By using the fixed point index theorem, this paper investigates a class of singular semipositone integral boundary value problem for fractional $q$-derivatives equations and obtains sufficient conditions for the existence of at least two and at least three positive solutions. Further, an example is given to illustrate the applications of our main results.

1. Introduction

Studies on $q$-difference equations appeared already at the beginning of the 20th century in intensive works especially by Jackson [1], Carmichael [2], and other authors such as Poincare, Picard and, Ramanujan [3]. Up to date, it has evolved into a multidisciplinary subject, for example, see [4–7] and the references therein. For some recent work on $q$-difference equations, we refer the reader to the papers [8–21], and the basic definitions and properties of $q$-difference calculus can be found in the book [3, 22]. On the other hand, fractional differential equations have gained importance due to their numerous applications in many fields of science and engineering including fluid flow, rheology, diffusive transport akin to diffusion, electrical networks, and probability [23]. Many researchers studied the existence of solutions to fractional boundary value problems, for example, [24–35] and the references therein.

The fractional $q$-difference calculus had its origin in the works by Al-Salam [36] and Agarwal [37]. More recently, perhaps due to the explosion in research within the fractional differential calculus setting, new developments in this theory of fractional $q$-difference calculus were made, specifically, $q$-analogues of the integral and differential fractional operators properties such as the Mittag-Leffler function, the $q$-Laplace transform, and $q$-Taylor’s formula [3, 13, 22, 38], just to mention some.

However, the theory of boundary value problems for nonlinear $q$-difference equations is still in the initial stage and many aspects of this theory need to be explored.

In [17], Ferreira considered a Dirichlet type nonlinear $q$-difference boundary value problem as follows:

$$D_q^α u(t) + f(u(t)) = 0, \quad 0 < t < 1, \quad 1 < α \leq 2,$$

$$u(0) = u(1) = 0.$$  \hfill (1)

By applying a fixed point theorem in cones, sufficient conditions for the existence of nontrivial solutions were enunciated.

In other paper, Ferreira [18] studied the existence of positive solutions to nonlinear $q$-difference boundary value problem as follows:

$$D_q^α u(t) + f(u(t)) = 0, \quad 0 < t < 1, \quad 2 < α \leq 3,$$

$$u(0) = D_q^2 u(0) = 0, \quad D_q u(1) = β ≥ 0.$$  \hfill (2)

By using a fixed point theorem in a cone, El-Shahed and Al-Askar [19] were concerned with the existence of positive solutions to nonlinear $q$-difference equation:

$$c D_q^3 u(t) + a(t) f(u(t)) = 0, \quad 0 < t \leq 1, \quad 2 < α \leq 3,$$

$$u(0) = D_q^2 u(0) = 0, \quad aD_q u(1) + bD_q^2 u(1) = 0.$$  \hfill (3)

In the present paper, we investigate a class of singular semipositive integral boundary value problem for fractional $q$-derivatives equation:

$$c D_q^3 u(t) + a(t) f(u(t)) = 0, \quad 0 < t \leq 1, \quad 2 < α \leq 3,$$

$$u(0) = D_q^2 u(0) = 0, \quad aD_q u(1) + bD_q^2 u(1) = 0,$$  \hfill (4)
where \(a, b \geq 0\) and \(C^\alpha D_q^u\) is the fractional \(q\)-derivatives of the Caputo type.

Recently, Liang and Zhang [20] discussed the following nonlinear \(q\)-fractional three-point boundary value problem:

\[
\begin{align*}
(D_q^\alpha u)(t) + f(t, u(t)) &= 0, \quad 0 < t < 1, \quad 2 < \alpha \leq 3, \\
& \\
& n - 1 < \alpha \leq n, n \in \mathbb{N}, \\
& (D_q^i u)(0) = 0, \quad i = 0, \ldots, n - 2, \\
& bD_q u(1) = \mu \int_0^1 u(\eta) d\eta, \\
& \end{align*}
\]

(5)

By using a fixed point theorem in partially ordered sets, the authors obtained sufficient conditions for the existence and uniqueness of positive and nondecreasing solutions to the above boundary value problem.

In [21], Graef and Kong investigated the following boundary value problem with fractional \(q\)-derivatives:

\[
(D_q^\alpha u)(t) + f(t, u(t)) = 0, \quad 0 < t < 1,
\]

(4)

subject to the boundary conditions

\[
u(0) = (D_q^u)(0) = 0, \quad u(1) = \mu \int_0^1 u(s) d_q s,\]

(8)

where \(\mu \in (0, 1)\), \(\mu\) is parameter with \(0 < \mu < \lfloor \alpha \rfloor_q\), \(D_q^\alpha\) is the \(q\)-derivative of Riemann-Liouville type of order \(\alpha\), and \(f : [0, 1] \times \mathbb{R}^+ \to \mathbb{R}\) is continuous and semipositive and may be singular at \(u = 0\), in which \(\mathbb{R}^+ = (0, +\infty)\), \(\mathbb{R} = (-\infty, +\infty)\). In the present work, we investigate the existence of positive solutions for fractional \(q\)-derivatives integral boundary value problem (7) and (8) involving the Riemann-Liouville’s fractional derivative, which is different from [11]. We gave the corresponding Green’s function of the boundary value problem (7) and (8), gave some properties of Green’s function, and constructed a cone by properties of Green’s function. Moreover the existence of at least two and three positive solutions to the boundary value problem (7) and (8) is enunciated.

2. Preliminaries on \(q\)-Calculus and Lemmas

For the convenience of the reader, below we recall some known facts on fractional \(q\)-calculus. The presentation here can be found in, for example, [1, 3, 12, 19, 21, 22].

Let \(q \in (0, 1)\) and define

\[
[a]_q = \frac{1 - q^a}{1 - q}, \quad a \in \mathbb{R}. \tag{9}
\]

The \(q\)-analogue of the power function \((a - b)^n\) with \(n \in \mathbb{N}_0 := \{0, 1, 2, \ldots\}\) is

\[
(a - b)^{(0)} = 1, \quad (a - b)^{(n)} = \prod_{k=0}^{n-1} (a - bq^k), \tag{10}
\]

where \(a, b \in \mathbb{R}\), \(a \neq 0\).

