We propose synchronal algorithm and cyclic algorithm based on the general iterative method for solving a hierarchical fixed point problem. Under suitable parameters, the iterative sequence converges strongly to a common fixed point of N nonexpansive mappings and also the unique solution of a variational inequality. The results presented in this paper improve and extend the corresponding results reported recently by some authors. Furthermore, a numerical example is given to demonstrate the effectiveness of our iterative schemes.

1. Introduction

Let H be a real Hilbert space with an inner product $\langle \cdot, \cdot \rangle$ and its induced norm $\| \cdot \|$. Let C be a nonempty, closed, and convex subset of H .

Let $T : C \rightarrow H$ be a nonlinear mapping; we denote the set of fixed points of T by $\text{Fix}(T)$ (i.e., $\text{Fix}(T) = \{x \in C : Tx = x\}$). A mapping $T : C \rightarrow H$ is called k -Lipschitzian continuous if there exists a constant $k > 0$ such that

$$\|Tx - Ty\| \leq k \|x - y\|, \quad \forall x, y \in C. \quad (1)$$

In particular, T is said to be a nonexpansive mapping if $k = 1$. A mapping B is called η -strongly monotone on C , if there exists a constant $\eta > 0$ such that

$$\langle Bx - By, x - y \rangle \geq \eta \|x - y\|^2, \quad \forall x, y \in C. \quad (2)$$

A variational inequality (short for VI) is formulated as finding a point $x^* \in C$ such that

$$\langle Bx^*, x - x^* \rangle \geq 0, \quad \forall x \in C. \quad (3)$$

If B is a monotone operator, then VI (3) is known as a monotone variational inequality. If the set C is replaced by the set of $\text{Fix}(T)$ of fixed points of a mapping T , then the VI (3) is called a hierarchical variational inequality problem.

Many practical problems in applied sciences such as signal processing [1], beamforming [2], and power control [3]

are formulated as the monotone variational inequality with a fixed point constrained. In recent years, several authors paid attention toward this kind of problem. Some methods have been proposed to solve the hierarchical fixed point problems and variational inequalities; see for instance [4–10] and the references therein.

In 2010, Tian [11] proposed a general iterative method and revealed the inner contact of the Yamada's algorithm [12] and viscosity iterative algorithm; then he obtained the following result in a real Hilbert space.

Theorem 1. Let x_n be generated by algorithm $x_{n+1} = \alpha_n \gamma f(x_n) + (I - \alpha_n \mu A)Tx_n$ with the sequence $\{\alpha_n\}$ of parameters satisfying conditions (C1)–(C3):

$$(C1) \quad \alpha_n \rightarrow 0,$$

$$(C2) \quad \sum_{n=0}^{\infty} \alpha_n = \infty,$$

$$(C3) \quad \text{either } \sum_{n=1}^{\infty} |\alpha_{n+1} - \alpha_n| < \infty \text{ or } \lim_{n \rightarrow \infty} (\alpha_{n+1}/\alpha_n) = 1.$$

Then x_n converges strongly to a fixed point $\tilde{x}$ of T which solves the variational inequality

$$\langle (\mu A - \gamma f)\tilde{x}, \tilde{x} - z \rangle \leq 0, \quad \forall z \in \text{Fix}(T). \quad (4)$$

Recently, Yao et al. [10] investigated an iterative method for solving a hierarchical fixed point problem by

$$\begin{aligned} y_n &= \beta_n Sx_n + (1 - \beta_n)x_n, \\ x_{n+1} &= P_C(\alpha_n f(x_n) + (1 - \alpha_n)Ty_n), \end{aligned} \quad (5)$$

where S, T are nonexpansive mapping with $\text{Fix}(T) \neq \emptyset$ and f is a contraction; the sequence converges strongly to the unique solution of the variational inequality

$$x^* \in \text{Fix}(T), \quad \langle (I - f)x^*, p - x^* \rangle \leq 0, \quad \forall p \in \text{Fix}(T). \quad (6)$$

Very recently, on this basis, Wang and Xu [8] introduced a new modified iterative method for solving a hierarchical fixed point problem. To be more precise, they proposed the following algorithm:

$$\begin{aligned} y_n &= \beta_n Sx_n + (1 - \beta_n)x_n, \\ x_{n+1} &= P_C(\alpha_n \rho Ux_n + (I - \alpha_n \mu F)Ty_n), \end{aligned} \quad (7)$$

where S, T are nonexpansive mappings with $\text{Fix}(T) \neq \emptyset$, U is a Lipschitzian mapping, and F is a Lipschitzian and strongly monotone operator. They proved the sequence generated by the above algorithm converges strongly to the unique solution of the variational inequality

$$\langle (\rho U - \mu F)x^*, p - x^* \rangle \leq 0, \quad \forall p \in \text{Fix}(T). \quad (8)$$

On the other hand, Tian and Di [13] established a synchronal algorithm and a cyclic algorithm for fixed point problems and variational inequalities. In 2012, Ceng et al. [4] proposed an iterative method to solve a special form of VI (3), where the constraint set is the set of common fixed points of N nonexpansive mappings $T_1, T_2, \dots, T_N$.

Motivated and inspired by the above works, in this paper, we combine the hybrid steepest descent algorithm and hierarchical variational inequalities to propose a synchronal algorithm and a cyclic algorithm involving finite family of nonexpansive mappings. Under certain assumptions, we will prove that the sequences converge strongly. Further an example will be given to demonstrate the effectiveness of our iterative schemes.

2. Preliminaries

Recall that given a nonempty, closed and convex subset C of a real Hilbert space H , for any $x \in H$, there exists a unique nearest point in C , denoted by $P_C x$, such that

$$\|x - P_C x\| \leq \|x - y\| \quad (9)$$

for all $y \in C$. Such a P_C is called the metric (or the nearest point) projection of H onto C . As we all know, $y = P_C x$ if and only if there holds the relation

$$\langle x - y, y - z \rangle \geq 0, \quad \forall z \in C. \quad (10)$$

In the sequel, we will make use of the following lemmas in a real Hilbert space H .

