New Δ -convergence theorems of iterative sequences for asymptotically nonexpansive mappings in CAT(0) spaces are obtained. Consider an asymptotically nonexpansive self-mapping T of a closed convex subset C of a CAT(0) space X . Consider the iteration process $\{x_n\}$, where $x_0 \in C$ is arbitrary and $x_{n+1} = \alpha_n x_n \oplus (1 - \alpha_n) T^n y_n$ or $x_{n+1} = \alpha_n T^n x_n \oplus (1 - \alpha_n) y_n$, $y_n = \beta_n x_n \oplus (1 - \beta_n) T^n x_n$ for $n \geq 1$, where $\{\alpha_n\}, \{\beta_n\} \subset (0, 1)$. It is shown that under certain appropriate conditions on $\alpha_n, \beta_n, \{x_n\}$ Δ -converges to a fixed point of T .

1. Introduction and Preliminaries

Let C be a nonempty subset of a metric space (X, d) . A mapping $T : C \rightarrow C$ is a contraction if there exists $k \in [0, 1)$ such that for all $x, y \in C$, we have $d(Tx, Ty) < kd(x, y)$. It is said to be nonexpansive if for all $x, y \in C$, we have $d(Tx, Ty) \leq d(x, y)$. T is said to be asymptotically nonexpansive if there exists a sequence $\{k_n\} \in [1, \infty)$ with $k_n \rightarrow 1$ such that $d(T^n x, T^n y) \leq k_n d(x, y)$ for all integers $n \geq 1$ and all $x, y \in C$. Clearly, every contraction mapping is nonexpansive and every nonexpansive mapping is asymptotically nonexpansive with sequence $k_n = 1$, for all $n \geq 1$. There are, however, asymptotically nonexpansive mappings which are not nonexpansive (see, e.g., [1]). As a generalization of the class of nonexpansive mappings, the class of asymptotically nonexpansive mappings was introduced by Goebel and Kirk [2] in 1972 and has been studied by several authors (see, e.g., [3–5]). Goebel and Kirk proved that if C is a nonempty closed convex and bounded subset of a uniformly convex Banach space (more general than a Hilbert space, i.e., CAT(0) space), then every asymptotically nonexpansive self-mapping of C has a fixed point. The weak and strong convergence problems to fixed points of nonexpansive and asymptotically nonexpansive mappings have been studied by many authors.

We will denote by $F(T)$ the set of fixed points of T . In 1967, Halpern [6] introduced an explicit iterative scheme for

a nonexpansive mapping T on a subset C of a Hilbert space by taking any point $u, x_1 \in C$ and defined the iterative sequence $\{x_n\}$ by

$$x_{n+1} = \alpha_n u + (1 - \alpha_n) T x_n, \quad \text{for } n \geq 1, \quad (1)$$

where $\alpha_n \in [0, 1]$. He pointed out that under certain appropriate conditions on $\alpha_n, \{x_n\}$ converges strongly to a fixed point of T . In 1994, Tan and Xu [7] introduced the following iterative scheme for asymptotically nonexpansive mapping on uniformly convex Banach space:

$$x_0 \in C,$$

$$x_{n+1} = \alpha_n f(x_n) + (1 - \alpha_n) T^n y_n, \quad n \geq 0, \quad (2)$$

$$y_n = \gamma_n x_n + (1 - \gamma_n) T^n x_n, \quad n \geq 0,$$

where $\{\alpha_n\}, \{\gamma_n\} \subset (0, 1)$. They proved that under certain appropriate conditions on $\alpha_n, \gamma_n, \{x_n\}$ converges weakly to a fixed point of T .

In 2012, we [8] studied the viscosity approximation methods for nonexpansive mappings on CAT(0) space. For a contraction f on C , consider the iteration process $\{x_n\}$, where $x_0 \in C$ is arbitrary and

$$x_{n+1} = \alpha_n f(x_n) \oplus (1 - \alpha_n) T x_n, \quad (3)$$

for $n \geq 1$, where $\{\alpha_n\} \subset (0, 1)$. We proved that under certain appropriate conditions on α_n , $\{x_n\}$ converges strongly to a fixed point of T which solves some variational inequality.