More generally, if \(\gamma \in \mathbb{R}\), then

\[
(a - b)^{(\gamma)} = a^\gamma \prod_{k=0}^{\infty} \frac{a - bq^k}{a - bq^{k+\gamma}}, \quad a \neq 0. \tag{11}
\]

Clearly, if \(b = 0\) then \(a^y = a^y\). The \(q\)-gamma function is defined by

\[
\Gamma_q(x) = \frac{(1 - q)^{(x-1)}}{(1 - q)^{x}}, \quad x \in \mathbb{R} \setminus \{0, -1, -2, \ldots\}, \tag{12}
\]

and satisfies \(\Gamma_q(x + 1) = [x]_q \Gamma_q(x)\).

The \(q\)-derivative of a function \(f\) is defined by

\[
(D_q f)(x) = \frac{f(qx) - f(x)}{(q - 1)x}, \tag{13}
\]

and the \(q\)-derivatives of higher order by

\[
(D_q^n f)(x) = D_q \left(D_q^{n-1} f\right)(x), \quad n \in \mathbb{N}. \tag{14}
\]
The \( q \)-integral of a function \( f \) defined in the interval \([0, b]\) is given by
\[
(I_q f)(x) = \int_0^x f(s) \, d_q s = x (1-q) \sum_{k=0}^{\infty} f(x q^k) q^k,
\]
where \( x \in [0, b] \).

If \( a \in [0, b] \) and \( f \) is defined in the interval \([0, b]\), then its integral from \( a \) to \( b \) is defined by
\[
\int_a^b f(s) \, d_q s = \int_a^b f(s) \, d_q s - \int_a^a f(s) \, d_q s.
\]

Similar to that for derivatives, an operator \( I_q^n \) is given by
\[
(I_q^n f)(x) = (I_q I_q^{n-1} f)(x), \quad n \in \mathbb{N}.
\]

The fundamental theorem of calculus applies to these operators \( I_q \) and \( D_q \), that is,
\[
(D_q I_q f)(x) = f(x),
\]
and if \( f \) is continuous at \( x = 0 \), then
\[
(I_q D_q f)(x) = f(x) - f(0).
\]

The following formulas will be used later, namely, the integration by parts formula:
\[
\int_0^x f(s) (D_q g)(s) \, d_q s = [f(s) g(s)]_{s=0}^{s=x} - \int_0^x (D_q f)(s) g(q s) \, d_q s,
\]
and if \( f \) is continuous at \( x = 0 \), then
\[
[D_q(t-s)^{\gamma-1} = \frac{\Gamma_q [\gamma-1]}{\Gamma_q [\gamma]} (t-s)^{\gamma-1},
\]
then, the following equality holds:
\[
(D_q^n D_q^m f)(x) = (D_q^m D_q^n f)(x) = \sum_{k=0}^{n-1} \frac{\Gamma_q [\gamma-1] \Gamma_q [\gamma] - \Gamma_q [\gamma-1] \Gamma_q [\gamma]}{\Gamma_q [\gamma] - \Gamma_q [\gamma-1]} (D_q^k f)(0).
\]

Lemma 3. Assume that \( y \geq 0 \) and \( a \leq b \leq t \), then \((t-a) \geq (t-b)\).

Lemma 4. Let \( \alpha, \beta \geq 0 \) and \( f \) be a function defined in \([0, 1]\). Then, the following formulas hold:
\[
(D_q^\alpha D_q^\beta f)(x) = D_q^{\alpha+\beta} f(x),
\]
and
\[
(D_q^\gamma D_q^\mu f)(x) = D_q^{\gamma+\mu} f(x).
\]

Lemma 5 (see [17]). Let \( \alpha > 0 \) and \( n \) be a positive integer. Then, the following equality holds:
\[
(D_q^n D_q^m f)(x) = (D_q^m D_q^n f)(x) = \sum_{k=0}^{n-1} \frac{\Gamma_q [\gamma-1] \Gamma_q [\gamma] - \Gamma_q [\gamma-1] \Gamma_q [\gamma]}{\Gamma_q [\gamma] - \Gamma_q [\gamma-1]} (D_q^k f)(0).
\]

Lemma 6. Let \( y \in C[0,1], q \in (0,1), 2 < \alpha \leq 3, 1 < \mu < [\alpha]_q \). Then the unique solution of the equation
\[
(D_q^\alpha u)(t) + y(t) = 0, \quad t \in (0,1),
\]
subject to \( BC(8) \) is given by
\[
u(t) = \int_0^1 G(t,qs) y(s) \, d_q s,
\]
where
\[
G(t,s) = \begin{cases} \frac{\Gamma_q [\gamma-1] \Gamma_q [\gamma] - \Gamma_q [\gamma-1] \Gamma_q [\gamma]}{\Gamma_q [\gamma] - \Gamma_q [\gamma-1]} (D_q^k f)(0) \\
\end{cases}
\]

Definition 1. Let \( \alpha \geq 0 \) and \( f \) be a function defined on \([0, 1]\). The fractional \( q \)-integral of Riemann-Liouville type is \((I_q f)(x) = f(x)\) and
\[
(I_q^\alpha f)(x) = \frac{1}{\Gamma_q (\alpha)} \int_0^x (x-q s)^{\alpha-1} f(s) \, d_q s,
\]
where \( \alpha > 0, x \in [0, 1] \).

The fractional \( q \)-derivative of order \( \alpha \geq 0 \) is defined by \((D_q^\alpha f)(x) = f(x)\) and \((D_q^\gamma f)(x) = (D_q^{\gamma+k-\alpha} f)(x)\) for \( \alpha > 0 \), where \( k \) is the smallest integer greater than or equal to \( \alpha \).
Then by the boundary conditions $(D_q u)(0) = 0$, we get $c_2 = 0$. Thus, (29) reduces to

$$ u(t) = c_1 t^{\alpha - 1} - \int_0^t \left( t - q \right)^{(\alpha - 1)} \frac{1}{\Gamma_\alpha (\alpha)} y(s) d_q s. $$

(31)

Using the boundary condition $u(1) = \mu \int_0^1 u(s) d_q s$, we get

$$ c_1 = \mu \int_0^1 u(s) d_q s + \int_0^1 \left( 1 - q s \right)^{(\alpha - 1)} \frac{1}{\Gamma_\alpha (\alpha)} y(s) d_q s. $$

(32)

Hence, we have

$$ u(t) = t^{\alpha - 1} \left( \mu \int_0^1 u(s) d_q s + \int_0^1 \left( 1 - q s \right)^{(\alpha - 1)} \frac{1}{\Gamma_\alpha (\alpha)} y(s) d_q s \right) - \int_0^t \left( t - q s \right)^{(\alpha - 1)} \frac{1}{\Gamma_\alpha (\alpha)} y(s) d_q s. $$

