We first study the existence of PC-mild solutions for impulsive fractional semilinear integrodifferential equations and then present controllability results for fractional impulsive integrodifferential systems in Banach spaces. The method we adopt is based on fixed point theorem, semigroup theory, and generalized Bellman inequality. The results obtained in this paper improve and extend some known results. At last, an example is presented to demonstrate the applications of our main results.

1. Introduction

Fractional calculus is an area having a long history whose infancy dates back to three hundred years. However, at the beginning of fractional calculus, it develops slowly due to the disadvantage of technology. In recent decades, as the ancient mathematicians expected, fractional differential equations have been found to be a powerful tool in many fields, such as viscoelasticity, electrochemistry, control, porous media, and electromagnetic. For basic facts about fractional derivative and fractional calculus, one can refer to the books [1–4]. Since the fractional theory has played a very significant role in engineering, science, economy, and many other fields, during the past decades, fractional differential equations have attracted many authors, and there has been a great deal of interest in the solutions of fractional differential equations in analytical and numerical sense (see, e.g., [5–10] and references therein).

On the other hand, the impulsive differential systems are used to describe processes which are subjected to abrupt changes at certain moments [11–13]. The study of dynamical systems with impulsive effects has been an object of intensive investigations. It is well known that controllability is a key topic for control theory. Controllability means that it is possible to steer any initial state of the system to any final state in some finite time using an admissible control. We refer the readers to the survey [14] and the reference therein for controllability of nonlinear systems in Banach spaces. The sufficient controllability conditions for fractional impulsive integrodifferential systems in Banach spaces have already been obtained in [15–18].

Balachandran and Park [17] studied the controllability of fractional integrodifferential systems in Banach spaces without impulse

\[
\frac{d^q x(t)}{dt^q} = Ax(t) + f\left(t, x(t), \int_0^t h(t, s, x(s)) \, ds\right) + Bu(t), \quad t \in J = [0, b],
\]

\[x(0) = x_0 \in X,\]  

where \(0 < q < 1\), the state \(x(t)\) takes values in the Banach space \(X\), \(f : J \times X \times X \to X\), \(h : \Delta \times X \to X\) are continuous functions, and here \(\Delta = \{(t, s) : 0 \leq s \leq t \leq b\}\).

The control function \(u \in L^2[J, U]\), a Banach space of admissible control functions with \(U\) as a Banach space, and \(B : U \to X\) is a bounded linear operator.

In [19], Mophou considered the existence and uniqueness of a mild solution for impulsive fractional semilinear differential equation

\[
D^q_{0+} x(t) = Ax(t) + f(t, x(t)), \quad t \in I = [0, T], \quad t \neq t_k, \\
x(0) = x_0 \in X, \\
\Delta x|_{t=t_k} = I_k\left(x\left(t_k^-\right)\right), \quad k = 1, 2, \ldots, m,
\]
where $D^\alpha_0$ is the Caputo fractional derivative, and $0 < \alpha < 1$. The operator $A : D(A) \subset X \to X$ is a generator of a $C_0$-semigroup $\{T(t)\}_{t \geq 0}$ on a Banach space $X$, and $I_k : X \to X$ are impulsive functions.

To consider fractional systems in the infinite dimensional space, the first important step is to define a new concept of the mild solution. Unfortunately, By Hernández et al. [20], we know that the concept of mild solutions used in [17–19], inspired by Jaradat et al. [21], was not suitable for fractional evolution systems at all. Therefore, it is necessary to restudy this interesting and hot topic again.

Recently, in Wang and Zhou [18], a suitable concept of mild solutions was introduced, using Krasnoselskii’s fixed point theorem and Sadovski’s fixed point theorem, investigating complete controllability of fractional evolution systems in the infinite dimensional spaces

$$^cD^\beta x(t) = Ax(t) + f(t, x(t), (Hx)(t)) + Bu(t),$$

$$t \in J = [0, b], \quad x(0) = x_0 \in X,$$  \tag{3}

where $^cD^\beta$ is the Caputo fractional derivative of the order $0 < \beta \leq 1$ with the lower limit zero, the state $x(\cdot)$ takes values in Banach space $X$, and the control function $u(\cdot)$ is given in $L^2(J, U)$, with $U$ as a Banach space. $A : D(A) \subset X \to X$ is the infinitesimal generator of a strongly continuous semigroup $\{T(t)\}_{t \geq 0}$ in $X$, $B$ is a bounded linear operator from $U$ to $X$, and $f : J \times X \to X$ is given $X$-value functions. Some sufficient conditions for complete controllability of the previous system were obtained.

Inspired by the work of the previous papers and many known results in [22–24], we study the existence of mild solutions for impulsive fractional semilinear integrodifferential equation

$$D^\alpha_0 x(t) = Ax(t) + f(t, x(t), (Hx)(t)),$$

$$t \in I = [0, b], \quad t \neq t_k, \quad x(0) = x_0 \in X,$$  \tag{4}

where $D^\alpha_0$ is the Caputo fractional derivative, $0 < \alpha < 1$, the state $x(\cdot)$ takes values in Banach space $X$, $A : D(A) \subset X \to X$ is the infinitesimal generator of a strongly continuous semigroup $\{T(t)\}_{t \geq 0}$, and $A$ is a bounded linear operator. $f : J \times X \times X \to X$ is given $X$-value functions, $H$ is defined as

$$(Hx)(t) = \int_0^t h(t, s, x(s)) \, ds,$$  \tag{5}

where $h : \Delta \times X \to X$ are continuous, here $\Delta = \{(t, s) : 0 \leq s \leq t \leq b\}$, $I_k : X \to X$ are impulsive functions, $0 = t_0 < t_1 < \cdots < t_m < t_{m+1} = b$, $\Delta x_{t_k \to t_{k+1}} = x(t_k^-) - x(t_k^+)$, and $x(t_k^-) = \lim_{h \to 0^-} x(t_k - h)$ and $x(t_k^+) = \lim_{h \to 0^+} x(t_k + h)$ represent the right and left limits of $x(t)$ at $t = t_k$, respectively.

We also define a control $u$ and present controllability results for fractional integrodifferential systems in Banach spaces

$$D^\alpha_0 x(t) = Ax(t) + f(t, x(t), (Hx)(t)) + Bu(t),$$

$$t \in I = [0, b], \quad t \neq t_k, \quad x(0) = x_0 \in X,$$  \tag{6}

where $B$ is a bounded linear operator from $U$ to $X$, and the control function $u(\cdot)$ is given in $L^2(J, U)$, with $U$ as a Banach space.

The rest of the paper is organized as follows. In Section 2, we present some preliminaries and lemmas that are to be used later to prove our main results. In Section 3, the existence of PC-mild solutions for (4) is discussed. In Section 4, by introducing a class of controls, we present the controllability results for fractional impulsive integrodifferential systems (6). In Section 5, an example is given to illustrate the theory.