The purpose of this paper is to study the iterative scheme defined as follows: consider an asymptotically nonexpansive self-mapping T of a closed convex subset C of a CAT(0) space X with coefficient k_n . consider the iteration process $\{x_n\}$, where $x_0 \in C$ is arbitrary and

$$\begin{aligned} x_{n+1} &= \alpha_n x_n \oplus (1 - \alpha_n) T^n y_n, \\ y_n &= \beta_n x_n \oplus (1 - \beta_n) T^n x_n, \end{aligned} \quad (4)$$

or

$$\begin{aligned} x_{n+1} &= \alpha_n T^n x_n \oplus (1 - \alpha_n) y_n, \\ y_n &= \beta_n x_n \oplus (1 - \beta_n) T^n x_n, \end{aligned} \quad (5)$$

for $n \geq 1$, where $\{\alpha_n\}, \{\beta_n\} \subset (0, 1)$. We show that $\{x_n\}$ Δ -converges to a fixed point of T under certain appropriate conditions on α_n, β_n , and k_n .

We now collect some elementary facts about CAT(0) spaces which will be used in the proofs of our main results.

Lemma 1. *Let X be a CAT(0) space. Then, one has the following:*

- (i) (see [9, Lemma 2.4]) for each $x, y, z \in X$ and $t \in [0, 1]$, one has

$$d((1-t)x \oplus ty, z) \leq (1-t)d(x, z) + td(y, z), \quad (6)$$

- (ii) (see [10]) for each $x, y, z \in X$ and $t, s \in [0, 1]$ one has

$$d((1-t)x \oplus ty, (1-s)x \oplus sy) \leq |t-s|d(x, y), \quad (7)$$

- (iii) (see [5, Lemma 3]) for each $x, y, z \in X$ and $t \in [0, 1]$, one has

$$d((1-t)z \oplus tx, (1-t)z \oplus ty) \leq td(x, y), \quad (8)$$

- (iv) (see [9]) for each $x, y, z \in X$ and $t \in [0, 1]$, one has

$$\begin{aligned} d^2((1-t)x \oplus ty, z) \\ \leq td^2(x, z) + (1-t)d^2(y, z) - t(1-t)d^2(x, y). \end{aligned} \quad (9)$$

Let X be a complete CAT(0) space and let $\{x_n\}$ be a bounded sequence in a complete X and for $x \in X$ set

$$r(x, \{x_n\}) = \limsup_{n \rightarrow \infty} d(x, x_n). \quad (10)$$

The asymptotic radius $r(\{x_n\})$ of $\{x_n\}$ is given by

$$r(\{x_n\}) = \inf \{r(x, \{x_n\}) : x \in X\}, \quad (11)$$

and the asymptotic center $A(\{x_n\})$ of $\{x_n\}$ is the set

$$A(\{x_n\}) = \{x \in X : r(x, \{x_n\}) = r(\{x_n\})\}. \quad (12)$$

It is known (see, e.g., [11, Proposition 7]) that in a CAT(0) space, $A(\{x_n\})$ consists of exactly one point.

A sequence $\{x_n\}$ in X is said to Δ -converge to $x \in X$ if x is the unique asymptotic center of $\{u_n\}$ for every subsequence $\{u_n\}$ of $\{x_n\}$. In this case, we write $\Delta\text{-}\lim_n x_n = x$ and call x the Δ -limit of $\{x_n\}$.

Lemma 2. *Assume that X is a CAT(0) space. Then, one has the following:*

- (i) (see [12]) every bounded sequence in X has a Δ -convergent subsequence;
- (ii) (see [13]) if K is a closed convex subset of X and $T : K \rightarrow X$ is an asymptotically nonexpansive mapping, then the conditions $\{x_n\}$ Δ -converge to x and $d(x_n, T(x_n)) \rightarrow 0$, imply $x \in K$ and $x \in F(T)$.