(33)

Integrate the above equation (33) from 0 to 1, and using (11), (19) and (20), we obtain

$$ \int_0^1 u(t) d_q t = \int_0^1 t^{\alpha - 1} \left( \mu \int_0^1 u(s) d_q s + \int_0^1 \left( 1 - q s \right)^{(\alpha - 1)} \frac{1}{\Gamma_\alpha (\alpha)} y(s) d_q s \right) d_q t $$

$$ + \int_0^1 t^{\alpha - 1} \left( \int_0^1 \left( 1 - q s \right)^{(\alpha - 1)} \frac{1}{\Gamma_\alpha (\alpha)} y(s) d_q s \right) d_q t $$

$$ - \int_0^1 \left( 1 - q s \right)^{(\alpha - 1)} \frac{1}{\Gamma_\alpha (\alpha)} y(s) d_q s \right) d_q t $$

$$ = \frac{(1 - q)\mu}{1 - q^\alpha} \int_0^1 u(s) d_q s $$

$$ + \frac{1 - q}{1 - q^\alpha} \int_0^1 \left( 1 - q s \right)^{(\alpha - 1)} \frac{1}{\Gamma_\alpha (\alpha)} y(s) d_q s $$

$$ - \int_0^1 \left( 1 - q s \right)^{(\alpha - 1)} \frac{1}{\Gamma_\alpha (\alpha)} y(s) d_q s $$

$$ = \frac{\mu}{\Gamma_\alpha (\alpha)} \int_0^1 u(s) d_q s $$

$$ + \int_0^1 \left( 1 - q s \right)^{(\alpha - 1)} \frac{y(s)}{\Gamma_\alpha (\alpha)} d_q s. $$

(34)

Then

$$ \int_0^1 u(t) d_q t = \frac{q^\alpha}{\Gamma_\alpha (\alpha) - \mu} \int_0^1 \left( 1 - q s \right)^{(\alpha - 1)} \frac{y(s)}{\Gamma_\alpha (\alpha)} d_q s. $$

(35)

Combining this with (29) and (31) yields

$$ u(t) = \frac{\mu q^\alpha}{\Gamma_\alpha (\alpha - 1)} \int_0^1 t^{\alpha - 1} \left( 1 - q s \right)^{(\alpha - 1)} y(s) d_q s $$

$$ + \frac{1}{\Gamma_\alpha (\alpha)} \int_0^1 t^{\alpha - 1} \left( 1 - q s \right)^{(\alpha - 1)} y(s) d_q s $$

$$ - \frac{1}{\Gamma_\alpha (\alpha)} \int_0^1 \left( t - q s \right)^{(\alpha - 1)} y(s) d_q s $$

$$ = \int_0^1 \left( [\alpha]_q - \mu + \mu q^\alpha - \mu \right) \left[ (\alpha) \Gamma_\alpha (\alpha) \right] y(s) d_q s $$

$$ - \frac{1}{\Gamma_\alpha (\alpha)} \int_0^1 \left( t - q s \right)^{(\alpha - 1)} y(s) d_q s $$

$$ = \int_0^1 G(t, q s) y(s) d_q s. $$

(36)

This completes the proof of the lemma.

Remark 7. For the special case where $\mu = 0$, Lemmas 6 has been obtained by Ferreira [18].

Lemma 8. The function $G(t, s)$ defined by (27) satisfies the following conditions:

(i) $G(t, s)$ is a continuous function on $(t, s) \in [0, 1] \times [0, 1]$, and $G(t, q s) \geq 0$, for $(t, s) \in [0, 1] \times [0, 1]$;

(ii) $\mu q^\alpha - 1 \rho(s) \leq (\alpha - 1)_q \mu \Gamma_\alpha (\alpha) G(t, q s) \leq \lambda^{\alpha - 1}, (\alpha - 1)_q \mu \Gamma_\alpha (\alpha) G(t, q s) \leq \lambda^{\alpha - 1}$, where

$$ \rho(s) = (1 - q s)^{(\alpha - 1)} s $$

$$ \lambda = \max \left( [\alpha - 1]_q \left[ (\alpha) \mu + \mu q^\alpha \right] \right). $$

(37)

Proof. The continuity of $G$ is easily checked. On the other hand, when $0 \leq q s \leq t \leq 1$, in view of Lemma 3, we have

$$ \int_0^1 G(t, q s) y(s) d_q s $$

$$ = \int_0^1 t^{\alpha - 1} \left( 1 - q s \right)^{(\alpha - 1)} \left( \frac{1}{\Gamma_\alpha (\alpha)} y(s) d_q s \right) $$

$$ = \left( \frac{1}{\Gamma_\alpha (\alpha)} y(s) d_q s \right) $$

Then

$$ \int_0^1 G(t, q s) y(s) d_q s $$

$$ = \mu q^\alpha \left( 1 - q s \right)^{(\alpha - 1)} \int_0^1 \left( 1 - q s \right)^{(\alpha - 1)} y(s) d_q s $$