2. Preliminaries and Lemmas

Let us consider the set of functions $PC[I, X] = \{x : I \to X : x \in C([t_k, t_{k+1}], X), \text{ and there exist } x(t^-_k) \text{ and } x(t^+_k), \text{ } k = 0, 1, 2, \ldots, m \text{ with } x(t^-_k) = x(t^+_k)\}$ is a Banach space. Throughout this paper, let $A$ be the infinitesimal generator of a $C_0$-semigroup $\{T(t)\}_{t \geq 0}$ of a uniformly bounded operator on $X$. Let $L_{PC}(X)$ be the Banach space of all linear and bounded operator on $X$. For a $C_0$-semigroup $\{T(t)\}_{t \geq 0}$, we set $M_1 = \sup_{t \in I} \|T(t)\|_{L_{PC}(X)}$. For each positive constant $r$, set $B_r = \{x \in PC[I, X] : \|x\| \leq r\}$.

**Definition 1.** The fractional integral of order $\gamma$ with the lower limit zero for a function $f$ is defined as

$$I^\gamma f(t) = \frac{1}{\Gamma(\gamma)} \int_0^t \frac{f(s)}{(t-s)^{1-\gamma}} \, ds,$$  \tag{7}

provided that the right side is point-wise defined on $[0, +\infty)$, where $\Gamma(\cdot)$ is the gamma function.
Definition 2. The Riemann-Liouville derivative of the order \( \gamma \) with the lower limit zero for a function \( f : [0, \infty) \rightarrow \mathbb{R} \) can be written as
\[
^{L}D_{t}^{\gamma} f(t) = \frac{1}{\Gamma(n-\gamma)} \frac{d^n}{dt^n} \int_{0}^{t} \frac{f(s)}{(t-s)^{1-\gamma}} ds, \quad t > 0, \ n - 1 < \gamma < n.
\] (8)

Definition 3. The Caputo derivative of the order \( \gamma \) for a function \( f : [0, \infty) \rightarrow \mathbb{R} \) can be written as
\[
^{D}_{t}^{\gamma} f(t) = \frac{1}{\Gamma(n-\gamma)} \int_{0}^{t} \frac{f^{(n)}(s)}{(t-s)^{1-\gamma}} ds
\]
\[
- t^{n-\gamma} f^{(n)}(t), \quad t > 0, \ n - 1 < \gamma < n.
\] (10)

Remark 4. (1) If \( f(t) \in C^{n}[0, \infty) \), then
\[
^{D}_{t}^{\gamma} f(t) = \frac{1}{\Gamma(n-\gamma)} \int_{0}^{t} \frac{f^{(n)}(s)}{(t-s)^{1-\gamma}} ds
\]
\[
- t^{n-\gamma} f^{(n)}(t), \quad t > 0, \ n - 1 < \gamma < n.
\] (12)

(2) The Caputo derivative of a constant is equal to zero.

(3) If \( f \) is an abstract function with values in \( X \), then integrals which appear in Definitions 1, 2, and 3 are taken in Bochner's sense.

Definition 5 (see [22]). A mild solution of the following nonhomogeneous impulsive linear fractional equation of the form
\[
^{D}_{t}^{\alpha} x(t) = Ax(t) + h(t), \quad t \in I = [0, b], \ 0 < q < 1, \ t \neq t_{k},
\]
\[
x(0) = x_{0} \in X,
\]
\[
\Delta x|_{t=t_{k}} = I_{k}(x(t_{k})), \quad k = 1, 2, \ldots, m,
\] (11)
is given by
\[
\begin{align*}
x(t) &= \begin{cases} 
\mathcal{T}(t)x_{0} + \int_{0}^{t} (t-s)^{q-1} \Delta (s) h(s) ds, & t \in [0, t_{1}], \\
\mathcal{T}(t)x_{0} + \mathcal{T}(t-t_{1}) I_{1}(x(t_{1})) + \int_{t_{1}}^{t} (t-s)^{q-1} \Delta (s) h(s) ds, & t \in (t_{1}, t_{2}], \\
\vdots & \vdots \\
\mathcal{T}(t)x_{0} + \sum_{k=1}^{m} \mathcal{T}(t-t_{k}) I_{k}(x(t_{k})) + \int_{t_{m}}^{t} (t-s)^{q-1} \Delta (s) h(s) ds, & t \in (t_{m}, b],
\end{cases}
\end{align*}
\] (12)

where \( \mathcal{T}(\cdot) \) and \( \Delta(\cdot) \) are called characteristic solution operators and given by
\[
\mathcal{T}(t) = \int_{0}^{\theta} \xi_{q}(\theta) T(r^{q}) d\theta,
\]
\[
\Delta(t) = q \int_{0}^{\theta} \Theta_{q}(\theta) T(r^{q}) d\theta,
\] (13)

and for \( \theta \in (0, \infty),
\]
\[
\xi_{q}(\theta) = \frac{1}{\Gamma(1/q)} \omega_{q}(\theta^{1/q}) \geq 0,
\]
\[
\omega_{q}(\theta) = \frac{1}{\pi} \sum_{n = 1}^{\infty} (-1)^{n} \theta^{q-1} \pi^{-1} \Gamma(nq + 1) \sin(n\pi q),
\] (14)

where \( \xi_{q} \) is a probability density function defined on \( (0, \infty) \); that is,
\[
\int_{0}^{\infty} \xi_{q}(\theta) d\theta = 1.
\] (15)

Definition 6. By a PC-mild solution of (4), we mean that a function \( x \in PC[I, X] \), which satisfies the following integral equation:
\[
\begin{align*}
\mathcal{T}(t)x_{0} + \int_{0}^{t} (t-s)^{q-1} \Delta (s) h(s) ds, & t \in [0, t_{1}], \\
\mathcal{T}(t)x_{0} + \mathcal{T}(t-t_{1}) I_{1}(x(t_{1})) + \int_{t_{1}}^{t} (t-s)^{q-1} \Delta (s) h(s) ds, & t \in (t_{1}, t_{2}], \\
\vdots & \vdots \\
\mathcal{T}(t)x_{0} + \sum_{k=1}^{m} \mathcal{T}(t-t_{k}) I_{k}(x(t_{k})) + \int_{t_{m}}^{t} (t-s)^{q-1} \Delta (s) h(s) ds, & t \in (t_{m}, b],
\end{align*}
\] (16)

Definition 7. By a PC-mild solution of the system (6), we mean that a function \( x \in PC[I, X] \), which satisfies the following integral equation:
\[
\begin{align*}
\mathcal{T}(t)x_{0} + \int_{0}^{t} (t-s)^{q-1} \Delta (s) h(s) ds, & t \in [0, t_{1}], \\
\mathcal{T}(t)x_{0} + \mathcal{T}(t-t_{1}) I_{1}(x(t_{1})) + \int_{t_{1}}^{t} (t-s)^{q-1} \Delta (s) h(s) ds, & t \in (t_{1}, t_{2}], \\
\vdots & \vdots \\
\mathcal{T}(t)x_{0} + \sum_{k=1}^{m} \mathcal{T}(t-t_{k}) I_{k}(x(t_{k})) + \int_{t_{m}}^{t} (t-s)^{q-1} \Delta (s) h(s) ds, & t \in (t_{m}, b],
\end{align*}
\] (17)

Definition 8. The system (6) is said to be controllable on the interval \( I \), if for every \( x_{0}, x_{1} \in X \), there exists a control \( u \in L^{2}(J, U) \) such that a mild solution \( x \) of (6) satisfies \( x(b) = x_{1} \).
Let $\mathbb{X}$ be a Banach space, and a one parameter family $T(t)$, $0 \leq t < +\infty$, of bounded linear operators from $\mathbb{X}$ to $\mathbb{X}$ is a semigroup of bounded linear operators on $\mathbb{X}$ if

1. $T(0) = I$ (here, $I$ is the identity operator on $\mathbb{X}$);
2. $T(t+s) = T(t)T(s)$ for every $t, s \geq 0$ (the semigroup property).