Lemma 3 (see [14, 15]). *Let $\{a_n\}, \{b_n\}$, and $\{c_n\}$ be three non-negative real sequences satisfying the following condition:*

$$a_{n+1} \leq (1 + b_n)a_n + c_n, \quad \forall n \geq n_0, \quad (13)$$

where n_0 is some nonnegative integer, $\sum_{n=1}^{\infty} b_n < \infty$, $\sum_{n=1}^{\infty} c_n < \infty$. Then the limit $\lim_{n \rightarrow \infty} a_n$ exists.

2. Δ -Convergence of the Iteration Sequences

In this section, we will study the Δ -convergence of the iteration sequence for asymptotically nonexpansive mappings in CAT(0) spaces.

Suppose that X be a CAT(0) space, C a closed convex subset of X , and $T : C \rightarrow C$ an asymptotically nonexpansive mapping with coefficient k_n . Firstly, we consider the iteration process:

$$\begin{aligned} x_0 &\in C, \\ x_{n+1} &= \alpha_n x_n \oplus (1 - \alpha_n) T^n y_n, \quad n \geq 0, \\ y_n &= \beta_n x_n \oplus (1 - \beta_n) T^n x_n, \quad n \geq 0, \end{aligned} \quad (14)$$

where $\{\alpha_n\}, \{\beta_n\} \subseteq (0, 1)$ and k_n satisfy the following.

- (i) There exist positive integers n_0, n_1 , and $\delta > 0, 0 < b < \min\{1, 1/L\}$, where $L = \sup_n k_n$, such that

$$\begin{aligned} 0 < \delta < \alpha_n < 1 - \delta, \quad n \geq n_0, \\ 0 < 1 - \beta_n < b, \quad n \geq n_1, \end{aligned} \quad (15)$$

- (ii) Consider $\sum_{n=1}^{\infty} (k_n^2 - 1) < \infty$.

We will prove that $\{x_n\}$ Δ -converges to a fixed point of T .

Lemma 4. *Let X be a CAT(0) space, C a closed convex subset of X , $T : C \rightarrow C$ an asymptotically nonexpansive mapping with coefficient k_n , and $\sum_{n=1}^{\infty} (k_n^2 - 1) < \infty$. If $F(T) \neq \emptyset$, $\{\alpha_n\}, \{\beta_n\} \subseteq (0, 1)$. Let $x_0 \in C$, $\{x_n\}$ be generated by $x_{n+1} = \alpha_n x_n \oplus (1 - \alpha_n) T^n y_n$, $y_n = \beta_n x_n \oplus (1 - \beta_n) T^n x_n$, $n \geq 0$. Then the limit $\lim_{n \rightarrow \infty} d(x_n, p)$ exists for all $p \in F(T)$.*

Proof. Taking $p \in F(T)$, we have

$$\begin{aligned}
 d(x_{n+1}, p) &= d(\alpha_n x_n \oplus (1 - \alpha_n) T^n y_n, p) \\
 &\leq \alpha_n d(x_n, p) + (1 - \alpha_n) d(T^n y_n, p) \\
 &\leq \alpha_n d(x_n, p) + (1 - \alpha_n) k_n d(y_n, p) \\
 &\leq \alpha_n d(x_n, p) \\
 &\quad + (1 - \alpha_n) k_n \{ \beta_n d(x_n, p) \\
 &\quad \quad + (1 - \beta_n) d(T^n x_n, p) \} \\
 &\leq \alpha_n d(x_n, p) \\
 &\quad + (1 - \alpha_n) k_n \{ \beta_n d(x_n, p) \\
 &\quad \quad + (1 - \beta_n) k_n d(x_n, p) \} \\
 &= \{ 1 + (1 - \alpha_n)(k_n - 1) \\
 &\quad \times [k_n(1 - \beta_n) + 1] \} d(x_n, p) \\
 &\leq \{ 1 + (k_n^2 - 1) \} d(x_n, p).
 \end{aligned} \tag{16}$$