Lemma 2. Let H be a real Hilbert space; the following inequalities hold:

$$\begin{aligned} (i) \quad & \|x + y\|^2 \leq \|x\|^2 + 2\langle y, x + y \rangle, \quad \forall x, y \in H, \\ (ii) \quad & \|tx + (1 - t)y\|^2 \leq t\|x\|^2 + (1 - t)\|y\|^2, \quad \forall t \in [0, 1], \\ & \quad \forall x, y \in H. \end{aligned}$$

Lemma 3 (see [13]). Let $B : H \rightarrow H$ be a k -Lipschitzian and η -strongly monotone operator on a Hilbert space H with $k > 0$, $\eta > 0$, $0 < \mu < 2\eta/k^2$, and $0 < t < 1$. Then $S = (I - t\mu B) : H \rightarrow H$ is a contraction with contractive coefficient $1 - t\tau$ and $\tau = (1/2)\mu(2\eta - \mu k^2)$.

Lemma 4 (see [5]). Let $V : C \rightarrow H$ be an l -Lipschitz mapping with coefficient $l \geq 0$ and $B : C \rightarrow H$ a k -Lipschitzian continuous operator and η -strongly monotone operator with $k > 0$, $\eta > 0$. Then for $0 < \gamma < \mu\eta/l$,

$$\begin{aligned} & \langle x - y, (\mu B - \gamma V)x - (\mu B - \gamma V)y \rangle \\ & \geq (\mu\eta - \gamma l)\|x - y\|^2, \quad x, y \in H. \end{aligned} \quad (11)$$

That is, $\mu B - \gamma V$ is strongly monotone with coefficient $\mu\eta - \gamma l$.

Lemma 5 (see [9]). Assume that $\{a_n\}$ is a sequence of nonnegative real numbers such that

$$a_{n+1} \leq (1 - \gamma_n)a_n + \delta_n, \quad (12)$$

where $\{\gamma_n\}$ is a sequence in $(0, 1)$ and $\{\delta_n\}$ is a sequence such that

$$\begin{aligned} (i) \quad & \sum_{n=1}^{\infty} \gamma_n = \infty, \\ (ii) \quad & \limsup_{n \rightarrow \infty} (\delta_n / \gamma_n) \leq 0 \text{ or } \sum_{n=1}^{\infty} |\delta_n| < \infty. \end{aligned}$$

Then, $\lim_{n \rightarrow \infty} a_n = 0$.

Lemma 6 (see [14]). Let H be a real Hilbert, and let $T_i : H \rightarrow H$ ($i = 1, 2, \dots$) be all nonexpansive mappings with $\cap_{i=1}^{\infty} \text{Fix}(T_i) \neq \emptyset$. Let $T = \sum_{i=1}^{\infty} \omega_i T_i$ ($i = 1, 2, \dots$), where $\{\omega_i\} \subset (0, 1)$ such that $\sum_{i=1}^{\infty} \omega_i = 1$. Then T is a nonexpansive mapping with $\text{Fix}(T) = \cap_{i=1}^{\infty} \text{Fix}(T_i)$.

Lemma 7 (see [13]). Let H be a Hilbert space, and let C be a nonempty closed convex subset of H and $T : C \rightarrow C$ a nonexpansive mapping with $\text{Fix}(T) \neq \emptyset$. If $\{x_n\}$ is a sequence in C weakly converging to x and if $\{(I - T)x_n\}$ converges strongly to y , then $(I - T)x = y$.

We adopt the following notations:

- (1) $x_n \rightharpoonup x$ stands for the weak convergence of $\{x_n\}$ to x ,
- (2) $x_n \rightarrow x$ stands for the strong convergence of $\{x_n\}$ to x .

3. Synchronal Algorithm

Throughout the rest of this paper, we always assume that $V : C \rightarrow H$ is an l -Lipschitzian mapping with coefficient $l \geq 0$ and $B : C \rightarrow H$ is a k -Lipschitzian continuous operator

and η -strongly monotone with $k > 0$, $\eta > 0$. Let $N \geq 1$ be an integer. Let, for each $1 \leq i \leq N$, $T_i : C \rightarrow C$ be a nonexpansive mapping and $S : C \rightarrow C$ also nonexpansive. Assume that $0 < \mu < 2\eta/k^2$ and $0 < \gamma < \mu(\eta - \mu k^2/2)/\alpha = \tau/l$.

Define a mapping $U_n = \beta_n S + (1 - \beta_n)I$. Since S is nonexpansive, it is easy to get that U_n is also nonexpansive. Consider the following mapping G_n on C defined by

$$G_n x = P_C(\alpha_n \gamma V(x) + (I - \alpha_n \mu B) T U_n x), \quad (13)$$

$$\forall x \in C, n \in \mathbb{N},$$

where $\alpha_n \in (0, 1)$, $T = \sum_{i=1}^N \omega_i T_i$ with $\omega_i > 0$, and $\sum_{i=1}^N \omega_i = 1$. By Lemmas 2 and 3, we obtain

$$\begin{aligned} \|G_n x - G_n y\| &\leq \alpha_n \gamma \|Vx - Vy\| \\ &\quad + (1 - \alpha_n \tau) \|T U_n x - T U_n y\| \\ &\leq \alpha_n \gamma l \|x - y\| + (1 - \alpha_n \tau) \|x - y\| \\ &= (1 - \alpha_n (\tau - \gamma l)) \|x - y\|. \end{aligned} \quad (14)$$

Since $0 < 1 - \alpha_n (\tau - \gamma l) < 1$, it follows that G_n is a contraction. Therefore, by the Banach contraction principle, G_n has a unique fixed point $x_n^V \in C$ such that

$$x_n^V = P_C(\alpha_n \gamma V(x_n^V) + (I - \alpha_n \mu B) T U_n x_n^V). \quad (15)$$

For simplicity, we will write x_n for x_n^V provided that no confusion occurs. Next we prove that the sequence $\{x_n\}$ converges strongly to a point $x^* \in \Omega = \bigcap_{i=1}^N \text{Fix}(T_i)$ which solves the variational inequality

$$\langle (\gamma V - \mu B)x^*, p - x^* \rangle \leq 0, \quad \forall p \in \Omega. \quad (16)$$

By the property of the projection, we can get $x^* = P_\Omega(I - \mu B + \gamma V)x^*$ equivalently.

