The commutativity of kth-order slant Toeplitz operators with harmonic polynomial symbols, analytic symbols, and coanalytic symbols is discussed. We show that, on the Lebesgue space and Bergman space, necessary and sufficient conditions for the commutativity of kth-order slant Toeplitz operators are that their symbol functions are linearly dependent. Also, we study the product of two kth-order slant Toeplitz operators and give some necessary and sufficient conditions.

1. Preliminaries

Throughout this paper, k is a fixed positive integer, and k ≥ 2. Let \( \varphi(z) = \sum_{i=-\infty}^{\infty} a_i z^i \) be a bounded measurable function on the unit circle \( T \), where \( a_i = \langle \varphi, z^i \rangle \) is the \( i \)th Fourier coefficient of \( \varphi \) and \( \{z^i : i \in \mathbb{Z}\} \) is the usual basis of \( L^2(T) \), with \( \mathbb{Z} \) being the set of integers. The \( k \)th-order slant Toeplitz operator \( U_{\varphi} \) with symbol \( \varphi \) in \( L^\infty(T) \) is defined on \( L^2(T) \) as follows:

\[
U_{\varphi}(z') = \sum_{i=-\infty}^{\infty} a_{ki-j} z^i.
\] (1)

In the past several decades, slant Toeplitz operators have played outstanding roles in wavelet analysis, curve and surface modelling, and dynamical systems (e.g., see [1–10]). For instance, Villemoes [7] has associated the Besov regularity of solution of the refinement equation with the spectral radius of an associated slant Toeplitz operators and has used the spectral radius of the slant Toeplitz operators to characterize the \( L_p \) (\( 1 \leq p \leq \infty \)) regularity of refinable functions; Goodman et al. [6] have shown the connection between the spectral radii and conditions for the solutions of certain differential equations that in the Lipschitz classes. However, these mathematicians concentrated mainly on the applications, but these considerations serve as a source of motivation to introduce and study the properties of slant Toeplitz operators.

In 1995, Ho [11–14] began a systematic study of the slant Toeplitz operators on the Hardy space. In [15–17], the authors discussed some properties of \( k \)th-order slant Toeplitz operator. In [18, 19], the authors defined the slant Toeplitz operator and \( k \)th-order slant Toeplitz operator on the Bergman spaces, respectively, and studied some properties of these operators.

In this paper, properties of \( k \)th-order slant Toeplitz operators with harmonic polynomial symbols, analytic symbols, and coanalytic symbols are discussed. We show that, on the Lebesgue space and Bergman space, the necessary and sufficient conditions for the commutativity of \( k \)th-order slant Toeplitz operators are that their symbol functions are linearly dependent. Meanwhile, we study the product of two \( k \)th-order slant Toeplitz operators and give some necessary and sufficient conditions.

2. Commutativity of \( k \)th-Order Slant Toeplitz Operators on \( L^2(T) \)

In [17], we investigated the properties of \( k \)th-order slant Toeplitz operators on \( L^2(T) \) and have obtained that for \( \varphi, \psi \in L^\infty(T) \), \( U_{\varphi} \) and \( U_{\psi} \) commute (essentially commute) if and only if \( \varphi(z^k) \psi - \varphi \psi(z^k) = 0 \).
Immediately we come up with the following problem. Could the commutativity of two $k$th-order slant Toeplitz operators be fully characterized by their symbols?

The partial answer to the perversive problem has been obtained in [17]: for $\psi \in H^{\infty}_{\mathbb{T}}(T)$ and $\varphi(z) = \sum_{p=0}^{\infty} a_p z^p$ or $\varphi(z) = \sum_{p=k+1}^{\infty} a_p z^p$, $U_\varphi$ and $U_\psi$ commute (essentially commute) if and only if there exist scalars $\alpha$ and $\beta$, not both zero, such that $\alpha \varphi + \beta \psi = 0$.

In this section the commutativity of $k$th-order slant Toeplitz operators with analytic symbols and harmonic symbols will be studied. First we discuss the commutativity of two $k$th-order slant Toeplitz operators with analytic symbols.

**Proposition 1.** Let $\varphi, \psi \in H^{\infty}(\mathbb{T})$, then the following statements are equivalent:

1. $\varphi(z)\psi(z) = \varphi(z)\psi(z)$;
2. there exist scalars $\alpha$ and $\beta$, not both zero, such that $\alpha \varphi + \beta \psi = 0$.

Proof. Begin with the easy direction. First, suppose that (1.2) holds. Without loss of generality, let $\alpha \neq 0$, so that $\varphi = -(\beta/\alpha)\psi$. Thus, $\varphi(z)^2 \psi(z) = \varphi(z) \psi(z)$.

To prove the other direction of the proposition, suppose that (1.1) holds; that is, $\varphi(z)\psi(z) = \varphi(z) \psi(z)$.

Let $\varphi(z) = \sum_{p=0}^{\infty} a_p z^p$ and $\psi(z) = \sum_{p=0}^{\infty} b_p z^p$, then

$$\sum_{p=0}^{\infty} a_p z^p \cdot \sum_{p=0}^{\infty} b_p z^p = \sum_{p=0}^{\infty} a_p \cdot \sum_{p=0}^{\infty} b_p z^{p+i},$$

that is,

$$\sum_{p=0}^{\infty} \sum_{i+j=p} a_i b_j z^p = \sum_{p=0}^{\infty} a_i b_j z^p,$$

where $i$ and $j$ are both nonnegative integers. Hence, for all nonnegative integers $i$, $j$, and $p$,

$$\sum_{k+i+j=p} a_i b_j = \sum_{i+k+j=p} a_i b_j.$$

Now we would give the proof in four cases.

*Case I.* Suppose that $a_0 b_0 \neq 0$. Let $\lambda = b_0/a_0$ and we continue the proof by the induction.

When $p = 1$, from (4) we get that $a_0 b_1 = a_1 b_0$, which means that $b_1 = \lambda a_1$.

When $p = 2$, from (4) we get that

$$a_0 b_2 + a_1 b_1 = a_1 b_2 + a_0 b_1, \quad \text{if } k = 2,$$

$$a_0 b_2 = a_1 b_2, \quad \text{if } k > 2,$$

which means that $b_2 = \lambda a_2$, since $b_1 = \lambda a_1$.

Now suppose that $b_1 = \lambda a_1$ for all integers $i$ with $0 \leq i \leq m$. Then, observe the connection between $a_{m+1}$ and $b_{m+1}$. Let $m+1 = kl + r$, where $l$ and $r$ are nonnegative integers with $0 \leq r \leq k - 1$.

When $p = m + 1$, from (4) we get

$$a_0 b_{m+1} + a_1 b_{m+1-k} + a_2 b_{m+1-2k} + \cdots + a_k b_{m+1-ik} = b_0 a_{m+1} + b_1 a_{m+1-k} + b_2 a_{m+1-2k} + \cdots + b_k a_{m+1-ik}.$$

From the assumption we have $a_0 b_{m+1} = b_0 a_{m+1}$; that is, $b_{m+1} = \lambda a_{m+1}$.

Hence, from the above discussion we get that $\lambda_i = \lambda a_i$ for all integers $i$ with $i \geq 0$ by the inductive, which means that $\psi(z) = \lambda \psi(z)$. So, the required result holds.

*Case II.* Suppose that $a_0 = 0$ and $b_0 \neq 0$. We want to show that $\varphi = 0$ for all integers $i$ with $i \geq 0$; that is, $\varphi \equiv 0$. Suppose that there exists some $a_i$ which is not zero. Without loss of generality, let $a_i = 0$ for all integers $i$ with $0 \leq i \leq l - 1$ and $a_i \neq 0$, where $l \geq 1$ is an integer, then $\varphi(z) = z^l \varphi(z)$ and $\varphi(z) = \sum_{p=0}^{\infty} a_i z^p$.

