u_n - p\| = \|T_{r_n}x_n - T_{r_n}p\| \leq \|x_n - p\|, \quad \forall n \geq 1. \quad (17)$$

Since $p \in \mathcal{F}$, by Lemma 7(i), $p \in \bigcap_{i=1}^{\infty} F(S_{i,\beta})$. Hence, it follows from (17) and (9) that

$$\begin{aligned} \|x_{n+1} - p\| &= \left\| \alpha_{0,n}u_n + \sum_{i=1}^{\infty} \alpha_{i,n}S_{i,\beta}u_n - p \right\| \\ &\leq \alpha_{0,n} \|u_n - p\| + \sum_{i=1}^{\infty} \alpha_{i,n} \|S_{i,\beta}u_n - p\| \\ &\leq \alpha_{0,n} \|u_n - p\| + \sum_{i=1}^{\infty} \alpha_{i,n} \|u_n - p\| \\ &= \|u_n - p\| \leq \|x_n - p\|, \quad \forall n \geq 1. \end{aligned} \quad (18)$$

This implies that for each $p \in \mathcal{F}$, the limits $\lim_{n \rightarrow \infty} \|x_n - p\|$ and $\lim_{n \rightarrow \infty} \|u_n - p\|$ exist. And so $\{x_n\}$ and $\{u_n\}$ are bounded and (16) holds.

Furthermore, by (9), it is easy to see that for each $i \geq 1$, $\{S_{i,\beta}u_n\}$ and $\{S_{i,\beta}x_n\}$ are also bounded.

Step 2. Next we prove that for each $i \geq 1$ the following holds:

$$\lim_{n \rightarrow \infty} \|x_n - S_i x_n\| = \lim_{n \rightarrow \infty} \|u_n - S_i u_n\| = 0. \quad (19)$$

In fact, by Lemma 5 for any positive integer $i \geq 1$ and $p \in \mathcal{F}$, we have

$$\begin{aligned} \|x_{n+1} - p\|^2 &= \left\| \alpha_{0,n}(u_n - p) + \sum_{i=1}^{\infty} \alpha_{i,n}(S_{i,\beta}u_n - p) \right\|^2 \\ &\leq \alpha_{0,n} \|u_n - p\|^2 + \sum_{i=1}^{\infty} \alpha_{i,n} \|S_{i,\beta}u_n - p\|^2 \\ &\quad - \alpha_{0,n} \alpha_{i,n} g(\|u_n - S_{i,\beta}u_n\|) \\ &\leq \alpha_{0,n} \|u_n - p\|^2 + \sum_{i=1}^{\infty} \alpha_{i,n} \|u_n - p\|^2 \\ &\quad - \alpha_{0,n} \alpha_{i,n} g(\|u_n - S_{i,\beta}u_n\|) \\ &\leq \|u_n - p\|^2 - \alpha_{0,n} \alpha_{i,n} g(\|u_n - S_{i,\beta}u_n\|) \\ &\leq \|x_n - p\|^2 - \alpha_{0,n} \alpha_{i,n} g(\|u_n - S_{i,\beta}u_n\|). \end{aligned} \quad (20)$$

This shows that

$$\begin{aligned} & \alpha_{0,n} \alpha_{i,n} g(\|u_n - S_{i,\beta} u_n\|) \\ & \leq \|x_n - p\|^2 \\ & - \|x_{n+1} - p\|^2 \longrightarrow 0 \quad (\text{as } n \longrightarrow \infty). \end{aligned} \quad (21)$$

Since g is a continuous and strictly increasing function with $g(0) = 0$. By condition (b), it yields that

$$\lim_{n \rightarrow \infty} \|u_n - S_{i,\beta} u_n\| = 0. \quad (22)$$

Therefore, we have

$$\lim_{n \rightarrow \infty} \|u_n - S_i u_n\| = \lim_{n \rightarrow \infty} \frac{1}{1 - \beta} \|u_n - S_{i,\beta} u_n\| = 0. \quad (23)$$