Theorem 8. Let C be a nonempty, closed, and convex subset of a real Hilbert space H and $V : C \rightarrow H$ an l -Lipschitzian mapping with $l \geq 0$. Let $N \geq 1$ be an integer. Let, for each $1 \leq i \leq N$, $T_i : C \rightarrow C$ be a nonexpansive mapping and let $S : C \rightarrow C$ be also nonexpansive. Assume the set $\Omega = \bigcap_{i=1}^N \text{Fix}(T_i) \neq \emptyset$. Let $B : C \rightarrow H$ be a k -Lipschitzian continuous operator and η -strongly monotone with $k > 0$, $\eta > 0$, $0 < \mu < 2\eta/k^2$ and $0 < \gamma < \mu(\eta - \mu k^2/2)/l = \tau/l$. Given $x_1 \in C$, let $\{x_n\}$ be the sequence generated by the following algorithm:

$$\begin{aligned} y_n &= \beta_n Sx_n + (1 - \beta_n)x_n, \\ x_{n+1} &= P_C(\alpha_n \gamma Vx_n + (I - \mu \alpha_n B) Ty_n). \end{aligned} \quad (17)$$

If $\{\alpha_n\}$ and $\{\beta_n\}$ satisfy the following properties:

- (i) $\{\alpha_n\} \subset (0, 1)$, $\lim_{n \rightarrow \infty} \alpha_n = 0$ and $\sum_{n=1}^{\infty} \alpha_n = \infty$,
- (ii) $\{\beta_n\} \subset [0, 1)$, $\lim_{n \rightarrow \infty} (\beta_n/\alpha_n) = 0$,
- (iii) $\sum_{n=1}^{\infty} |\alpha_{n+1} - \alpha_n| < \infty$ and $\sum_{n=1}^{\infty} |\beta_{n+1} - \beta_n| < \infty$.

Then, $\{x_n\}$ converges strongly to $x^* \in \Omega$, which solves the variational inequality (16).

Proof. The proof is divided into several steps.

Step 1. Show first that $\{x_n\}$ is bounded.

Take any $p \in \Omega$; we have

$$\begin{aligned} \|y_n - p\| &= \|\beta_n (Sx_n - p) + (1 - \beta_n)(x_n - p)\| \\ &\leq \beta_n \|Sx_n - Sp\| + \beta_n \|Sp - p\| \\ &\quad + (1 - \beta_n) \|x_n - p\| \leq \|x_n - p\| + \beta_n \|Sp - p\|. \end{aligned} \quad (18)$$

Further we get

$$\begin{aligned} \|x_{n+1} - p\| &= \|P_C(\alpha_n \gamma Vx_n + (I - \mu \alpha_n B) Ty_n) - P_C p\| \\ &\leq \|\alpha_n (\gamma Vx_n - \mu Bp) \\ &\quad + (I - \mu \alpha_n B) Ty_n - (I - \mu \alpha_n B) p\| \\ &\leq \alpha_n (\|\gamma Vx_n - \gamma Vp\| + \|\gamma Vp - \mu Bp\|) \\ &\quad + (1 - \alpha_n \tau) \|Ty_n - p\| \\ &\leq \alpha_n l \gamma \|x_n - p\| + \alpha_n \|\gamma Vp - \mu Bp\| \\ &\quad + (1 - \alpha_n \tau) \|y_n - p\| \\ &= (1 - \alpha_n (\tau - l \gamma)) \|x_n - p\| \\ &\quad + \alpha_n (\tau - l \gamma) \frac{\|\gamma Vp - \mu Bp\| + \|Sp - p\|}{\tau - l \gamma} \\ &\leq \max \left\{ \|x_n - p\|, \frac{\|\gamma Vp - \mu Bp\| + \|Sp - p\|}{\tau - l \gamma} \right\}. \end{aligned} \quad (19)$$

By induction, we obtain $\|x_n - p\| \leq \max\{\|x_1 - p\|, (\|\gamma Vp - \mu Bp\| + \|Sp - p\|)/(\tau - l \gamma)\}$, $n \geq 1$. Hence, $\{x_n\}$ is bounded, so is $\{y_n\}$. It follows from the Lipschitz continuity of B and V that $\{Bx_n\}$, $\{Bu_n\}$, and $\{Vx_n\}$ are also bounded. From the nonexpansivity of T and S , it follows that $\{Tx_n\}$, $\{Sx_n\}$, and $\{BTy_n\}$ are also bounded.

Step 2. Show that

$$\lim_{n \rightarrow \infty} \|x_{n+1} - x_n\| = 0. \quad (20)$$

By (17), we have

$$\begin{aligned} \|x_{n+1} - x_n\| &= \|P_C(\alpha_n \gamma Vx_n + (I - \mu \alpha_n B) Ty_n) \\ &\quad - P_C(\alpha_{n-1} \gamma Vx_{n-1} + (I - \mu \alpha_{n-1} B) Ty_{n-1})\| \\ &\leq \|\alpha_n \gamma Vx_n + (I - \mu \alpha_n B) Ty_n \\ &\quad - (\alpha_{n-1} \gamma Vx_{n-1} + (I - \mu \alpha_{n-1} B) Ty_{n-1})\| \\ &\leq \alpha_n \gamma \|Vx_n - Vx_{n-1}\| \\ &\quad + \|(I - \mu \alpha_n B) Ty_n - (I - \mu \alpha_n B) Ty_{n-1}\| \\ &\quad + \|(I - \mu \alpha_n B) Ty_{n-1} - (I - \mu \alpha_{n-1} B) Ty_{n-1}\| \\ &\quad + |\alpha_n - \alpha_{n-1}| \gamma \|Vx_{n-1}\| \end{aligned}$$

$$\begin{aligned}
&\leq \alpha_n \gamma l \|x_n - x_{n-1}\| \\
&\quad + |\alpha_n - \alpha_{n-1}| (\gamma l \|Vx_{n-1}\| + \mu \|BTy_{n-1}\|) \\
&\quad + (1 - \alpha_n \tau) \|y_n - y_{n-1}\|.
\end{aligned} \tag{21}$$

