We define the notion of α^* - ψ -contractive mappings for cone metric space and obtain fixed points of multivalued mappings in connection with Hausdorff distance function for closed bounded subsets of cone metric spaces. We obtain some recent results of the literature as corollaries of our main theorem. Moreover, a nontrivial example of α^* - ψ -contractive mapping satisfying all conditions of our main result has been constructed.

1. Introduction

Banach contraction principle is widely recognized as the source of metric fixed point theory. Also, this principle plays an important role in several branches of mathematics. For instance, it has been used to study the existence of solutions for nonlinear equations, systems of linear equations, and linear integral equations and to prove the convergence of algorithms in computational mathematics. Because of its importance for mathematical theory, Banach contraction principle has been extended in many directions.

In 2007, Huang and Zhang [1] introduced cone metric space with normal cone, as a generalization of metric space. Rezapour and Hambarani [2] presented the results of [1] for the case of cone metric space without normality in cone. Many authors work out on it (see [3, 4]). Cho and Bae [5] introduced the Hausdorff distance function on cone metric spaces and generalized the result of [6] for multivalued mappings.

In 2012, Samet et al. [7] introduced the concept of α - ψ -contractive type mappings. Their results generalized some ordered fixed point results (see [7]). In [8], Karapinar et al. introduced the notion of a G^m -Meir-Keeler contractive mapping and established some fixed point theorems for the G^m -Meir-Keeler contractive mapping in the setting of G -metric spaces. For more details in fixed point theory related to our

paper, we refer to the reader [9–19]. Asl et al. [20] introduced the notion of α^* - ψ -contractive mappings and improved the concept of α - ψ -contractive mappings along with some fixed point theorems in metric space. Consequently, Ali et al. [21], Mohammadi et al. [22] and Salimi et al. [23] studied the concept of α^* - ψ -contractive mappings for proving fixed point results by using generalized contractive conditions in complete metric spaces.

In this paper, we first define the notion of α^* - ψ -contractive mappings for cone metric spaces and then we use it to study fixed point theorems for multivalued mappings satisfying α^* - ψ -contractive conditions in a complete cone metric space without the assumption of normality. We also furnish a nontrivial example to support our main result.

2. Preliminaries

In the following, we always suppose that $\mathbb{E}$ is a real Banach space, P is a cone in $\mathbb{E}$ with nonempty interior, and $\leq$ is the partial ordering with respect to P . By θ , we denote the zero element of $\mathbb{E}$. A subset P is called a cone if and only if

- (i) P is closed, nonempty, and $P = \{\theta\}$;
- (ii) $a, b \in \mathbb{R}$, $a, b \geq 0$, $x, y \in P \Rightarrow ax + by \in P$;
- (iii) $P \cap (-P) = \{\theta\}$.

For a given cone $P \subseteq \mathbb{E}$, we define a partial ordering $\leq$ with respect to P by $x \leq y$ if and only if $y - x \in P$; $x < y$ will stand for $x \leq y$ and $x \neq y$, while $x \ll y$ stand for $y - x \in \text{int } P$, where $\text{int } P$ denotes the interior of P .

Definition 1 (see [1]). Let X be a nonempty set. A function $d : X \times X \rightarrow \mathbb{E}$ is said to be a *cone metric*, if the following conditions hold:

- (C1) $\theta \leq d(x, y)$ for all $x, y \in X$ and $d(x, y) = \theta$ if and only if $x = y$;
- (C2) $d(x, y) = d(y, x)$ for all $x, y \in X$;
- (C3) $d(x, z) \leq d(x, y) + d(y, z)$ for all $x, y, z \in X$.

The pair (X, d) is then called a *cone metric space*.

Lemma 2 (see [1]). Let (X, d) be a cone metric space, $x \in X$, and let $\{x_n\}$ be a sequence in X . Then

- (i) $\{x_n\}$ converges to x whenever for every $c \in \mathbb{E}$ with $\theta \ll c$ there is a natural number n_0 such that $d(x_n, x) \ll c$, for all $n \geq n_0$. We denote this by $\lim_{n \rightarrow \infty} x_n = x$;
- (ii) $\{x_n\}$ is a Cauchy sequence whenever for every $c \in \mathbb{E}$ with $\theta \ll c$ there is a natural number n_0 such that $d(x_n, x_m) \ll c$, for all $n, m \geq n_0$;
- (iii) (X, d) is complete cone metric if every Cauchy sequence in X is convergent.