$$ = \mu q^\alpha \left( 1 - q s \right)^{(\alpha - 1)} \int_0^1 y(s) d_q s $$

$$ \geq \mu q^\alpha \left( 1 - q s \right)^{(\alpha - 1)} \rho(s) \geq 0.$$

(38)
Further, since we have
\[
\begin{align*}
G(t,qs) &= \left( [\alpha_q] - \mu \right) \left[ t^{\alpha-1} (1 - qs)^{(\alpha-1)} - (t - qs)^{(\alpha-1)} \right] \\
& \quad + \mu q^\alpha t^{\alpha-1} (1 - qs)^{(\alpha-1)} s \\
& \quad \times \left( [\alpha_q] - \mu \right) \Gamma_q (\alpha)^{-1} \\
& \leq \left( [\alpha - 1] \right) \left( [\alpha_q] - \mu \right) \left( t - tqs \right)^{(\alpha-2)} \\
& \quad \times \left( [\alpha_q] - \mu \right) \Gamma_q (\alpha)^{-1} \\
& = \left( [\alpha_q] - \mu \right) \left( [\alpha_q] - \mu \right) \left( t - tqs \right)^{(\alpha-2)} s (1 - t) \\
& \quad + \mu q^\alpha t^{\alpha-1} (1 - qs)^{(\alpha-1)} s \\
& \quad \times \left( [\alpha_q] - \mu \right) \Gamma_q (\alpha)^{-1} \\
& \leq \left( q [\alpha - 1] q \right) \left( [\alpha_q] - \mu \right) \left( t - tqs \right)^{(\alpha-2)} s (1 - t) \\
& \quad + \mu q^\alpha t^{\alpha-1} (1 - qs)^{(\alpha-1)} s \\
& \quad \times \left( [\alpha_q] - \mu \right) \Gamma_q (\alpha)^{-1} \\
& \leq \left( q [\alpha - 1] q \right) \left( [\alpha_q] - \mu \right) \left( t - tqs \right)^{(\alpha-2)} s (1 - t) \\
& \quad + \mu q^\alpha t^{\alpha-1} (1 - qs)^{(\alpha-1)} s \\
& \quad \times \left( [\alpha_q] - \mu \right) \Gamma_q (\alpha)^{-1} \\
& = \left( q [\alpha - 1] q \right) \left( [\alpha_q] - \mu \right) \left( t - tqs \right)^{(\alpha-2)} s \\
& \quad + \mu q^\alpha t^{\alpha-1} (1 - qs)^{(\alpha-1)} s \\
& \quad \times \left( [\alpha_q] - \mu \right) \Gamma_q (\alpha)^{-1}, \\
\end{align*}
\]
we get
\[
\begin{align*}
& \left( [\alpha_q] - \mu \right) \Gamma_q (\alpha) G(t,qs) \\
& \leq q (\alpha - 1) q \left( [\alpha_q] - \mu \right) \mu q^\alpha t^{\alpha-1} (1 - qs)^{(\alpha-1)} s \\
& \leq \lambda \rho (s), \\
& \left( [\alpha_q] - \mu \right) \Gamma_q (\alpha) G(t,qs) \\
& \leq t^{\alpha-1} (1 - qs)^{(\alpha-1)} \left( [\alpha_q] - \mu + \mu q^\alpha \right) \\
& \quad \times \left( [\alpha_q] - \mu \right) \Gamma_q (\alpha) G(t,qs) \\
& \leq t^{\alpha-1} (1 - qs)^{(\alpha-1)} \left( [\alpha_q] - \mu + \mu q^\alpha \right) \left( 1 - tqs \right)^{(\alpha-2)} s (1 - t) \\
& \quad + \mu q^\alpha t^{\alpha-1} (1 - qs)^{(\alpha-1)} s \\
& \quad \times \left( [\alpha_q] - \mu \right) \Gamma_q (\alpha)^{-1} \\
& \leq t^{\alpha-1} (1 - qs)^{(\alpha-1)} \left( [\alpha_q] - \mu + \mu q^\alpha \right) s (1 - q^\alpha s) \\
& \quad + \mu q^\alpha t^{\alpha-1} (1 - qs)^{(\alpha-1)} s \\
& \quad \times \left( [\alpha_q] - \mu \right) \Gamma_q (\alpha)^{-1} \\
& \leq t^{\alpha-1} (1 - qs)^{(\alpha-1)} \left( [\alpha_q] - \mu + \mu q^\alpha \right) s (1 - q^\alpha s) \\
& \quad + \mu q^\alpha t^{\alpha-1} (1 - qs)^{(\alpha-1)} s \\
& \quad \times \left( [\alpha_q] - \mu \right) \Gamma_q (\alpha)^{-1}, \\
\end{align*}
\]
Remark 9. If we let \( 0 < \tau < 1 \), then
\[
\min_{t \in [\tau, 1]} G(t,qs) \geq \frac{\mu q^\alpha t^{\alpha-1}}{\left( [\alpha_q] - \mu \right) \Gamma_q (\alpha)} \rho (s), \quad \text{for } s \in [0, 1].
\]
According to [16], we may take \( \tau = q^n, n \in \mathbb{N} \).

Lemma 10. Let \( p \in C[0, 1] \). Then the boundary value problem
\[
\begin{align*}
(D_q^\alpha u) (t) + p (t) &= 0, \quad t \in (0, 1), 2 < \alpha \leq 3, \\
u (0) &= \left( D_q^\alpha u \right) (0) = 0, \quad u (1) = \mu \int_0^1 u (s) d_q s,
\end{align*}
\]
has a unique solution \( u(t) = \int_0^1 G(t,qs) p(s)d_q s \) with
\[
\begin{align*}
u (t) &\leq \frac{\lambda}{\left( [\alpha_q] - \mu \right) \Gamma_q (\alpha)} t^{\alpha-1} \int_0^1 p(s) d_q s \\
&= \lambda_0 t^{\alpha-1} \int_0^1 p(s) d_q s,
\end{align*}
\]
where \( \lambda_0 = \lambda / \left( [\alpha_q] - \mu \right) \Gamma_q (\alpha) \).
From [39, Theorem 2.3.1], one has the following definition. Let Q be a retract of real Banach space E, Ω be a relatively bounded open subset of Q, T : Ω → Q be completely continuous operator. The integer i(T, Ω, Q) be defined by
\[ i(T, Ω, Q) = \deg \left( I - T \cdot \chi, B(\theta, r) \cap \chi^{-1}(Ω), \phi \right) \]
where \( \chi : E \to Q \) is an arbitrary retraction and \( r > 0 \) such that \( B(\theta, r) \supset \Omega \). Then the integer \( i(T, Ω, Q) \) is called the fixed point index of \( T \) on \( Ω \) with respect to \( Q \).

**Lemma 11** (see [39]). Let \( P \) be a cone in a Banach space \( E \). Let \( Ω \) be an open bounded subset of \( E \) with \( Ω = \Omega \cap P \neq \emptyset \) and \( \mathcal{O} \neq P \). Assume that \( T : \mathcal{O} \to P \) is a compact map such that \( u \neq Tu \) for \( u \in \mathcal{O} \). Then
\[ i(T, \Omega, Q) = \deg \left( I - T \cdot \chi, B(\theta, r) \cap \chi^{-1}(\Omega), \phi \right) \]

where \( \chi : E \to Q \) is an arbitrary retraction and \( r > 0 \) such that \( B(\theta, r) \supset \Omega \). Then the integer \( i(T, \Omega, Q) \) is called the fixed point index of \( T \) on \( \Omega \) with respect to \( Q \).

**3. The Main Results**

In order to abbreviate our discussion, we give the following assumptions.