Because $\varphi(z) \psi(z) = \varphi(z) \psi(z)$, we can get that $\varphi(z) \psi(z) = \varphi(z) \psi(z)$, which means that

$$\sum_{p=0}^{\infty} \sum_{k+i+j=p} a_i b_j z^p = \sum_{p=0}^{\infty} \sum_{i+k+j=p} a_i b_j z^p.$$
Theorem 3. Let \( \varphi, \psi \in H^\infty(\mathbb{T}) \) or \( \overline{\varphi}, \overline{\psi} \in H^\infty(\mathbb{T}) \), the following statements are equivalent:

(1.1) \( U_\varphi \) and \( U_\psi \) commute;
(1.2) \( U_\varphi \) and \( U_\psi \) essentially commute;
(1.3) \( \varphi(z^k)\varphi(z) = \psi(z)\varphi(z^k) \);
(1.4) there exist scalars \( \alpha \) and \( \beta \), not both zero, such that \( \alpha \varphi + \beta \psi = 0 \).

Now we start to study the commutativity of two \( k \)-th order slant Toeplitz operators with harmonic symbols.

Proposition 4. Let \( \varphi(z) = \sum_{p=-n}^n a_p z^p \) and \( \psi(z) = \sum_{p=-n}^n b_p z^p \), where \( a_n^2 + b_n^2 \neq 0 \) and \( n \) is a positive integer, then the following statements are equivalent:

(1.1) \( \varphi(z^k)\varphi(z) = \varphi(z)\varphi(z^k) \);
(1.2) there exist scalars \( \alpha \) and \( \beta \), not both zero, such that \( \alpha \varphi + \beta \psi = 0 \).

Proof. We begin with the easy direction. First, suppose that (1.2) holds and let \( \alpha \neq 0 \) without loss of generality, so that \( \varphi = -\beta/\alpha \psi \). Thus, \( \varphi(z^k)\varphi(z) = \varphi(z)\varphi(z^k) \).

To prove the other direction of the proposition, suppose that (1.1) holds. Since \( \varphi(z) = \sum_{p=-n}^n a_p z^p \) and \( \psi(z) = \sum_{p=-n}^n b_p z^p \), then \( \varphi(z^k) = \sum_{p=-n}^n a_p z^{kp} \). Hence, by the induction we obtain that \( \varphi(z^k)\varphi(z) = \varphi(z)\varphi(z^k) \), so the required result holds.

Lemma 5. Let \( \varphi(z) = \sum_{p=-n}^n a_p z^p \), \( \psi(z) = \sum_{p=-m}^m b_p z^p \), and \( \varphi(z^k)\psi(z) = \varphi(z)\psi(z^k) \), then

\[
\sum_{p=-l}^{l+k} \sum_{i+j=p} a_ib_j z^p = \sum_{p=-l}^{l+k} \sum_{i+j=p} a_i b_j z^p.
\]

(11)

for any integers \( p \) with \( 0 \leq |p| \leq n + km + 1 \)

\[
\sum_{i+k=j} a_ib_j = 0,
\]

(12)

and

\[
\sum_{k+j=p} a_ib_j = 0,
\]

(13)

for any integers \( p \) with \( 0 \leq |p| \leq n + km \).

We want to show that \( a_i = 0 \) for any integers \( i \) with \( m + 1 \leq j \leq n \). Here are two cases: \( n < m + k \) and \( n \geq m + k \). When \( m = lk + r \), where \( l \) and \( r \) are nonnegative integers with \( 0 \leq r \leq k - 1 \).

First Case. If \( n < m + k \), then \( k(m+1) + m = km + m + k > km + n \). Now we, continue the discussion by induction.

When \( p = kn + m \), by (12), we can get that \( a_{n,m} = 0 \). So, \( a_{n,0} = 0 \), since \( b_{n,0} b_n = 0 \).

When \( p = kn + m + k \), by (12) we can get that \( a_{n,-1} b_m + (m-k) a_{n,-1} b_m = 0 \), where \( (m-k)^+ = \max(\text{sgn} (2m - k + 1), 0) \) and \( \text{sgn} \) is a sign function. So, \( a_{n,-1} = 0 \), since \( b_{m,0} b_m = 0 \) and \( a_{n,-1} \).

Suppose that \( a_{n,-j} = 0 \) for any integers \( j \) with \( 0 \leq j < t \leq n - m - 1 \). Now, consider the value of \( a_{n,-t-1} \).

When \( p = kn + m - k(t+1) \), by (12) we get that

\[
a_{n,-t-1} b_m + \cdots + a_{n,-t-1,k} b_{m-k} = 0,
\]

(14)

where

\[
\lambda = t + 1,
\]

if \( 2m \geq (t+1)k \),

\[
\lambda = \left[ \frac{2m}{k} \right],
\]

(15)

if \( 2m < (t+1)k \).
and \([2m/k]\) is the biggest integer which is not bigger than \(2m/k\). Then, by the assumption and (14), we get that \(a_{n-t-1} = 0\), since \(b_m b_m \neq 0\).

Hence, from the above discussion we obtain that \(a_j = 0\) for all integers \(j\) with \(m + 1 \leq j \leq n\) by the induction.

**Second Case.** If \(n \geq m + k\), then \(k(m+1) + m = km + m + k \leq km + n\). Now we continue the discussion by induction.

When \(p = kn + m\), by (12), we can get that \(a_nb_m = 0\). So, \(a_n = 0\), since \(b_m b_m \neq 0\).

Suppose that \(a_{n-t-1}\) for any integers \(j\) with \(0 \leq j \leq t < n - m - 1\). Now, consider the value of \(a_{n-t-1}\).

If \(p = kn + m - k(t + 1) > km + n\), by (12) we get that

\[
a_{n-t-1}b_m + \cdots + a_{n-t-1+k}b_m = 0,
\]

where

\[
\lambda = t + 1, \quad \text{if} \ 2m \geq (t + 1)k,
\]

\[
\lambda = \left[\frac{2m}{k}\right], \quad \text{if} \ 2m < (t + 1)k,
\]

and \([x]\) is the biggest integer which is not bigger than \(x\). Then, by the assumption and (16), we get that \(a_{n-t-1} = 0\), since \(b_m b_m \neq 0\).

If \(p = mn + m - k(t + 1) \leq km + n\), by (13), we get that

\[
a_{n-t-1}b_m + \cdots + a_{n-t-1+k}b_m = 0,
\]

where

\[
\lambda_1 = t + 1, \quad \text{if} \ 2m \geq (t + 1)k,
\]

\[
\lambda_1 = \left[\frac{2m}{k}\right], \quad \text{if} \ 2m < (t + 1)k,
\]

\[
\lambda_2 = 2m, \quad \text{if} \ km + kn - kt - k + m \leq n,
\]

\[
\lambda_2 = \left[\frac{n + km + kt + k - kn - m}{k}\right], \quad \text{if} \ km + kn - kt - k + m > n,
\]

and \([x]\) is the biggest integer which is not bigger than \(x\). Then, by the assumption and (18), we get that \(a_{n-t-1} = 0\), since \(b_m b_m \neq 0\).

Hence, from the above discussion we obtain that \(a_j = 0\) for all integers \(j\) with \(m + 1 \leq j \leq n\) by the induction.

Similarly, we could get that \(a_j = 0\) for all integers \(j\) with \(-n \leq j \leq -(m + 1)\).

From Proposition 4 and Lemma 5, it is evident that Proposition 6 holds.

**Proposition 6.** Let \(\varphi(z) = \sum_{p=-n}^n a_p z^p\), \(\psi(z) = \sum_{p=-m}^m b_p z^p\) and \(b_m b_m \neq 0\), where \(n, m\) are integers and \(n > m \geq 1\), then the following statements are equivalent:

(1.1) \(\varphi(z^k)\psi(z) = \varphi(z)\psi(z^k)\);

(1.2) there exist scalars \(\alpha\) and \(\beta\), not both zero, such that \(\alpha \varphi + \beta \psi = 0\).

Theorem 7 is obvious from Theorem 2.8 in [17] and Proposition 6.

**Theorem 7.** Let \(\varphi(z) = \sum_{p=-n}^n a_p z^p\), \(\psi(z) = \sum_{p=-m}^m b_p z^p\), and \(b_m b_m \neq 0\), where \(n\) and \(m\) are integers and \(n > m \geq 1\), and the following statements are equivalent:

(1.1) \(U_\varphi\) and \(U_\psi\) commute;

(1.2) \(U_\varphi\) and \(U_\psi\) essentially commute;

(1.3) \(\varphi(z^k)\psi(z) = \varphi(z)\psi(z^k)\);

(1.4) there exist scalars \(\alpha\) and \(\beta\), not both zero, such that \(\alpha \varphi + \beta \psi = 0\).