Remark 3 (see [3]). The results concerning fixed points and other results, in case of cone spaces with nonnormal cones, cannot be provided by reducing to metric spaces, because in this case neither of the conditions of the lemmas 1–4, in [1] hold. Further, the vector cone metric is not continuous in the general case; that is, from $x_n \rightarrow x, y_n \rightarrow y$ it need not follow that $d(x_n, y_n) \rightarrow d(x, y)$.

Let (X, d) be a cone metric space. The following properties of cone metric spaces have been noticed [3].

- (PT1) If $u \leq v$ and $v \ll w$, then $u \ll w$.
- (PT2) If $u \ll v$ and $v \leq w$, then $u \ll w$.
- (PT3) If $u \ll v$ and $v \ll w$, then $u \ll w$.
- (PT4) If $\theta \leq u \ll c$ for each $c \in \text{int } P$, then $u = \theta$.
- (PT5) If $a \leq b + c$, for each $c \in \text{int } P$, then $a \leq b$.
- (PT6) $\{a_n\}$ be a sequence in $\mathbb{E}$. If $c \in \text{int } P$ and $\theta \leq a_n \rightarrow \theta$ (as $n \rightarrow \infty$), then there exists $n_0 \in \mathbb{N}$ such that for all $n \geq n_0$, we have $a_n \ll c$.

With some modifications, we have the following definition from [24].

Definition 4. Let Ψ be a family of nondecreasing functions, $\psi : P \rightarrow P$ such that

- (i) $\psi(\theta) = \theta$ and $\theta < \psi(t) < t$ for $t \in P \setminus \{\theta\}$,
- (ii) $t \in \text{Int } P$ implies $t - \psi(t) \in \text{Int } P$,
- (iii) $\lim_{n \rightarrow +\infty} \psi^n(t) = \theta$ for every $t \in P \setminus \{\theta\}$.

3. Main Result

For a cone metric space (X, d) , denote (see [5])

$$N(X) = \{A : A \text{ is non empty subset of } X\}$$

$$CB(X) = \{A : A \text{ is non empty,}$$

closed and bounded subset of $X\},$

$$s(p) = \{q \in \mathbb{E} : p \leq q\} \quad \text{for } q \in \mathbb{E}, \quad (1)$$

$$s(a, B) = \bigcup_{b \in B} s(d(a, b)) = \bigcup_{b \in B} \{x \in \mathbb{E} : d(a, b) \leq x\}$$

for $a \in X$ and $B \in CB(X)$.

For $A, B \in CB(X)$ we denote

$$s(A, B) = \left(\bigcap_{a \in A} s(a, B) \right) \cap \left(\bigcap_{b \in B} s(b, A) \right). \quad (2)$$

Lemma 5. Let (X, d) be a cone metric space, and let P be a cone in Banach space $\mathbb{E}$.

- (1) Let $p, q \in \mathbb{E}$. If $p \leq q$, $s(q) \subset s(p)$.
- (2) Let $x \in X$ and $A \in N(X)$. If $\theta \in s(x, A)$, then $x \in A$.
- (3) Let $q \in P$ and let $A, B \in CB(X)$ and $a \in A$. If $q \in s(A, B)$, then $q \in s(a, B)$ for all $a \in A$ or $q \in s(A, b)$ for all $b \in B$.
- (4) Let $q \in P$ and let $\lambda \geq 0$, then $\lambda s(q) \subseteq s(\lambda q)$.

Remark 6. Let (X, d) be a cone metric space. If $\mathbb{E} = \mathbb{R}$ and $P = [0, +\infty)$, then (X, d) is a metric space. Moreover, for $A, B \in CB(X)$, $H(A, B) = \inf s(A, B)$ is the Hausdorff distance induced by d .

Definition 7. Let (X, d) be a complete cone metric space with cone $P, \psi \in \Psi, \alpha : X \times X \rightarrow [0, +\infty)$, and $F : X \rightarrow CB(X)$ is known as α^* - ψ -contractive multivalued mapping whenever

$$\psi(d(x, y)) \in \alpha^*(Fx, Fy) s(Fx, Fy) \quad (3)$$

for all $x, y \in X$, where $\alpha^*(A, B) = \inf\{\alpha(a, b) : a \in A, b \in B\}$. Also, we say that F is α^* -admissible whenever $\alpha(x, y) \geq 1$ implies $\alpha^*(Fx, Fy) \geq 1$.