Observe that

$$\begin{aligned}
&\|y_n - y_{n-1}\| \\
&= \|\beta_n Sx_n + (1 - \beta_n) x_n - \beta_{n-1} Sx_{n-1} \\
&\quad - (1 - \beta_{n-1}) x_{n-1}\| \\
&\leq \|\beta_n Sx_n - \beta_{n-1} Sx_{n-1}\| \\
&\quad + \|(1 - \beta_n) x_n - (1 - \beta_{n-1}) x_{n-1}\| \\
&\quad + \|\beta_n Sx_{n-1} - \beta_{n-1} Sx_{n-1}\| \\
&\quad + \|(1 - \beta_n) x_{n-1} - (1 - \beta_{n-1}) x_{n-1}\| \\
&\leq \beta_n \|x_n - x_{n-1}\| + (1 - \beta_n) \|x_n - x_{n-1}\| \\
&\quad + |\beta_n - \beta_{n-1}| \|Sx_{n-1}\| + |\beta_n - \beta_{n-1}| \|x_{n-1}\| \\
&= \|x_n - x_{n-1}\| \\
&\quad + |\beta_n - \beta_{n-1}| (\|Sx_{n-1}\| + \|x_{n-1}\|).
\end{aligned} \tag{22}$$

Together with (21) and (22), we get

$$\begin{aligned}
&\|x_{n+1} - x_n\| \\
&\leq \alpha_n \gamma l \|x_n - x_{n-1}\| \\
&\quad + |\alpha_n - \alpha_{n-1}| (\gamma l \|Vx_{n-1}\| + \mu \|BTy_{n-1}\|) \\
&\quad + (1 - \alpha_n \tau) \|x_n - x_{n-1}\| \\
&\quad + |\beta_n - \beta_{n-1}| (\|Sx_{n-1}\| + \|x_{n-1}\|) \\
&= (1 - \alpha_n (\tau - \gamma l)) \|x_n - x_{n-1}\| \\
&\quad + |\alpha_n - \alpha_{n-1}| (\gamma l \|Vx_{n-1}\| + \mu \|BTy_{n-1}\|) \\
&\quad + |\beta_n - \beta_{n-1}| (\|Sx_{n-1}\| + \|x_{n-1}\|) \\
&\leq (1 - \alpha_n (\tau - \gamma l)) \|x_n - x_{n-1}\| \\
&\quad + (|\alpha_n - \alpha_{n-1}| + |\beta_n - \beta_{n-1}|) M_1,
\end{aligned} \tag{23}$$

where $M_1 = \sup_n \{\|\gamma l Vx_{n-1}\| + \mu \|BTy_{n-1}\| + \|Sx_{n-1}\| + \|x_{n-1}\|\}$.

By Lemma 5, we obtain

$$\|x_{n+1} - x_n\| \longrightarrow 0. \tag{24}$$

Step 3. Show that

$$\|x_n - Tx_n\| \longrightarrow 0. \tag{25}$$

Observe that

$$\begin{aligned}
&\|x_{n+1} - Ty_n\| \\
&= \|P_C (\alpha_n \gamma Vx_n + (I - \mu \alpha_n BTy_n)) - P_C Ty_n\| \\
&\leq \alpha_n \|\gamma Vx_n - \mu BTy_n\| \longrightarrow 0.
\end{aligned} \tag{26}$$

From condition (i) and (ii), we obtain

$$\begin{aligned}
&\|x_{n+1} - Tx_n\| \\
&\leq \|x_{n+1} - Ty_n\| + \|Ty_n - Tx_n\| \\
&\leq \|x_{n+1} - Ty_n\| + \|y_n - x_n\| \\
&= \|x_{n+1} - Ty_n\| + \beta_n \|Sx_n - x_n\| \longrightarrow 0.
\end{aligned} \tag{27}$$

Step 4. Show that

$$\limsup_{n \rightarrow \infty} \langle (\gamma V - \mu B) x^*, x_n - x^* \rangle \leq 0, \tag{28}$$

where $x^* = P_\Omega(I - \mu B + \gamma V)x^*$ is a unique solution of the variational inequality (16).

Indeed, take a subsequence $\{x_{n_j}\}$ of $\{x_n\}$ such that

$$\begin{aligned}
&\limsup_{n \rightarrow \infty} \langle (\gamma V - \mu B) x^*, x_n - x^* \rangle \\
&= \lim_{j \rightarrow \infty} \langle (\gamma V - \mu B) x^*, x_{n_j} - x^* \rangle.
\end{aligned} \tag{29}$$

Since $\{x_{n_j}\}$ is bounded, there exists a subsequence $\{x_{n_{j_k}}\}$ of $\{x_{n_j}\}$ which converges weakly to $\hat{x}$. Without loss of generality, we can assume $x_{n_j} \rightharpoonup \hat{x}$ and

$$\|x_{n_j} - Tx_{n_j}\| \longrightarrow 0. \tag{30}$$

By Lemma 7, we have $\hat{x} = T\hat{x}$. From Lemma 6, we get

$$\hat{x} \in \text{Fix}(T) = \bigcap_{i=1}^N \text{Fix}(T_i). \tag{31}$$

Since $x^* = P_\Omega(I - \mu B + \gamma V)x^*$, it follows that

$$\begin{aligned}
&\limsup_{n \rightarrow \infty} \langle (\gamma V - \mu B) x^*, x_n - x^* \rangle \\
&= \lim_{j \rightarrow \infty} \langle (\gamma V - \mu B) x^*, x_{n_j} - x^* \rangle \\
&= \langle (\gamma V - \mu B) x^*, \hat{x} - x^* \rangle \leq 0.
\end{aligned} \tag{32}$$