On the other hand, it follows from Lemma 8 that $u_n = T_{r_n} x_n$ and for each $p \in \mathcal{F}$

$$\begin{aligned} \|u_n - p\|^2 &= \|T_{r_n} x_n - T_{r_n} p\|^2 \leq \langle T_{r_n} x_n - T_{r_n} p, x_n - p \rangle \\ &= \langle u_n - p, x_n - p \rangle \\ &= \frac{1}{2} \{ \|u_n - p\|^2 + \|x_n - p\|^2 - \|x_n - u_n\|^2 \}. \end{aligned} \quad (24)$$

This shows that

$$\|u_n - p\|^2 \leq \|x_n - p\|^2 - \|x_n - u_n\|^2. \quad (25)$$

In view of (20) and (25)

$$\|x_{n+1} - p\|^2 \leq \|u_n - p\|^2 \leq \|x_n - p\|^2 - \|x_n - u_n\|^2, \quad (26)$$

that is,

$$\|x_n - u_n\|^2 \leq \|x_n - p\|^2 - \|x_{n+1} - p\|^2 \longrightarrow 0 \quad (\text{as } n \longrightarrow \infty). \quad (27)$$

In view of (27), (22), (14), and noting that $\{x_n - S_{i,\beta} x_n\}$ is bounded, we have

$$\begin{aligned} & \|x_n - S_{i,\beta} x_n\| \\ & \leq \|x_n - u_n\| + \|u_n - S_{i,\beta} u_n\| + \|S_{i,\beta} u_n - S_{i,\beta} x_n\| \\ & \leq \|x_n - u_n\| + \|u_n - S_{i,\beta} u_n\| \\ & + \left\{ \|x_n - u_n\|^2 + \frac{2}{1 - \beta} \left| \langle u_n - S_{i,\beta} u_n, x_n - S_{i,\beta} x_n \rangle \right| \right\}^{1/2} \\ & \longrightarrow 0 \quad (\text{as } n \longrightarrow \infty). \end{aligned} \quad (28)$$

Therefore, we have

$$\lim_{n \rightarrow \infty} \|x_n - S_i x_n\| = \lim_{n \rightarrow \infty} \frac{1}{1 - \beta} \|x_n - S_{i,\beta} x_n\| = 0. \quad (29)$$

The conclusion is proved.

Step 3. Next we prove that the weak-accumulation point set $W_\omega(x_n)$ of the sequence $\{x_n\}$ is a singleton and $W_\omega(x_n) \subset \mathcal{F}$.

In fact, for any $w \in W_\omega(x_n)$, there exists a subsequence $\{x_{n_i}\} \subset \{x_n\}$ such that $x_{n_i} \rightharpoonup w$. It follows from (27) that $u_{n_i} \rightharpoonup w$. Since $u_n = T_{r_n} x_n$, from (15) and condition (A2) we have

$$\left\langle y - u_{n_i}, \frac{1}{r_{n_i}} (u_{n_i} - x_{n_i}) \right\rangle \geq \phi(y, u_{n_i}), \quad \forall y \in C. \quad (30)$$

Since $(1/r_{n_i})(u_{n_i} - x_{n_i}) \rightarrow 0$ (as $n_i \rightarrow \infty$) and $u_{n_i} \rightharpoonup w$, it follows from condition (A4) that

$$\phi(y, w) \leq 0, \quad \forall y \in C. \quad (31)$$

For any $t \in (0, 1)$, $y \in C$, letting $y_t = ty + (1-t)w$, then $y_t \in C$. By condition (A1) and (A4), we have

$$0 = \phi(y_t, y_t) \leq t\phi(y_t, y) + (1-t)\phi(y_t, w) \leq t\phi(y_t, y). \quad (32)$$

This implies that $\phi(y_t, y) \geq 0$. Letting $t \rightarrow 0$, by condition (A3) we have

$$\phi(w, y) \geq 0, \quad \forall y \in C. \quad (33)$$

This shows that $w \in C$ is a solution to the equilibrium (11), that is, $w \in \Omega$.

On the other hand, by Lemma 6, for each $i \geq 1$, $I - S_i$ is demiclosed at 0. In view of (19), we know that $w \in \mathcal{F}$. Due to the arbitrariness of $w \in W_\omega(x_n)$, we have $W_\omega(x_n) \subset \mathcal{F}$.