(H0) There exists \( p(t) \in C[0, 1] \), such that
\[ \phi(t)h_0(u) \leq f(t, u) + \rho(t) \leq \varphi(t)(g(u) + h(u)) \]
for all \( t, u \in [0, 1] \times \mathbb{R}^*_+ \), where \( \phi, \varphi \in C([0, 1], \mathbb{R}^*_+) \), \( g \in C(\mathbb{R}^*_+, \mathbb{R}^*_+) \), and \( g(u) \) is nonincreasing with respect to \( u; h_0 \), \( h \in (\mathbb{R}^*_+, \mathbb{R}^*_+) \) and \( h_0(u), h(u) \) are nondecreasing with respect to \( u \), where \( \mathbb{R}^*_+ = (0, +\infty) \).

(H1) \( 0 < \int_0^1 \varphi(s)p(s)\,ds < +\infty \).

Let \( X = C[0, 1] \) be the Banach space endowed with norm \( \|u\| = \max_{t \in [0, 1]} |u(t)| \), and define the cone \( \Omega \in X \) by
\[ \Omega = \left\{ u \in X : u(t) \geq \frac{\mu q^\alpha}{\lambda} \|u\|_X, q \in (0, 1), 2 < \alpha \leq 3 \right\}. \]

By a positive solution of BVP (7) and (8), we mean a function \( u \in C[0, 1] \) such that \( u(t) \) satisfies (7) and (8) and \( u(t) > 0 \) on \((0, 1)\).

Setting \( F(t, u) = f(t, u) + \rho(t) \) and for any \( u \in \Omega, m \in \mathbb{N} \), we consider the following singular nonlinear boundary value problem:
\[ \left\{ \begin{array}{l}
\left( D_q u \right)(t) + F(t, [u(t)]^+) = 0, \quad t \in (0, 1), \\
u(0) = (D_q u)(0) = 0, \quad u(1) = \mu \int_0^1 u(s)\,d_q s,
\end{array} \right. \]

where \( [u(t)]^+ = \max\{u(t) - w(t), 0\} \).

According to Remark 2, we can see that if \( u(t) \geq w(t) \) for \( t \in [0, 1] \) is a positive solution of BVP (48), then \( u - w \) is a positive solution of BVP (7) and (8).

**Lemma 12.** For any \( m \in \mathbb{N} \), let \( T_m : \Omega \to \Omega \) be the operator defined by
\[ (T_m u)(t) = \int_0^1 G(t, qs) F \left( s, [u(s)]^+ + \frac{1}{m} \right)\,d_q s. \]

Then \( T_m : \Omega \to \Omega \) is completely continuous.

**Proof.** For any \( u \in \Omega, m \in \mathbb{N} \), Lemma 8 implies that \( (T_m u)(t) \geq 0 \) on \([0, 1]\), and
\[ (T_m u)(t) \geq \frac{\mu q^\alpha}{\lambda} \int_0^1 \rho(s) \varphi \left( s, [u(s)]^+ + \frac{1}{m} \right)\,d_q s. \]

On the other hand,
\[ \|T_m u\|_X = \max_{0 \leq t \leq 1} (T_m u)(t) \leq \frac{\lambda}{\gamma(\alpha)} \int_0^1 \rho(s) \varphi \left( s, [u(s)]^+ + \frac{1}{m} \right)\,d_q s. \]

Then \( (T_m u)(t) \geq \frac{\mu q^\alpha}{\lambda} \|T_m u\|_X \), which leads to \( T_m(\Omega) \subset \Omega \). Thus \( T_m : \Omega \to \Omega \) is continuous.

It follows from the nonnegativeness and continuity of \( G(t, s) \) and \( F \) that the operator \( T_m \) is continuous. Suppose \( B \subset \Omega \) is any bounded set; then, for any \( u \in B \), there is a constant number \( M > 0 \) such that \( \|u\|_X \leq M \). Let
\[ L \left( m^{-1}, M, \lambda_0 \right) = \lambda_0 \left[ g \left( \frac{1}{m} \right) + h(M + 1) \right]. \]

for all \( u \in B \), by Lemma 8, we have
\[ \|T_m u\|_X \leq L \left( m^{-1}, M, \lambda_0 \right) \int_0^1 \rho(s) \varphi \left( s, [u(s)]^+ + \frac{1}{m} \right)\,d_q s \leq +\infty. \]

Hence, \( T_m(\Omega) \) is bounded.

On the other hand, for any \( \varepsilon > 0 \), according to (H1), there is a constant \( \delta > 0 \) such that
\[ \int_0^\delta \varphi(s)\,d_q s < \frac{\varepsilon}{6L(m^{-1}, M, \lambda_0)}, \]
\[ \int_{1-\delta}^1 \varphi(s)\,d_q s < \frac{\varepsilon}{6L(m^{-1}, M, \lambda_0)}. \]
From the property of continuity of $G$, there exists $\eta$ with $0 < \eta < \delta$ such that for any $t_1, t_2 \in [0, 1]$, and $s \in [0, 1]$, when $t_2 - t_1 < \eta$ we have

$$|G(t_2, qs) - G(t_1, qs)| < \frac{\varepsilon}{3\rho_0L(m^{-1}, M, \lambda_0)},$$

$$|(T_m u)(t_2) - (T_m u)(t_1)| \leq \int_0^1 |G(t_2, qs) - G(t_1, qs)| F(s, [u(s)]^*) + \frac{1}{m} d_q s \leq L(m^{-1}, M, \lambda_0) \int_0^1 |G(t_2, qs) - G(t_1, qs)| \varphi(s) d_q s$$

$$\leq 2L(m^{-1}, M, \lambda_0) \left( \int_0^\delta \varphi(s) G(s, qs) d_q s + \int_1^{-\delta} \varphi(s) G(s, qs) d_q s \right)$$

$$+ L(m^{-1}, M, \lambda_0) \int_{-\delta}^{1-\delta} |G(t_2, qs) - G(t_1, qs)| \varphi(s) d_q s < \frac{2\varepsilon}{3} + L(m^{-1}, M, \lambda_0) \varphi_0$$

$$\times \int_{-\delta}^{1-\delta} |G(t_2, qs) - G(t_1, qs)| d_q s < \varepsilon,$$  \hspace{1cm} (55)

where $\varphi_0 = \max\{\varphi(t) : -\delta < t < 1-\delta\}$. By means of the Arzela-Ascoli Theorem, $T_m : \Omega \to \Omega$ is completely continuous. \hfill $\square$

**Theorem 13.** Suppose $(H0)$ and $(H1)$ hold. In addition, assume that the following conditions are satisfied.

- $(C1)$ There exists a constant $r > 2\lambda^2 k_0/\mu q^\alpha$ such that

$$\lambda_0 \int_0^1 \rho(s) \varphi(s) \left( g \left( \frac{\mu q^{\alpha-1} r}{2\lambda} \right) + h(r + 1) \right) d_q s < r, \hspace{1cm} (56)$$

where $k_0 = \int_0^1 \rho(s) d_q s/([\alpha]_q - \mu) \Gamma_q(\alpha)$.