By Lemma 3, we can get that $\lim_{n \rightarrow \infty} d(x_n, p)$ exists. $\square$

Remark 5. The above lemma implies that $\{x_n\}$ is bounded and so is the sequence $\{T x_n\}$. Moreover, let $L = \sup_n k_n$, then we have

$$\begin{aligned}
 d(T^n x_n, p) &\leq k_n d(x_n, p) \leq L d(x_n, p), \\
 d(y_n, p) &\leq \beta_n d(x_n, p) + (1 - \beta_n) d(T^n x_n, p) \\
 &\leq L d(x_n, p) \\
 d(T^n y_n, p) &\leq k_n d(y_n, p) \leq L^2 d(x_n, p).
 \end{aligned} \tag{17}$$

It follows that the sequences $\{T^n x_n\}$, $\{y_n\}$, $\{T^n y_n\}$ are bounded.

Proposition 6. Let X be a $CAT(0)$ space, C a closed convex subset of X , and $T : C \rightarrow C$ an asymptotically nonexpansive mapping with coefficient k_n . If $F(T) \neq \emptyset$, $\{\alpha_n\}, \{\beta_n\} \subseteq (0, 1)$. Let $x_0 \in C$, $\{x_n\}$ be generated by $x_{n+1} = \alpha_n x_n \oplus (1 - \alpha_n) T^n y_n$, $y_n = \beta_n x_n \oplus (1 - \beta_n) T^n x_n$, $n \geq 0$. Then under the hypotheses (i) and (ii), one can get that $\lim_{n \rightarrow \infty} d(x_n, T^n y_n) = 0$.

Proof. By the assumption, $F(T)$ is nonempty. Take $p \in F(T)$, by Lemma 1(iv), we have

$$\begin{aligned}
 d^2(x_{n+1}, p) &= d^2(\alpha_n x_n \oplus (1 - \alpha_n) T^n y_n, p) \\
 &\leq \alpha_n d^2(x_n, p) + (1 - \alpha_n) d^2(T^n y_n, p) \\
 &\quad - \alpha_n (1 - \alpha_n) d^2(x_n, T^n y_n) \\
 &\leq d^2(x_n, p) + (1 - \alpha_n) \{ d^2(T^n y_n, p) \\
 &\quad \quad - d^2(y_n, p) \}
 \end{aligned}$$

$$\begin{aligned}
 &+ (1 - \alpha_n) \{ d^2(y_n, p) - d^2(x_n, p) \} \\
 &\quad - \alpha_n (1 - \alpha_n) d^2(x_n, T^n y_n), \\
 d^2(y_n, p) - d^2(x_n, p) \\
 &= d^2(\beta_n x_n \oplus (1 - \beta_n) T^n x_n, p) - d^2(x_n, p) \\
 &\leq \beta_n d^2(x_n, p) + (1 - \beta_n) d^2(T^n x_n, p) \\
 &\quad - \beta_n (1 - \beta_n) d^2(x_n, T^n x_n) - d^2(x_n, p) \\
 &\leq \beta_n d^2(x_n, p) + (1 - \beta_n) d^2(T^n x_n, p) \\
 &\quad - d^2(x_n, p),
 \end{aligned} \tag{18}$$

which implies that

$$\begin{aligned}
 d^2(y_n, p) - d^2(x_n, p) &\leq (1 - \beta_n) [d^2(T^n x_n, p) - d^2(x_n, p)] \\
 &\leq (1 - \beta_n) (k_n^2 - 1) d^2(x_n, p).
 \end{aligned} \tag{19}$$

Therefore, we have

$$\begin{aligned}
 d^2(x_{n+1}, p) &\leq d^2(x_n, p) + (1 - \alpha_n) (k_n^2 - 1) d^2(y_n, p) \\
 &\quad + (1 - \alpha_n) (1 - \beta_n) (k_n^2 - 1) d^2(x_n, p) \\
 &\quad - \alpha_n (1 - \alpha_n) d^2(x_n, T^n y_n).
 \end{aligned} \tag{20}$$