A semigroup of bounded linear operator, $T(t)$, is uniformly continuous if $\lim_{t \to 0} \|T(t) - I\| = 0$.

**Lemma 10** (see [25]). Linear operator $A$ is the infinitesimal generator of a uniformly continuous semigroup if and only if $A$ is a bounded linear operator.

**Lemma 11** (see [19]). Let $T$ be a continuous and compact mapping of a Banach space $\mathbb{X}$ into itself, such that

$$\{ x \in \mathbb{X} : x = \lambda Tx \text{ for some } 0 \leq \lambda \leq 1 \}$$

is bounded. Then, $T$ has a fixed point.

**Lemma 12.** The operators $\mathcal{T}(t)$ and $\mathcal{S}(t)$ have the following properties.

(i) For any fixed $t \geq 0$, $\mathcal{T}(t)$ and $\mathcal{S}(t)$ are linear and bounded operators; that is, for any $x \in \mathbb{X}$,

$$\|\mathcal{T}(t)x\| \leq M_1 \|x\|, \quad \|\mathcal{S}(t)x\| \leq \frac{qM_1}{\Gamma(1+q)} \|x\|. \quad (19)$$

(ii) $\{\mathcal{T}(t), t \geq 0\}$ and $\{\mathcal{S}(t), t \geq 0\}$ are strongly continuous.

(iii) $\{\mathcal{T}(t), t \geq 0\}$ and $\{\mathcal{S}(t), t \geq 0\}$ are uniformly continuous; that is, for each fixed $t > 0$, and $e > 0$, there exists $h > 0$ such that

$$\|\mathcal{T}(t+e) - \mathcal{T}(t)\| \leq e, \quad \text{for } t + e > 0, \ |e| < h,$$

$$\|\mathcal{S}(t+e) - \mathcal{S}(t)\| \leq e, \quad \text{for } t + e > 0, \ |e| < h. \quad (20)$$

Proof. For the proof of (i) and (ii), the reader can refer to [23, Lemma 2.9] and [24, Lemmas 3.2–3.5]. For each fixed $t > 0$, and $h > e > 0$, one can obtain

$$\|\mathcal{T}(t+e) - \mathcal{T}(t)\| \leq \int_0^e \xi_q(\theta) \|T((t+\theta)^q) - I\| d\theta$$

$$\leq M_1 \int_0^e \xi_q(\theta) \|T((t+\theta)^q) - I\| d\theta,$$

$$\|\mathcal{S}(t+e) - \mathcal{S}(t)\| \leq qM_1 \int_0^e \theta \xi_q(\theta) \|T((t+e)^q - t^q) - I\| d\theta. \quad (21)$$

Because $A$ is a bounded linear operator, from Lemma 10 and Definition 9, we know that $A$ is the infinitesimal generator of a uniformly continuous semigroup. Thus, by the properties of uniformly continuous semigroup $(T(t))_{t \geq 0}$, we get

$$\|\mathcal{T}(t+e) - \mathcal{T}(t)\| \leq e,$$

$$\|\mathcal{S}(t+e) - \mathcal{S}(t)\| \leq e; \quad (22)$$

that is, $\{\mathcal{T}(t), t \geq 0\}$ and $\{\mathcal{S}(t), t \geq 0\}$ are uniformly continuous.

We list here the hypotheses to be used later.

$(H_1)$ $f : I \times \mathbb{X} \times \mathbb{X} \to \mathbb{X}$ is continuous and there exist functions $\mu_1, \mu_2 \in L[I, \mathbb{R}^+]$ such that

$$\|f(t,x_1,y_1) - f(t,x_2,y_2)\| \leq \mu_1(t) \|x_1 - x_2\| + \mu_2(t) \|y_1 - y_2\|, \quad (23)$$

$$x_1, x_2, y_1, y_2 \in \mathbb{X}.$$

$(H_2)$ There exist $\omega_0 \in C[I, \mathbb{R}^+]$ such that

$$\|I_k(x_1) - I_k(x_2)\| \leq \omega_k(t) \|x_1 - x_2\|, \quad x_1, x_2 \in \mathbb{X}, \quad k = 1, 2, \ldots, m. \quad (25)$$

$(H_3)$ The function $\Omega_m(t) : I \to \mathbb{R}^+$ is defined by

$$\Omega_m(t) = \frac{qM_1}{\Gamma(1+q)} \int_0^t (s-t)^{q-1} \left(\mu_1(s) + \nu_1^0 \nu_1^0 \mu_2(s)\right) ds$$

$$+ m \omega_0 M_1, \quad (26)$$

where $\nu_1^0 = \max\{\nu_1(t) \mid t \in I\}, \omega_0 = \max\{\omega_k(t) \mid t \in I, k = 1, 2, \ldots, m\}$, and $0 < \Omega_m(t) < 1, t \in I$.

$(H'_2)$ The constants $\Omega_n$ and $\Omega'_m(t) : I \to \mathbb{R}^+$ are defined by

$$\Omega_n = \frac{qM_1K}{\Gamma(1+q)} \int_0^b (b-s)^{q-1} \left(\mu_1(s) + \nu_1^0 \nu_1^0 \mu_2(s)\right) ds$$

$$+ \omega_0 m M_1,$$

$$\Omega'_m(t) = \frac{qM_1}{\Gamma(1+q)} \int_0^t (t-s)^{q-1} \left(\mu_1(s) + \nu_1^0 \nu_1^0 \mu_2(s)\right) ds$$

$$+ \frac{qM_1 \Omega_m}{\Gamma(1+q)} \int_0^t (t-s)^{q-1} ds + \omega_0 m M_1, \quad (27)$$

and $0 < \Omega'_m(t) < 1, t \in I$. 
3. Existence of Mild Solutions

Theorem 13. If the hypotheses $(H_1)$–$(H_4)$ are satisfied, then the fractional impulsive integrodifferential equation (4) has a unique mild solution $x \in PC[I, \mathbb{X}]$.