- $(C2)$ There exist constants $\xi_1, \xi_2$ with $\xi_2 > \xi_1 > r$ such that

$$\mu^* h_0 \left( \frac{1}{2} \xi_1 \right) \int_r^{1} \rho(s) \varphi(s) d_q s > \xi_i, \hspace{1cm} i = 1, 2, \hspace{1cm} (57)$$

where $\mu^* = \mu q^\alpha r^{\alpha-1}/([\alpha]_q - \mu) \Gamma_q(\alpha), \tau = q^n, n \in \mathbb{N}$.

- $(C3)$

$$\lim_{u \to +\infty} \frac{h(u)}{u} = 0. \hspace{1cm} (58)$$

Then BVP (7) and (8) has at least two positive solutions $u^*, u^{**}$ with $r \leq \|u^*\|_X \leq \xi_1 < \xi_2 \leq \|u^{**}\|_X$.

**Proof.** First, we prove that

$$i(T_m, \Omega_0, \Omega) = 1, \hspace{1cm} (59)$$

where $\Omega_0 = \{u \in \Omega : \|u\|_X < r\}$.

To see this, let $u \in \Omega \cap \partial \Omega_0$. Then $\|u\|_X = r$ and $u(t) \geq (\mu q^\alpha /\lambda) r^{\alpha-1} r$ for $t \in [0, 1]$. Now for $t \in (0, 1)$, we get

$$u(t) - w(t) \geq u(t) - \frac{\lambda}{([\alpha]_q - \mu) \Gamma_q(\alpha)} \int_0^1 \rho(s) d_q s$$

$$\geq u(t) - \frac{\mu q^\alpha r^{\alpha-1} r}{2\lambda} \geq \frac{1}{2} u(t)$$

$$\geq \frac{\mu q^\alpha r^{\alpha-1} r}{2\lambda} \|u\|_X = \frac{\mu q^\alpha r^{\alpha-1} r}{2\lambda} r.$$

(60)

So, for any $u \in \Omega \cap \partial \Omega_0$, $t \in (0, 1)$, we get

$$\frac{\mu q^\alpha r^{\alpha-1} r}{2\lambda} r \leq u(t) - w(t) \leq r. \hspace{1cm} (61)$$

It follows from (C1), (61) and Lemma 8 that, for any $u \in \Omega \cap \partial \Omega_0$,

$$\|T_m u\| = \int_0^1 G(t, qs) F(s, [u(s)]^*) + \frac{1}{m} d_q s$$

$$\leq \lambda_0 \int_0^1 \rho(s) \varphi(s) \left( g \left( [u(s)]^* + \frac{1}{m} \right) + h([u(s)]^* + \frac{1}{m}) \right) d_q s$$

$$\leq \lambda_0 \int_0^1 \rho(s) \varphi(s) \left( g \left( \frac{\mu q^\alpha r^{\alpha-1} r}{2\lambda} + h(r + 1) \right) d_q s < r$$

$$= \|u\|_X. \hspace{1.5cm} (62)$$

This together with (56) yields $T_m(\Omega_0) \subset \Omega_0$. From the (i) of Lemma 11, (59) is satisfied.

Let us choose $\epsilon > 0$ such that

$$\epsilon \lambda_0 \int_0^1 \rho(s) \varphi(s) d_q s < 1. \hspace{1cm} (63)$$

Then for the above $\epsilon$, according to (C2) and (C3), there exists $R > \xi_2 > 0$ such that, for any $u \geq R$,

$$h(u) \leq \epsilon u. \hspace{1cm} (64)$$

Take

$$R_1 = R + \left( \lambda_0 \int_0^1 \rho(s) \varphi(s) \left( g \left( \frac{\mu q^\alpha r^{\alpha-1} r}{2\lambda} + h(r + 1) + \epsilon \right) d_q s \right) \right.$$

$$\times \left( 1 - \epsilon \lambda_0 \int_0^1 \rho(s) \varphi(s) d_q s \right)^{-1} \hspace{1cm} (65)$$

then $R_1 > R > \xi_2$. 

Now let \( \Omega_1 = \{ u \in \Omega : \|u\|_X < R_1 \} \) and \( \partial \Omega_1 = \{ u \in \Omega : \|u\|_X = R_1 \} \). Then, for any \( u \in \Omega \cap \partial \Omega_1 \), we have

\[
(T_m u)(t) = \int_0^1 G(t,qs) F\left(s, [u(s)]^* + \frac{1}{m}\right) dq s \\
\leq \lambda_0 \int_0^1 \rho(s) \phi(s) \\
\times \left( g\left( [u(s)]^* + \frac{1}{m}\right) + h\left( [u(s)]^* + \frac{1}{m}\right) \right) dq s \\
+ \frac{\lambda_0}{m} \int_0^1 \rho(s) \phi(s) dq s.
\]

Thus

\[
\min_{t \in [t_1, 1]} (T_m u)(t) = \min_{t \in [t_1, 1]} \int_0^1 G(t,qs) F\left(s, [u(s)]^* + \frac{1}{m}\right) dq s \\
\geq \min_{t \in [t_1, 1]} \int_0^1 G(t,qs) \phi(s) h_0\left( [u(s)]^* + \frac{1}{m}\right) dq s \\
\geq \mu^{*} h_0\left( \frac{1}{2} \xi_1 \right) \int_t^1 \rho(s) \phi(s) dq s > \xi_1.
\]

This means that \( T_m(\Omega_1) \subset \Omega_1 \), for \( u \in \Omega_1 \). Thus, it follows from the (i) of Lemma 11 that

\[
i \left( T_m, \Omega_1, \partial \Omega_1 \right) = 1.
\]

Similarly, we can prove that, for any \( u \in \Omega_1 \),

\[
i \left( T_m, \Omega_1, \partial \Omega_1 \right) = 1.
\]