Step 5. Show that

$$x_n \longrightarrow x^*. \tag{33}$$

Denote $z_n = \alpha_n \gamma Vx_n + (I - \mu \alpha_n B)Ty_n$, then $x_{n+1} = P_C z_n$. From (17), we have

$$\begin{aligned}
&\|x_{n+1} - x^*\|^2 \\
&= \|P_C z_n - x^*\|^2 = \langle P_C z_n - z_n, P_C z_n - x^* \rangle \\
&\quad + \langle z_n - x^*, x_{n+1} - x^* \rangle \leq \langle z_n - x^*, x_{n+1} - x^* \rangle
\end{aligned}$$

$$\begin{aligned}
&= \langle (I - \mu\alpha_n B) T y_n - (I - \mu\alpha_n B) T x^* \\
&\quad + \alpha_n (\gamma V x_n - \mu B x^*), x_{n+1} - x^* \rangle \\
&\leq (1 - \alpha_n \tau) \|y_n - x^*\| \|x_{n+1} - x^*\| \\
&\quad + \alpha_n \langle \gamma V x_n - \gamma V x^*, x_{n+1} - x^* \rangle \\
&\quad + \alpha_n \langle \gamma V x^* - \mu B x^*, x_{n+1} - x^* \rangle \\
&\leq (1 - \alpha_n \tau) (\|x_n - x^*\| + \beta_n \|S x^* - x^*\|) \|x_{n+1} - x^*\| \\
&\quad + \alpha_n \gamma l \|x_n - x^*\| \|x_{n+1} - x^*\| \\
&\quad + \alpha_n \langle \gamma V x^* - \mu B x^*, x_{n+1} - x^* \rangle \\
&\leq \frac{1 - \alpha_n (\tau - \gamma l)}{2} (\|x_n - x^*\|^2 + \|x_{n+1} - x^*\|^2) \\
&\quad + \beta_n \|x_{n+1} - x^*\| \|S x^* - x^*\| \\
&\quad + \alpha_n \langle \gamma V x^* - \mu B x^*, x_{n+1} - x^* \rangle.
\end{aligned} \tag{34}$$

This implies that

$$\begin{aligned}
&\|x_{n+1} - x^*\|^2 \\
&\leq \frac{1 - \alpha_n (\tau - \gamma l)}{1 + \alpha_n (\tau - \gamma l)} \|x_n - x^*\|^2 + \frac{2}{1 + \alpha_n (\tau - \gamma l)} \\
&\quad \times (\beta_n \|x_{n+1} - x^*\| \|S x^* - x^*\| \\
&\quad + \alpha_n \langle \gamma V x^* - \mu B x^*, x_{n+1} - x^* \rangle) \\
&\leq (1 - \alpha_n (\tau - \gamma l)) \|x_n - x^*\|^2 \\
&\quad + 2\beta_n M_2 + 2\alpha_n \langle \gamma V x^* - \mu B x^*, x_{n+1} - x^* \rangle,
\end{aligned} \tag{35}$$

where $M_2 = \sup_n \|x_{n+1} - x^*\| \|S x^* - x^*\|$, $n \geq 1$. Put $\gamma_n = \alpha_n (\tau - \gamma l)$, $\delta_n = 2\beta_n M_2 + 2\alpha_n \langle \gamma V x^* - \mu B x^*, x_{n+1} - x^* \rangle$. It is easy to see that $\limsup_{n \rightarrow \infty} \delta_n / \gamma_n \leq 0$. Hence by Lemma 5, the sequence $\{x_n\}$ converges strongly to x^* . $\square$

Remark 9. Let $N = 1$ in Theorem 8; we can get Theorem 3.1 of [8].

Remark 10. Let $N = 1$, $\gamma = 1$, $\mu = 1$, $B = I$ and V , be a contraction in Theorem 8; it is easy to get the theorem of [10].

4. Cyclic Algorithm

In this section, we consider the cyclic algorithm of N nonexpansive mappings $T_1, T_2, \dots, T_N$. Similarly, we can get that the mapping G_n on C defined by

$$\begin{aligned}
G_n x &= P_C (\alpha_n \gamma V(x) + (I - \alpha_n \mu B) T_{[n]} U_n x), \\
&\forall x \in C, n \in \mathbb{N},
\end{aligned} \tag{36}$$

is a contraction, where $T_{[n]} = T_i$ with $i = n(\text{mod})N$ taking values in $\{1, 2, \dots, N\}$.

Theorem 11. Let C be a nonempty, closed, and convex subset of a real Hilbert space H , and let $V : C \rightarrow H$ be an l -Lipschitzian mapping with $l \geq 0$. Let $N \geq 1$ be an integer. Let, for each $1 \leq i \leq N$, $T_i : C \rightarrow C$ be a nonexpansive mapping and let $S : C \rightarrow C$ be also nonexpansive. Assume the set $\Omega = \bigcap_{i=1}^N \text{Fix}(T_i) \neq \emptyset$. Let $B : C \rightarrow H$ be a k -Lipschitzian continuous operator and η -strongly monotone with $k > 0$, $\eta > 0$, $0 < \mu < 2\eta/k^2$, and $0 < \gamma < \mu(\eta - \mu k^2/2)/l = \tau/l$. Given $x_1 \in C$, let $\{x_n\}$ be the sequence generated by the following algorithm:

$$\begin{aligned}
y_n &= \beta_n S x_n + (1 - \beta_n) x_n, \\
x_{n+1} &= P_C (\alpha_n \gamma V x_n + (I - \mu\alpha_n B) T_{[n]} y_n).
\end{aligned} \tag{37}$$

If $\{\alpha_n\}$ and $\{\beta_n\}$ satisfy the following properties:

- (i) $\{\alpha_n\} \subset (0, 1)$, $\lim_{n \rightarrow \infty} \alpha_n = 0$ and $\sum_{n=1}^{\infty} \alpha_n = \infty$,
- (ii) $\{\beta_n\} \subset [0, 1)$, $\lim_{n \rightarrow \infty} (\beta_n / \alpha_n) = 0$,
- (iii) $\sum_{n=1}^{\infty} |\alpha_{n+1} - \alpha_n| < \infty$ and $\sum_{n=1}^{\infty} |\beta_{n+1} - \beta_n| < \infty$.