Proof. Define an operator $Q$ on $PC[I, \mathbb{X}]$ by

$$
(Qx)(t) = \begin{cases}
\mathcal{T}(t)x_0 + \int_0^t (t-s)^{\sigma-1} \delta'(t-s) \\
\times f(s, x(s), (Hx)(s)) ds, \quad t \in [0, t_1], \\
\mathcal{T}(t)x_0 + \sum_{k=1}^m \mathcal{T}(t-t_k)I_k(x(t_k)), \\
+ \int_0^t (t-s)^{\sigma-1} \delta(s) \\
\times f(s, x(s), (Hx)(s)) ds, \quad t \in (t_1, t_2], \\
\vdots \\
\mathcal{T}(t)x_0 + \sum_{k=1}^m \mathcal{T}(t-t_k)I_k(x(t_k)), \\
+ \int_0^t (t-s)^{\sigma-1} \delta(s) \\
\times f(s, x(s), (Hx)(s)) ds, \quad t \in (t_m, b].
\end{cases}
$$

(28)

We will show that $Q$ is well defined on $PC[I, \mathbb{X}]$. For $0 \leq t < t_1$, applying (28), we obtain

$$
\|Qx(t) - (Qx)(\tau)\| \\
\leq \|\mathcal{T}(t) - \mathcal{T}(\tau)\| \|x_0\| \\
+ \left\| \int_0^t (t-s)^{\sigma-1} \delta'(t-s) \\
\times f(s, x(s), (Hx)(s)) ds \\
+ \int_0^t (t-s)^{\sigma-1} \delta(s) \\
\times f(s, x(s), (Hx)(s)) ds \right\| \\
+ \left\| \int_0^t (t-s)^{\sigma-1} \delta'(t-s) \\
\times f(s, x(s), (Hx)(s)) ds \right\| \\
+ \left\| \int_0^t (t-s)^{\sigma-1} \delta(s) \\
\times f(s, x(s), (Hx)(s)) ds \right\| \\
\leq \|\mathcal{T}(t) - \mathcal{T}(\tau)\| \|x_0\| \\
+ \left\| \int_0^t (t-s)^{\sigma-1} \delta'(t-s) \\
\times f(s, x(s), (Hx)(s)) ds \right\| \\
+ \left\| \int_0^t (t-s)^{\sigma-1} \delta'(t-s) \\
\times f(s, x(s), (Hx)(s)) ds \right\| \\
+ \left\| \int_0^t (t-s)^{\sigma-1} \delta(s) \\
\times f(s, x(s), (Hx)(s)) ds \right\|.
$$

(29)

From the well-known inequality $|t^\sigma - \tau^\sigma| \leq (t-\tau)^\sigma$ for $\sigma \in (0, 1]$ and $0 < \tau \leq t$ and Lemma 12, it is obvious that $\|Qx(t) - (Qx)(\tau)\| \to 0$ as $t \to \tau$. Thus, we deduce that $Qx \in C([0, t_1], \mathbb{X})$. For $t_1 < \tau < t \leq t_2$, applying (28), we have

$$
\|Qx(t) - (Qx)(\tau)\| \\
\leq \|\mathcal{T}(t) - \mathcal{T}(\tau)\| \|x_0\| \\
+ \left\| \int_0^t (t-s)^{\sigma-1} \delta'(t-s) \\
\times f(s, x(s), (Hx)(s)) ds \right\| \\
+ \left\| \int_0^t (t-s)^{\sigma-1} \delta'(t-s) \\
\times f(s, x(s), (Hx)(s)) ds \right\| \\
+ \left\| \int_0^t (t-s)^{\sigma-1} \delta(s) \\
\times f(s, x(s), (Hx)(s)) ds \right\|.
$$

(30)

It is easy to get that, as $t \to \tau$, the right-hand side of the previous inequality tends to zero. Thus, we can deduce that $Qx \in C([t_1, t_2], \mathbb{X})$. By repeating the same procedure, we can also obtain that $Qx \in C([t_2, t_3], \mathbb{X}), \ldots, Qx \in C([t_m, b], \mathbb{X})$. That is, $Qx \in PC[I, \mathbb{X}]$.

Take $t \in [0, t_1]$; then,

$$
\|Qx(t) - (Qx)(\tau)\| \\
\leq \left\| \int_0^t (t-s)^{\sigma-1} \delta'(t-s) \\
\times f(s, x(s), (Hx)(s)) ds \right\| \\
+ \left\| \int_0^t (t-s)^{\sigma-1} \delta'(t-s) \\
\times f(s, x(s), (Hx)(s)) ds \right\| \\
+ \left\| \int_0^t (t-s)^{\sigma-1} \delta(s) \\
\times f(s, x(s), (Hx)(s)) ds \right\| \\
+ \left\| \int_0^t (t-s)^{\sigma-1} \delta(s) \\
\times f(s, x(s), (Hx)(s)) ds \right\|.
$$

(31)

From $(H_2)$ and $(H_3)$, we obtain

$$
\|Qx(t) - (Qy)(t)\| \\
\leq \left\| \int_0^t (t-s)^{\sigma-1} \delta'(t-s) \\
\times f(s, x(s), (Hx)(s)) ds \right\| \\
+ \left\| \int_0^t (t-s)^{\sigma-1} \delta'(t-s) \\
\times f(s, x(s), (Hx)(s)) ds \right\| \\
+ \left\| \int_0^t (t-s)^{\sigma-1} \delta(s) \\
\times f(s, x(s), (Hx)(s)) ds \right\| \\
+ \left\| \int_0^t (t-s)^{\sigma-1} \delta(s) \\
\times f(s, x(s), (Hx)(s)) ds \right\|.
$$

(32)

So we deduce that

$$
\|Qx(t) - (Qy)(t)\|_{PC} \\
\leq \frac{qM_1}{\Gamma(1+q)} \int_0^t (t-s)^{\sigma-1} \left( \mu_1(s) + \nu_1 b_2(s) \right) ds \\
\times \|x-y\|_{PC}.
$$

(33)
In general, for each \( t \in (t_i, t_{i+1}], 1 \leq i \leq m \), using the assumptions,
\[
\| (Qx)(t) - (Qy)(t) \|_{PC} \leq \frac{qM_1}{\Gamma(1+q)} \int_0^t (t-s)^{q-1} \left( \mu_1(s) + v_1^0 b \mu_2(s) \right) ds \| x - y \|_{PC} + \sum_{k=1}^i \mathcal{T}(t-t_k) I_k(x(t_k^-)) + \sum_{k=1}^i \mathcal{T}(t-t_k) I_k(y(t_k^-)) \leq \frac{qM_1}{\Gamma(1+q)} \int_0^t (t-s)^{q-1} \left( \mu_1(s) + v_1^0 b \mu_2(s) \right) ds \| x - y \|_{PC} + m \omega_0 M_1 \| x - y \|_{PC} \leq \Omega_i(t) \| x - y \|_{PC},
\]
when \( i = m \), obviously
\[
\| (Qx)(t) - (Qy)(t) \|_{PC} \leq \frac{qM_1}{\Gamma(1+q)} \int_0^t (t-s)^{q-1} \left( \mu_1(s) + v_1^0 b \mu_2(s) \right) ds \| x - y \|_{PC} + m \omega_0 M_1 \| x - y \|_{PC} \leq \Omega_m(t) \| x - y \|_{PC}.
\]
Noting that \( \Omega_i(t) \leq \Omega_m(t) \), with assumption (H4) and in the view of the contraction mapping principle, we know that \( Q \) has a unique fixed point \( x \in PC[I, \mathbb{X}] \); that is,
\[
Qx = x
\]
is a PC-mild solution of (4).