3. **Product of Two \(k\)th-Order Slant Toeplitz Operators on \(L^2(\mathbb{T})\)**

In [15, 17], the authors have investigated properties of the product of two \(k\)th-order slant Toeplitz operators on \(L^2(\mathbb{T})\) and have obtained the following result.

**Theorem 8** (see [15, 17]). Let \(\varphi, \psi \in L^\infty(\mathbb{T})\), then the following statements are equivalent:

(1.1) \(U_\varphi U_\psi\) is a \(k\)th-order slant Toeplitz operator;

(1.2) \(U_\varphi U_\psi\) is a zero operator;

(1.3) \(U_\varphi U_\psi\) is compact;

(1.4) \(\varphi(z^k)\psi(z) = 0\).

In this section, we will describe properties of the product of two \(k\)th-order slant Toeplitz operators with analytic symbols and harmonic symbols on \(L^2(\mathbb{T})\) by their symbols. First, we start to discuss properties of two \(k\)th-order slant Toeplitz product with analytic symbols.

**Proposition 9.** Let \(\varphi, \psi \in H^\infty(\mathbb{T})\), then \(\varphi(z^k)\psi(z) = 0\) if and only if \(\varphi = 0\) or \(\psi = 0\).

**Proof.** As we know, the “if” direction of the proposition is trivial.

Now suppose that \(\varphi(z^k)\psi(z) = 0\). Since \(\varphi, \psi \in H^\infty(\mathbb{T})\), we have \(\varphi(z^k)\psi(z) = 0\), where \(\varphi\) and \(\psi\) are the Poisson extensions of \(\varphi\) and \(\psi\), respectively, and they are analytic on the unit disk \(\mathbb{D}\). Hence, we get that \(\varphi(z^k)\) is identically 0 or \(\psi\) is identically 0; that is, \(\varphi\) is identically 0 or \(\psi\) is identically 0.

Similarly, we could obtain Corollary 10.

**Corollary 10.** Let \(\varphi, \psi \in H^\infty(\mathbb{T})\), then \(\varphi(z^k)\psi(z) = 0\) if and only if \(\varphi = 0\) or \(\psi = 0\).

It is obvious that Theorem II holds from the preceding analysis.
Theorem 11. Let \( \varphi, \psi \in H^\infty(\mathbb{T}) \) or \( \overline{\varphi}, \overline{\psi} \in H^\infty(\mathbb{T}) \), then the following statements are equivalent:

1. \( U_\varphi U_\psi \) is a \( k \)-th order slant Toeplitz operator;
2. \( U_\varphi \) is a zero operator;
3. \( U_\psi \) is compact;
4. \( \varphi(z^k)\psi(z) = 0 \);
5. \( \varphi = 0 \) or \( \psi = 0 \).

Now, we start to discuss the properties of two \( k \)-th order slant Toeplitz product with harmonic symbols.

Proposition 12. Let \( \varphi(z) = \sum_{p=0}^n a_p z^p \) and \( \psi(z) = \sum_{p=0}^m b_p z^p \), where \( n \) and \( m \) are both positive integers, then \( \varphi(z^k)\psi(z) = 0 \) if and only if \( \varphi = 0 \) or \( \psi = 0 \).

Proof. We begin with the easy direction. First, suppose that \( \varphi = 0 \) or \( \psi = 0 \); then it is clear that \( \varphi(z^k)\psi(z) = 0 \).

Without loss of generality, let \( a_0^2 + b_0^2 = 0 \). Otherwise, \( a_i^2 + b_i^2 = 0 \); then we can consider the value of \( a_i \) and \( b_j \), where \( i \) and \( j \) are both integers with \( 0 \leq i \leq n - 1 \) and \( 0 \leq j \leq m - 1 \), since \( \varphi(z) \) and \( \psi(z) \) are both polynomial functions. There are four cases:

1. \( a_i = 0 \) for all integers \( i \) with \( 0 \leq i \leq n \);
2. \( a_i \neq 0 \) for all integers \( j \) with \( 0 \leq j \leq m \);
3. \( a_i \neq 0 \) and \( b_j = 0 \) for all integers \( i \) with \( s + 1 \leq i \leq n \);
4. \( a_i \neq 0 \) and \( b_j = 0 \) for all integers \( i \) with \( t + 1 \leq j \leq m \), where \( s \) and \( t \) are both nonnegative integers with \( s \leq n - 1 \) and \( t \leq m - 1 \). If the first two cases hold, then the required result holds; if the latter two cases hold, then we have \( \varphi(z) = \sum_{p=0}^n a_p z^p \) and \( \psi(z) = \sum_{p=0}^m b_p z^p \). Since \( \varphi(z) \) and \( \psi(z) \) are both polynomials, \( \varphi(z^k)\psi(z) = 0 \).

Now suppose that \( \varphi(z^k)\psi(z) = 0 \) and \( a_n^2 + b_n^2 = 0 \). If not, then \( \varphi(z) = \sum_{p=0}^n a_p z^p \), \( \psi(z) = \sum_{p=0}^m b_p z^p \), then

\[ \varphi(z^k)\psi(z) = \sum_{p=0}^n a_p z^{kp} \sum_{p=0}^m b_p z^{-p} = \sum_{p=-m}^{kn} \sum_{k+p} a_k b_j z^p. \]

(20)

where \( i \) and \( j \) are both integers with \( 0 \leq i \leq n \) and \( 0 \leq j \leq m \). Because \( \varphi(z^k)\psi(z) = 0 \), we get, for any integers \( p \) with \(-m \leq p \leq kn \),

\[ \sum_{k+p=j} a_k b_{j} = 0. \]

(21)

where \( i \) and \( j \) are both integers with \( 0 \leq i \leq n \) and \( 0 \leq j \leq m \). Since \( a_n^2 + b_n^2 = 0 \), we only obtain either \( a_n \neq 0 \) or \( b_n \neq 0 \).

First Case. If \( a_n \neq 0 \). Now we want to show that \( \psi = 0 \) by the induction.

When \( p = kn \), by (21), we get that \( a_n b_0 = 0 \), which means that \( b_0 = 0 \), since \( a_n \neq 0 \).

When \( p = kn - 1 \), by (21), we get that \( a_n b_{-1} = 0 \), which means that \( b_{-1} = 0 \), since \( a_n \neq 0 \).

Now suppose that \( b_{-l} = 0 \) for any integers \( l \) with \( 0 \leq l \leq m \), where \( t \) is an integer with \( 0 \leq t \leq m - 1 \). Considering the value of \( b_{t-1} \), when \( p = kn + t - 1 \), by (24), we get that

\[ a_n b_{t-1} + \cdots + a_{n-\lambda} b_{t-1+k\lambda} = 0. \]

(25)

where \( \lambda = \min\{n, [(t + 1)/k] \} \) and \( [x] \) is the biggest integer which is not bigger than \( x \). By the assumption and the above equation, we get that \( a_n b_{t-1} = 0 \); that is, \( b_{t-1} = 0 \), since \( a_n \neq 0 \).

From the preceding analysis, by the induction, we can obtain that \( b_{-l} = 0 \) for any integers \( l \) with \( 0 \leq l \leq m \). Hence, \( \psi = 0 \).

Second Case. If \( b_{-m} \neq 0 \). Arguing as in the First case, we obtain that \( \varphi \equiv 0 \).

\[ \square \]

Proposition 13. Let \( \varphi(z) = \sum_{p=0}^n a_p z^p \) and \( \psi(z) = \sum_{p=-m}^m b_p z^p \), where \( n \) and \( m \) are positive integers and \( a_n^2 + b_m^2 + b_{-m}^2 \neq 0 \), then the following statements are equivalent:

1. \( \varphi(z^k)\psi(z) = 0 \);
2. \( \psi(z^k)\psi(z) = 0 \);
3. \( \varphi = 0 \) or \( \psi = 0 \).

Proof. We begin with the easy direction. First, suppose that \( \varphi = 0 \) or \( \psi = 0 \); then it is clear that (1.1) and (1.2) hold.