Thus, using (59), (67), and (72), we obtain

\[
i \left( T_m, \Omega_1 \setminus \Omega_1 \right) = 1.
\]

\[
T_m u (t) = \int_0^1 G(t,qs) F\left(s, [u_1(s)]^* + \frac{1}{m}\right) dq s,
\]

where \( r \leq \|u_1\|_X < \xi_1 \). Obviously, \( F(t, [u_1(s)]^* + 1/m) \) is continuous for any \( u_1 \in C([0,1], R^+) \). Also, it can be seen that \( u_1 \) has uniform lower and upper bounds. This directly comes from \( u_1 \in \Omega_1 \setminus (\Omega_1 \cup \Omega_{10}) \). Hence, in order to pass the solution \( u_1 \) of the problem (48) to that of the original problem (7) and (8), we need the following fact:

\[
\{ u_{m_1} \}_{m=1}^{\infty} \text{ is an equicontinuous family on } [0, 1].
\]

As in the proof of Lemma 12, we can prove that the sequence \( \{ u_{m_1} \}_{m=1}^{\infty} \) is equicontinuous on \([0, 1] \). Now the Arzela-Ascoli Theorem guarantees that the sequence \( \{ u_{m_1} \}_{m=1}^{\infty} \) has a subsequence \( \{ u_{m_{k1}} \}_{k=1}^{\infty} \) converging uniformly on \([0, 1] \) to \( u_1 \). As for (61) and the fact \( r \leq \|u_1\|_X < \xi_1 \), we obtain that

\[
\frac{\mu q^{\frac{q}{q-1}}}{2\lambda} r \leq u_1(t) - w(t) \leq \xi_1, \quad \forall t \in [0, 1].
\]

Moreover, \( u_{m_{k1}} \) satisfies the following integral equation:

\[
u_{m_{k1}}(t) = \int_0^1 G(t,qs) F\left(s, [u_{m_{k1}}(s)]^* + \frac{1}{m_{k1}}\right) dq s.
\]
Letting $k \to +\infty$, we have
\[ u_1 = \int_0^1 G(t, qs) F(s, [u_1(s)]^*) d_q s. \] (79)

Let $u^*(t) = u_1(t) - w(t)$, then $u^*$ is a positive solution of BVP (7) and (8).

From (73), $T_m$ has at least one fixed point $u_{m2} \in \overline{D}_{11}$. Similar to (76), there exists a subsequence \{\$u_{m2}\}_{k=1}^{\infty}$ such that \lim_{k \to \infty} u_{m2}(t) = u_2(t) \in X$, and $\xi_2 \leq \|u_2\|_X \leq R_1$. Let $u^{**}(t) = u_2(t) - w(t)$, then $u^{**}$ is also a positive solution of BVP (7) and (8).

Since $\xi_1 < \xi_2$, we have $u^* \neq u^{**}$. This implies that $u^*, u^{**}$ are two different positive solutions of BVP (7) and (8). \hfill $\square$

**Theorem 14.** Suppose (H0), (H1), (C1), and (C5) hold. In addition, assume that the following conditions are satisfied.

(C4) There exists $R_1$ with $R_1 > \xi_2(\xi_2$ as given in (C2)) such that
\[ \lambda_0 \int_0^1 \rho(s) \phi(s) \left( g \left( \frac{\mu q^a s^{-a-1}}{2\alpha} - R_1 \right) + h(R_1+1) \right) d_q s < R_1. \] (80)

(C5) \[ \lim_{u \to +\infty} \frac{h_0(u)}{u} = +\infty. \] (81)

Then BVP (7) and (8) has at least three different positive solutions.

**Proof.** It can be seen that condition (C4) is equivalent to condition (C3). As a consequence we obtain that the BVP (7) and (8) has at least two different positive solutions $u_1, u_2$ with $r \leq \|u_i\|_X < \|u_2\|_X < R_1$.

On the other hand, choose a real number $M^* > 0$ such that
\[ M^* \geq \frac{2\lambda}{\mu \mu q^a r^{-a-1} \int_0^1 \rho(s) \phi(s) d_q s}. \] (82)

By (C5), there exists $R_1^* > R_1$ such that
\[ h_0(u) \geq M^* u, \quad u \geq R_1^*. \] (83)

Choose
\[ R_2 > \max \left\{ R_1, \frac{2\lambda R_1^*}{\mu q^a r^{-a-1}} \right\}, \] (84)

and let $\Omega_2 = \{ u \in \Omega : \|u\|_X < R_2 \}$.

In the following, we will prove that
\[ u \notin T_m u + \mathcal{V} h, \quad h \in \Omega \setminus \{0\}, \forall u \in \partial \Omega_2, \forall \nu \in [0, 1], m \in \mathbb{N}. \] (85)

Suppose that (85) is false; then there exists $u_0 \in [0, 1], u_0 \in \partial \Omega_2$, such that
\[ u_0 = T_m u_0 + v_0 h. \] (86)

For $u_0 \in \partial \Omega_2$ and for any $t \in [r, 1]$, we have
\[ u_0(t) - \omega(t) \geq u_0(t) - \frac{\lambda}{(\alpha - \mu) \Gamma(a)} \int_0^1 \mu q^a (\frac{\rho(s)}{\mu q^a s^{-a-1}})(\frac{\mu q^a s^{-a-1}}{2\alpha} - R_2) d_q s \]
\[ \geq \left( 1 - \frac{\lambda^2 \frac{1}{\mu q^a (\alpha - \mu) \Gamma(a)} \Gamma(a) R_2}{2\lambda} \right) u_0(t) \]
\[ \geq \frac{\mu q^a r^{-a-1}}{2\lambda} R_2 > R_1 > 0. \] (87)

It follows from (83) and (85) that we have
\[ R_2 = \|u_0\|_X = \|T_m u_0 + v_0 h\|_X \]
\[ \geq \int_0^1 G(t, qs) F(s, [u_0(s)]^*) \frac{1}{m} d_q s \]
\[ > \mu^* \int_0^1 \rho(s) \phi(s) h_0 \left( \|u_0(s)\|^* + \frac{1}{m} \right) d_q s \]
\[ \geq \mu^* \int_0^1 \rho(s) \phi(s) d_q s \cdot M^* \left( \|u_0(s)\|^* + \frac{1}{m} \right) \]
\[ \geq \frac{M^* \mu q^a r^{-a-1}}{2\lambda} \int_0^1 \rho(s) \phi(s) d_q s, \quad R_2 \geq R_2, \]

which is a contradiction. Hence, (85) is ture; from the (ii) of Lemma II, we get
\[ i(T_m, \Omega_2, \Omega) = 0. \] (89)

Combining this with (67) yields
\[ i \left( T_m, \Omega_2 \setminus \overline{\Omega}_1, \Omega \right) = i(T_m, \Omega_2, \Omega) - i(T_m, \Omega_1, \Omega) = -1. \] (90)

This implies that $T_m$ has at least one fixed point $u_{m3} \in \Omega_2 \setminus \overline{\Omega}_1$, with $R_1 < \|u_{m3}\|_X < R_2$. Similar to (76), there exists a subsequence \{\$u_{m3}\}_{k=1}^{\infty}$ such that \lim_{k \to +\infty} u_{m3}(t) = u_3(t) \in X$, and $R_1 < \|u_3\|_X \leq R_2$. Let $u_3(t) = u_3(t) - \omega(t)$, then $u_3$ is also a positive solution of BVP (7) and (8). So the proof is complete. \hfill $\square$

By the induction method, we can obtain the following multiplicity results for BVP (7) and (8).

