This work is concerned with a mixed boundary value problem for the semilinear parabolic equation with a memory term and generalized Lewis functions which depends on both spacial variable and time. Under suitable conditions, we prove the existence and uniqueness of global solutions and the energy functional decaying exponentially or polynomially to zero as the time goes to infinity by introducing brief Lyapunov function and precise priori estimates.

1. Introduction

In this paper, we are concerned with the global existence and uniform energy decay rates for the nonlocal semilinear heat equation with a memory term and generalized Lewis function

$$A(x, t) u_t - \Delta u + \int_0^t g(t-s) \operatorname{div} [a(x) \nabla u(s)] ds = 0, \quad (1)$$

$$(x, t) \in \Omega \times (0, \infty),$$

subjected to mixed boundary and initial conditions

$$-\frac{\partial u}{\partial \nu} + \int_0^t g(t-s) [a(x) \nabla u(s) \cdot \nu] ds = f(u),$$

$$(x, t) \in \Gamma_0 \times (0, \infty), \quad (2)$$

$$u(x, t) = 0, \quad (x, t) \in \Gamma_1 \times [0, \infty),$$

$$u(x, 0) = u_0(x), \quad x \in \Omega,$$

where $\Omega \subset \mathbb{R}^n$ ($n \geq 1$) is a bounded domain with sufficient smooth boundary $\partial\Omega$, such that $\partial\Omega = \Gamma_0 \cup \Gamma_1$, $\Gamma_0 \cap \Gamma_1 = \emptyset$, and Γ_0, Γ_1 have positive measures, ν is the unit outward normal on $\partial\Omega$, $A(x, t)$ is a generalized Lewis function (when $A(x, t) = C$, C is a positive constant, and $A(x, t)$ is called Lewis function; see [1]) which satisfies

- (i) positive function $A(x, t) \in W^{1,\infty}(0, \infty; L^\infty(\Omega))$ and $A_t(x, t) \leq 0$ a.e. for $t \geq 0$.

Equation (1) arises naturally from a variety of mathematical models in engineering and physical science. For example, in the study of heat conduction in materials with memory, the classical Fourier's law of heat flux is replaced by the following form:

$$q = -d\nabla u - \int_{-\infty}^t \nabla [k(x, t) u(x, \tau)] d\tau, \quad (3)$$

where u , d , and the integral term represent temperature, diffusion coefficient, and the effect of memory term in the material, respectively. The study of this type of equations has drawn a considerable attention; see [2–6]. From the mathematical point of view, one would expect the integral term in the equation to be dominated by the leading term. So the theory of parabolic equations can be applied to this type of equations.

Recently, many works were dedicated to studying the global existence, blow-up solutions, and asymptotic properties of the initial boundary value problem for the parabolic equation with memory term. In the absence of the memory

term ($g \equiv 0$), for the quasilinear parabolic equations with absorption term

$$u_t = \operatorname{div}(|\nabla u|^{p-2} \nabla u) - f(u), \quad (x, t) \in \Omega \times (0, \infty), \quad (4)$$

where $\Omega \subset \mathbb{R}^n$ ($n \geq 1$) is a bounded domain with smooth boundary and $p \geq 2$, there are many results about the global existence and finite time blow-up of solutions for the homogeneous Dirichlet boundary value problems; see [7–11]. The conclusions in Levine [7], Kalantarov, Ladyzhenskaya [8], and Levine et al. [9] showed that global and nonglobal existence depends on the nonlinearity of f , p , the dimension n , and the initial data. For the research on global existence and asymptotic properties of the solution, we refer the readers to [10, 11]. Pucci and Serrin [10] studied the following equation with the homogeneous Dirichlet boundary conditions:

$$A(t)|u_t|^{m-2}u_t = \Delta u - f(x, u), \quad (x, t) \in \Omega \times (0, \infty), \quad (5)$$

where $m > 1$ and the strong solution tends to 0 when $t \rightarrow \infty$ under the condition $(f(x, u), u) > 0$ but did not give the decay rate. Berrimi and Messaoudi [11] proved that if a bounded square matrix $A(t) \in C(\mathbb{R}^+)$ satisfying

$$(A(t)v, v) \geq c_0|v|^2, \quad t \in \mathbb{R}^+, v \in \mathbb{R}^n, \quad (6)$$

then the solution with small initial energy decays exponentially for $m = 2$ and polynomially for $m > 2$.

When there is a memory term ($g \neq 0$), Messaoudi [12] studied the semilinear heat equation with a power form source term

$$u_t - \Delta u + \int_0^t g(t-s) \Delta u(x, s) ds = |u|^{p-2}u, \quad (7)$$

$$(x, t) \in \Omega \times (0, \infty),$$

where the relaxation function $g : \mathbb{R}^+ \rightarrow \mathbb{R}^+$ is a bounded C^1 function and $p > 2$; he proved the existence of blow-up solution with positive initial energy and the homogeneous Dirichlet boundary condition by convexity method. Later, Fang and Sun [13] improved the results of [12] with when $|u|^{p-2}u$ be replaced by fully nonlinear source term $f(u)$. For the study of general energy decay for the quasilinear parabolic system with a memory term, we see [14].

In the works mentioned above, there are few about the global existence and uniform energy decay rates of solution for parabolic equation with mixed boundary conditions. Motivated by it, we intend to study global existence and uniqueness of solutions for the mixed initial boundary value problem (1)-(2) with a memory term and generalized Lewis function by the Galerkin method and also give the estimates of uniform energy decay rates.

The main innovations of this paper are: (1) that the model is representative, considering the mixed boundary value problem with a generalized Lewis function and time integral boundary conditions, and f, g are weak; (2) we give the reason and process of the definition of the energy functional; (3) we prove the energy decays exponentially or polynomially to zero as the time goes to infinity by introducing brief Lyapunov function and precise priori estimates.

The present work is organized as follows. In Section 2, we present the assumptions, lemmas, and energy functional for our work. In Section 3, we prove the existence and uniqueness of the global solution; Section 4 is devoted to proving the energy decay results.

2. Preliminaries

In the sequel we state the general hypotheses on the relaxation function g , coefficient a , nonlinearity f , and initial value u_0 .

(H1) $g : \mathbb{R}^+ \rightarrow \mathbb{R}^+$, $g(0) > 0$ and g is a non-decreasing differentiable function.

(H2) $a : \Omega \rightarrow \mathbb{R}^+$ is a nonnegative bounded function and $a(x) \geq a_0 > 0$ with

$$1 - \|a\|_{L^\infty} \int_0^\infty g(s) ds = l > 0. \quad (8)$$

(H3) The function $f : \mathbb{R} \rightarrow \mathbb{R}$ is Lipschitz continuous and satisfies

$$f(s)s \geq 2F(s) \geq 0, \quad s \in \mathbb{R}, \quad (9)$$

where $F(u) := \int_0^u f(s)ds$.

(H4) (Compatibility Condition) The initial value satisfies

$$u_0 \in V \cap H^2(\Omega), \quad -\frac{\partial u_0}{\partial \nu} = f(u_0). \quad (10)$$

Remark 1. The condition $1 - \|a\|_{L^\infty} \int_0^\infty g(s)ds = l > 0$ is necessary to guarantee the parabolicity of the problem (1)-(2).