Now suppose that (1.1) holds. Since \( \varphi(z) = \sum_{p=0}^n a_p z^p \),

\[ \psi(z) = \sum_{p=-m}^m b_p z^p, \]

then

\[ \varphi(z^k)\psi(z) = \sum_{p=0}^n a_p z^{kp} \sum_{p=-m}^m b_p z^{-p} = \sum_{p=-m}^{kn} \sum_{k+p=j} a_k b_j z^p, \]

(23)

where \( i \) and \( j \) are both integers with \( 0 \leq i \leq n \) and \( -m \leq j \leq m \). Because \( \varphi(z^k)\psi(z) = 0 \), we get that for any integers \( p \) with \(-m \leq p \leq kn + m \),

\[ \sum_{k+p=j} a_k b_j = 0, \]

(24)

where \( i \) and \( j \) are both integers with \( 0 \leq i \leq n \) and \( -m \leq j \leq m \). Since \( a_n^2 + b_m^2 + b_{-m}^2 \neq 0 \), we can obtain that \( a_n \neq 0 \), \( b_m \neq 0 \), or \( b_{-m} \neq 0 \).

First Case. If \( a_n \neq 0 \). Now we want to continue the proof by induction.

When \( p = kn + m \), by (24), we get that \( a_n b_m = 0 \), which means that \( b_m = 0 \), since \( a_n \neq 0 \).

When \( p = kn + m + 1 \), by (24), we get that \( a_n b_{m-1} = 0 \), which means that \( b_{m-1} = 0 \), since \( a_n \neq 0 \).

Now suppose that \( b_t = 0 \) for any integers \( t \) with \( 0 \leq t \leq m \), where \( t \) is an integer with \( 0 \leq t \leq m \). Considering the value of \( b_{t-1} \), when \( p = kn + t - 1 \), by (24), we get that

\[ a_n b_{t-1} + \cdots + a_{n-\lambda} b_{t-1+k\lambda} = 0, \]

(25)
where $\lambda = \min \{n, [(m-t+1)/2]\}$ and $[x]$ is the biggest integer which is not bigger than $x$. By the assumption and the above equation, we get that $a_n b_{m-1} = 0$; that is, $b_{l-1} = 0$, since $a_n \neq 0$.

From the preceding analysis, by the induction we can obtain that $b_l = 0$ for any integers $l$ with $0 \leq l \leq n$. Then, by Proposition 12 we get that $\psi \equiv 0$, since $\phi$ is not identically.

**Second Case.** If $b_m \neq 0$. In the following, we will continue the proof by induction.

When $p = kn + m$, by (24), we get that $a_n b_m = 0$, which means that $a_n = 0$, since $b_m \neq 0$.

When $p = kn + m - k$, by (24), we get that $a_{n-1} b_m + (m-k) a_n b_{m-k} = 0$, where $(m-k)^2 = \max \{0, \text{sgn} \ (2m-k+1)\}$ and $\text{sgn}$ is a sign function. So, $a_{n-1} = 0$, since $a_n = 0$ and $b_m \neq 0$.

Now, suppose that $a_n = 0$ for any integers $l$ with $t \leq l < n$, where $t$ is an integer with $0 < t \leq n$. Considering the value of $a_{l-1}$, when $p = m + kt - k$, by (24), we get that

$$b_n a_{l-1} + \cdots + b_{m-k} a_{l-1+k} = 0,$$

where $\lambda = \min \{n-t+1, [2m/k]\}$ and $[x]$ is the biggest integer which is not bigger than $x$. By the assumption and the above equation, we get that $b_m a_{l-1} = 0$; that is, $a_{l-1} = 0$, since $b_m \neq 0$.

From the preceding analysis, by the induction we can obtain that $a_l = 0$ for any integers $l$ with $0 \leq l \leq n$, which means that $\phi \equiv 0$.

**Third Case.** If $b_m \neq 0$. A computation analogous to the one done in the second case from which we can get that $\phi \equiv 0$.

From the above analysis, we have that (1.3) holds.

Arguing as in the previous discussion, we obtain that if (1.2) holds, then (1.3) is true.

**Proposition 14.** Let $\phi(z) = \sum_{p=-n}^{n} a_p z^p$, $\psi(z) = \sum_{p=-m}^{m} b_p z^p$, where $n$ and $m$ are both positive integers and $a_n^2 + b_n^2 + a_m^2 + b_m^2 \neq 0$, then $\phi(z) \psi(z) = 0$ if and only if $\phi = 0$ or $\psi = 0$.

**Proof.** We begin with the easy direction. First, suppose that $\phi = 0$ or $\psi = 0$; then it is clear that $\phi(z) \psi(z) = 0$.

Now suppose that $\phi(z) \psi(z) = 0$. Since $\phi(z) = \sum_{p=-n}^{n} a_p z^p$, $\psi(z) = \sum_{p=-m}^{m} b_p z^p$, then

$$\psi(z) \phi(z) = \sum_{p=-n}^{n} a_p b_p z^p = 0$$

(27)

where $i$ and $j$ are both integers with $-n \leq i \leq n$ and $-m \leq j \leq m$. Because $\phi(z) \psi(z) = 0$, we get that, for any integers $p$ with $-(kn+m) \leq p \leq kn+m$, $a_i b_j = 0$.

$$a_i b_j = 0,$$

(28)

where $i$ and $j$ are both integers with $-n \leq i \leq n$ and $-m \leq j \leq m$.

Since $a_n^2 + b_n^2 + a_m^2 + b_m^2 \neq 0$, without loss of generality, suppose that $a_n \neq 0$. We want to continue the proof by induction.

When $p = kn + m$, by (28), we get that $a_n b_m = 0$, which means that $b_m = 0$, since $a_n \neq 0$. When $p = kn + m - 1$, by (28), we get that $a_n b_{m-1} = 0$, which means that $b_{m-1} = 0$, since $a_n \neq 0$.

Now suppose that $b_l = 0$ for any integers $l$ with $0 \leq l \leq m$, where $t$ is an integer with $0 < t \leq m$. Considering the value of $b_{l-1}$. When $p = kn + t - 1$, by (28) we get that

$$a_n b_{l-1} + \cdots + a_{n-t} b_{l-1+k} = 0,$$

(29)

where $\lambda = \min \{2n, [(m-t+1)/k]\}$ and $[x]$ is the biggest integer which is not bigger than $x$. By the assumption and the above equation, we get that $a_n b_{l-1} = 0$; that is, $b_{l-1} = 0$, since $a_n \neq 0$.

From the preceding analysis, by the induction we can obtain that $b_l = 0$ for any integers $l$ with $0 \leq l \leq m$. Then, by Proposition 13 we get that $\psi \equiv 0$, since $\phi$ is not identically and $\phi(z^k) \psi(z) = 0$ is equivalent to $\phi(z^k) \psi(z) = \phi(z^m) \psi(z) = 0$.

**Form Proposition 3.4 and Theorem 3.1 in [15, 17], we will obtain the following theorem which describes the product of two slant Toeplitz operators with harmonic symbols.**

**Theorem 15.** Let $\phi(z) = \sum_{p=-n}^{n} a_p z^p$, $\psi(z) = \sum_{p=-m}^{m} b_p z^p$, where $n$ and $m$ are both positive integers and $a_n^2 + b_n^2 + a_m^2 + b_m^2 \neq 0$, then the following statements are equivalent:

(1.1) $U_{\phi} U_{\psi}$ is a $k$th-order slant Toeplitz operator;

(1.2) $U_{\phi} U_{\psi}$ is a zero operator;

(1.3) $U_{\phi} U_{\psi}$ is compact;

(1.4) $\phi(z^k) \psi(z) = 0$;

(1.5) $\phi = 0$ or $\psi = 0$.