Note that an α^* - ψ -contractive multivalued mappings for cone metric space is generalized α^* - ψ -contractive. When $\psi \in \Psi$ is a strictly increasing mapping, α^* - ψ -contractive is called strictly generalized α^* - ψ -contractive.

Theorem 8. Let (X, d) be a complete cone metric space with cone $P, \alpha : X \times X \rightarrow [0, +\infty)$ be a function, $\psi \in \Psi$ be a strictly increasing map and $F : X \rightarrow CB(X)$, and F be α^* -admissible and α^* - ψ -contractive multivalued mapping on X . Suppose that there exist $x_0 \in X, x_1 \in Fx_0$ such that $\alpha(x_0, x_1) \geq 1$. Assume that if $\{x_n\}$ is a sequence in X such that $\alpha(x_n, x_{n+1}) \geq 1$ for all n and $x_n \rightarrow u$ as $n \rightarrow +\infty$ then $\alpha(x_n, u) \geq 1$ for all n . Then, there exists a point x^* in X such that $x^* \in Fx^*$.

Proof. We may suppose that $x_0 \neq x_1$. Then $\alpha^*(Fx_0, Fx_1) \geq 1$ and

$$\psi(d(x_0, x_1)) \in \alpha^*(Fx_0, Fx_1) s(Fx_0, Fx_1). \quad (4)$$

By Lemma 5(3), we have

$$\psi(d(x_0, x_1)) \in \alpha^*(Fx_0, Fx_1) s(x_1, Fx_1). \quad (5)$$

By definition, we can take $x_2 \in Fx_1$ such that

$$\psi(d(x_0, x_1)) \in \alpha^*(Fx_0, Fx_1) s(d(x_1, x_2)). \quad (6)$$

By Lemma 5(4), we have

$$\begin{aligned} \psi(d(x_0, x_1)) &\in \alpha^*(Fx_0, Fx_1) s(d(x_1, x_2)) \\ &\subseteq s(\alpha^*(Fx_0, Fx_1) d(x_1, x_2)). \end{aligned} \quad (7)$$

So,

$$\alpha^*(Fx_0, Fx_1) d(x_1, x_2) \leq \psi(d(x_0, x_1)). \quad (8)$$

Hence,

$$0 < d(x_1, x_2) \leq \alpha^*(Fx_0, Fx_1) d(x_1, x_2) \leq \psi(d(x_0, x_1)) \quad (9)$$

$x_1 \neq x_2$ and $\alpha(x_1, x_2) \geq 1$. Thus $\alpha^*(Fx_1, Fx_2) \geq 1$ and $d(x_1, x_2) \leq \psi(d(x_0, x_1))$. If $x_2 \in Fx_2$, then x_2 is a fixed point of F . Assume that $x_2 \notin Fx_2$. Then

$$\psi(d(x_1, x_2)) \in \alpha^*(Fx_1, Fx_2) s(Fx_1, Fx_2). \quad (10)$$

By Lemma 5(3), we have

$$\psi(d(x_1, x_2)) \in \alpha^*(Fx_1, Fx_2) s(x_2, Fx_2). \quad (11)$$

By definition, we can take $x_3 \in Fx_2$ such that

$$\psi(d(x_1, x_2)) \in \alpha^*(Fx_1, Fx_2) s(d(x_2, x_3)). \quad (12)$$

By Lemma 5(4), we have

$$\begin{aligned} \psi(d(x_1, x_2)) &\in \alpha^*(Fx_1, Fx_2) s(d(x_2, x_3)) \\ &\subseteq s(\alpha^*(Fx_1, Fx_2) d(x_2, x_3)). \end{aligned} \quad (13)$$

So,

$$\alpha^*(Fx_1, Fx_2) d(x_2, x_3) \leq \psi(d(x_1, x_2)). \quad (14)$$

Hence,

$$0 < d(x_2, x_3) \leq \alpha^*(Fx_1, Fx_2) d(x_2, x_3) \leq \psi(d(x_1, x_2)). \quad (15)$$

It is clear that $x_2 \neq x_3$ and $\alpha(x_2, x_3) \geq 1$. Thus, $\alpha^*(Fx_2, Fx_3) \geq 1$ and $d(x_2, x_3) < \psi^2(\psi(d(x_0, x_1)))$.