Since $\{x_n\}$ and $\{y_n\}$ are bounded and $0 < \delta < \alpha_n < 1 - \delta$ for all $n \geq n_0$, we have

$$\begin{aligned}
 \delta^2 d^2(x_n, T^n y_n) &\leq d^2(x_n, p) - d^2(x_{n+1}, p) \\
 &\quad + (1 - \alpha_n) (k_n^2 - 1) d^2(y_n, p) \\
 &\quad + (1 - \alpha_n) (1 - \beta_n) (k_n^2 - 1) d^2(x_n, p).
 \end{aligned} \tag{21}$$

By the conditions (i) and (ii), we have

$$\sum_{n=1}^{\infty} \delta^2 d^2(x_n, T^n y_n) < \infty, \tag{22}$$

which implies that

$$\lim_{n \rightarrow \infty} d^2(x_n, T^n y_n) = 0. \tag{23}$$

$\square$

Theorem 7. Let X be a $CAT(0)$ space, C a closed convex subset of X , and $T : C \rightarrow C$ an asymptotically nonexpansive mapping with coefficient k_n . If $F(T) \neq \emptyset$, $\{\alpha_n\}, \{\beta_n\} \subseteq (0, 1)$. Let $x_0 \in C$, $\{x_n\}$ be generated by $x_{n+1} = \alpha_n x_n \oplus (1 - \alpha_n) T^n y_n$, $y_n = \beta_n x_n \oplus (1 - \beta_n) T^n x_n$, $n \geq 0$. Then under the hypotheses (i) and (ii), one can get that $\{x_n\}$ Δ -converges to a fix point of T .

Proof. We first show that $\lim_{n \rightarrow \infty} d(x_n, T^n x_n) = 0$. Indeed

$$\begin{aligned} d(x_n, y_n) &= d(x_n, \beta_n x_n \oplus (1 - \beta_n) T^n x_n) \\ &\leq (1 - \beta_n) d(x_n, T^n x_n) \\ &\leq (1 - \beta_n) \{d(x_n, T^n y_n) + d(T^n y_n, T^n x_n)\} \\ &\leq (1 - \beta_n) \{d(x_n, T^n y_n) + Ld(y_n, x_n)\}; \end{aligned} \quad (24)$$

it follows that

$$[1 - L(1 - \beta_n)] d(x_n, y_n) \leq (1 - \beta_n) d(x_n, T^n y_n). \quad (25)$$

By the conditions (i) and (ii) and Proposition 6, we get $\lim_{n \rightarrow \infty} d(x_n, y_n) = 0$.

And then,

$$\begin{aligned} d(x_n, T^n x_n) &\leq d(x_n, T^n y_n) + d(T^n y_n, T^n x_n) \\ &\leq d(x_n, T^n y_n) + Ld(y_n, x_n). \end{aligned} \quad (26)$$

By Proposition 6, we get that $\lim_{n \rightarrow \infty} d(x_n, T^n x_n) = 0$.

