We introduce the concept of an α_c -admissible non-self-mappings with respect to η_c and establish the existence of PPF dependent fixed and coincidence point theorems for $\alpha_c\eta_c$ - ψ -contractive non-self-mappings in the Razumikhin class. As applications of our PPF dependent fixed point and coincidence point theorems, we derive some new fixed and coincidence point results for ψ -contractions whenever the range space is endowed with a graph or with a partial order. The obtained results generalize, extend, and modify some PPF dependent fixed point results in the literature. Several interesting consequences of our theorems are also provided.

1. Introduction and Preliminaries

In nonlinear functional analysis, one of the most significant research areas is fixed point theory. On the other hand, fixed point theory has an application in distinct branches of mathematics and also in different sciences, such as engineering, computer science, and economics. In 1922, Banach proved that every contraction in a complete metric space has a unique fixed point. This celebrated result have been generalized and improved by many authors in the context of different abstract spaces for various operators (see [1–31] and references therein). In 1997, Bernfeld et al. [5] introduced the concept of fixed point for mappings that have different domains and ranges, which is called PPF dependent fixed point or the fixed point with PPF dependence. Furthermore, they gave the notion of Banach type contraction for non-self-mapping and also proved the existence of PPF dependent fixed point theorems in the Razumikhin class for Banach type contractions (see [17]). The PPF dependent fixed point theorems are useful for proving the solutions of nonlinear functional differential and integral equations which may depend upon the past history, present data, and future

consideration (see [9]). On the other hand, Samet et al. [22] introduced the concept of α -admissible self-mappings and proved fixed point results for α -admissible contractive mappings in complete metric spaces and provided application of the obtained results to ordinary differential equations. More recently, Salimi et al. [24] modified the notions of α - ψ -contractive and α -admissible mappings and established fixed point theorems to generalize the results in [22]. In this paper, we introduce the concept of an α_c -admissible non-self-mapping with respect to η_c and establish the existence of PPF dependent fixed and coincidence point theorems for $\alpha_c\eta_c$ - ψ -contractive non-self-mappings in the Razumikhin class. As applications of our PPF dependent fixed point and coincidence point theorems, we derive some new fixed and coincidence point results for ψ -contractions whenever the range space is endowed with a graph or with a partial order. The obtained results generalize, extend, and modify some PPF dependent fixed results in the literature. Several interesting consequences of our theorems are also provided.

Throughout this paper, we assume that $(E, \|\cdot\|_E)$ is a Banach space, I denotes a closed interval $[a, b]$ in $\mathbb{R}$, and

$E_0 = C(I, E)$ denotes the set of all continuous E -valued functions on I equipped with the supremum norm $\|\cdot\|_{E_0}$ defined by

$$\|\phi\|_{E_0} = \sup_{t \in I} \|\phi(t)\|_E. \quad (1)$$

For a fixed element $c \in I$, the Razumikhin or minimal class of functions in E_0 is defined by

$$\mathcal{R}_c = \{\phi \in E_0 : \|\phi\|_{E_0} = \|\phi(c)\|_E\}. \quad (2)$$

Clearly, every constant function from I to E belongs to $\mathcal{R}_c$.

Definition 1. Let $\mathcal{R}_c$ be the Razumikhin class, then

- (i) the class $\mathcal{R}_c$ is algebraically closed with respect to difference, if $\phi - \xi \in \mathcal{R}_c$ whenever $\phi, \xi \in \mathcal{R}_c$;
- (ii) the class $\mathcal{R}_c$ is topologically closed if it is closed with respect to the topology on E_0 generated by the norm $\|\cdot\|_{E_0}$.

Definition 2 (see [5]). A mapping $\phi \in E_0$ is said to be a PPF dependent fixed point or a fixed point with PPF dependence of mapping $T : E_0 \rightarrow E$ if $T\phi = \phi(c)$ for some $c \in I$.

Definition 3 (see [17]). Let $S : E_0 \rightarrow E_0$ and let $T : E_0 \rightarrow E$. A point $\phi \in E_0$ is said to be a PPF dependent coincidence point or a coincidence point with PPF dependence of S and T if $T\phi = (S\phi)(c)$ for some $c \in I$.