Throughout this paper, we define that

$$V = \{u \mid u \in H^1(\Omega), u = 0 \text{ on } \Gamma_1\}, \quad (11)$$

and the following scalar products

$$(u, v) = \int_\Omega u(x)v(x)dx, \quad (u, v)_{\Gamma_0} = \int_{\Gamma_0} u(x)v(x)d\Gamma, \quad (12)$$

and norms

$$\|u\|_{L^p(\Omega)} = \left(\int_\Omega |u|^p dx \right)^{1/p}, \quad \|u\|_{L^p(\Gamma_0)} = \left(\int_{\Gamma_0} |u|^p d\Gamma \right)^{1/p}. \quad (13)$$

To simplify the notations, we denote $\|u\|_{L^p(\Omega)}$ and $\|u\|_{L^p(\Gamma_0)}$ by $\|u\|_p$ and $\|u\|_{p, \Gamma_0}$, respectively.

Next, we give some important lemmas which will be used in the proof of our main results.

Lemma 2. For any $g, u \in C^1[0, +\infty)$, we have

$$\begin{aligned} & \int_{\Omega} \int_0^t g(t-s) a(x) \nabla u(s) \nabla u'(t) ds dx \\ &= -\frac{1}{2} \int_{\Omega} \left[g(t) \left| \sqrt{a(x)} \nabla u(t) \right|^2 - (g' \circ \nabla u) \right] dx \\ & \quad - \frac{1}{2} \frac{d}{dt} \int_{\Omega} \left[(g \circ \nabla u) - \int_0^t g(s) \right. \\ & \quad \left. \times \left| \sqrt{a(x)} \nabla u(t) \right|^2 ds \right] dx, \end{aligned} \quad (14)$$

where $(g \circ \nabla u) = \int_0^t g(t-s) \left| \sqrt{a(x)} (\nabla u(t) - \nabla u(s)) \right|^2 ds$.

Proof. Differentiating $\int_{\Omega} (g \circ \nabla u) dx$ with respect to t and noting $\int_0^t g(t-s) ds = \int_0^t g(s) ds$ yield

$$\begin{aligned} & \frac{d}{dt} \int_{\Omega} (g \circ \nabla u) dx = \frac{d}{dt} \\ & \quad \times \int_{\Omega} \int_0^t g(t-s) \\ & \quad \times \left| \sqrt{a(x)} \right. \\ & \quad \left. \times (\nabla u(t) - \nabla u(s)) \right|^2 ds dx \\ &= \int_{\Omega} \int_0^t g'(t-s) \\ & \quad \times \left| \sqrt{a(x)} (\nabla u(t) - \nabla u(s)) \right|^2 ds dx \\ & \quad + 2 \int_{\Omega} \int_0^t g(t-s) a(x) \\ & \quad \times [(\nabla u(t) - \nabla u(s))] \\ & \quad \times \nabla u'(t) ds dx \\ &= \int_{\Omega} [g'(t-s) \circ \nabla u] dx \\ & \quad + 2 \int_{\Omega} \int_0^t g(t-s) a(x) \nabla u(t) \\ & \quad \times \nabla u'(t) ds dx \\ & \quad - 2 \int_{\Omega} \int_0^t g(t-s) a(x) \nabla u(s) \\ & \quad \times \nabla u'(t) ds dx \\ &= \int_{\Omega} [g'(t-s) \circ \nabla u] dx \end{aligned}$$

$$\begin{aligned} & + \frac{d}{dt} \int_{\Omega} \int_0^t g(s) \left| \sqrt{a(x)} \nabla u(t) \right|^2 ds dx \\ & - \int_{\Omega} g(t) \left| \sqrt{a(x)} \nabla u(t) \right|^2 dx \\ & - 2 \int_{\Omega} \int_0^t g(t-s) a(x) \nabla u(s) \\ & \quad \times \nabla u'(t) ds dx, \end{aligned} \quad (15)$$

which implies

$$\begin{aligned} & \int_{\Omega} \int_0^t g(t-s) a(x) \nabla u(s) \nabla u'(t) ds dx \\ &= -\frac{1}{2} \int_{\Omega} \left[g(t) \left| \sqrt{a(x)} \nabla u(t) \right|^2 - (g' \circ \nabla u) \right] dx \\ & \quad - \frac{1}{2} \frac{d}{dt} \int_{\Omega} \left[(g \circ \nabla u) - \int_0^t g(s) \right. \\ & \quad \left. \times \left| \sqrt{a(x)} \nabla u(t) \right|^2 ds \right] dx. \end{aligned} \quad (16)$$

This completes the proof. $\square$

In order to define the energy functional $E(t)$ of the problem (1)-(2), we give the following computation. Multiplying (1) by u_t , integrating over Ω , and using Green's formula, we get from Lemma 2 that

$$\begin{aligned} 0 &= \int_{\Omega} A(x, t) u_t u_t dx - \int_{\Omega} \Delta u u_t dx \\ & \quad + \int_{\Omega} \int_0^t g(t-s) \operatorname{div} [a(x) \nabla u(s)] u_t ds dx \\ &= \int_{\Omega} A(x, t) |u_t|^2 dx + \int_{\Omega} \nabla u \nabla u_t dx \\ & \quad - \int_{\Omega} \int_0^t a(x) g(t-s) \nabla u(s) \nabla u'(t) ds dx \\ & \quad + \int_{\Gamma_0} f(u) u_t d\Gamma \\ &= \int_{\Omega} A(x, t) |u_t|^2 dx \\ & \quad + \frac{1}{2} \frac{d}{dt} \left(\int_{\Omega} |\nabla u|^2 dx - \int_{\Omega} \int_0^t g(s) ds \left| \sqrt{a(x)} \nabla u(t) \right|^2 dx \right. \\ & \quad \left. + \int_{\Omega} (g \circ \nabla u) dx \right) + \frac{d}{dt} \int_{\Gamma_0} F(u) d\Gamma \end{aligned}$$

$$\begin{aligned}
& + \frac{1}{2} \int_{\Omega} \left[g(t) \left| \sqrt{a(x)} \nabla u(t) \right|^2 - (g' \circ \nabla u) \right] dx \\
& = \frac{d}{dt} \left(\frac{1}{2} k(x, t) \int_{\Omega} |\nabla u|^2 dx \right. \\
& \quad \left. + \frac{1}{2} \int_{\Omega} (g \circ \nabla u) dx + \int_{\Gamma_0} F(u) d\Gamma \right) \\
& \quad + \int_{\Omega} A(x, t) |u_t|^2 dx \\
& \quad + \frac{1}{2} \int_{\Omega} g(t) \left| \sqrt{a(x)} \nabla u(t) \right|^2 dx \\
& \quad - \frac{1}{2} \int_{\Omega} (g' \circ \nabla u) dx,
\end{aligned} \tag{17}$$

where $k(x, t) = 1 - a(x) \int_0^t g(s) ds > 1 - \|a(x)\|_{L^\infty} \int_0^\infty g(s) ds > 0$.

The above computation inspires us to define the energy functional $E(t)$ of the problem (1)-(2) as

$$\begin{aligned}
E(t) & = \frac{1}{2} k(x, t) \int_{\Omega} |\nabla u|^2 dx \\
& \quad + \frac{1}{2} \int_{\Omega} (g \circ \nabla u) dx + \int_{\Gamma_0} F(u) d\Gamma.
\end{aligned} \tag{18}$$

We have the following properties about $E(t)$.