Assume in addition that

$$\begin{aligned}
\bigcap_{i=1}^N \text{Fix}(T_i) &= \text{Fix}(T_N T_{N-1} \cdots T_2 T_1) \\
&= \text{Fix}(T_1 T_N T_{N-1} \cdots T_2) \\
&= \cdots = \text{Fix}(T_2 T_1 T_N \cdots T_3).
\end{aligned} \tag{38}$$

Then, $\{x_n\}$ converges strongly to $x^* \in \Omega$, which solves the variational inequality (16).

Proof. The proof is divided into several steps.

Step 1. Show first that $\{x_n\}$ is bounded.

The proof of Step 1 is similar to that of Theorem 8.

Step 2. Show that

$$\lim_{n \rightarrow \infty} \|x_{n+N} - x_n\| = 0. \tag{39}$$

By (37), we have

$$\begin{aligned}
&\|x_{n+N+1} - x_{n+1}\| \\
&\leq \|\alpha_{n+N} \gamma V x_{n+N} + (I - \mu\alpha_{n+N} B) T_{[n]} y_{n+N} \\
&\quad - \alpha_n \gamma V x_n - (I - \mu\alpha_n B) T_{[n]} y_n\| \\
&\leq \alpha_{n+N} \gamma \|V x_{n+N} - V x_n\| \\
&\quad + \|(I - \mu\alpha_{n+N} B) T_{[n]} y_{n+N} \\
&\quad - (I - \mu\alpha_{n+N} B) T_{[n]} y_n\| \\
&\quad + \|(I - \mu\alpha_{n+N} B) T_{[n]} y_n \\
&\quad - (I - \mu\alpha_n B) T_{[n]} y_n\| \\
&\quad + |\alpha_{n+N} - \alpha_n| \gamma \|V x_n\|
\end{aligned}$$

$$\begin{aligned}
&\leq \alpha_{n+N} \gamma l \|x_{n+N} - x_n\| \\
&\quad + (1 - \alpha_{n+N} \tau) \|y_{n+N} - y_n\| \\
&\quad + |\alpha_{n+N} - \alpha_n| (\gamma l \|Vx_n\| + \mu \|BT_{[n]} y_n\|).
\end{aligned} \tag{40}$$

Observe that

$$\begin{aligned}
&\|y_{n+N} - y_n\| \\
&= \|\beta_{n+N} Sx_{n+N} + (1 - \beta_{n+N}) x_{n+N} \\
&\quad - \beta_n Sx_n - (1 - \beta_n) x_n\| \\
&\leq \|\beta_{n+N} Sx_{n+N} - \beta_{n+N} Sx_n\| \\
&\quad + \|(1 - \beta_{n+N}) x_{n+N} - (1 - \beta_{n+N}) x_n\| \\
&\quad + \|\beta_{n+N} Sx_n - \beta_n Sx_n\| \\
&\quad + \|(1 - \beta_{n+N}) x_n - (1 - \beta_n) x_n\| \\
&\leq \beta_{n+N} \|x_{n+N} - x_n\| \\
&\quad + (1 - \beta_{n+N}) \|x_{n+N} - x_n\| \\
&\quad + |\beta_{n+N} - \beta_n| \|Sx_n\| + |\beta_{n+N} - \beta_n| \|x_n\| \\
&= \|x_{n+N} - x_n\| \\
&\quad + |\beta_{n+N} - \beta_n| (\|Sx_n\| + \|x_n\|).
\end{aligned} \tag{41}$$

Together with (40) and (41), we have

$$\begin{aligned}
&\|x_{n+N+1} - x_{n+1}\| \\
&\leq \alpha_{n+N} \gamma l \|x_{n+N} - x_n\| \\
&\quad + |\alpha_{n+N} - \alpha_n| (\gamma l \|Vx_n\| + \mu \|BT_{[n]} y_n\|) \\
&\quad + (1 - \alpha_{n+N} \tau) \|x_{n+N} - x_n\| \\
&\quad + |\beta_{n+N} - \beta_n| (\|Sx_n\| + \|x_n\|) \\
&= (1 - \alpha_{n+N} (\tau - \gamma l)) \|x_{n+N} - x_n\| \\
&\quad + |\alpha_{n+N} - \alpha_n| (\gamma l \|Vx_n\| + \mu \|BT_{[n]} y_n\|) \\
&\quad + |\beta_{n+N} - \beta_n| (\|Sx_n\| + \|x_n\|) \\
&\leq (1 - \alpha_{n+N} (\tau - \gamma l)) \|x_{n+N} - x_n\| \\
&\quad + (|\alpha_{n+N} - \alpha_n| + |\beta_{n+N} - \beta_n|) M_3,
\end{aligned} \tag{42}$$

where $M_3 = \sup_n \{\gamma l \|Vx_n\| + \mu \|BT_{[n]} y_n\| + \|Sx_n\| + \|x_n\|\}$.