**4. Commutativity of $k$th-Order Slant Toeplitz Operators on Bergman Spaces**

Let $C$ be the complex plane and let $D$ be the unit disk in $C$. Let $dA$ be the area measure on $D$ normalized so that $\int_D 1 dA = 1$. Let $A^2(D)$ be the space of analytic functions in $L^2(D, dA)$ which consists of Lebesgue measurable functions $f$ on $D$ with

$$\int_D |f(z)|^2 dA(z) < +\infty.$$  

(30)

It is well known that $A^2(D)$ is a closed subspace of the Hilbert space $L^2(D, dA)$ with the inner product $\langle \cdot, \cdot \rangle$ and $\{z^j : i \in Z^+\}$ are the orthogonal basis in $A^2(D)$, where $Z^+$ is the set of nonnegative integers. Let $L^2(D)$ be the Banach space of Lebesgue measurable functions $f$ on $D$ with $f_{\infty} = \text{ess sup} \ |f(z)| : z \in D| < +\infty$.

(31)

Let $P$ denote the orthogonal projection from $L^2(D, dA)$ onto $A^2(D)$. For $f \in L^2(D)$, the Toeplitz operator $T_f$ on $A^2(D)$ is defined by

$$T_f (g) = P(fg), \quad g \in A^2(D),$$

(32)
and the kth-order slant Toeplitz operator $B_f$ on $A^2(D)$ is defined by

$$B_f = W_k T_f,$$

where $W_k$ is a bounded linear operator on $A^2(D)$ which is defined as

$$W_k(z) = \begin{cases} z^{i/k}, & \text{if } i \text{ is divisible by } k, \\ 0, & \text{otherwise}. \end{cases}$$

In this section we will investigate the commutativity of kth-order slant Toeplitz operators with coanalytic symbols and harmonic symbols on Bergman space $A^2(D)$. First, we study the commutativity of kth-order slant Toeplitz operators with coanalytic symbols.

**Lemma 16.** Let $q \geq 0$ be an integer, let $f, g \in H^\infty(D)$, both of which are not 0 identically. If $f W_k g = g W_k f$, the following statements are equivalent:

1. $f(0) = 0$ for any integers $i$ with $0 \leq i \leq q$ and $f(q+1)(0) \neq 0$;
2. $g(0) = 0$ for any integers $i$ with $0 \leq i \leq q$ and $g(q+1)(0) \neq 0$.

**Proof.** First, suppose that (1.1) holds. Since $f \in H^\infty(D)$, we get that $f(z) = z^{(q+1)/p} f_p(z)$ and $W_k f = f_p W_k$, which means $f_p(0) \neq 0$, and $f_1, f_2 \in H^\infty(D)$. Because $f g W_k g = f g (W_k g)$, we get that

$$f_1(z) W_k g(z) = z^{(q+1)/p} f_2(z) g(z),$$

so $g(0) = 0$. Since $g$ is not 0 identically, without loss of generality, take $g(q+1)(0) = 0$ for any integers $j$ with $0 \leq j \leq p$ and $g(q+1)(0) \neq 0$, then $g(z) = z^{(q+1)/p} g_1(z)$ and $(W_k g)(z) = z^{(q+1)/p} g_2(z)$, where $g_1(0) \neq 0$, $g_2(0) \neq 0$, and $g_1, g_2 \in H^\infty(D)$; so, by (35) we get that

$$f_1(z) g_2(z) z^{(q+1)/p} = z^{(q+1)/p} f_2(z) g_1(z).$$

Similarly, we can obtain the other direction of the Lemma. \hfill \Box

**Theorem 17.** Let $\overline{\varphi}, \overline{\psi} \in H^\infty(D)$, then the following statements are equivalent:

1. $B_\overline{\varphi}$ and $B_\overline{\psi}$ commute;
2. there exist scalars $\alpha$ and $\beta$, not both zero, such that $\alpha \varphi + \beta \psi = 0$.

**Proof.** First suppose that (1.2) holds; then it is obvious that $B_\overline{\varphi}$ and $B_\overline{\psi}$ commute.

Now suppose that (1.1) holds. So, we get that $B_\overline{\varphi} B_\overline{\psi} = B_\overline{\psi} B_\overline{\varphi}$; that is, $\overline{\varphi} W_k \overline{\psi} = \overline{\psi} W_k \overline{\varphi}$.

Now we continue the discussion in three cases.

**First Case.** If $\varphi \equiv 0$ or $\psi \equiv 0$. It is obvious that the required result holds.

**Second Case.** If $\overline{\varphi}(0) \neq 0$ and $\overline{\psi}(0) \neq 0$. Since $\overline{\varphi}, \overline{\psi} \in H^\infty(D)$, let $\overline{\varphi}(z) = \sum_{p=0}^\infty a_p z^p$ and $\overline{\psi}(z) = \sum_{p=0}^\infty b_p z^p$, then $a_0 \neq 0$, $b_0 \neq 0$, and $W_k \overline{\psi}(z) = \sum_{p=0}^\infty b_p (kp + 1)/(p + 1) z^p$ and $W_k \overline{\varphi}(z) = \sum_{p=0}^\infty a_p z^p$, so

$$\overline{\varphi} W_k \overline{\psi}(z) = \sum_{p=0}^\infty b_p z^p \cdot \sum_{p=0}^\infty a_p \frac{kp + 1}{p + 1} z^p$$

$$= \sum_{p=0}^\infty \frac{ki + 1}{i + 1} a_p b_p z^p,$$

$$\overline{\psi} W_k \overline{\varphi}(z) = \sum_{p=0}^\infty a_p z^p \cdot \sum_{p=0}^\infty b_p \frac{kp + 1}{p + 1} z^p$$

$$= \sum_{p=0}^\infty \frac{kj + 1}{j + 1} a_p b_p z^p.$$

Because $\overline{\varphi} W_k \overline{\psi} = \overline{\psi} W_k \overline{\varphi}$, we get that

$$\sum_{p=0}^\infty \sum_{k+i+j=p} \frac{ki + 1}{i + 1} a_p b_j = \sum_{p=0}^\infty \sum_{i+k+j=p} \frac{kj + 1}{j + 1} a_i b_p,$$

that is, for any integers $p \geq 0$,

$$\sum_{k+i+j=p} \frac{ki + 1}{i + 1} a_p b_j = \sum_{i+k+j=p} \frac{kj + 1}{j + 1} a_i b_p,$$

where $i$ and $j$ are both nonnegative integers. In the following, we want to continue the proof by the induction.

When $p = 0$, by (39), we get that $a_0 b_0 = a_0 b_0$, so $b_0 = (b_0/a_0) a_0$, since $a_0 \neq 0$. Let $\lambda = b_0/a_0$, then $b_0 = \lambda a_0$.

When $p = 1$, by (39), we get that $a_1 b_0 = a_1 b_0$, so $b_1 = \lambda a_1$.

Suppose that $b_j = \lambda a_j$ for any integers $j$ with $0 \leq j \leq i$, where $i$ is a nonnegative integer. Now, consider the connection between $a_{i+1}$ and $b_{i+1}$.

When $p = i+1$, by (39), we get that

$$\sum_{k+i+j=i+1} \frac{ki + 1}{i + 1} a_p b_j = \sum_{i+k+j=i+1} \frac{kj + 1}{j + 1} a_i b_p,$$

that is,

$$a_i b_{i+1} + \cdots + \frac{k\lambda + 1}{\lambda + 1} a_0 b_{i+1} = b_0 a_{i+1} + \cdots + \frac{k\lambda + 1}{\lambda + 1} b_{i+1} a_{i+1},$$

where $\lambda = [(i + 1)/k]$ and $[x]$ is the biggest integer which is not bigger than $x$. By this assumption, we can obtain that $q b_{i+1} = b_0 a_{i+1}$; that is, $b_{i+1} = \lambda a_{i+1}$, since $a_0 \neq 0$. 