Lemma 3. *The energy $E(t)$ is nonnegative and*

$$\begin{aligned}
\frac{d}{dt} E(t) & = \frac{1}{2} \int_{\Omega} \left[(g' \circ \nabla u) dx - g(t) \left| \sqrt{a(x)} \nabla u(t) \right|^2 \right] dx \\
& \quad - A(x, t) |u_t|^2 dx \leq 0.
\end{aligned} \tag{19}$$

To show the uniform decay of the solution, we introduce a functional

$$\varphi(t) = \frac{1}{2} \int_{\Omega} A(x, t) |u(x, t)|^2 dx. \tag{20}$$

Here, we need to point out that C denotes a positive constant not necessarily the same at different occurrences.

Lemma 4. *There exists a positive constant C such that*

$$|\varphi(t)| \leq CE(t), \quad t \geq 0. \tag{21}$$

Proof. By Poincaré inequality, we have

$$\begin{aligned}
|\varphi(t)| & = \left| \frac{1}{2} \int_{\Omega} A(x, t) |u(x, t)|^2 dx \right| \\
& \leq \frac{\lambda C}{2} \int_{\Omega} |\nabla u|^2 dx \leq CE(t),
\end{aligned} \tag{22}$$

where λ is a positive constant. $\square$

Lemma 5. *There exist two positive constants k_1 and k_2 , such that for some $T > 0$, we have*

$$\frac{d}{dt} \varphi(t) \leq -k_1 E(t) + k_2 \int_{\Omega} (g \circ \nabla u) dx, \quad \forall t \geq T. \tag{23}$$

Proof. Multiplying (1) by $u(t)$, integrating over Ω , and using Green's formula, we get

$$\begin{aligned}
0 & = \int_{\Omega} A(x, t) u_t u(t) dx - \int_{\Omega} \Delta u(t) dx \\
& \quad + \int_{\Omega} \int_0^t g(t-s) \operatorname{div} [a(x) \nabla u(s)] u(t) ds dx \\
& = \int_{\Omega} A(x, t) u_t u(t) dx + \int_{\Omega} |\nabla u|^2 dx \\
& \quad - \int_{\Omega} \int_0^t a(x) g(t-s) \nabla u(s) \nabla u(t) ds dx \\
& \quad + \int_{\Gamma_0} f(u) u(t) d\Gamma.
\end{aligned} \tag{24}$$

Differentiating $\varphi(t)$, we get

$$\begin{aligned}
\frac{d}{dt} \varphi(t) & = \frac{1}{2} \int_{\Omega} A_t(x, t) |u(t)|^2 dx \\
& \quad + \int_{\Omega} A(x, t) u_t u(t) dx \\
& = \frac{1}{2} \int_{\Omega} A_t(x, t) |u(t)|^2 dx - \int_{\Omega} |\nabla u|^2 dx \\
& \quad + \int_{\Omega} \int_0^t a(x) g(t-s) \nabla u(s) \nabla u(t) ds dx \\
& \quad - \int_{\Gamma_0} f(u) u d\Gamma \\
& = \frac{1}{2} \int_{\Omega} A_t(x, t) |u(t)|^2 dx - 2E(t) \\
& \quad + k(x, t) \int_{\Omega} |\nabla u|^2 dx + \int_{\Omega} (g \circ \nabla u) dx \\
& \quad + 2 \int_{\Gamma_0} F(u) d\Gamma - \int_{\Omega} |\nabla u|^2 dx \\
& \quad + \int_{\Omega} \int_0^t a(x) g(t-s) \nabla u(s) \nabla u(t) ds dx
\end{aligned}$$

$$\begin{aligned}
& - \int_{\Gamma_0} f(u) u \, d\Gamma \\
& = \frac{1}{2} \int_{\Omega} A_t(x, t) |u(t)|^2 dx - 2E(t) \\
& \quad - \left(\int_0^t g(s) \, ds \right) \int_{\Omega} |\sqrt{a(x)} \nabla u|^2 dx \\
& \quad + \int_{\Omega} (g \circ \nabla u) \, dx + 2 \int_{\Gamma_0} F(u) \, d\Gamma \\
& \quad + \int_{\Omega} \int_0^t a(x) g(t-s) \nabla u(s) \nabla u(t) \, ds \, dx \\
& \quad - \int_{\Gamma_0} f(u) u \, d\Gamma.
\end{aligned} \tag{25}$$

Next, estimating some items of (25), combined with the definition of $E(t)$, we get $2E(t) \geq \int_{\Omega} k(x, t) |\nabla u|^2 dx$; that is,

$$\int_{\Omega} |\nabla u|^2 dx \leq 2E(t) + \left(\int_0^t g(s) \, ds \right) \int_{\Omega} |\sqrt{a(x)} \nabla u|^2 dx. \tag{26}$$

By (H3), Cauchy inequality, and Hölder inequality, we have that

$$\begin{aligned}
& \left| \int_{\Omega} \int_0^t a(x) g(t-s) \nabla u(s) \nabla u(t) \, ds \, dx \right| \\
& \leq \left| \int_{\Omega} \int_0^t a(x) g(t-s) [\nabla u(s) - \nabla u(t)] \, ds \, dx \right| \\
& \quad + \left| \int_{\Omega} \int_0^t g(t-s) |\sqrt{a(x)} \nabla u(t)|^2 \, ds \, dx \right| \\
& \leq \frac{1}{2\eta} \int_{\Omega} \left(\int_0^t g^{1/2}(t-s) g^{1/2}(t-s) \sqrt{a(x)} \right. \\
& \quad \left. \times [\nabla u(s) - \nabla u(t)] \, ds \right)^2 dx \\
& \quad + \eta \int_{\Omega} |\sqrt{a(x)} \nabla u(t)|^2 dx + \left(\int_0^t g(s) \, ds \right) \\
& \quad \times \int_{\Omega} |\sqrt{a(x)} \nabla u|^2 dx \\
& \leq \frac{1}{2\eta} \int_{\Omega} \left(\int_0^t g(t-s) \, ds \int_0^t g(t-s) \right. \\
& \quad \left. \times |\sqrt{a(x)} (\nabla u(s) - \nabla u(t))|^2 \, ds \right) dx \\
& \quad + \eta \int_{\Omega} |\sqrt{a(x)} \nabla u(t)|^2 dx
\end{aligned}$$

$$\begin{aligned}
& + \left(\int_0^t g(s) \, ds \right) \int_{\Omega} |\sqrt{a(x)} \nabla u|^2 dx \\
& \leq \eta \|a\|_{L^\infty} \int_{\Omega} |\nabla u(t)|^2 dx \\
& \quad + \frac{\|g\|_{L^1}}{2\eta} \int_{\Omega} \int_0^t g(t-s) \, ds \\
& \quad \times |\sqrt{a(x)} (\nabla u(s) - \nabla u(t))|^2 ds \, dx \\
& \quad + \|a\|_{L^\infty} \|g\|_{L^1} \int_{\Omega} |\nabla u(t)|^2 dx \\
& \leq \|a\|_{L^\infty} (\eta + \|g\|_{L^1}) \int_{\Omega} |\nabla u(t)|^2 dx \\
& \quad + \frac{\|g\|_{L^1}}{2\eta} \int_{\Omega} (g \circ \nabla u) \, dx \\
& \leq 2\|a\|_{L^\infty} (\eta + \|g\|_{L^1}) E(t) \\
& \quad + \frac{\|g\|_{L^1}}{2\eta} \int_{\Omega} (g \circ \nabla u) \, dx \\
& \quad + \|a\|_{L^\infty} (\eta + \|g\|_{L^1}) \left(\int_0^t g(s) \, ds \right) \\
& \quad \times \int_{\Omega} |\sqrt{a(x)} \nabla u(t)|^2 dx.
\end{aligned} \tag{27}$$