By Lemma 5, we get

$$\|x_{n+N} - x_n\| \longrightarrow 0. \tag{43}$$

Step 3. Show that

$$\|x_n - T_{[n+N-1]} T_{[n+N-2]} \cdots T_{[n]} x_n\| \longrightarrow 0. \tag{44}$$

Observe that

$$\begin{aligned}
&\|x_{n+1} - T_{[n]} y_n\| \\
&= \|P_C (\alpha_n \gamma Vx_n + (I - \mu \alpha_n) BT_{[n]} y_n) - P_C T_{[n]} y_n\| \\
&\leq \alpha_n \|\gamma Vx_n - \mu BT_{[n]} y_n\| \longrightarrow 0.
\end{aligned} \tag{45}$$

From conditions (i) and (ii) of Theorem 11, we obtain

$$\begin{aligned}
&\|x_{n+1} - T_{[n]} x_n\| \\
&\leq \|x_{n+1} - T_{[n]} y_n\| + \|T_{[n]} y_n - T_{[n]} x_n\| \\
&\leq \|x_{n+1} - T_{[n]} y_n\| + \|y_n - x_n\| \\
&= \|x_{n+1} - T_{[n]} y_n\| + \beta_n \|Sx_n - x_n\| \longrightarrow 0.
\end{aligned} \tag{46}$$

Recursively,

$$\begin{aligned}
&\|x_{n+N} - T_{[n+N-1]} x_{n+N-1}\| \longrightarrow 0, \\
&\|x_{n+N-1} - T_{[n+N-2]} x_{n+N-2}\| \longrightarrow 0.
\end{aligned} \tag{47}$$

Since every $T_{[n]}$ is nonexpansive, it is easy to get

$$\|T_{[n+N-1]} x_{n+N-1} - T_{[n+N-1]} T_{[n+N-2]} x_{n+N-2}\| \longrightarrow 0. \tag{48}$$

Similarly, we obtain

$$\begin{aligned}
&\|T_{[n+N-1]} T_{[n+N-2]} x_{n+N-2} \\
&\quad - T_{[n+N-1]} T_{[n+N-2]} T_{[n+N-3]} x_{n+N-3}\| \longrightarrow 0 \\
&\quad \vdots \\
&\|T_{[n+N-1]} T_{[n+N-2]} \cdots T_{[n+1]} x_{n+1} \\
&\quad - T_{[n+N-1]} T_{[n+N-2]} \cdots T_{[n]} x_n\| \longrightarrow 0.
\end{aligned} \tag{49}$$

Thus we get

$$\begin{aligned}
&\|x_{n+N} - T_{[n+N-1]} \cdots T_{[n]} x_n\| \\
&\leq \|x_{n+N} - T_{[n+N-1]} x_{n+N-1}\| \\
&\quad + \|T_{[n+N-1]} x_{n+N-1} \\
&\quad - T_{[n+N-1]} T_{[n+N-2]} x_{n+N-2}\| \\
&\quad + \cdots + \|T_{[n+N-1]} T_{[n+N-2]} \cdots T_{[n+1]} x_{n+1} \\
&\quad - T_{[n+N-1]} \cdots T_{[n]} x_n\| \longrightarrow 0.
\end{aligned} \tag{50}$$

Since

$$\begin{aligned}
&\|x_n - T_{[n+N-1]} T_{[n+N-2]} \cdots T_{[n]} x_n\| \\
&\leq \|x_n - x_{n+N}\| + \|x_{n+N} - T_{[n+N-1]} \cdots T_{[n]} x_n\|,
\end{aligned} \tag{51}$$

we obtain (44).

Step 4. Show that

$$\limsup_{n \rightarrow \infty} \langle (\gamma V - \mu B) x^*, x_n - x^* \rangle \leq 0, \tag{52}$$

where $x^* = P_\Omega(I - \mu B + \gamma V)x^*$ is a unique solution of the variational inequality (16).

Indeed, take a subsequence $\{x_{n_j}\}$ of $\{x_n\}$ such that

$$\begin{aligned} \limsup_{n \rightarrow \infty} \langle (\gamma V - \mu B)x^*, x_n - x^* \rangle \\ = \lim_{j \rightarrow \infty} \langle (\gamma V - \mu B)x^*, x_{n_j} - x^* \rangle. \end{aligned} \quad (53)$$

Since $\{x_{n_j}\}$ is bounded, there exists a subsequence $\{x_{n_{j_k}}\}$ of $\{x_{n_j}\}$ which converges weakly to $\hat{x}$. Without loss of generality, we can assume $x_{n_j} \rightharpoonup \hat{x}$ and

$$\|x_{n_j} - T_{[n_j+N-1]}T_{[n_j+N-2]} \cdots T_{[n_j]}x_{n_j}\| \rightarrow 0. \quad (54)$$

Notice that, for each n_j , $T_{[n_j+N-1]}T_{[n_j+N-2]} \cdots T_{[n_j]}$ is some permutation of the mappings $T_1T_2 \cdots T_N$. Since $T_1T_2 \cdots T_N$ are finite, all the finite permutations are $N!$; there must be some permutation that appears infinite times. Without loss of generality, we can assume this permutation is $T_NT_{N-1} \cdots T_1$. We obtain

$$\|x_{n_j} - T_NT_{N-1} \cdots T_1x_{n_j}\| \rightarrow 0. \quad (55)$$

Obviously, $T_NT_{N-1} \cdots T_1$ is nonexpansive. By Lemma 7, we have $\hat{x} = T_NT_{N-1} \cdots T_1\hat{x}$. Further by the assumption in Theorem 11, we get

$$\hat{x} \in \text{Fix}(T_NT_{N-1} \cdots T_1) = \bigcap_{i=1}^N \text{Fix}(T_i). \quad (56)$$

Since $x^* = P_\Omega(I - \mu B + \gamma V)x^*$, it follows that

$$\begin{aligned} \limsup_{n \rightarrow \infty} \langle (\gamma V - \mu B)x^*, x_n - x^* \rangle \\ = \lim_{j \rightarrow \infty} \langle (\gamma V - \mu B)x^*, x_{n_j} - x^* \rangle \\ = \langle (\gamma V - \mu B)x^*, \hat{x} - x^* \rangle \leq 0. \end{aligned} \quad (57)$$