Hence, by the induction, we obtain that $b_j = \lambda a_j$ for any nonnegative integers $j$ from the previous discussion; that is, 
\[ \psi(0) = 0 \quad \text{or} \quad \overline{\psi(0)} = 0 \]
without loss of generality, take $\overline{\psi(0)} = 0$ for any integers $0 \leq i \leq i_1$ and $\overline{\psi^{(i_1+1)}(0)} \neq 0$. By Lemma 16, we get that 
\[ \overline{\psi^{(0)}(0)} = 0 \quad \text{for any integers} \quad 0 \leq i \leq i_1 \quad \text{and} \quad \overline{\psi^{(i_1+1)}(0)} \neq 0, \]
and 
\[ \overline{\psi(z)} = z^{i_1+1} \psi_i(z), \quad \overline{\overline{\psi(z)}} = z^{i_1+1} \psi_i(z), \quad (42) \]
where $\psi_i, \psi_i \in H^\infty(D)$, and $\overline{\psi}(0) \neq 0, \psi_i(0) \neq 0$, so $\overline{W_i^*(\overline{\psi})} = z^{(i+1)(i+1)} W_i^*(\psi_i)$ and $\overline{\overline{W_i^*(\overline{\psi})}} = z^{(i+1)(i+1)} W_i^*(\psi_i)$. Since $\overline{W_i^*(\overline{\psi})} = \overline{W_i^*(\overline{\psi})}, \psi_i$, we can get that $\psi_i, W_i^*(\psi_i)$. Since $\psi_i(0) \neq 0$ and $\psi_i(0) \neq 0$, yet by the second case we get that $\psi_i = \lambda_1 \psi_i$, where $\lambda_1 = \psi_i(0)/\psi_i(0)$. So, $\overline{\overline{\psi(z)}} = z^{i_1+1} \psi_i(z) = \lambda_1 z^{i_1+1} \psi_i(z) = \lambda_1 \psi_i(z).$ The required result holds.

Now we are in a position to discuss the commutativity of slant Toeplitz operators with harmonic symbols.

**Theorem 18.** Let $\psi(z) = \sum_{p=0}^{n} a_p z^p + \sum_{p=0}^{n} b_p z^p$ and $\psi(z) = \sum_{p=0}^{n} a_p z^p + \sum_{p=0}^{n} b_p z^p$, where $\alpha^2 + \beta^2 \neq 0$ and $n \geq 1$ is an integer, then the following statements are equivalent:

1. $B_\psi$ and $B_\psi$ commute; 
2. there exist scalars $\alpha$ and $\beta$, not both zero, such that $\alpha \psi + \beta \overline{\psi} = 0$.

**Proof.** First suppose that (1.2) holds. It is obvious that $B_\psi$ and $B_\psi$ commute.

Now suppose that (1.1) holds. Let $\psi_1(z) = \sum_{p=0}^{n} a_p z^p$, 
\[ \overline{\psi_1(z)} = \sum_{p=0}^{n} a_p z^p, \quad \psi_1(z) = \sum_{p=0}^{n} b_p z^p, \quad \overline{\psi_1(z)} = \sum_{p=0}^{n} b_p z^p, \quad \text{and} \quad \overline{\overline{\psi_1(z)}} = \sum_{p=0}^{n} b_p z^p, \]
then $\psi_1 = \overline{\psi_1}$ and $\psi = \overline{\psi}$. Since $B_\psi$ and $B_\psi$ commute, we have $T_p W_1^* T_p W_1^* = T_p W_1^* T_p W_1^*$, that is, 
\[ \psi_1 W_1^* \psi_1 + \overline{\psi_1(z)} \overline{\psi_1(z)} + \overline{\psi_1(z)} = \psi_1 W_1^* \psi_1 + \overline{\psi_1(z)} \overline{\psi_1(z)} + \overline{\psi_1(z)} \overline{\psi_1(z)}. \quad (43) \]
Then, by (43), we get that for any integers $p$ with $kn+1 \leq p \leq kn+n$, 
\[ \sum_{i+j=p} \alpha^{i-j} k_i + 1 = \sum_{i+j=p} \beta^{i-j} k_i + 1, \quad (44) \]
where $i$ and $j$ are positive integers which are not bigger than $n$. Since $\alpha^2 + \beta^2 \neq 0$, without loss of generality, take $\alpha \neq 0$. Now we continue the proof by the induction.

When $p = kn+n$, by (44), we get that $\overline{\alpha \psi_1(z)} = \overline{\alpha \psi_1(z)}(kn+1)/(n+1)$, so $\overline{\alpha \psi_1(z)} = \overline{\alpha \psi_1(z)}(kn+1)/(n+1)$, since $\alpha \neq 0$. Now we continue the proof by the induction.

When $p = kn+n-1$, by (44), we get that $\overline{\alpha \psi_1(z)} = \overline{\alpha \psi_1(z)}((kn+1)/(n+1))$, so $\overline{\alpha \psi_1(z)} = \overline{\alpha \psi_1(z)}((kn+1)/(n+1))$, since $\alpha \neq 0$. Then $\overline{\alpha \psi_1(z)} = \overline{\alpha \psi_1(z)}$, since $\alpha \neq 0$.}

Suppose that $\overline{\alpha \psi_1(z)} = \overline{\alpha \psi_1(z)}(kn+1)/(n+1)$, since $\alpha \neq 0$. Now, consider the connection between $a_{-m+1}$ and $b_{-m+1}$.

When $p = kn+n-l-1$, by (44), we get that 
\[ \frac{2n+1}{n+1} + \cdots + \frac{2n+1}{n+1} + \frac{k}{k+1} + \frac{k}{k+1} + \frac{k}{k+1}. \]

Then, by (43), we get that for any integers $p$ with $0 \leq i \leq l$ and $b_{-m+1}$, 
\[ \overline{\alpha \psi_1(z)} = \overline{\alpha \psi_1(z)}. \]

So, by (46) we get that 
\[ \psi_1 \psi_1 + \overline{\psi_1(z)} \overline{\psi_1(z)} + \overline{\psi_1(z)} = \psi_1 \psi_1 + \overline{\psi_1(z)} \overline{\psi_1(z)} + \overline{\psi_1(z)} \overline{\psi_1(z)}. \]

That is, 
\[ \overline{(\psi_1(z))} = \overline{(\psi_1(z))}. \]

Since $\alpha \psi_1(z) = \overline{\psi_1(z)}$, we have 
\[ \overline{(\psi_1(z))} = \overline{(\psi_1(z))}. \]

When $p = kn-n$, by (50), we get that 
\[ \frac{2n}{n+1} + \cdots + \frac{2n}{n+1} + \frac{k}{k+1} + \frac{k}{k+1} + \frac{k}{k+1}. \]

Then we have
Suppose that \( a_j = \lambda b_j \) for any integers \( j \) with \( 0 \leq j \leq s \), where \( 0 \leq s \leq n - 1 \). By (50), we get that

\[
\left( \sum_{p=s+1}^{n} \left( \lambda b_p - a_p \right) z^{k_p}, \sum_{p=1}^{n} b_p \cdot p + 1 \right) = 0. \quad (52)
\]

Now consider the connection between \( a_{s+1} \) and \( b_{s+1} \).

When \( l = kn - s - 1 \), by (52), we get that \( (\lambda b_{s+1} - a_{s+1} b_{s+1}) (1/(n+1)) = 0 \), so \( a_{s+1} = \lambda b_{s+1} \), since \( b_{n} \neq 0 \).

Form the above discussion, by the induction we can obtain that \( a_j = \lambda b_j \) for any integers \( j \) with \( 0 \leq j \leq n \), so \( \varphi_1(z) = \sum_{p=0}^{n} a_p z^p = \sum_{p=0}^{n} \lambda b_p z^p = \lambda \varphi_1(z) \).

Since \( \varphi_2 = \overline{\lambda} \varphi_2 \), we have \( \varphi = \varphi_1 + \overline{\lambda} \varphi_2 = \lambda \varphi_1 + \overline{\lambda} \varphi_2 = \lambda \varphi \).

Hence, the required result holds.

**Lemma 19.** Let \( \varphi(z) = \sum_{p=0}^{m} a_p z^p + \sum_{p=1}^{n} a_p z^p \) and \( \psi(z) = \sum_{p=0}^{m} b_p z^p + \sum_{p=1}^{n} b_p z^p \), where \( n \) and \( m \) are integers with \( n > m \geq 1 \) and \( b_m \neq 0 \). If \( B_\varphi \) and \( B_\psi \) commute, then \( a_j = 0 \) for any integers \( j \) with \( m + 1 \leq j \leq n \).