Now we prove that $W_\omega(x_n)$ is a singleton. Suppose to the contrary that there exist $x^*, y^* \in W_\omega(x_n)$ with $x^* \neq y^*$. Therefore, there exist subsequences $\{x_{n_i}\}$ and $\{x_{n_j}\}$ in $\{x_n\}$ such that $x_{n_i} \rightharpoonup x^*$ and $x_{n_j} \rightharpoonup y^*$. Since $x^*, y^* \in \mathcal{F}$, by (16), the limits $\lim_{n \rightarrow \infty} \|x_n - x^*\|$ and $\lim_{n \rightarrow \infty} \|x_n - y^*\|$ exist. By using the opial property of H , we have

$$\begin{aligned} \liminf_{n_i \rightarrow \infty} \|x_{n_i} - x^*\| &< \liminf_{n_i \rightarrow \infty} \|x_{n_i} - y^*\| = \lim_{n \rightarrow \infty} \|x_n - y^*\| \\ &= \lim_{n_j \rightarrow \infty} \|x_{n_j} - y^*\| < \liminf_{n_j \rightarrow \infty} \|x_{n_j} - x^*\| \\ &= \lim_{n \rightarrow \infty} \|x_n - x^*\| = \liminf_{n_i \rightarrow \infty} \|x_{n_i} - x^*\|. \end{aligned} \quad (34)$$

This is a contradiction. Therefore, $W_\omega(x_n)$ is a singleton. Without loss of generality, we can assume that $W_\omega(x_n) = \{x^*\}$ and $x_n \rightharpoonup x^*$. By using (15) and (19), we have $u_n \rightharpoonup x^*$.

This completes the proof of the conclusion (I).

Next we prove the conclusion (II).

Without loss of generality, we can assume that S_1 is semi-compact. From (19) we have that

$$\|x_n - S_1 x_n\| \longrightarrow 0 \quad (\text{as } n \longrightarrow \infty). \quad (35)$$

Therefore, there exists a subsequence of $\{x_{n_i}\} \subset \{x_n\}$ such that $x_{n_i} \rightharpoonup u^* \in C$. Since $x_{n_i} \rightharpoonup x^*$, we have $x^* = u^*$ and so $x_{n_i} \rightharpoonup x^* \in \mathcal{F}$. By virtue of (16), we have

$$\lim_{n \rightarrow \infty} \|u_n - x^*\| = 0, \quad \lim_{n \rightarrow \infty} \|x_n - x^*\| = 0, \quad (36)$$

This completes the proof of Theorem 9. $\square$

Taking $\phi \equiv 0$ and $r_n = 1$, for all $n \geq 1$ in Theorem 9, we have $x_n = u_n$, for all $n \geq 1$. Therefore, the following theorem can be obtained from Theorem 9 immediately.

Theorem 10. Let $H, C, \{S_i\}, k, \beta$ and $\{S_{i,\beta}\}$ be the same as in Theorem 9. Let $\{x_n\}$ be the sequences defined by

$$\begin{cases} x_1 \in C, & \text{chosen arbitrarily,} \\ x_{n+1} = \alpha_{0,n}x_n + \sum_{i=1}^{\infty} \alpha_{i,n}S_{i,\beta}x_n, \end{cases} \quad (37)$$

where $\{\alpha_{i,n}\} \subset (0, 1)$ satisfies the following conditions:

- (a) $\sum_{i=0}^{\infty} \alpha_{i,n} = 1$, for each $n \geq 1$;
- (b) for each $i \geq 1$, $\liminf_{n \rightarrow \infty} \alpha_{0,n} \alpha_{i,n} > 0$.
- (I) If $\mathcal{F} := (\bigcap_{i=1}^{\infty} F(S_i)) \neq \emptyset$, then both $\{x_n\}$ converge weakly to some point $x^* \in \mathcal{F}$;
- (II) in addition, if there exists some positive integer m such that S_m is semicompact, then $\{x_n\}$ converge strongly to $x^* \in \mathcal{F}$.

Remark 11. Theorems 9 and 10 improve and extend the corresponding recent results of [4, 8–11].

Acknowledgments

The authors would like to express their thanks to the referees for their helpful comments and advices. This work was supported by the Natural Science Foundation of Yunnan Province (Grant no. 2011FB074).