In order to obtain results by the Schaefer fixed point theorem, let us list the following hypotheses.

\((H_5)\) \( f : I \times \mathbb{X} \times \mathbb{X} \rightarrow \mathbb{X} \) is continuous and there exist functions \( \mu_3, \mu_4, \mu_5 \in L[I, \mathbb{R}^+] \) such that
\[
\| f(t, x, y) \| \leq \mu_3(t) + \mu_4(t) \| x \| + \mu_5(t) \| y \|, \quad t \in I, \; x, y \in \mathbb{X}.
\]
\((H_6)\) \( h : \Delta \times \mathbb{X} \times \mathbb{X} \rightarrow \mathbb{X} \) is continuous and there exist functions \( \nu_2, \nu_3 \in C[I, \mathbb{R}^+] \) such that
\[
\| h(t, s, x) \| \leq \nu_2(s) + \nu_3(s) \| x \|, \quad x \in \mathbb{X}.
\]
\((H_7)\) There exist \( \psi_k \in C[I, \mathbb{R}^+] \) such that
\[
\| I_k(x) \| \leq \psi_k(t) \| x \|, \quad x \in \mathbb{X}.
\]
\((H_8)\) For all bounded subsets \( B_r \), the set
\[
\Pi_h, \delta(t) = \left\{ \mathcal{T}_\delta(t)x_0 + \int_0^{t-h} (t-s)^{q-1} \mathcal{S}_\delta(t-s)F(s) \, ds + \sum_{k=1}^m \mathcal{T}_\delta(t-t_k) I_k(x(t_k^-)) : x \in B_r \right\}
\]
is relatively compact in \( \mathbb{X} \) for arbitrary \( h \in (0, t) \) and \( \delta > 0 \), where
\[
\mathcal{S}_\delta(t) = \int_\delta^\infty \xi_q(\theta) T(\theta^t) d\theta, \quad \mathcal{S}_\delta(t) = q \int_\delta^\infty \theta \xi_q(\theta) T(\theta^t) d\theta.
\]
\((H'_8)\) For all bounded subsets \( B_r \), the set
\[
\Pi_h, \delta'(t) = \left\{ \mathcal{T}_\delta(t)x_0 + \int_0^{t-h} (t-s)^{q-1} \mathcal{S}_\delta(t-s) [F(s) + Bu(s)] ds + \sum_{k=1}^m \mathcal{T}_\delta(t-t_k) I_k(x(t_k^-)) : x \in B_r \right\}
\]
is relatively compact in \( \mathbb{X} \) for arbitrary \( h \in (0, t) \) and \( \delta > 0 \).

\textbf{Theorem 14.} If the hypotheses (H5)-(H8) are satisfied, the fractional impulsive integrodifferential equation (4) has at least one mild solution \( x \in PC[I, \mathbb{X}] \).
Proof. From Theorem 13, we know that operator \( Q \) is defined as follows:

\[
(Qx)(t) = \begin{cases} 
\mathcal{T}(t)x_0 + \int_0^t (t-s)^{\delta-1} \mathcal{S}(t-s) \\
\times f(s, x(s), (Hx(s)) ds, & t \in [0, t_1], \\
\mathcal{T}(t)x_0 + \sum_{k=1}^m \mathcal{T}(t-t_k) I_k(x(t_k)) \\
+ \int_0^t (t-s)^{\delta-1} \mathcal{S}(t-s) \\
\times f(s, x(s), (Hx(s)) ds & t \in (t_1, t_2], \\
\vdots \\
\mathcal{T}(t)x_0 + \sum_{k=1}^m \mathcal{T}(t-t_k) I_k(x(t_k)) \\
+ \int_0^t (t-s)^{\delta-1} \mathcal{S}(t-s) \\
\times f(s, x(s), (Hx(s)) ds & t \in (t_m, b].
\end{cases}
\]  

(43)

We will prove the results in five steps.

Step 1 (continuity of \( Q \) on \((t_i, t_{i+1}) \) \((i = 0, 1, 2, \ldots, m)\). Let \( x_n, x \in PC[I, X] \) such that \( \|x_n - x\|_{PC} \to 0 \) \((n \to +\infty)\), and then \( r = \sup_n \|x_n\|_{PC} < \infty \) and \( \|x\|_{PC} < r \); for every \( t \in (t_i, t_{i+1}) \) \((i = 0, 1, 2, \ldots, m)\), we have

\[
\| (Qx_n)(t) - (Qx)(t) \| \\
\leq \frac{qM_1}{\Gamma(1 + q)} \int_0^t (t-s)^{q-1} \\
\times \| f(s, x_n(s), (Hx_n)(s)) - f(s, x(s), (Hx)(s)) \| ds \\
+ \left\| \sum_{k=1}^m \mathcal{T}(t-t_k) I_k(x_n(t_k)) - \sum_{k=1}^m \mathcal{T}(t-t_k) I_k(x(t_k)) \right\|.
\]  

(44)

Since the functions \( f \) and \( I_k \) are continuous,

\[
f(s, x_n(s), (Hx_n)(s)) \to f(s, x(s), (Hx)(s)),
\]

\[
I_k(x_n(t_k)) \to I_k(x(t_k)) \quad n \to \infty.
\]  

(45)

By conditions \((H_x)\) and \((H_x)\), we know that

\[
\| f(s, x_n(s), (Hx_n)(s)) - f(s, x(s), (Hx)(s)) \| \\
\leq 2\mu_3(s) + \mu_4(s) \|x\| + \|x_n\| \\
+ \mu_6(s) \|Hx\| + \|Hx_n\| \\
\leq 2\mu_3(s) + 2\mu_5(s) \int_0^t \varphi_2(\theta) d\theta \\
+ \left( \mu_4(s) + \mu_5(s) \int_0^t \varphi_3(\theta) d\theta \right) (\|x\| + \|x_n\|)
\]

\[
\leq 2\mu_3(s) + 2\mu_5(s) \int_0^t \varphi_2(\theta) d\theta \\
+ \left( \mu_4(s) + 2\mu_5(s) \int_0^t \varphi_3(\theta) d\theta \right) r.
\]  

(46)

Hence,

\[
(t-s)^{q-1} \| f(s, x_n(s), (Hx_n)(s)) - f(s, x(s), (Hx)(s)) \| \\
\to 0 \quad t \to t_i,
\]

(47)

By the Lebesgue dominated convergence theorem, we get

\[
\int_0^t (t-s)^{q-1} \| f(s, x_n(s), (Hx_n)(s)) - f(s, x(s), (Hx)(s)) \| ds \to 0.
\]  

(48)

It is easy to obtain that

\[
\lim_{n \to \infty} \| (Qx_n)(t) - (Qx)(t) \|_{PC} = 0.
\]  

(49)

Thus, \( Q \) is continuous on \((t_i, t_{i+1}) \) \((i = 0, 1, 2, \ldots, m)\).