**Corollary 15.** Suppose (H0), (H1), (C1), and (C5) hold. In addition, there exist constants $r_i, \xi_{ik}, (i = 1, \ldots, m; k = 1, 2)$
with \( r < \xi_{11} < \xi_{12} < r_1 < \xi_{21} < \xi_{22} < r_2 < \cdots < \xi_{m1} < \xi_{m2} < r_m \) such that

\[
\lambda \int_0^1 \rho(s) \varphi(s) \left( g \left( \frac{\alpha q \Delta s^{\alpha-1}}{2\lambda} r_i + h (r_i + 1) \right) \right) \, d_s < r_i, \quad i = 1, 2, \ldots, m,
\]

\[ \mu \ast h_0 \left( \frac{1}{2} \xi_k \right) \int_r^1 \rho(s) \phi(s) \, d_s > \xi_k, \quad i = 1, 2, \ldots, m; \]

\[ k = 1, 2, \ldots, m \]

where \( \mu = \alpha q \Delta s^{\alpha-1}/(\alpha \alpha_n - \mu) \Gamma_\alpha(\alpha) \).

Then BVP (7) and (8) has at least \( 2m + 1 \) different positive solutions.

Now we present an example to illustrate our main results.

**Example 16.** Consider the following problem:

\[
D_{0+}^{2.5} u(t) + \frac{t}{10} \left( \frac{1}{20u} + h(u) \right) - 40 (1 + t) = 0, \quad 0 < t < 1,
\]

\[ u(0) = (D_{0+}^{2.5} u)(0) = 0, \quad u(1) = 1.5 \int_0^1 u(s) \, d_{0+} s,
\]

where \( h(u) = \begin{cases} 
8u, & 0 \leq u \leq 60, \\
\frac{1}{490} u^3, & 60 \leq u \leq 900, \\
30u^2, & 900 \leq u \leq 1600, \\
3.2 \times 10^5 \sqrt{u}, & u \geq 1600.
\end{cases} \)

Then BVP (91) has at least two positive solutions.

**Proof.** In this case, \( \alpha = 2.5, q = 0.5, \mu = 1.5 \), and

\[ f(t, u) = \frac{t}{10} \left( \frac{1}{20u} + h(u) \right) - 40 (1 + t). \]

Let

\[ p(t) = 40 (1 + t), \quad \phi(t) = \frac{t}{10}, \quad \varphi(t) = \frac{\sqrt{t}}{10}, \]

\[ g(u) = \frac{1}{20u}, \quad h_0(\alpha) = \frac{7}{8} h(u). \]

It is easy to see that the assumptions (H0), (H1) hold.

Take \( n = 2 \), then \( r = q^\alpha = 0.25 \). By calculation, we get

\[ \lambda = 0.7335, \quad \lambda_0 \approx 1.3913, \quad \mu \ast \approx 0.0524, \]

\[
k_0 = \frac{1}{(\alpha \alpha_1 - \mu) \Gamma_\alpha(\alpha)} \int_0^1 p(s) \, d_s \approx \frac{\int_0^1 40 (1 + s) \, d_{0+} s}{0.5272} = 12.6454.
\]

Set \( r = 52 \), then

\[ r = 52 > \frac{2\lambda^2 k_0}{\mu \alpha^2} = 51.3086, \]

\[ \Delta := \lambda_0 \int_0^1 \rho(s) \varphi(s) \left( g \left( \frac{\mu \alpha \Delta s^{\alpha-1}}{2\lambda} r + h (r + 1) \right) \right) \, d_s \]

\[ = \frac{\lambda_0}{10} \int_0^1 \left( 1 - \frac{1}{s} \right)^{(3/2)} s^{3/2} \]

\[ \times \left( \frac{\lambda_0}{520} \mu \alpha \Delta s^{3/2} (r + 1) \right) \, d_s \]

\[ \leq \lambda_0 \left( \frac{\lambda}{520 \mu \alpha} + h (r + 1) \right) \]

\[ \times \int_0^1 \left( 1 - \frac{1}{s} \right)^{(3/2)} \, d_s \approx 35.8280 < r = 52, \]

which implies that the assumption (C1) holds.

On the other hand, take \( \xi_1 = 1 \times 10^3, \xi_2 = 1.1 \times 10^3 \), then

\[
\mu \ast h_0 \left( \frac{1}{2} \xi_k \right) \int_r^1 \rho(s) \phi(s) \, d_s \]

\[ = \frac{\mu \ast h_0 \left( \frac{1}{2} \xi_k \right) \int_r^1 \left( 1 - \frac{1}{s} \right)^{(3/2)} s^{3/2} \, d_s}{160} \]

\[ \geq \frac{\mu \ast h_0 \left( \frac{1}{2} \xi_k \right) \int_r^1 \left( 1 - \frac{1}{s} \right)^{(3/2)} s^{3/2} \, d_s}{1.1681 \times 10^3} > 1 \times 10^3 = \xi_1, \]

\[ \mu \ast h_0 \left( \frac{1}{2} \xi_k \right) \int_r^1 \rho(s) \phi(s) \, d_s \]

\[ \geq 1.4135 \times 10^3 > 1.1 \times 10^3 = \xi_2 \]

which implies that the assumption (C2) holds.

Finally, we have

\[ \lim_{u \to +\infty} \frac{h(u)}{u} = \lim_{u \to +\infty} \frac{3.2 \times 10^5 \sqrt{u}}{u} = 0. \]

Thus (C3) also holds. It follows from Theorem 13 that the BVP (91) has at least two positive solutions \( u^*, u^{**} \) with \( 52 \leq \|u^*\| \leq 1 \times 10^3 < 1.1 \times 10^3 \leq \|u^{**}\| \).