Definition 4 (see [5]). The mapping $T : E_0 \rightarrow E$ is called a Banach type contraction if there exists $k \in [0, 1)$ such that

$$\|T\phi - T\xi\|_E \leq k\|\phi - \xi\|_{E_0}, \quad (3)$$

for all $\phi, \xi \in E_0$.

Samet et al. [22] defined the notion of α -admissible mappings as follows.

Definition 5. Let T be a self-mapping on X and let $\alpha : X \times X \rightarrow [0, +\infty)$ be a function. We say that T is an α -admissible mapping if

$$x, y \in X, \quad \alpha(x, y) \geq 1 \implies \alpha(Tx, Ty) \geq 1. \quad (4)$$

In [22] the authors considered the family Ψ of nondecreasing functions $\psi : [0, +\infty) \rightarrow [0, +\infty)$ such that $\sum_{n=1}^{+\infty} \psi^n(t) < +\infty$ for each $t > 0$, where ψ^n is the n th iterate of ψ .

Salimi et al. [24] modified and generalized the notions of α - ψ -contractive mappings and α -admissible mappings as follows.

Definition 6 (see [24]). Let T be a self-mapping on X and $\alpha, \eta : X \times X \rightarrow [0, +\infty)$ be two functions. We say that T is an α -admissible mapping with respect to η if

$$\alpha(x, y) \geq \eta(x, y) \implies \alpha(Tx, Ty) \geq \eta(Tx, Ty), \quad (5)$$

$$x, y \in X.$$

Note that if we take $\eta(x, y) = 1$, then this definition reduces to Definition 5. Also, if we take, $\alpha(x, y) = 1$, then we say that T is an η -subadmissible mapping.

The following result is a proper generalization of the above-mentioned results.

Theorem 7 (see [24]). Let (X, d) be a complete metric space and let T be an α -admissible mapping. Assume that

$$x, y \in X, \quad \alpha(x, y) \geq 1 \implies d(Tx, Ty) \leq \psi(M(x, y)), \quad (6)$$

where $\psi \in \Psi$ and

$$M(x, y) = \max \left\{ d(x, y), \frac{d(x, Tx) + d(y, Ty)}{2}, \frac{d(x, Ty) + d(y, Tx)}{2} \right\}. \quad (7)$$

Also, suppose that the following assertions hold:

- (i) there exists $x_0 \in X$ such that $\alpha(x_0, Tx_0) \geq 1$,
- (ii) either T is continuous or for any sequence $\{x_n\}$ in X with $\alpha(x_n, x_{n+1}) \geq 1$ for all $n \in \mathbb{N} \cup \{0\}$ and $x_n \rightarrow x$ as $n \rightarrow +\infty$, we have $\alpha(x_n, x) \geq 1$ for all $n \in \mathbb{N} \cup \{0\}$.

Then T has a fixed point.

For more details on modified α - ψ -contractive mappings and related fixed point results we refer the reader to [8, 13, 14, 25, 26].

2. PPF Dependent Fixed and Coincidence Point Results

First we define the notion of non-self α -admissible mapping with respect to η as follows.

Definition 8. Let $c \in I$ and let $T : E_0 \rightarrow E, \alpha, \eta : E \times E \rightarrow [0, +\infty)$. We say that T is an α_c -admissible non-self-mapping with respect to η_c if for $\phi, \xi \in E_0$,

$$\alpha(\phi(c), \xi(c)) \geq \eta(\phi(c), \xi(c)) \implies \alpha(T\phi, T\xi) \geq \eta(T\phi, T\xi). \quad (8)$$

Note that if we take $\eta(\phi(c), \xi(c)) = 1$, then we say T is an α_c -admissible non-self-mapping. Also, if we take $\alpha(\phi(c), \xi(c)) = 1$, then we say that T is an η_c -subadmissible non-self-mapping.