If $x_3 \in Fx_3$, then x_3 is a fixed point of F . Assume that $x_3 \notin Fx_3$:

$$\psi(d(x_2, x_3)) \in \alpha^*(Fx_2, Fx_3) s(Fx_2, Fx_3). \quad (16)$$

By Lemma 5(3), we have

$$\psi(d(x_2, x_3)) \in \alpha^*(Fx_2, Fx_3) s(x_3, Fx_3). \quad (17)$$

By definition, we can take $x_4 \in Fx_3$ such that

$$\psi(d(x_2, x_3)) \in \alpha^*(Fx_2, Fx_3) s(d(x_3, x_4)). \quad (18)$$

By Lemma 5(4), we have

$$\begin{aligned} \psi(d(x_2, x_3)) &\in \alpha^*(Fx_2, Fx_3) s(d(x_3, x_4)) \\ &\subseteq s(\alpha^*(Fx_2, Fx_3) d(x_3, x_4)). \end{aligned} \quad (19)$$

So

$$\alpha^*(Fx_2, Fx_3) d(x_3, x_4) \leq \psi(d(x_2, x_3)). \quad (20)$$

Hence

$$0 < d(x_3, x_4) \leq \alpha^*(Fx_2, Fx_3) d(x_3, x_4) \leq \psi(d(x_2, x_3)). \quad (21)$$

It is clear that $x_3 \neq x_4$ and $\alpha(x_3, x_4) \geq 1$. Thus, $\alpha^*(Fx_3, Fx_4) \geq 1$ and $d(x_3, x_4) < \psi^3(\psi(d(x_0, x_1)))$. By continuing this process, we obtain a sequence $\{x_n\}$ in X such that $x_n \in Tx_{n-1}$, $x_n \neq x_{n-1}$, $\alpha(x_n, x_{n+1}) \geq 1$ and

$$d(x_n, x_{n+1}) \leq \psi(d(x_{n-1}, x_n)) \leq \dots \leq \psi^n(d(x_0, x_1)) \quad (22)$$

for all n . $\square$

Fix $\theta \ll c$. We choose a positive real number δ such that $(c - \psi(c)) + I(\theta, \delta) \subset \text{Int}P$, where $I(\theta, \delta) = \{y \in E : \|y\| < \delta\}$. By (iii) of Definition 4, there exists a natural number N such that $\psi^m(d(x_0, x_1)) \in I(\theta, \delta)$, for all $m \geq N$. Then

$$\psi^m(d(x_0, x_1)) \ll c - \psi(c), \quad (23)$$

for all $m \geq N$. Consequently, $d(x_m, x_{m+1}) \ll c - \psi(c)$, for all $m \geq N$. Fix $m \geq N$. Now we prove

$$d(x_m, x_{n+1}) \ll c \quad (24)$$

for all $n \geq m$. Note that (24) holds when $n = m$. Assume that (24) holds for some $n \geq m$. Then, we have

$$d(x_m, x_{n+1}) \ll c. \quad (25)$$

Now by (22), we have

$$\begin{aligned} d(x_m, x_{n+2}) &\leq d(x_m, x_{m+1}) + d(x_{m+1}, x_{n+2}) \\ &\ll c - \psi(c) + \psi d(x_m, x_{n+1}) \\ &\ll c - \psi(c) + \psi(c) = c. \end{aligned} \quad (26)$$

Therefore, (24) holds when $n = n+1$. By induction, we deduce that (24) holds for all $n \geq m$. This is sufficient to conclude that $\{x_n\}$ is a Cauchy sequence. Choose $u \in X$ such that $x_n \rightarrow u$. Since $\alpha(x_n, u) \geq 1$ for all n and F is α^* -admissible, so $\alpha^*(Fx_n, Fu) \geq 1$ for all n . From (3), we have