Combining this with (H2), (H3), (25), (27), and Lemma 4, we get

$$\begin{aligned}
\frac{d}{dt} \varphi(t) & \leq - [2 - 2\|a\|_{L^\infty} (\eta + \|g\|_{L^1})] E(t) \\
& \quad + \left(1 + \frac{\|g\|_{L^1}}{2\eta} \right) \int_{\Omega} (g \circ \nabla u) \, dx - \int_{\Gamma_0} f(u) u \, d\Gamma \\
& \quad - [1 - \|a\|_{L^\infty} (\eta + \|g\|_{L^1})] \left(\int_0^t g(s) \, ds \right) \\
& \quad \times \int_{\Omega} |\sqrt{a(x)} \nabla u(t)|^2 dx + 2 \int_{\Gamma_0} F(u) \, d\Gamma \\
& \leq - [2 - 2\|a\|_{L^\infty} (\eta + \|g\|_{L^1})] E(t) \\
& \quad + \left(1 + \frac{\|g\|_{L^1}}{2\eta} \right) \int_{\Omega} (g \circ \nabla u) \, dx \\
& \quad - [1 - \|a\|_{L^\infty} (\eta + \|g\|_{L^1})] \left(\int_0^t g(s) \, ds \right) \\
& \quad \times \int_{\Omega} |\sqrt{a(x)} \nabla u(t)|^2 dx.
\end{aligned} \tag{28}$$

For convenience, we take

$$\begin{aligned}\theta_1(\eta) &= 2 - 2\|a\|_{L^\infty}(\eta + \|g\|_{L^1}), \\ \theta_2(\eta) &= 1 + \frac{\|g\|_{L^1}}{2\eta}, \\ \theta_3(\eta) &= [1 - \|a\|_{L^\infty}(\eta + \|g\|_{L^1})] \left(\int_0^t g(s) ds \right).\end{aligned}\quad (29)$$

Clearly, $\theta_2(\eta) > 0$, for $\eta > 0$. We have to take appropriate η to ensure that $\theta_1(\eta) > 0$ and $\theta_3(\eta) > 0$. First, if $\theta_1(\eta) > 0$, that is, $2 - 2\|a\|_{L^\infty}(\eta + \|g\|_{L^1}) > 0$, we can get $\eta < 1/\|a\|_{L^\infty} - \|g\|_{L^1}$. Next, if $\theta_3(\eta) > 0$, that is, $[1 - \|a\|_{L^\infty}(\eta + \|g\|_{L^1})] \left(\int_0^t g(s) ds \right) > 0$, noting that $\int_0^t g(s) ds \leq \|g\|_{L^1}$ and $\int_0^t g(s) ds \geq \int_0^T g(s) ds := g_0 > 0$ for $t \geq T > 0$, we get

$$\begin{aligned}0 &< [1 - \|a\|_{L^\infty}(\eta + \|g\|_{L^1})] \left(\int_0^t g(s) ds \right) \\ &= \int_0^t g(s) ds - \|a\|_{L^\infty}(\eta + \|g\|_{L^1}) \left(\int_0^t g(s) ds \right) \\ &\leq \|g\|_{L^1} - g_0 \|a\|_{L^\infty}(\eta + \|g\|_{L^1}) \\ &= \|g\|_{L^1} - g_0 \|a\|_{L^\infty} \|g\|_{L^1} - g_0 \|a\|_{L^\infty} \eta,\end{aligned}\quad (30)$$

so we can take

$$\eta < \frac{\|g\|_{L^1} - g_0 \|a\|_{L^\infty} \|g\|_{L^1}}{g_0 \|a\|_{L^\infty}}. \quad (31)$$

For some $T > 0$, we take positive constant η_0 such that

$$\eta_0 = \frac{1}{2} \min \left\{ \frac{1}{\|a\|_{L^\infty}} - \|g\|_{L^1}, \frac{\|g\|_{L^1} - g_0 \|a\|_{L^\infty} \|g\|_{L^1}}{g_0 \|a\|_{L^\infty}} \right\}, \quad (32)$$

$$\forall t \geq T;$$

then we have $k_1 = \theta_1(\eta_0) > 0$, $k_2 = \theta_2(\eta_0) > 0$ for $t \geq T$, and

$$\frac{d}{dt} \varphi(t) \leq -k_1 E(t) + k_2 \int_{\Omega} (g \circ \nabla u) dx. \quad (33)$$

This completes the proof. $\square$

3. Global Existence and Uniqueness

In this section, we show the existence and uniqueness of the global solution to problem (1)-(2) by the Galerkin method, contraction mapping principle, and contradiction argument.

Theorem 6. Assume that (H1)-(H4) holds; there exists a unique global solution of the problem (1)-(2).

Proof

Step 1. We consider the following auxiliary problem for a given v :

$$\begin{aligned}A(x, t) u_t - \Delta u + \int_0^t g(t-s) \operatorname{div} [a(x) \nabla u(s)] ds &= 0, \\ (x, t) &\in \Omega \times (0, \infty), \\ -\frac{\partial u}{\partial \nu} + \int_0^t g(t-s) [a(x) \nabla u(s) \cdot \nu] ds &= f(v), \\ (x, t) &\in \Gamma_0 \times [0, \infty), \\ u(x, t) &= 0, \quad (x, t) \in \Gamma_1 \times (0, \infty), \\ u(x, 0) &= u_0(x), \quad x \in \Omega,\end{aligned}\quad (34)$$

where u is the solution that we required. Giving some $T > 0$, we will consider the solution of the problem (34) in the space $S = C([0, T]; V) \cap C^1([0, T]; L^1(\Omega))$ and define the norm as $\|u\|_S^2 = \max_{t \in [0, T]} \|\nabla u\|_2^2$.

Step 2. We will show that with the hypotheses (H1)–(H4), for $T > 0$, $v \in S$, there exists a unique $u \in S$ which satisfies (34).