Step 2 (\( Q \) maps bounded sets into bounded sets in \( PC[I, X] \)). From (43), we get

\[
\| (Qx)(t) \| \\
\leq \| \mathcal{T}(t)x_0 \| + \frac{qM_1}{\Gamma(1 + q)} \int_0^t (t-s)^{q-1} \\
\times \| f(s, x(s), (Hx)(s)) \| ds \\
+ m \| \mathcal{T}(t-t_k) I_k(x(t_k)) \|,
\]

and we know that

\[
\| f(s, x(s), (Hx)(s)) \| \\
\leq \mu_3(s) + \mu_5(s) \int_0^t \varphi_2(\theta) d\theta \\
+ \left( \mu_4(s) + 2\mu_5(s) \int_0^t \varphi_3(\theta) d\theta \right) (\|x\| + \|x_n\|)
\]

\[
\leq \varphi_1(s) + \varphi_2(s) \|x\|.
\]  

(50)

(51)

From (50) and (51), we obtain

\[
\| (Qx)(t) \| \leq M_1 \|x_0\| + mM_4 \|x\| \\
+ \frac{q\beta M_1}{\Gamma(1 + q)} \int_0^t (\varphi_1(s) + \varphi_2(s) \|x\|) ds,
\]

(52)

where \( \psi_0 = \max \{\psi(t) \mid t \in I, k = 1, 2, \ldots, m\} \). Thus, for any \( x \in B_r = \{x \in PC[I, X] \mid \|x\|_{PC} \leq r\} \),

\[
\| (Qx)(t) \| \\
\leq M_1 \|x_0\| + \frac{q\beta M_1}{\Gamma(1 + q)} \int_0^b \varphi_1(s) ds \\
+ \left( \frac{q\beta M_1}{\Gamma(1 + q)} \int_0^t \varphi_2(s) ds + mM_4 \varphi_0 \right) r = \gamma_1.
\]  

(53)

Hence, we deduce that \( \| (Qx)(t) \| \leq \gamma_1 \); that is, \( Q \) maps bounded sets to bounded sets in \( PC[I, X] \).
Step 3. \( (Q(B_r) \) is equicontinuous with \( B_r \) on \( (t_i, t_{i+1}] \) \( (i = 0, 1, 2, \ldots, m) \). For any \( x \in B_r, t, t' \in (t_i, t_{i+1}] \) \( (i = 0, 1, 2, \ldots, m) \), we obtain

\[
\| (Qx) (t') - (Qx) (t) \| \\
\leq \| \mathcal{F}(t') x_0 - \mathcal{F}(t) x_0 \| \\
+ \left\| \int_0^{t'} (t'' - s)^{-\gamma} \delta (t'' - s) F(s) f(s) \, ds \right\| \\
- \left\| \int_0^{t'} (t' - s)^{-\gamma} \delta (t' - s) F(s) f(s) \, ds \right\|
\]

(54)

after some elementary computation, we have

\[
\| (Qx) (t') - (Qx) (t) \| \\
\leq \| \mathcal{F}(t') - \mathcal{F}(t) \| \| x_0 \| \\
+ \left\| \int_0^{t'} (t'' - s)^{-\gamma} \delta (t'' - s) F(s) f(s) \, ds \right\| \\
+ \left\| \int_0^{t'} (t' - s)^{-\gamma} \delta (t' - s) F(s) f(s) \, ds \right\|
\]

(55)

Using the fact that \( \mathcal{F}(t) \) and \( \delta(t) \) are uniformly continuous, and the well-known inequality \( |t'' - t'\sigma| \leq (t'' - t')^{\gamma} \) for \( \sigma \in (0,1] \) and \( 0 < \tau \leq t'' \), we can conclude that

\[
\lim_{\tau \to t''} \| (Qx)(t') - (Qx)(t') \| = 0.
\]

Thus \( Q(B_r) \) is equicontinuous with \( B_r \) on \( (t_i, t_{i+1}] \) \( (i = 0, 1, 2, \ldots, m) \).

Step 4 (\( Q \) maps \( B_r \) into a precompact set in \( X \)). We define

\[
\Pi = Q B_r \text{ and } \Pi(t) = \{ (Qx)(t) : x \in B_r \} \text{ for } t \in I.
\]

Set

\[
\Pi_{\delta, h}(t) = \{ (Q_{h, \delta} x)(t) : x \in B_r \},
\]

(56)

where

\[
\Pi_{\delta, h}(t) = \left\{ \mathcal{F}(t) x_0 + \int_0^{t-h} (t-s)^{\gamma-1} \delta(t-s) F(s) f(s) \, ds \\
+ \sum_{k=1}^{m} \mathcal{F}(t-h_k) I_k (x(t_k)) : x \in B_r \right\}.
\]

(57)

From Lemma 12(ii)-(iii), \( (H_b) \), and the same method used in Theorem 3.2 of [18], we can verify that the set \( \Pi(t) \) can be arbitrary approximated by the relatively compact set \( \Pi_{\delta, h}(t) \). Thus, \( Q(B_r)(t) \) is relatively compact in \( X \).

Step 5 (the set \( E = \{ x \in PC[I, X] : x = \lambda Qx \text{ for some } 0 < \lambda < 1 \} \) is bounded). Let \( x \in E \), and then

\[
| x(t) | \\
\leq \lambda M_1 \| x_0 \| + \frac{\lambda q^b M_1}{\Gamma(1 + q)} \int_0^t \| f_0(s) \| | x(s) | \, ds \\
+ \frac{\lambda q^b M_1}{\Gamma(1 + q)} \int_0^t \| f_0(s) \| | x(s) | \, ds
\]

(59)

Similarly to the results of (53), we know that

\[
\| x(t) \| \leq \frac{M_1 \| x_0 \|}{\rho} + \frac{q^b M_1}{\rho \Gamma(1 + q)} \int_0^t \| f_0(s) \| | x(s) | \, ds
\]

(60)

Obviously there exists \( \lambda \) sufficiently small such that \( \rho = 1 - \lambda m M_2 \psi_0 > 0 \), and then we get

\[
\| x(t) \| \leq \frac{M_1 \| x_0 \|}{\rho} + \frac{q^b M_1}{\rho \Gamma(1 + q)} \int_0^t \| f_0(s) \| | x(s) | \, ds
\]

(59)

Let

\[
N_b = \frac{M_1}{\rho} \| x_0 \| + \frac{q^b M_1}{\rho \Gamma(1 + q)} \int_0^t \| f_0(s) \| | x(s) | \, ds
\]

(61)

It is clear that \( f(t) \) is nonnegative continuous function on \( [0, +\infty) \), and generalized Bellman inequality implies that

\[
\| x(t) \| \leq N_b \| f(t) \| dx \leq N_b \| f(t) \| dx = C_0
\]

(62)

where \( C_0 \) is a constant. Obviously, the set \( E \) is bounded on \( (t_i, t_{i+1}] \) \( (i = 0, 1, 2, \ldots, m) \). Since \( Q \) is continuous and compact, thanks to Schaefer’s fixed point Theorem, \( Q \) has a fixed point (36) which is a PC-mild solution of (4).