$$\psi(d(x_n, u)) \in \alpha^*(Fx_n, Fu) s(Fx_n, Fu) \quad (27)$$

for all $n \in \mathbb{N}$. By Lemma 5(3), we have

$$\psi(d(x_n, u)) \in \alpha^*(Fx_n, Fu) s(x_{n+1}, Fu). \quad (28)$$

By definition, we can take $v_n \in Fu$ such that

$$\psi(d(x_n, u)) \in \alpha^*(Fx_n, Fu) s(d(x_{n+1}, v_n)). \quad (29)$$

By Lemma 5(4), we have

$$\begin{aligned} \psi(d(x_n, u)) &\in \alpha^*(Fx_n, Fu) s(d(x_{n+1}, v_n)) \\ &\subseteq s(\alpha^*(Fx_n, Fu) d(x_{n+1}, v_n)). \end{aligned} \quad (30)$$

So

$$\alpha^*(Fx_n, Fu) d(x_{n+1}, v_n) \leq \psi(d(x_n, u)). \quad (31)$$

Hence

$$\begin{aligned} 0 &< d(x_{n+1}, v_n) \\ &\leq \alpha^*(Fx_n, Fu) d(x_{n+1}, v_n) \\ &\leq \psi(d(x_n, u)) \\ &\leq d(x_n, u). \end{aligned} \quad (32)$$

Moreover, for a given $c \in \text{Int}P$, we have

$$\begin{aligned} d(u, v_n) &\leq d(u, x_{n+1}) + d(x_{n+1}, v_n) \\ &\leq d(u, x_{n+1}) + \alpha^*(Fx_n, Fu) d(x_{n+1}, v_n) \\ &\leq d(u, x_{n+1}) + \psi(d(x_n, u)) \\ &\leq d(u, x_{n+1}) + d(x_n, u) \\ &\ll \frac{c}{2} + \frac{c}{2} = c, \quad \text{for } n \geq k = k(c). \end{aligned} \quad (33)$$

Hence, according to Lemma 2(i), we have $\lim_{n \rightarrow \infty} v_n = u$. Since Fu is closed, $u \in Fu$.

Theorem 9. Let (X, d) be a complete cone metric space with cone P , $\alpha : X \times X \rightarrow [0, +\infty)$ be a function, and $F : X \rightarrow CB(X)$ be α^* -admissible. If there exists a constant $k \in [0, 1)$ such that

$$kd(x, y) \in \alpha^*(Fx, Fy) s(Fx, Fy) \quad (34)$$

for all $x, y \in X$. Suppose that there exist $x_0 \in X, x_1 \in Fx_0$ such that $\alpha(x_0, x_1) \geq 1$. Assume that if $\{x_n\}$ is a sequence in X such that $\alpha(x_n, x_{n+1}) \geq 1$ for all n and $x_n \rightarrow u$ as $n \rightarrow +\infty$; then $\alpha(x_n, u) \geq 1$ for all n . Then, there exists a point x^* in X such that $x^* \in Fx^*$.

Proof. Take $\psi(t) = kt$ in Theorem 8. $\square$

Theorem 10. Let (X, d) be a complete cone metric space with cone P , $\psi \in \Psi$ be a strictly increasing map, and $F : X \rightarrow CB(X)$ be multivalued mapping such that

$$\psi(d(x, y)) \in s(Fx, Fy) \quad (35)$$

for all $x, y \in X$. Then, there exists a point x^* in X such that $x^* \in Fx^*$.

Proof. Take $\alpha^*(Fx, Fy) = 1$ in the Theorem 8. $\square$

Corollary 11. Let (X, d) be a complete cone metric space with cone P and let $F : X \rightarrow CB(X)$ be a multivalued mapping. If there exists a constant $k \in [0, 1)$ such that

$$kd(x, y) \in s(Fx, Fy) \quad (36)$$

for all $x, y \in X$, then, there exists a point x^* in X such that $x^* \in Fx^*$.

Proof. Take $\psi(t) = kt$ and $\alpha^*(Fx, Fy) = 1$ in the Theorem 8. $\square$

Corollary 12 (see [20]). Let (X, d) be a complete metric space, $\alpha : X \times X \rightarrow [0, +\infty)$ be a function, $\psi \in \Psi$ be a strictly increasing map, and $F : X \rightarrow CB(X)$ be α^* -admissible such that

$$\alpha^*(Fx, Fy) H(Fx, Fy) \leq \psi(d(x, y)) \quad (37)$$

for all $x, y \in X$. Suppose that there exist $x_0 \in X$ such that $\alpha(x_0, Fx_0) \geq 1$. Assume that if $\{x_n\}$ is a sequence in X such that $\alpha(x_n, x_{n+1}) \geq 1$ for all n and $x_n \rightarrow u$ as $n \rightarrow +\infty$ then $\alpha(x_n, u) \geq 1$ for all n . Then, there exists a point x^* in X such that $x^* \in Fx^*$.