Choose the basis $\{w_j\}_{j \geq 1}$ in $V \cap H^2(\Omega)$, which are orthonormal in $L^2(\Omega)$ and let $V_m = \operatorname{span}\{w_1, \dots, w_m\}$ be the subspace of $V \cap H^2(\Omega)$ generated by the first m vectors. For any $m \in N$, define

$$u_m(t) = \sum_{j=1}^m \zeta_{jm} w_j, \quad (35)$$

where $u_m(t)$ satisfies the following equation:

$$\begin{aligned}(A(x, t) u'_m, w) + (\nabla u_m, \nabla w) \\ - \int_0^t a(x) g(t-s) (\nabla u_m(s), \nabla w) ds \\ + (f(v), w)_{\Gamma_0} = 0,\end{aligned}\quad (36)$$

with the initial condition

$$u_m(0) = u_{0m} = \sum_{j=1}^m (u_m(0), w_j) w_j, \quad (37)$$

for any $w \in V$. By standard nonlinear ODE theory, we know that the problem (36) has a unique solution on some interval $[0, T_m]$. The extension of the solution to the whole interval $[0, T)$ is a consequence of the first estimate, which we are going to prove below. Taking $w = u'_m(t)$, we get

$$\begin{aligned}(A(x, t) u'_m, u'_m) + (\nabla u_m, \nabla u'_m) \\ - \int_0^t a(x) g(t-s) (\nabla u_m(s), \nabla u'_m(t)) ds \\ + (f(v), u'_m(t))_{\Gamma_0} = 0;\end{aligned}\quad (38)$$

that is,

$$\begin{aligned}
& \int_{\Omega} A(x, t) |u'_m(t)|^2 dx + \frac{d}{dt} \left[\frac{1}{2} \|\nabla u_m(t)\|_2^2 \right] \\
& + \frac{1}{2} \int_{\Omega} [a(x) g(t) |\nabla u_m(t)|^2 - (g' \circ \nabla u_m(t))] dx \\
& + \frac{1}{2} \frac{d}{dt} \int_{\Omega} \left[(g \circ \nabla u_m(t)) \right. \\
& \quad \left. - \int_0^t g(s) |\sqrt{a(x)} \nabla u_m(t)|^2 ds \right] dx \\
& + (f(v), u'_m(t))_{\Gamma_0} = 0,
\end{aligned} \tag{39}$$

then, we have

$$\begin{aligned}
& \int_{\Omega} A(x, t) |u'_m(t)|^2 dx \\
& + \frac{d}{dt} \left[\frac{1}{2} \left(1 - a(x) \int_0^t g(s) ds \right) \|\nabla u_m(t)\|_2^2 \right] \\
& + \frac{1}{2} \frac{d}{dt} \int_{\Omega} (g \circ \nabla u_m(t)) (t) dx \\
& + \frac{1}{2} g(t) \|\sqrt{a(x)} \nabla u_m(t)\|_2^2 \\
& - \frac{1}{2} \int_{\Omega} (g' \circ \nabla u_m(t)) (t) dx + (f(v), u'_m(t))_{\Gamma_0} = 0.
\end{aligned} \tag{40}$$

Integrating (40) over $(0, t)$, $t \in [0, T_m]$, we get

$$\begin{aligned}
& \int_0^t \int_{\Omega} A(x, t) |u'_m(t)|^2 dx dt \\
& + \frac{1}{2} \left(1 - a(x) \int_0^t g(s) ds \right) \|\nabla u_m(t)\|_2^2 \\
& + \frac{1}{2} \int_{\Omega} (g \circ \nabla u_m(t)) (t) dx - \frac{1}{2} \|\nabla u_m(0)\|_2^2 \\
& + \int_0^t g(s) \|\sqrt{a(x)} \nabla u_m(s)\|_2^2 ds \\
& - \frac{1}{2} \int_0^t \int_{\Omega} (g' \circ \nabla u_m(t)) (t) dx dt \\
& + \int_0^t \int_{\Gamma_0} f(v) u'_m(t) d\Gamma dt = 0.
\end{aligned} \tag{41}$$

Next, estimating some items of (41), by (H1), we obtain

$$\begin{aligned}
& \int_{\Omega} (g \circ \nabla u_m(t)) (t) dx - \int_0^t \int_{\Omega} (g' \circ \nabla u_m(t)) (t) dx dt \\
& + \int_0^t g(s) \|\sqrt{a(x)} \nabla u_m(s)\|_2^2 ds \geq 0.
\end{aligned} \tag{42}$$

By the Hölder inequality, $p/(p+1) + 1/(p+1) = 1$ and $H_0^1(\Omega) \hookrightarrow L^{p+1}(\Omega)$, $H_0^1(\Gamma_0) \hookrightarrow L^{2p}(\Gamma_0)$, we have

$$\begin{aligned}
& \int_0^t \int_{\Gamma_0} f(v) u'_m(t) d\Gamma dt \leq \int_0^t \|f(v)\|_{p+1, \Gamma_0}^p \|u'_m(t)\|_{p+1, \Gamma_0} dt \\
& \leq \frac{1}{4\eta} \int_0^t \|f(v)\|_{p+1, \Gamma_0}^p dt + \eta \int_0^t \|\nabla u'_m(t)\|_2^2 dt \\
& \leq \eta \int_0^t \|\nabla u'_m(t)\|_2^2 dt + C(T).
\end{aligned} \tag{43}$$

By assumption of the boundedness of $A(x, t)$ and Sobolev embedding inequality, we get

$$\int_0^t \int_{\Omega} A(x, t) |u'_m(t)|^2 dx dt \leq C(T) + C_{\delta} \int_0^t \|u'_m(t)\|_2^2 dt. \tag{44}$$

Substituting the estimates (42)–(44) into (41), we obtain

$$\begin{aligned}
& C_{\delta} \int_0^t \|u'_m(t)\|_2^2 dt + \frac{1}{2} k(x, t) \|\nabla u_m(t)\|_2^2 \\
& + \eta \int_0^t \|u'_m(t)\|_2^2 dt \leq C(T).
\end{aligned} \tag{45}$$

Hence, there exists a subsequence of $\{u_m\}$, which will be still denoted by $\{u_m\}$, such that

$$\begin{aligned}
& u'_m \rightharpoonup u \text{ weak-star in } L^{\infty}([0, T]; V), \\
& u'_m \rightharpoonup u' \text{ weak-star in } L^{\infty}([0, T]; L^1(\Omega)), \\
& u'_m \rightharpoonup u' \text{ weak-star in } L^2([0, T] \times H_0^1(\Omega)) \cap L^{m+2}([0, T] \times \Gamma_0).
\end{aligned}$$

Noting that $u \in H^1([0, T]; V)$, we can get $u \in C([0, T]; V)$. The existence of solution u is proved.

Next, we will prove the uniqueness of the solution u of (34) by contradiction argument. Let u_1, u_2 be two solutions of problem (34) with the same initial values. Letting that $U = u - u^-$ and taking U into (41), we have

$$\begin{aligned}
& \int_0^t \int_{\Omega} A(x, t) |U_t(t)|^2 dx dt \\
& + \frac{1}{2} \left(1 - a(x) \int_0^t g(s) ds \right) \|\nabla U(t)\|_2^2 \\
& + \frac{1}{2} \int_{\Omega} (g \circ \nabla U(t)) (t) dx \\
& + \frac{1}{2} \int_0^t g(s) \|\sqrt{a(x)} \nabla U(s)\|_2^2 ds \\
& + \left\{ -\frac{1}{2} \int_{\Omega} \int_0^t (g' \circ \nabla U(s)) ds dx \right\} = 0.
\end{aligned} \tag{46}$$

By (H1)–(H3), each term of the left-hand side is nonnegative; then $u = u^-$ follows immediately.

Step 3 (local existence and uniqueness). In this step, we will derive existence and uniqueness of local solution to problem

(1)-(2) for appropriate small time T by using contraction mapping theorem. That is,

$$\begin{aligned} & (A(x, t) u_t, \omega) + (\nabla u, \nabla \omega) \\ & - \int_0^t a(x) g(t-s) (\nabla u(s), \nabla \omega) ds \\ & + (f(u), \omega)_{\Gamma_0} = 0, \end{aligned} \quad (47)$$

such that

$$u \in C([0, T]; V) \cap C^1([0, T]; L^1(\Omega)). \quad (48)$$

For $R > 0$, $T > 0$, we define

$$B_R = \{u \in S : u(0) = 0, \|u\|_S \leq R\}. \quad (49)$$

B_R is nonempty for taking R sufficiently large. We define a mapping $F : u = F(v)$ from B_R to S .