**Proof.** Let \( \varphi_1(z) = \sum_{p=0}^{m} a_p z^p + \sum_{i=1}^{n} a_{ki} z^i \), \( \psi_1(z) = \sum_{p=0}^{m} \lambda b_p z^p + \sum_{i=1}^{n} \lambda b_{pi} z^i \), \( \varphi_2(z) = \sum_{p=0}^{m} b_p z^p + \sum_{i=1}^{n} b_{pi} z^i \), then \( \varphi = \varphi_1 + \overline{\lambda} \varphi_2 \) and \( \psi = \psi_1 + \overline{\lambda} \psi_2 \). Since \( B_\varphi \) and \( B_\psi \) commute, we have \( T_\varphi W_k^* T_\psi W_k^* + 1 = T_\varphi W_k^* W_k^* T_\psi W_k^* 1 \); that is,

\[
\varphi_2 W_k^* \varphi_2 + \psi_1 (0) \varphi_2 + P (\overline{\lambda} \psi_2) \varphi_2 = \psi_2 W_k^* \psi_2 + \varphi_1 (0) \psi_2 + P (\overline{\lambda} \psi_2) \psi_2 ,
\]

\[
\sum_{p=0}^{m} \sum_{k=j+1}^{n+s} a_{j} b_{k-j} \frac{k+j+1}{j+1} z^p + \varphi_1 (0) \sum_{p=1}^{m} a_p z^p = \sum_{p=0}^{m} \sum_{k=j+1}^{n+s} a_{j} b_{k-j} \frac{k+j+1}{j+1} z^p + \varphi_1 (0) \sum_{p=1}^{m} a_p z^p ,
\]

\[
\sum_{p=0}^{m} \sum_{k=j+1}^{n+s} a_{j} b_{k-j} \frac{k+j+1}{j+1} z^p + \varphi_1 (0) \sum_{p=1}^{m} a_p z^p = \sum_{p=0}^{m} \sum_{k=j+1}^{n+s} a_{j} b_{k-j} \frac{k+j+1}{j+1} z^p + \varphi_1 (0) \sum_{p=1}^{m} a_p z^p ,
\]

\[
\sum_{p=0}^{m} \sum_{k=j+1}^{n+s} a_{j} b_{k-j} \frac{k+j+1}{j+1} z^p + \varphi_1 (0) \sum_{p=1}^{m} a_p z^p = \sum_{p=0}^{m} \sum_{k=j+1}^{n+s} a_{j} b_{k-j} \frac{k+j+1}{j+1} z^p + \varphi_1 (0) \sum_{p=1}^{m} a_p z^p .
\]

\[
(53)
\]

Since \( n > m \), let \( n = m + r \), where \( r \) is a positive integer. Then, by the previous equation, we get that

\[
\sum_{k=j+1}^{n+s} \frac{a_j b_{k-j}}{j+1} = 0 , \quad \text{that is,} \quad \frac{a_j b_{m}}{n} = 0 , \quad (54)
\]

so \( a_j = 0 \), since \( b_{m} \neq 0 \).

Suppose that \( a_{n-t+1} = 0 \) for any integers \( t \) with \( 0 \leq t \leq r - 2 \). Now consider the value of \( a_{n-t+1} \). By the assumption and the above equation we get that

\[
\sum_{p=0}^{m} \sum_{k=j+1}^{n+s} a_{j} b_{k-j} \frac{k+j+1}{j+1} z^p + \varphi_1 (0) \sum_{p=1}^{m} a_p z^p = 0 ,
\]

\[
\sum_{p=0}^{m} \sum_{k=j+1}^{n+s} a_{j} b_{k-j} \frac{k+j+1}{j+1} z^p + \varphi_1 (0) \sum_{p=1}^{m} a_p z^p = 0 ,
\]

\[
\sum_{p=0}^{m} \sum_{k=j+1}^{n+s} a_{j} b_{k-j} \frac{k+j+1}{j+1} z^p + \varphi_1 (0) \sum_{p=1}^{m} a_p z^p = 0 .
\]

\[
(55)
\]

Since \( t + 1 < r \), we can get that \( \sum_{k=j+1}^{n+s} a_{j} b_{k-j} ((k + i - 1) + (i + 1)) = 0 \); that is,

\[
\sum_{k=j+1}^{n+s} a_{j} b_{k-j} (k + i - 1 + i + 1) = 0 ,
\]

\[
\sum_{k=j+1}^{n+s} a_{j} b_{k-j} (k + i - 1 + i + 1) = 0 ,
\]

\[
\sum_{k=j+1}^{n+s} a_{j} b_{k-j} (k + i - 1 + i + 1) = 0 .
\]

\[
(56)
\]

where \( \lambda = \min \{ r, [2m/k] \} \) and \([2m/k]\) is the biggest integer which is not bigger than \( 2m/k \). Since \( b_{m} \neq 0 \), by assumption, we get that \( a_{n-t+1} = 0 \).

From the preceding discussion, by the induction we can get that \( a_j = 0 \) for any integers \( j \) with \( m + 1 \leq j \leq n \).

**Theorem 20.** Let \( \varphi(z) = \sum_{p=0}^{m} \alpha_p z^p + \sum_{p=1}^{n} \alpha_p z^p \) and \( \psi(z) = \sum_{p=0}^{m} \beta_p z^p + \sum_{p=1}^{n} \beta_p z^p \), where \( \alpha_n^2 + \beta_m^2 \neq 0 \), and \( m \) and \( n \) are integers with \( n > m \geq 1 \), then the following statements are equivalent:

(1.1) \( B_\varphi \) and \( B_\psi \) commute;

(1.2) there exist scalars \( \alpha \) and \( \beta \), not both zero, such that \( \alpha \varphi + \beta \psi = 0 \).

**Proof.** First suppose that (1.2) holds. It is obvious that \( B_\varphi \) and \( B_\psi \) commute.

Now suppose that (1.1) holds. Since \( \alpha_n^2 + \beta_m^2 \neq 0 \), we can get that \( a_n \neq 0 \) or \( b_m \neq 0 \).

If \( b_m \neq 0 \), by Lemma 19, we can get the required result.

If \( a_n \neq 0 \), by Theorem 18, we can get the required result.
By (57) we get that for any integers $p$ with $km + 1 \leq p \leq km + m$,

$$\sum_{i+j=p} a_{i} \bar{b}_{j} \frac{kj+1}{j+1} = \sum_{i+j=p} a_{i} \bar{b}_{j} \frac{ki+1}{i+1},$$

(58)

where $i$ and $j$ are positive integers with $-m \leq i \leq n$ and $-m \leq j \leq m$. Now we continue the proof by the induction.

When $p = km + m$, by (58), we get that $\frac{a_{m}}{\bar{b}_{m}} \frac{(km + 1)/(m + 1)}{b_{m}} = \frac{a_{m}}{\bar{b}_{m}} \frac{(km + 1)/(m + 1)}{b_{m}}$, so $\frac{a_{m}}{\bar{b}_{m}} = \frac{a_{m}}{\bar{b}_{m}}$, since $b_{m} \neq 0$. Let $\lambda = \frac{a_{m}}{\bar{b}_{m}}$, then $\frac{a_{m}}{\bar{b}_{m}} = \lambda b_{m}$.

When $p = km + m - 1$, by (58), we get that $\frac{a_{m-1}}{\bar{b}_{m}} \frac{(km + 1)/(m + 1)}{b_{m}} = \frac{a_{m-1}}{\bar{b}_{m}} \frac{(km + 1)/(m + 1)}{b_{m}}$, since $b_{m} \neq 0$.

Suppose that $\frac{a_{m+i}}{\bar{b}_{m+i}} = \lambda b_{m+i}$ for any integers $i$ with $0 \leq i \leq m - 1$. Now consider the connection between $a_{m+i}$ and $b_{m+i}$.

When $p = km + m - l$, by (58), we get that

$$\sum_{i+j=p} a_{i} \bar{b}_{j} \frac{km+1}{m+1} \ldots + \frac{a_{m+i}}{\bar{b}_{m+i}} \frac{k(m-r)+1}{m-1} + \ldots$$

(59)

$$\frac{a_{m+i}}{\bar{b}_{m+i}} \frac{km+1}{m+1} \ldots + \frac{a_{m+i}}{\bar{b}_{m+i}} \frac{k(m-r)+1}{m-1}.$$

From the assumption we obtain that $\frac{a_{m+i}}{\bar{b}_{m+i}} \frac{(km + 1)/(m + 1)}{b_{m+i}} = \frac{a_{m+i}}{\bar{b}_{m+i}} \frac{(km + 1)/(m + 1)}{b_{m+i}}$, since $b_{m+i} \neq 0$.