4. Controllability Results

By introducing a class of controls, we present the controllability results for fractional impulsive integro-differential systems (6).

□
(H₉) The linear operator \( W_i \) from \( L^2[(t_{i-1}, t_i], U] \) into \( X \) is defined by
\[
W_i u = \int_0^{t_i} (t_i - s)^{q-1} \delta(t_i - s) Bu(s) \, ds,
\]
\( i = 1, 2, \ldots, m, m + 1, \)
induces an invertible operator \( \tilde{W}^- \) defined on \( L^2[(t_{i-1}, t_i], U] \) and \( \tilde{W}^- \) is well defined, and we will prove that when using the previous control, operator \( Q \) is a fixed point. Clearly, this fixed point is a PC-mild solution of the control problem \( 6 \) and \( \lambda(x) = x_1 \); that is, the control we defined steers the system \( 6 \) from initial \( x_0 \) to \( x_1 \) in the time \( b \).

For any \( x_1, x_2 \in C[(t_{i-1}, t_i], X] \) \( (i = 0, 1, 2, \ldots, m) \), by conditions \( (H_1) - (H_3), (H'_1), \) and \( (H_9) \), we get
\[
\|Bu(t) - Bu(t)\| \leq \left( \frac{qM_1K}{\Gamma(1+q)} \int_0^b (b-s)^{q-1} \right.
\]
\[
\times \left( \mu(s) + \nu(b)\mu_2(s) \right) ds \leq \Omega_0 \|x_1(s) - x_2(s)\|_{PC}\]
\[
\|(Qx_1)(t) - (Qx_2)(t)\| \leq \int_0^t (t-s)^{q-1} \delta(s) ds \times \|\delta(s) [Bu(s) - Bu(s)]\| ds
\]
\[
+ \sum_{k=1}^m \left( \|\delta(s) [I_k(x_1(t_k)) - x_1(t_k)]\|_{PC} \right)
\]
\[
\leq \Omega'_m \|x_1(s) - x_2(s)\|_{PC}.
\]

Since \( 0 < \Omega'_m(t) < 1 \), then \( Q \) is contraction mapping. Any fixed point of \( Q \) is a PC-mild solution of \( 6 \) which satisfies \( \lambda(b) = x_1 \). Thus, the system \( 6 \) is controllable on \( I \).

Theorem 16. If the hypotheses \( (H_2) - (H_7), (H'_2), \) and \( (H_9) \) are satisfied, the fractional impulsive integrodifferential system \( 6 \) is controllable on \( I \).
Proof. Using the condition \((H_9)\), for an arbitrary function \(x(\cdot)\), define the control
\[
\begin{align*}
\overline{W}_1 \left[ x_0 + \frac{x_1 - x_0}{m+1} - \mathcal{G}(t_1)x_0 \
- \int_0^{t_1} (t_1 - s)^{q-1} \delta(t_1 - s) \times f(s, x(s), (Hx)(s)) ds \right] (t), \quad t \in [0, t_1], \\
\overline{W}_2 \left[ x_0 + \frac{2(x_1 - x_0)}{m+1} - \mathcal{G}(t_2)x_0 \
- \int_0^{t_2} (t_2 - s)^{q-1} \delta(t_2 - s) \times f(s, x(s), (Hx)(s)) ds \right] (t), \quad t \in (t_1, t_2], \\
\vdots \\
\overline{W}_{m+1} \left[ x_1 - \mathcal{G}(b)x_0 \
- \int_0^{b} (b - s)^{q-1} \delta(b - s) \times f(s, x(s), (Hx)(s)) ds \right] (t), \quad t \in (t_m, b].
\end{align*}
\]

We will prove that when using the previous control, operator \(Q\) defined in (65) has a fixed point.

We discuss that in five steps.

Step 1 (continuity of \(Q\) on \((t_i, t_{i+1})\) \((i = 0, 1, 2, \ldots, m)\)). Let \(x_n, x \in \text{PC}[I, X]\), such that \(\|x_n - x^*\|_{\text{PC}} \to 0 \quad (n \to +\infty)\), and then \(r = \sup_n \|x_n\|_{\text{PC}} < \infty\) and \(\|x^*\|_{\text{PC}} < r\). For every \(t \in (t_i, t_{i+1})\) \((i = 0, 1, 2, \ldots, m)\), we have
\[
\|Qx_n(t) - Qx(t)\| \\
\leq \frac{qM_1}{\Gamma(1+q)} \int_0^t (t-s)^{q-1} \times \|f(s, x_n(s), (Hx_n)(s)) - f(s, x(s), (Hx)(s))\| ds + \frac{qM_1}{\Gamma(1+q)} \int_0^t (t-s)^{q-1} \|Bx_n(s) - Bx(s)\| ds + \psi_0 M_1 \sum_{k=1}^m \|I_k(x_n(t_k^*)) - I_k(x(t_k^*))\|. \\
\leq N_1 + N_2 \|x\|, \\
\tag{70}
\]

Thus, from (65), we get, for any \(x \in \text{PC} = \{x \in \text{PC}[I, X]: \|x\|_{\text{PC}} \leq r\},\)
\[
\|Qx(t)\| \leq M_1 \|x_0\| + \frac{qM_1}{\Gamma(1+q)} \int_0^b (\varphi_1(s) + N_1) ds + qM_1 \frac{\psi_0 M_1}{\Gamma(1+q)} \int_0^b \varphi_2(s) + N_2 ds + mM_1 \psi_0 r = \gamma_2. \\
\tag{71}
\]

Hence, we deduce that \(\|(Qx)(t)\| \leq \gamma_2\) that is, \(Q\) maps bounded sets to bounded sets in \(\text{PC}[I, X]\). Using the same method used in Theorem 14, we can verify that \(Q(B_r)\) is equicontinuous with \(B_r\) on \((t_i, t_{i+1})\) \((i = 0, 1, 2, \ldots, m)\), \(Q\) maps \(B_r\) into a precompact set in \(X\), and \(Q(B_r)(t)\) is relatively compact in \(X\). Steps 3 and 4 are omitted.