Firstly, we will prove that F is a contraction mapping from B_R to itself. From Lemma 2, we know that for any fixed $v \in B_R$, the solution satisfies the following equation:

$$\begin{aligned} & \int_0^t \int_{\Omega} A(x, t) |u_t|^2 dx dt + \frac{1}{2} \left(1 - a(x) \int_0^t g(s) ds \right) \|\nabla u\|_2^2 \\ & + \frac{1}{2} \int_{\Omega} (g \circ \nabla u)(t) dx - \frac{1}{2} \|\nabla u(0)\|_2^2 \\ & + \frac{1}{2} \int_0^t g(s) \|\sqrt{a(x)} \nabla u(s)\|_2^2 ds \\ & - \frac{1}{2} \int_{\Omega} \int_0^t (g' \circ \nabla u)(s) ds dx \\ & + \int_0^t \int_{\Gamma_0} f(v) u_t(t) d\Gamma dt = 0. \end{aligned} \quad (50)$$

Similar to the estimates of (42) and (43), we obtain

$$\begin{aligned} & C_{\delta} \int_0^t \|u_t(t)\|_2^2 dt + \frac{1}{2} k(x, t) \|\nabla u\|_2^2 \\ & + \eta \int_0^t \|\nabla u'(t)\|_2^2 dt \\ & \leq \frac{1}{4\eta} T \|\nabla v\|_2^{2p} \leq \frac{1}{4\eta} TR^{2p}; \end{aligned} \quad (51)$$

selecting T sufficiently small, then we have

$$\|u(s)\|_S^2 \leq R^2, \quad (52)$$

for taking T sufficiently small, so F is a mapping from B_R to itself.

Secondly, we will prove that F is a contraction mapping. Let $U = u - u^-$, $V = v - v^-$, where $F(v) = u$, $F(v^-) = u^-$; then for any $w \in V$, we have

$$\begin{aligned} & (A(x, t) U_t, w) + (\nabla U, \nabla w) \\ & - \int_0^t a(x) g(t-s) (\nabla U(s), \nabla w) ds \\ & + \int_{\Gamma_0} (f(v) - f(v^-)) w d\Gamma = 0. \end{aligned} \quad (53)$$

Taking $w = U_t$ and integrating over $(0, t]$, we get

$$\begin{aligned} & \int_0^t \int_{\Omega} A(x, t) |U_t|^2 dx dt + \frac{1}{2} \left(1 - a(x) \int_0^t g(s) ds \right) \|\nabla U\|_2^2 \\ & + \frac{1}{2} \int_{\Omega} (g \circ \nabla U)(t) dx \\ & + \frac{1}{2} \int_0^t g(s) \|\sqrt{a(x)} \nabla U(s)\|_2^2 ds \\ & - \frac{1}{2} \int_{\Omega} \int_0^t (g' \circ \nabla U)(s) ds dx \\ & + \int_0^t \int_{\Gamma_0} (f(v) - f(v^-)) U_t(t) d\Gamma dt = 0. \end{aligned} \quad (54)$$

By (H3), we obtain

$$\begin{aligned} \int_{\Gamma_0} (f(v) - f(v^-)) U_t(t) d\Gamma & \leq C_1 \int_{\Gamma_0} |v - v^-| |U_t(t)| d\Gamma \\ & \leq C_2 \|U_t(t)\|_2 \|\nabla V^-(t)\|_{2, \Gamma_0} \\ & \leq C_3 \|U_t(t)\|_2 \|\nabla V^-(t)\|_{2, \Gamma_0}, \end{aligned} \quad (55)$$

where ξ is located between v and v^- . Combining of (42), (55), and (54) yields

$$\begin{aligned} & \int_0^t \int_{\Omega} A(x, t) |U_t(t)|^2 dx dt + \frac{1}{2} \left(1 - a(x) \int_0^t g(s) ds \right) \\ & \times \|\nabla U\|_2^2 \leq C_3 \int_0^t \|U_t(t)\|_2 \|\nabla V^-(t)\|_{2, \Gamma_0} dt; \end{aligned} \quad (56)$$

that is

$$\|U\|_S \leq C_4 TR^p \|V^-\|_S. \quad (57)$$

Taking T sufficiently small such that $C_4 TR^p < 1$, F is a contraction mapping.

Step 4. We show that if $T_{\max} = \sup\{T > 0 : u = u(t) \text{ exists on } [0, T]\} < \infty$, then $\lim_{t \rightarrow T_{\max}^-} \|u\|_S^2 = \infty$.

We will use a standard continuation argument to prove it. Indeed, by contradiction argument, suppose that $T_{\max} < \infty$ and $\lim_{t \rightarrow T_{\max}^-} \|u\|_S^2 < \infty$; then there exists a sequence $\{t_n, n =$

$1, 2, \dots\}$ and a constant $K > 0$, such that $t_n \rightarrow T_{\max}$ as $n \rightarrow +\infty$ and $\|u(t_n)\|_S^2 \leq K, n = 1, 2, \dots$. As we have already shown previously, for each $n \in N$ there exists a unique solution of the problem (1)–(2) with initial data $u(t_n)$ on $[t_n, t_n + T^*]$, where $T^* > 0$ depends on K and is independent of $n \in N$. Thus, for $n \in N$ large enough, we can get $T_{\max} < t_n + T^*$. This contradicts the maximality of $T_{\max}$.

Step 5. In the final step, we only need to prove the existence of the global solution. By (H3) and Poincaré inequality, we have

$$\begin{aligned} E(0) \geq E(t) &= \frac{1}{2}k(x, t) \int_{\Omega} |\nabla u|^2 dx \\ &\quad + \frac{1}{2} \int_{\Omega} (g \circ \nabla u)(t) dx + \int_{\Gamma_0} F(u) d\Gamma \\ &\geq \frac{1}{2} \left(1 - a(x) \int_0^t g(s) ds \right) \|\nabla u\|_2^2 \\ &\quad + \frac{1}{2} \int_{\Omega} (g \circ \nabla u)(t) dx \\ &\geq C \|u\|_S^2, \quad \forall t \geq 0. \end{aligned} \quad (58)$$

It is easy to see that $T_{\max} = \infty$. This completes the proof. $\square$

4. Uniform Energy Decay Rates

In this section, we establish the estimate of uniform energy decay rates and make use of the above assumptions and preliminaries to prove the results.