We claim that $\lim_{n \rightarrow \infty} d(x_n, T x_n) = 0$. Indeed we have

$$\begin{aligned} d(y_n, T^n x_n) &= d(\beta_n x_n \oplus (1 - \beta_n) T^n x_n, T^n x_n) \\ &\leq \beta_n d(x_n, T^n x_n) \rightarrow 0. \\ d(x_{n+1}, x_n) &= d(\alpha_n x_n \oplus (1 - \alpha_n) T^n y_n, x_n) \\ &\leq (1 - \alpha_n) d(x_n, T^n y_n) \rightarrow 0. \\ d(x_{n-1}, T^{n-1} x_n) &\leq d(x_{n-1}, T^{n-1} x_{n-1}) \\ &\quad + d(T^{n-1} x_{n-1}, T^{n-1} x_n) \\ &\leq d(x_{n-1}, T^{n-1} x_{n-1}) + Ld(x_{n-1}, x_n) \rightarrow 0. \\ d(x_n, T^{n-1} x_n) &\leq d(\alpha_{n-1} x_{n-1} \\ &\quad \oplus (1 - \alpha_{n-1}) T^{n-1} y_{n-1}, T^{n-1} x_n) \\ &\leq \alpha_{n-1} d(x_{n-1}, T^{n-1} x_n) \\ &\quad + (1 - \alpha_{n-1}) d(T^{n-1} y_{n-1}, T^{n-1} x_n) \\ &\leq \alpha_{n-1} d(x_{n-1}, T^{n-1} x_n) \\ &\quad + (1 - \alpha_{n-1}) Ld(y_{n-1}, x_n) \\ &\leq \alpha_{n-1} d(x_{n-1}, T^{n-1} x_n) \\ &\quad + (1 - \alpha_{n-1}) L[d(y_{n-1}, x_{n-1}) \\ &\quad + d(x_{n-1}, x_n)] \rightarrow 0. \end{aligned} \quad (27)$$

Thus,

$$\begin{aligned} d(x_n, T x_n) &\leq d(x_n, T^n x_n) + d(T^n x_n, T x_n) \\ &\leq d(x_n, T^n x_n) + Ld(T^{n-1} x_n, x_n) \rightarrow 0. \end{aligned} \quad (28)$$

Since $\{x_n\}$ is bounded, we may assume that $\{x_n\}$ Δ -converges to a point $\hat{x}$. By Lemma 2, we have $\hat{x} \in F(T)$. $\square$

Next we will consider another iteration process:

$$\begin{aligned} x_0 &\in C, \\ x_{n+1} &= \alpha_n T^n x_n \oplus (1 - \alpha_n) y_n, \quad n \geq 0, \\ y_n &= \beta_n x_n \oplus (1 - \beta_n) T^n x_n, \quad n \geq 0, \end{aligned} \quad (29)$$

where $\{\alpha_n\}, \{\beta_n\} \subseteq (0, 1)$, and k_n satisfy the following

(H1) There exist positive integers n_0 and $\delta > 0$, such that

$$\begin{aligned} 0 < \delta < \alpha_n < 1 - \delta, \quad n \geq n_0; \\ 1 - \beta_n &\rightarrow 0; \end{aligned} \quad (30)$$

(H2) $\sum_{n=1}^{\infty} (k_n - 1) < \infty$.

We will prove that $\{x_n\}$ also Δ -converges to a fixed point of T .

Lemma 8. Let X be a CAT(0) space, C a closed convex subset of X , $T : C \rightarrow C$ an asymptotically nonexpansive mapping with coefficient k_n , and $\sum_{n=1}^{\infty} (k_n - 1) < \infty$. If $F(T) \neq \emptyset$, $\{\alpha_n\}, \{\beta_n\} \subseteq (0, 1)$. Let $x_0 \in C$, $\{x_n\}$ be generated by $x_{n+1} = \alpha_n T^n x_n \oplus (1 - \alpha_n) y_n$, $y_n = \beta_n x_n \oplus (1 - \beta_n) T^n x_n$, $n \geq 0$. Then the limit $\lim_{n \rightarrow \infty} d(x_n, p)$ exists for all $p \in F(T)$.