Step 5 (the set \(E = \{x \in \text{PC}[I, X]: x = \lambda Qx\quad \text{for some} \quad 0 < \lambda < 1\} \) is bounded). Let \(x \in E\), and similar to the results (74)
we know that
\[
\lVert x(t) \rVert \leq \lambda M_1 \lVert x_0 \rVert + \lambda q b \frac{M_1 t}{\Gamma(1 + q)} \int_0^t (\varphi_1(s) + N_1) ds + \lambda q b \frac{M_1 t}{\Gamma(1 + q)} \int_0^t (\varphi_2(s) + N_2) ds + \lambda m M \psi_0 \]
\times \lVert x(t) \rVert .
\] (75)

There exists a \( \lambda \) sufficiently small such that \( \rho_2 = 1 - \lambda m M \psi_0 > 0 \), and then
\[
\lVert x(t) \rVert \leq \frac{\lambda M_1}{\rho_2} \lVert x_0 \rVert + \frac{\lambda q b M_1}{\rho_2 \Gamma(1 + q)} \int_0^b (\varphi_1(s) + N_1) ds
\]
\[+ \frac{\lambda q b M_1}{\rho_2 \Gamma(1 + q)} \int_0^t (\varphi_2(s) + N_2) ds \lVert x(s) \rVert ds.
\] (76)

Let
\[
N_4 = \frac{\lambda M_1}{\rho_2} \lVert x_0 \rVert + \frac{\lambda q b M_1}{\rho_2 \Gamma(1 + q)} \int_0^b (\varphi_1(s) + N_1) ds,
\]
\[f(s) = \frac{\lambda q b M_1}{\rho_2 \Gamma(1 + q)} \int_0^t (\varphi_2(s) + N_2) ds.
\] (77)

It is clear that \( f(s) \) is nonnegative continuous function on \([0, +\infty)\), and generalized Bellman inequality implies that
\[
\lVert x(t) \rVert \leq N_4 e^{\int_0^t f(s) ds} \leq N_4 e^{\int_0^t f(s) ds} = C_1,
\] (78)

where \( C_1 \) is a constant. Thus the set \( E \) is bounded. Since \( Q \) is continuous and compact, thanks to Schaefer's fixed point Theorem, \( Q \) has a fixed point (36), and this fixed point is a PC-mild solution of (6) which satisfies \( x(b) = x_1 \). Hence, the system (6) is controllable on \( I \).

\section{An Example}

Consider the following nonlinear partial integrodifferential equation of the form
\[
\frac{\partial^{2/3}}{\partial t^{2/3}} z(t, y) = \int_0^1 (y-s) z(s, y) ds
\]
\[+ f(t, z(t, y), Hz(t, y)) + \mu(t, y), \; t \in I = [0, 1],
\]
\[z(t, 0) = z(t, 1) = 0,
\]
\[z(0, y) = 0, \; 0 < y < 1,
\]
\[\Delta z|_{t=1/2} = L_1 z(1, y),
\]
where \( 0 < q < 1, \mu: \mathbb{R} \times (0, 1) \to (0, 1) \) is continuous. Let us take \( \mathbb{X} = C([0, 1]) \). Consider the operator \( A: D(A) \subset \mathbb{X} \to \mathbb{X} \) defined by
\[
(Aw)(t) = \int_0^t (y-s) w(s) ds.
\] (80)

It is easy to get
\[
\|Aw\| = \|w\| \int_0^1 |y-s| ds = \left(\frac{1}{2} - y(1 - y)\right) \|w\| \leq \frac{1}{2} \|w\; ;
\] (81)

clearly \( A \) is the infinitesimal generator of a uniformly continuous semigroup \((T(t))_{t \geq 0}\) on \( \mathbb{X} \). Put \( x(t) = z(t, \cdot) \) and \( \mu(t, \cdot) \), and take
\[
f(t, x, Hx) = c' + a(t) \left(\frac{\|x\|}{1 + \|x\|}\right)
\]
\[+ \int_0^t k(t, s) \left(\frac{\|x\|}{1 + \|x\|}\right) ds,
\]
\[I_1(x) = \|x\|,
\] (82)

where \( a(t) \in C[0, 1], k(t, s) \in C([0, 1] \times [0, 1]) \). Then clearly, \( f: [0, 1] \times \mathbb{R} \times \mathbb{R} \to \mathbb{R} \) and \( I_1: \mathbb{R} \to \mathbb{R} \) are continuous functions. \( f, I_1, k, \) and \( h \) satisfy \((H_2)-(H_4)\), respectively. Equations (79) are an abstract formulation of (6). For \( y \in (0, 1) \), we define
\[
W_1 u = \int_0^{1/2} \left(\frac{1}{2} - s\right)^{-1/3} \delta \left(\frac{1}{2} - s\right) Bu(s) ds,
\]
\[W_2 u = \int_0^{1/2} (1-s)^{-1/3} \delta (1-s) Bu(s) ds,
\] (83)

where
\[
\mathcal{F}(t) w(s) = \int_0^{\infty} 2\pi_2(t, \theta) w(t^{2/3} + s) d\theta,
\]
\[2 \int_0^{\infty} \theta \pi_2(t, \theta) w(t^{2/3} + s) d\theta,
\] (84)

and for \( \theta \in (0, \infty) \),
\[
\pi_2(t, \theta) = \frac{3}{2} \theta^{-5/2} \pi_2(t, \theta^{-3/2}),
\]
\[\pi_2(t, \theta) = \frac{1}{2} \sum_{n=1}^{\infty} (-1)^n \theta^{-(2n+3)/3} \sin \left(\frac{2n \pi}{3}\right),
\] (85)

Assume that the linear operator \( W_i \) from \( L^2(T_{\lambda}, U) \) \((i = 1, 2)\) into \( \mathbb{X} \) induces an invertible operator \( W_i^{-1} \) defined on \( L^2(T_{\lambda}, U) / \text{Ker} W_i \) and there exists a positive constant \( K > 0 \) such that \( \|BW_i^{-1}\| \leq K \). Moreover, \((H_3)\) is satisfied. All conditions of Theorem 16 are now fulfilled, so we deduce that (79) is controllable on \( I \). On the other hand, we have
\[
\|f(t, x, Hx) - f(t, y, Hy)\|
\]
\[\leq a(t) \|x - y\| + \int_0^t k(t, s) \|x - y\| ds,
\]
\[k(t, s) \|x\| - k(t, s) \|y\| \leq k_0 \left(\|x\| - \|y\|\right),
\]
\[k_0 = \max{k(t, s) | (t, s) \in I \times I},
\]
\[\|I_1(x) - I_1(y)\| \leq \|x - y\|.
\] (86)
Further, other conditions \((H_1)-(H_3)\) are satisfied and it is possible to choose \(a(t), k(t, s)\) in such a way that condition \((H_2')\) is satisfied. Hence, by Theorem 15, the system (79) is controllable on \(I\).