Theorem 7. Assume that (H1)–(H4) hold and there exists a positive constant $c > 0$ such that $g'(t) \leq -cg(t)$. If $u_0 \in H^1(\Omega)$, then for some $T > 0$, there exists a positive constant C_0 such that the solution of (1)–(2) satisfies

$$E(t) \leq 4E(0) e^{-c_0 t}, \quad \forall t \geq T. \quad (59)$$

Proof. Let $\gamma > 0$ be a positive constant. We introduce

$$\psi(t) = \gamma E(t) + \varphi(t); \quad (60)$$

since $|\varphi(t)| \leq CE(t)$, we get

$$\frac{\gamma}{2} E(t) \leq \psi(t) \leq 2\gamma E(t), \quad \forall t \geq 0, \quad (61)$$

by taking γ large enough. From (18) and the assumption of $g'(t) \leq -cg(t)$, applying Lemma 3 and taking γ large enough and $t \geq T$, we obtain that

$$\begin{aligned} \frac{d}{dt} \psi(t) &= \gamma \frac{d}{dt} E(t) + \frac{d}{dt} \varphi(t) \\ &\leq \gamma \left(\frac{1}{2} \int_{\Omega} (g' \circ \nabla u - g(t) |\sqrt{a(x)} \nabla u|^2) dx \right. \\ &\quad \left. - \int_{\Omega} A(x, t) |u_t|^2 dx - k_1 E(t) + k_2 \int_{\Omega} (g \circ \nabla u) dx \right) \\ &\leq -\left(\frac{c\gamma}{2} - k_2 \right) \int_{\Omega} (g \circ \nabla u) dx \\ &\quad - \frac{\gamma}{2} \int_{\Omega} g(t) |\sqrt{a(x)} \nabla u|^2 dx \\ &\quad - \gamma \int_{\Omega} A(t) |u_t|^2 dx - k_1 E(t) \\ &\leq -k_1 E(t) \leq -\frac{k_1}{2\gamma} \psi(t), \end{aligned} \quad (62)$$

by the Gronwall's inequality which implies that

$$\psi(t) \leq \psi(0) e^{-(k_1/2\gamma)t}, \quad \forall t \geq T. \quad (63)$$

Using (61), we obtain

$$E(t) \leq 4E(0) e^{-(k_1/2\gamma)t}, \quad \forall t \geq T. \quad (64)$$

This completes the proof. $\square$

Theorem 8. Assume that (H1)–(H4) hold, and there exists a positive constant $c > 0$ such that $g'(t) \leq -cg^{1+1/q}(t)$, $q > 2$. If $u_0 \in H^1(\Omega)$, then for some $T > 0$ there exists a positive constant C_ω , such that the solution of (1)–(2) satisfies

$$E(t) \leq \frac{C_\omega}{(1+t)^q}, \quad \forall t \geq T. \quad (65)$$

In order to prove Theorem 8, we first quote the following lemma.

Lemma 9. Assume that $v \in L^\infty(0, T; H^1(\Omega))$ and g is a continuous function. Then there exists a positive constant C , such that

$$\begin{aligned} \int_{\Omega} (g \circ \nabla v) dx &\leq C \left(t \|v(t)\|_{H^1}^2 + \int_0^t \|v(s)\|_{H^1}^2 ds \right)^{1/(q+1)} \\ &\quad \times \left(\int_{\Omega} g^{1+1/q} \circ \nabla v dx \right)^{q/(q+1)}. \end{aligned} \quad (66)$$

Moreover,

$$\int_0^\infty g^{1-\theta}(s) ds < \infty, \quad 0 < \theta < 1. \quad (67)$$

Then we have

$$\begin{aligned} \int_{\Omega} (g \circ \nabla v) dx &\leq C \left(\int_0^{\infty} g^{1-\theta}(s) ds \|v\|_{L^{\infty}(0,T;H^1(\Omega))}^2 \right)^{1/(\theta q+1)} \\ &\quad \times \left(\int_{\Omega} g^{1+1/q} \circ \nabla v dx \right)^{\theta q/(\theta q+1)}. \end{aligned} \quad (68)$$

Proof. Applying the Hölder inequality, we obtain

$$\begin{aligned} \int_{\Omega} (g \circ \nabla v) dx &= \int_{\Omega} \int_0^t g(t-s) \\ &\quad \times \left| \sqrt{a(x)} (\nabla v(t) - \nabla v(s)) \right|^2 ds dx \\ &\leq \left(\int_{\Omega} \int_0^t |g(s)|^{1-\theta} |\omega(s)| ds dx \right)^{1/(\theta q+1)} \\ &\quad \times \left(\int_{\Omega} \int_0^t |g(s)|^{1+1/q} |\omega(s)| ds dx \right)^{\theta q/(\theta q+1)} \\ &\leq \left(\int_{\Omega} g^{1-\theta} \circ \nabla v dx \right)^{1/(\theta q+1)} \\ &\quad \times \left(\int_{\Omega} g^{1+1/q} \circ \nabla v dx \right)^{\theta q/(\theta q+1)}, \end{aligned} \quad (69)$$

where $\omega(s) = \left| \sqrt{a(x)} (\nabla v(t) - \nabla v(s)) \right|^2$. Noting that $\int_0^{\infty} g^{1-\theta}(s) ds < \infty$, $0 < \theta < 1$, we obtain

$$\begin{aligned} \int_{\Omega} g^{1-\theta} \circ \nabla v dx &= \int_0^t g^{1-\theta}(t-s) \\ &\quad \times \int_{\Omega} \left| \sqrt{a(x)} (\nabla v(t) - \nabla v(s)) \right|^2 dx ds \\ &\leq C \int_0^t g^{1-\theta}(s) ds \|v\|_{L^{\infty}(0,T;H^1(\Omega))}^2, \end{aligned} \quad (70)$$

which implies that

$$\begin{aligned} \int_{\Omega} g \circ \nabla v dx &\leq C \left(\int_0^t g^{1-\theta}(s) ds \|v\|_{L^{\infty}(0,T;H^1(\Omega))}^2 \right)^{1/(\theta q+1)} \\ &\quad \times \left(\int_{\Omega} g^{1+1/q} \circ \nabla v dx \right)^{\theta q/(\theta q+1)}. \end{aligned} \quad (71)$$

If $\theta = 1$, we have

$$\begin{aligned} \int_{\Omega} g^{1-\theta} \circ \nabla v dx &= \int_{\Omega} 1 \circ \nabla v dx \\ &= \int_{\Omega} \int_0^t \left| \sqrt{a(x)} (\nabla v(t) - \nabla v(s)) \right|^2 ds dx \\ &\leq C \left(t \int_{\Omega} |\nabla v(t)|^2 dx \right. \\ &\quad \left. + \int_{\Omega} \int_0^t |\nabla v(s)|^2 dx ds \right). \end{aligned} \quad (72)$$

Applying the above inequality and (69), we obtain

$$\begin{aligned} \int_{\Omega} g \circ \nabla v dx &\leq C \left(t \int_{\Omega} |\nabla v(t)|^2 dx \right. \\ &\quad \left. + \int_{\Omega} \int_0^t |\nabla v(s)|^2 dx ds \right)^{1/(q+1)} \\ &\quad \times \left(\int_{\Omega} g^{1+1/q} \circ \nabla v dx \right)^{q/(q+1)} \\ &\leq C \left(t \|v(t)\|_{H^1}^2 + \int_0^t \|v(s)\|_{H^1}^2 ds \right)^{1/(q+1)} \\ &\quad \times \left(\int_{\Omega} g^{1+1/q} \circ \nabla v dx \right)^{q/(q+1)}. \end{aligned} \quad (73)$$

This completes the proof. $\square$

Proof of Theorem 8. From the assumption $g'(t) \leq -cg^{1+1/q}(t)$, we have $[g^{-1/q}(t)]' \geq c/q$. Integrating it over $[0, t]$, we get

$$g(t) \leq C_1(1+t)^{-q}, \quad C_1 > 0. \quad (74)$$

Taking $\theta = 1/2$ in Lemma 9, $(1-\theta)q = q/2 > 1$, then we obtain

$$\int_0^{\infty} g^{1-\theta}(s) ds \leq \int_0^{\infty} \frac{1}{(1+s)^{q/2}} < \infty. \quad (75)$$