Proof. Taking $p \in F(T)$, we have

$$\begin{aligned} d(x_{n+1}, p) &= d(\alpha_n T^n x_n \oplus (1 - \alpha_n) y_n, p) \\ &\leq \alpha_n k_n d(x_n, p) + (1 - \alpha_n) d(y_n, p) \\ &\leq \alpha_n k_n d(x_n, p) \\ &\quad + (1 - \alpha_n) \{\beta_n d(x_n, p) + (1 - \beta_n) d(T^n x_n, p)\} \\ &\leq \alpha_n k_n d(x_n, p) \\ &\quad + (1 - \alpha_n) \{\beta_n d(x_n, p) + (1 - \beta_n) k_n d(x_n, p)\} \\ &= \{1 + (k_n - 1) [1 - (1 - \alpha_n) \beta_n]\} d(x_n, p). \end{aligned} \quad (31)$$

By Lemma 3, we can get that $\lim_{n \rightarrow \infty} d(x_n, p)$ exists. $\square$

Next, we will prove $\lim_{n \rightarrow \infty} d(T^n x_n, y_n) = 0$.

Proposition 9. Let X be a CAT(0) space, C a closed convex subset of X , and $T : C \rightarrow C$ an asymptotically nonexpansive mapping with coefficient k_n . If $F(T) \neq \emptyset$, $\{\alpha_n\}, \{\beta_n\} \subseteq (0, 1)$. Let $x_0 \in C$, $\{x_n\}$ be generated by $x_{n+1} = \alpha_n T^n x_n \oplus (1 - \alpha_n) y_n$, $y_n = \beta_n x_n \oplus (1 - \beta_n) T^n x_n$, $n \geq 0$. Then under the hypotheses (H1) and (H2), one can get that $\lim_{n \rightarrow \infty} d(T^n x_n, y_n) = 0$.

Proof. By the assumption, $F(T)$ is nonempty. Take $p \in F(T)$, let $L = \sup_n k_n$, then we have

$$\begin{aligned} d(T^n x_n, p) &\leq k_n d(x_n, p) \leq L d(x_n, p), \\ d(y_n, p) &\leq \beta_n d(x_n, p) + (1 - \beta_n) d(T^n x_n, p) \\ &\leq L d(x_n, p) \\ d(T^n y_n, p) &\leq k_n d(y_n, p) \leq L^2 d(x_n, p). \end{aligned} \quad (32)$$

It follows that the sequences $\{x_n\}, \{T^n x_n\}, \{y_n\}, \{T^n y_n\}$ are bounded.

By Lemma 1, we have

$$\begin{aligned} d^2(x_{n+1}, p) &= d^2(\alpha_n T^n x_n \oplus (1 - \alpha_n) y_n, p) \\ &\leq \alpha_n k_n^2 d^2(x_n, p) + (1 - \alpha_n) d^2(y_n, p) \\ &\quad - \alpha_n (1 - \alpha_n) d^2(T^n x_n, y_n) \\ &\leq d^2(x_n, p) + (1 - \alpha_n) \{d^2(y_n, p) - d^2(x_n, p)\} \\ &\quad + \alpha_n (k_n^2 - 1) d^2(x_n, p) \\ &\quad - \alpha_n (1 - \alpha_n) d^2(T^n x_n, y_n). \end{aligned} \quad (33)$$

Similar to the proof of Proposition 6, we can get

$$d^2(y_n, p) - d^2(x_n, p) \leq (1 - \beta_n) (k_n^2 - 1) d^2(x_n, p). \quad (34)$$

Therefore, we have

$$\begin{aligned} d^2(x_{n+1}, p) &\leq d^2(x_n, p) + (1 - \alpha_n) (1 - \beta_n) \\ &\quad \times (k_n^2 - 1) d^2(x_n, p) \\ &\quad + \alpha_n (k_n^2 - 1) d^2(x_n, p) \\ &\quad - \alpha_n (1 - \alpha_n) d^2(T^n x_n, y_n). \end{aligned} \quad (35)$$

Since $\{x_n\}, \{y_n\}$ are bounded and $0 < \delta < \alpha_n < 1 - \delta$ for all $n \geq n_0$, we have

$$\begin{aligned} \delta^2 d^2(T^n x_n, y_n) &\leq d^2(x_n, p) - d^2(x_{n+1}, p) \\ &\quad + (1 - \alpha_n) (1 - \beta_n) (k_n^2 - 1) d^2(x_n, p) \\ &\quad + \alpha_n (k_n^2 - 1) d^2(x_n, p). \end{aligned} \quad (36)$$