From the pervious discussion, by the induction we obtain that $\frac{a_{m+i}}{\bar{b}_{m+i}} = \lambda b_{m+i}$ for any integers $i$ with $0 \leq i \leq m - 1$. Hence, $\frac{\bar{b}}{\psi_{2}}(z) = \sum_{p=0}^{m} a_{p} \bar{z}^{p} = \sum_{p=0}^{m} \bar{\lambda} b_{p} \bar{z}^{p} = \bar{\lambda} \bar{\psi}_{2}(z)$.

Since $\psi_{2}(z) = \lambda \psi_{2}(z)$, by (57), we get that

$$\psi_{1}(0) \psi_{2} + P(\bar{\psi}_{1} W^{*} \psi_{2}) = \psi_{1}(0) \psi_{2} + P(\psi_{1} W^{*} \psi_{2}).$$

(60)

Then,

$$\left\langle \psi_{1}(0) \psi_{2} + P(\bar{\psi}_{1} W^{*} \psi_{2}), z^{km} \right\rangle$$

$$= \left\langle W^{*} \psi_{2}, z^{km} \psi_{1} \right\rangle = \frac{1}{m+1}$$

(61)

and we get that $\bar{b}_{m} \bar{a}_{0} = \frac{a_{m}}{\bar{b}_{m}}$, that is, $a_{0} = \bar{\lambda} b_{0}$. So, by (60), we have that $\psi_{1}(0) \psi_{2} = \bar{\lambda} \psi_{2}$ and $P(\bar{\psi}_{1} W^{*} \psi_{2}) = P(\psi_{1} W^{*} \psi_{2})$; that is, $P(\lambda \bar{\psi}_{1} - \bar{\psi}_{1}) W^{*} \psi_{2} = 0$. Hence, for any integers $l$ with $km - m \leq l \leq km - 1$, we have

$$0 = \left\langle z^{l}, 0 \right\rangle = \left\langle z^{l}, P(\lambda \bar{\psi}_{1} - \bar{\psi}_{1}) W^{*} \psi_{2} \right\rangle$$

$$= \left\langle z^{l}, (\lambda \bar{\psi}_{1} - \bar{\psi}_{1}) W^{*} \psi_{2} \right\rangle = \left\langle (\lambda \bar{\psi}_{1} - \bar{\psi}_{1}) z^{l}, W^{*} \psi_{2} \right\rangle,$$

(62)

that is,

$$\left\langle \sum_{p=0}^{m} (\bar{\lambda} b_{p} - a_{p}) z^{p+1} - \sum_{p=m+1}^{n} a_{p} z^{p+1}, \sum_{p=1}^{m} b_{p} \frac{kp+1}{p+1} z^{kp} \right\rangle = 0.$$  

(63)

Since $a_{0} = \lambda b_{0}$, we have

$$\left\langle \sum_{p=1}^{m} (\bar{\lambda} b_{p} - a_{p}) z^{p+1} - \sum_{p=m+1}^{n} a_{p} z^{p+1}, \sum_{p=1}^{m} b_{p} \frac{kp+1}{p+1} z^{kp} \right\rangle = 0.$$  

(64)

When $l = km - 1$, by (64), we get that $\langle \bar{\lambda} b_{s} - a_{s} \rangle \bar{b}_{m} ((km + 1)/(m + 1)) = 0$, so $a_{s} = \bar{\lambda} b_{s}$, since $b_{m} \neq 0$. Then, we have

$$\left\langle \sum_{p=1}^{m} (\bar{\lambda} b_{p} - a_{p}) z^{p+1} - \sum_{p=m+1}^{n} a_{p} z^{p+1}, \sum_{p=1}^{m} b_{p} \frac{kp+1}{p+1} z^{kp} \right\rangle = 0.$$  

(65)

Suppose that $a_{j} = \bar{\lambda} b_{j}$ for any integers $j$ with $0 \leq j \leq s$, where $0 \leq s \leq m - 1$. By (64), we get that

$$\left\langle \sum_{p=s+1}^{m} (\bar{\lambda} b_{p} - a_{p}) z^{p+1} - \sum_{p=m+1}^{n} a_{p} z^{p+1}, \sum_{p=1}^{m} b_{p} \frac{kp+1}{p+1} z^{kp} \right\rangle = 0.$$  

(66)

Now consider the connection between $a_{s+1}$ and $b_{s+1}$.

When $l = km - s - 1$, by (66), we get that $\langle \bar{\lambda} b_{s+1} - a_{s+1} \rangle \bar{b}_{m} ((km + 1)/(m + 1)) = 0$, so $a_{s+1} = \bar{\lambda} b_{s+1}$, since $b_{m} \neq 0$.

From the pervious discussion, by the induction, we can obtain that $a_{j} = \bar{\lambda} b_{j}$ for any integers $j$ with $0 \leq j \leq m$. Hence,

$$\psi_{1}(z) = \sum_{p=0}^{m} a_{p} z^{p} = \sum_{p=0}^{m} \bar{\lambda} b_{p} z^{p} = \bar{\lambda} \psi_{1}(z).$$

(67)

Let $\psi_{2}(z) = \sum_{p=m+1}^{n} a_{p} z^{p}$, then $\psi_{1}(z) + \bar{\psi}_{2} = \bar{\lambda} \psi_{1}(z) + \bar{\lambda} \bar{\psi}_{2}$, since $\psi_{2} = \bar{\psi}_{2}$.

Now we want to show that $\psi_{2} \equiv 0$. Because $B_{p} B_{q} = B_{q} B_{p}$, yet we get that $B_{p} B_{q} = B_{q} B_{p}$, which means that

$$T_{\bar{\psi}_{1}} W_{k}^{*} T_{\bar{\psi}_{1}} W_{k}^{*} = T_{\bar{\psi}_{1}} W_{k}^{*} T_{\bar{\psi}_{1}} W_{k}^{*}.$$

(68)

Since $m \geq 1$, we have $T_{\bar{\psi}_{1}} W_{k}^{*} T_{\bar{\psi}_{1}} W_{k}^{*} = 0$; that is, $T_{\bar{\psi}_{1}} W_{k}^{*} (\psi_{2} + \psi_{1}(0)) = 0$. Then, we get that for any integers $l$ with $0 \leq l \leq km - 1$, $T_{\bar{\psi}_{1}} W_{k}^{*} (\psi_{2} + \psi_{1}(0)) = 0$. Hence, we have

$$\left\langle \sum_{j=m+1}^{m} \bar{b}_{j} \frac{kj+1}{j+1} z^{kj} + \psi_{1}(0), \sum_{i=m+1}^{n} a_{i} z^{i+l} \right\rangle = 0.$$  

(69)
By (69), we can get that for any integers \( l \) with \( \max\{0, km - n\} \leq l \leq km - m - 1 \), \( b - m \alpha_{km - l}(1/(m+1)) = 0 \); that is, \( a_{km - l} = 0 \), since \( b_m \neq 0 \).

If \( n \leq km \), then \( \varphi = 0 \), which means that \( \varphi = \bar{\lambda} \psi \), so the required result holds.

By (69), we can get that for any integers \( l \) with \( \max\{0, km - n\} \leq l \leq km - m - 1 \), \( b - m \alpha_{km - l}(1/(m+1)) = 0 \); that is, \( T_{\varphi l} \tilde{W}_{k}^\ast (z^{km}) = 0 \), which means that \( T_{\varphi l} \tilde{W}_{k}^\ast (z^{km}) = 0 \).

If \( n \geq km + 1 \), then \( \varphi = 0 \), which means that \( \varphi = \bar{\lambda} \psi \), so, the required result holds.

If \( n \geq km + 1 \), then \( \varphi_{l}(z) = \sum_{p=km+1}^{n} a_{p} z^{p} \). Then successively by the pervious method, we can get that \( a_{i} = 0 \) for all integers \( i \) with \( m + 1 \leq i \leq n \), which means that \( \varphi = \bar{\lambda} \psi \). So, the required result holds.