Substituting this estimate into (68), using (18) and Lemma 4, we have

$$\int_{\Omega} g \circ \nabla u dx \leq C_2 E(0)^{2/q+2} \left(\int_{\Omega} g^{1+1/q} \circ \nabla u dx \right)^{q/(q+2)}. \quad (76)$$

Applying (76), (23), and Lemma 3 and taking $t \geq T$, we get

$$\begin{aligned} \frac{d}{dt} \varphi(t) &\leq -k_1 E(t) + k_2 \int_{\Omega} (g \circ \nabla u) dx \\ &\leq -k_1 E(t) + k_2 C_2 E(0)^{2/(q+2)} \\ &\quad \times \left(\int_{\Omega} g^{1+1/q} \circ \nabla u dx \right)^{q/(q+2)}. \end{aligned} \quad (77)$$

Since $|\varphi(t)| \leq CE(t)$, applying the Young's inequality, from (19) and (77), we deduce that

$$\begin{aligned} \frac{d}{dt} [E^{2/q} \varphi](t) &= \frac{2}{q} \varphi(t) E^{2/q-1}(t) \frac{d}{dt} E(t) + E^{2/q}(t) \frac{d}{dt} \varphi(t) \\ &\leq -\frac{2}{q} CE^{2/q}(t) \frac{d}{dt} E(t) + E^{2/q}(t) \frac{d}{dt} \varphi(t) \\ &\leq -C_0 \frac{d}{dt} E^{1+2/q}(t) - k_1 E^{1+2/q}(t) \\ &\quad + k_2 C_2 E(0)^{2/(q+2)} E^{2/q}(t) \\ &\quad \times \left(\int_{\Omega} g^{1+1/q} \circ \nabla u \, dx \right)^{q/(q+2)} \\ &\leq -C_0 \frac{d}{dt} E^{1+2/q}(t) - k_1 E^{1+2/q}(t) \\ &\quad + k_2 C_2 E(0)^{2/q+2} \varepsilon E^{1+2/q}(t) \\ &\quad + k_2 C_2 E(0)^{2/q+2} C_{\varepsilon} \left(\int_{\Omega} g^{1+1/q} \circ \nabla u \, dx \right). \end{aligned} \quad (78)$$

Since $g'(t) \leq -cg^{1+1/q}(t)$, that is, $g^{1+(1/q)}(t) \leq -(1/c)g'(t)$, then we obtain

$$\int_{\Omega} g^{1+(1/q)} \circ \nabla u \, dx \leq -\frac{1}{c} \int_{\Omega} g' \circ \nabla u \, dx. \quad (79)$$

It follows from Lemma 3 that

$$\begin{aligned} \int_{\Omega} g' \circ \nabla u \, dx &= 2 \frac{d}{dt} E(t) + \frac{1}{2} \int_{\Omega} g(t) \left| \sqrt{a(x)} \nabla u(t) \right|^2 dx \\ &\quad + \int_{\Omega} A(x, t) |u_t|^2 dx \geq 2 \frac{d}{dt} E(t); \end{aligned} \quad (80)$$

hence, we get

$$\int_{\Omega} g^{1+(1/q)} \circ \nabla u \, dx \leq -C_3 \frac{d}{dt} E(t). \quad (81)$$

Taking ε sufficiently small, using (78) and (81), we have

$$\begin{aligned} \frac{d}{dt} [E^{2/q} \varphi](t) &\leq -C_0 \frac{d}{dt} E^{1+2/q}(t) \\ &\quad - \frac{k_1}{2} E^{1+2/q}(t) - C_4 \frac{d}{dt} E(t); \end{aligned} \quad (82)$$

then we obtain

$$\begin{aligned} \frac{d}{dt} [E^{2/q} \varphi + C_0 E](t) &\leq -\frac{k_1}{2} E^{1+(2/q)}(t) - C_4 \frac{d}{dt} E(t), \\ \forall t \geq T. \end{aligned} \quad (83)$$

Let $\gamma > 0$ be a positive constant and define that

$$\psi(t) = \gamma E(t) + E^{2/q}(t) [\varphi(t) + C_0 E(t)]. \quad (84)$$

Since $|\varphi(t)| \leq CE(t)$, $(d/dt)E(t) \leq 0$, we get

$$\frac{\gamma}{2} E(t) \leq \psi(t) \leq 2\gamma E(t), \quad \forall t \geq 0, \quad (85)$$

by taking γ sufficiently large. Using (83) and Lemma 3 and taking γ sufficiently large, we obtain

$$\begin{aligned} \frac{d}{dt} \psi(t) &= \gamma \frac{d}{dt} E(t) + \frac{d}{dt} \{E^{2/q}(t) [\varphi(t) + C_0 E(t)]\} \\ &\leq \gamma \frac{d}{dt} E(t) - C_4 \frac{d}{dt} E(t) - \frac{k_1}{2} E^{1+2/q}(t) \\ &= (\gamma - C_4) \frac{d}{dt} E(t) - \frac{k_1}{2} E^{1+2/q}(t) \\ &\leq -\frac{k_1}{2} E^{1+(2/q)}(t), \quad \forall t \geq T. \end{aligned} \quad (86)$$

From (85) and (86), we have

$$\frac{d}{dt} \psi(t) \leq -C_5 \psi^{1+2/q}(t), \quad \forall t \geq T. \quad (87)$$

Applying the Gronwall's inequality, we get

$$\psi(t) \leq \frac{C_6}{(1+t)^{q/2}}, \quad \forall t \geq T; \quad (88)$$

hence

$$E(t) \leq \frac{C_7}{(1+t)^{q/2}}, \quad \forall t \geq T. \quad (89)$$

Since $q > 2$, we have

$$\begin{aligned} \int_0^{\infty} E(s) \, ds &\leq \int_0^{\infty} \frac{C_7}{(1+t)^{q/2}} \, ds < \infty, \\ tE(t) &\leq \frac{C_7 t}{(1+t)^{q/2}} < \infty, \end{aligned} \quad (90)$$

and then we obtain

$$\begin{aligned} \int_0^{\infty} \|u(s)\|_{H^1}^2 \, ds + t \|u(t)\|_{H^1}^2 \\ \leq C_8 \left(\int_0^{\infty} E(s) \, ds + tE(t) \right) < \infty. \end{aligned} \quad (91)$$

Using Lemma 9, we get

$$\int_{\Omega} g \circ \nabla u \, dx \leq C_9 \left(\int_{\Omega} g^{1+1/q} \circ \nabla u \, dx \right)^{q/(q+1)}. \quad (92)$$

By (92) and replacing the left-hand side term of (78) by $(d/dt)[E^{1/q} \varphi](t)$, we deduce that

$$E(t) \leq \frac{C_w}{(1+t)^q}, \quad \forall t \geq T. \quad (93)$$

This completes the proof. $\square$

Conflict of Interests

The authors declare that they have no conflict of interests.

Authors' Contribution

All authors contributed equally to the paper and read and approved the final paper.

Acknowledgments

This work is supported by the Natural Science Foundation of Shandong Province of China (ZR2012AM018) and the Fundamental Research Funds for the Central Universities (no. 201362032). The authors would like to deeply thank all the reviewers for their insightful and constructive comments.