By Remark 6, we have the following corollaries.

Corollary 13 (see [20]). Let (X, d) be a complete metric space, $\psi \in \Psi$ be a strictly increasing map, and $F : X \rightarrow CB(X)$ be a multivalued mapping such that

$$H(Fx, Fy) \leq \psi(d(x, y)) \quad (38)$$

for all $x, y \in X$. Then, there exists a point x^* in X such that $x^* \in Fx^*$.

Proof. Take $\alpha^*(Fx, Fy) = 1$ in the Corollary 12. $\square$

Corollary 14 (see [20]). Let (X, d) be a complete metric space, $\alpha : X \times X \rightarrow [0, +\infty)$ be a function, and $F : X \rightarrow CB(X)$ be α^* -admissible. If there exists a constant $k \in [0, 1)$ such that

$$\alpha^*(Fx, Fy) H(Fx, Fy) \leq kd(x, y) \quad (39)$$

for all $x, y \in X$. Suppose that there exist $x_0 \in X$ such that $\alpha(x_0, Fx_0) \geq 1$. Assume that if $\{x_n\}$ is a sequence in X such that $\alpha(x_n, x_{n+1}) \geq 1$ for all n and $x_n \rightarrow u$ as $n \rightarrow +\infty$ then $\alpha(x_n, u) \geq 1$ for all n . Then, there exists a point x^* in X such that $x^* \in Fx^*$.

Proof. Take $\psi(t) = kt$ in the Corollary 13. $\square$

Corollary 15 (see [25]). Let (X, d) be a complete metric space and let $F : X \rightarrow CB(X)$ be a multivalued mapping. If there exists a constant $k \in [0, 1)$ such that

$$H(Fx, Fy) \leq kd(x, y) \quad (40)$$

for all $x, y \in X$. Then, there exists a point x^* in X such that $x^* \in Fx^*$.

Proof. Take $\alpha^*(Fx, Fy) = 1$ in the Corollary 14. $\square$

Example 16. Let $X = [0, 1]$, $E = C^1[0, 1]$, $P = \{\theta \leq x(t) : t \in X\}$, where $\theta(t) = 0$ for all $t \in X$. Define $d : X \times X \rightarrow E$ by

$$d(x, y) = |x - y|e^t \quad (41)$$

and $F : X \rightarrow 2^X$ by $Fx = [0, (x/12)]$ for all $x \in X$ and

$$\alpha(x, y) = \begin{cases} \frac{1}{|x - y|} & \text{if } x \neq y \\ 1 & \text{if } x = y. \end{cases} \quad (42)$$

Then, $\alpha(x, y) \geq 1 \Rightarrow \alpha^*(Fx, Fy) = \inf\{\alpha(x, y) : x \in Fx, y \in Fy\} \geq 1$. Then, clearly F is α^* -admissible. Now for x, y and $x \leq y$, we get

$$\begin{aligned} \psi(d(x, y)) &= \frac{1}{5} |x - y|e^t \geq \frac{1}{12} |x - y|e^t \\ &= \alpha^*(Fx, Fy) s(Fx, Fy) \end{aligned} \quad (43)$$

which implies that

$$\psi(d(x, y)) \in \alpha^*(Fx, Fy) s(Fx, Fy). \quad (44)$$

So F is α^* - ψ -contractive multivalued mapping on X where $\psi(t) = t/5$. Thus, all the conditions of main result are satisfied to obtain the fixed point of F .

Conflict of Interests

The authors declare that they have no competing interests.

Authors' Contributions

All authors contributed equally and significantly in writing this paper. All authors read and approved the final paper.

Acknowledgments

The authors thank the editor and the referees for their valuable comments and suggestions which improved greatly the quality of this paper. The first author gratefully acknowledges the support from the Deanship of Scientific Research (DSR) at King Abdulaziz University (KAU) during this research.