Step 5. Show that

$$x_n \rightarrow x^*. \quad (58)$$

Denote $z_n = \alpha_n \gamma Vx_n + (I - \mu \alpha_n B)T_{[n]}y_n$; then $x_{n+1} = P_C z_n$. From (37), we have

$$\begin{aligned} \|x_{n+1} - x^*\|^2 \\ = \|P_C z_n - x^*\|^2 = \langle P_C z_n - z_n, P_C z_n - x^* \rangle \\ + \langle z_n - x^*, x_{n+1} - x^* \rangle \leq \langle z_n - x^*, x_{n+1} - x^* \rangle \\ = \langle (I - \mu \alpha_n B)T_{[n]}y_n - (I - \mu \alpha_n B)x^*, x_{n+1} - x^* \rangle \\ + \alpha_n \langle \gamma Vx_n - \mu Bx^*, x_{n+1} - x^* \rangle \\ \leq (1 - \alpha_n \tau) \|y_n - x^*\| \|x_{n+1} - x^*\| \\ + \alpha_n \langle \gamma Vx_n - \gamma Vx^*, x_{n+1} - x^* \rangle \\ + \alpha_n \langle \gamma Vx^* - \mu Bx^*, x_{n+1} - x^* \rangle \end{aligned}$$

$$\begin{aligned} \leq (1 - \alpha_n \tau) (\|x_n - x^*\| + \beta_n \|Sx^* - x^*\|) \\ \times \|x_{n+1} - x^*\| + \alpha_n \gamma l \|x_n - x^*\| \|x_{n+1} - x^*\| \\ + \alpha_n \langle \gamma Vx^* - \mu Bx^*, x_{n+1} - x^* \rangle \\ \leq \frac{1 - \alpha_n(\tau - \gamma l)}{2} (\|x_n - x^*\|^2 + \|x_{n+1} - x^*\|^2) \\ + \beta_n \|x_n - x^*\| \|Sx^* - x^*\| \\ + \alpha_n \langle \gamma Vx^* - \mu Bx^*, x_{n+1} - x^* \rangle. \end{aligned} \quad (59)$$

This implies that

$$\begin{aligned} \|x_{n+1} - x^*\|^2 \\ \leq \frac{1 - \alpha_n(\tau - \gamma l)}{1 + \alpha_n(\tau - \gamma l)} \|x_n - x^*\|^2 + \frac{2}{1 + \alpha_n(\tau - \gamma l)} \\ \times (\beta_n \|x_n - x^*\| \|Sx^* - x^*\| \\ + \alpha_n \langle \gamma Vx^* - \mu Bx^*, x_{n+1} - x^* \rangle) \\ \leq (1 - \alpha_n(\tau - \gamma l)) \|x_n - x^*\|^2 \\ + 2\beta_n M_1 + 2\alpha_n \langle \gamma Vx^* - \mu Bx^*, x_{n+1} - x^* \rangle, \end{aligned} \quad (60)$$

where $M_1 = \sup_n \|x_n - x^*\| \|Sx^* - x^*\|$, $n \geq 1$. Put $\gamma_n = \alpha_n(\tau - \gamma l)$, $\delta_n = 2\beta_n M_1 + 2\alpha_n \langle \gamma Vx^* - \mu Bx^*, x_{n+1} - x^* \rangle$. It is easy to see that $\limsup_{n \rightarrow \infty} \delta_n / \gamma_n \leq 0$. Hence, by Lemma 6, the sequence $\{x_n\}$ converges strongly to x^* . $\square$

5. Numerical Result

In this section, we consider the following simple example to demonstrate the effectiveness, realization, and convergence of the algorithms in Theorems 8 and 11.

Example 12. Let $H = \mathbb{R}$, $C = [1/4, +\infty)$. Define $T_1 : x \mapsto \sqrt{x}$, $T_2 : x \mapsto x + \pi/4 - \arctan x$, $S : x \mapsto \sin x$. Take $B = I$ with Lipschitz constant $k = 1$ and strongly monotone constant $\eta = 1$, $\forall x \in H$, $\forall x \in H$, with Lipschitz coefficient $l = 2$. Give the parameters $\alpha_n = 1/2n$; $\beta_n = 1/n^2$ for every $n \geq 1$; fix $\mu = 1$ and $\gamma = 1/4$. Then by Theorems 8 and 11, respectively, the sequence $\{x_n\}$ is generated by

$$y_n = \frac{1}{n^2} \sin(x_n) + \left(1 - \frac{1}{n^2}\right) x_n, \quad (61)$$

$$x_{n+1} = P_C \left(\frac{1}{4n} x_n + \left(1 - \frac{1}{2n}\right) T y_n \right),$$

$$y_n = \frac{1}{n^2} \sin(x_n) + \left(1 - \frac{1}{n^2}\right) x_n, \quad (62)$$

$$x_{n+1} = P_C \left(\frac{1}{4n} x_n + \left(1 - \frac{1}{2n}\right) T_{[n]} y_n \right).$$

As $n \rightarrow \infty$, we have $\{x_n\} \rightarrow x^* = 1$.

TABLE 1: $x_1 = 2$.

n (iterative number)	x_n (iterative point)	Errors (n)
50	0.9901	9.9×10^{-3}
500	0.9990	9.9852×10^{-4}
2000	0.9999	9.9985×10^{-5}

TABLE 2: $x_1 = 2$.

n (iterative number)	x_n (iterative point)	Errors (n)
50	0.9902	9.8×10^{-3}
500	0.9990	9.9814×10^{-4}
2000	0.9999	9.9981×10^{-5}

Let $\omega_i = 1/2$, $i = 1, 2$; then we have $Tx = (1/2)(\sqrt{x} + x + \pi/4 - \arctan x)$, $T_{[n]}x = \sqrt{x}$ if n is odd and $T_{[n]}x = x + \pi/4 - \arctan x$ if n is even. Put $z_n = (1/4n)x_n + (1 - 1/2n)Ty_n$; then (61) is equivalent to

$$x_{n+1} = \begin{cases} z_n, & \text{if } z_n \in C, \\ \frac{1}{4}, & \text{if } z_n \notin C. \end{cases} \quad (63)$$

Using the same method to treat (62), we can get similar equation as the above formula.

Now we turn to numerical simulation using the algorithms (17) and (37), respectively. Take the initial guess $x_1 = 2$; using software Matlab R2012, we obtain the numerical experiment results in Tables 1 and 2.

From the computer programming point of view, the algorithms are easier to implement in this paper.