By the conditions (H1) and (H2), we have $\sum_{n=1}^{\infty} (k_n^2 - 1) < \infty$ and

$$\sum_{n=1}^{\infty} \delta^2 d^2(T^n x_n, y_n) < \infty, \quad (37)$$

which implies that

$$\lim_{n \rightarrow \infty} d^2(T^n x_n, y_n) = 0. \quad (38)$$

□

Theorem 10. Let X be a CAT(0) space, C a closed convex subset of X , and $T : C \rightarrow C$ an asymptotically nonexpansive mapping with coefficient k_n . If $F(T) \neq \emptyset$, $\{\alpha_n\}, \{\beta_n\} \subseteq (0, 1)$. Let $x_0 \in C$, $\{x_n\}$ be generated by $x_{n+1} = \alpha_n T^n x_n \oplus (1 - \alpha_n) y_n$, $y_n = \beta_n x_n \oplus (1 - \beta_n) T^n x_n$, $n \geq 0$. Then under the hypotheses (H1) and (H2), one can get that $\{x_n\}$ Δ -converges to a fix point of T .

Proof. We first show that $\lim_{n \rightarrow \infty} d(x_n, T^n x_n) = 0$. Indeed, by Lemma 1, and $\beta_n \rightarrow 1$, we can get

$$\begin{aligned} d(x_n, y_n) &= d(x_n, \beta_n x_n \oplus (1 - \beta_n) T^n x_n) \\ &\leq (1 - \beta_n) d(x_n, T^n x_n) \rightarrow 0. \end{aligned} \quad (39)$$

And then,

$$d(x_n, T^n x_n) \leq d(x_n, y_n) + d(y_n, T^n x_n). \quad (40)$$

By Proposition 9, we obtain that $\lim_{n \rightarrow \infty} d(x_n, T^n x_n) = 0$.

We claim that $\lim_{n \rightarrow \infty} d(x_n, T x_n) = 0$. Indeed we have

$$\begin{aligned} d(x_{n+1}, x_n) &= d(\alpha_n T^n x_n \oplus (1 - \alpha_n) y_n, x_n) \\ &\leq \alpha_n d(T^n x_n, x_n) + (1 - \alpha_n) d(x_n, y_n) \rightarrow 0. \\ d(x_n, T^{n-1} x_n) &\leq d(\alpha_{n-1} T^{n-1} x_{n-1} \oplus (1 - \alpha_{n-1}) y_{n-1}, T^{n-1} x_n) \\ &\leq \alpha_{n-1} d(T^{n-1} x_{n-1}, T^{n-1} x_n) \\ &\quad + (1 - \alpha_{n-1}) d(y_{n-1}, T^{n-1} x_n) \\ &\leq \alpha_{n-1} k_{n-1} d(x_{n-1}, x_n) \\ &\quad + (1 - \alpha_{n-1}) [d(y_{n-1}, T^{n-1} x_{n-1}) \\ &\quad \quad + d(T^{n-1} x_{n-1}, T^{n-1} x_n)] \\ &\leq \alpha_{n-1} k_{n-1} d(x_{n-1}, x_n) \\ &\quad + (1 - \alpha_{n-1}) [d(y_{n-1}, T^{n-1} x_{n-1}) \\ &\quad \quad + k_{n-1} d(x_{n-1}, x_n)] \rightarrow 0. \end{aligned} \quad (41)$$

Thus,

$$\begin{aligned} d(x_n, T x_n) &\leq d(x_n, T^n x_n) + d(T^n x_n, T x_n) \\ &\leq d(x_n, T^n x_n) + L d(T^{n-1} x_n, x_n) \rightarrow 0. \end{aligned} \quad (42)$$

Since $\{x_n\}$ is bounded, we may assume that $\{x_n\}$ Δ -converges to a point $\hat{x}$. By Lemma 2, we have $\hat{x} \in F(T)$. □