Example 9. Let $E = \mathbb{R}$ be a real Banach space with usual norm and let $I = [0, 1]$. Define $T : E_0 \rightarrow E$ by $T\phi = (1/2)\phi(1)$ for all $\phi \in E_0$ and $\alpha, \eta : E \times E \rightarrow [0, +\infty)$ by

$$\alpha(x, y) = \begin{cases} x^4 + y^8 + 1, & \text{if } x \geq y \\ \frac{1}{3}, & \text{otherwise,} \end{cases} \quad (9)$$

$\eta(x, y) = x^4 + 1/2$. Then, T is an α_1 -admissible mapping with respect to η_1 . In fact, if $\alpha(\phi(1), \xi(1)) \geq \eta(\phi(1), \xi(1))$, then $\phi(1) \geq \xi(1)$ and so, $(1/2)\phi(1) \geq (1/2)\xi(1)$. That is, $T\phi \geq T\xi$ which implies that $\alpha(T\phi, T\xi) \geq \eta(T\phi, T\xi)$.

Denote with Ψ the family of nondecreasing functions $\psi : [0, +\infty) \rightarrow [0, +\infty)$ such that $\sum_{n=1}^{\infty} \psi^n(t) < +\infty$ for all $t > 0$, where ψ^n is the n th iterate of ψ .

The following Remark is obvious.

Remark 10. If $\psi \in \Psi$, then $\psi(t) < t$ for all $t > 0$.

Definition 11. Let $T : E_0 \rightarrow E$, $\alpha, \eta : E \times E \rightarrow [0, \infty)$ be three mappings and $c \in I$. Then,

(i) T is an $\alpha_c \eta_c$ - ψ -contractive non-self-mapping if

$$\begin{aligned} \alpha(\phi(c), \xi(c)) &\geq \eta(\phi(c), T\phi) \\ \implies \|T\phi - T\xi\|_E &\leq \psi(M(\phi, \xi)), \end{aligned} \quad (10)$$

(ii) T is a modified α_c - ψ -contractive non-self-mapping if

$$\alpha(\phi(c), \xi(c)) \geq 1 \implies \|T\phi - T\xi\|_E \leq \psi(M(\phi, \xi)), \quad (11)$$

where $\psi \in \Psi$ and

$$\begin{aligned} M(\phi, \xi) &= \max \left\{ \|\phi - \xi\|_{E_0}, \frac{\|\phi(c) - T\phi\|_E + \|\xi(c) - T\xi\|_E}{2}, \right. \\ &\quad \left. \frac{\|\phi(c) - T\xi\|_E + \|\xi(c) - T\phi\|_E}{2} \right\}. \end{aligned} \quad (12)$$

The following theorem is our first main result in this section.

Theorem 12. Let $T : E_0 \rightarrow E$, $\alpha, \eta : E \times E \rightarrow [0, \infty)$ be three mappings that satisfy the following assertions:

- (i) there exists $c \in I$ such that $\mathcal{R}_c$ is topologically closed and algebraically closed with respect to difference;
- (ii) T is an α_c -admissible non-self-mapping with respect to η_c ;
- (iii) T is an $\alpha_c \eta_c$ - ψ -contractive non-self-mapping;
- (iv) if $\{\phi_n\}$ is a sequence in E_0 such that $\phi_n \rightarrow \phi$ as $n \rightarrow \infty$ and $\alpha(\phi_n(c), \phi_{n+1}(c)) \geq \eta(\phi_n(c), \phi_{n+1}(c))$ for all $n \in \mathbb{N} \cup \{0\}$, then $\alpha(\phi_n(c), \phi(c)) \geq \eta(\phi_n(c), T\phi_n)$ for all $n \in \mathbb{N} \cup \{0\}$;
- (v) there exists $\phi_0 \in \mathcal{R}_c$ such that $\alpha(\phi_0(c), T\phi_0) \geq \eta(\phi_0(c), T\phi_0)$.

Then, T has a PPF dependent fixed point.

Proof. Let, $\phi_0 \in \mathcal{R}_c$. Since $T\phi_0 \in E$, there exists $x_1 \in E$ such that $T\phi_0 = x_1$. Choose $\phi_1 \in \mathcal{R}_c$ such that,

$$x_1 = \phi_1(c). \quad (13)$$

By continuing this process, by induction, we can build a sequence $\{\phi_n\}$ in $\mathcal{R}_c \subseteq E_0$ such that

$$T\phi_{n-1} = \phi_n(c), \quad \forall n \in \mathbb{N}. \quad (14)$$

Since $\mathcal{R}_c$ is algebraically closed with respect to difference, it follows that

$$\|\phi_{n-1} - \phi_n\|_{E_0} = \|\phi_{n-1}(c) - \phi_n(c)\|_E, \quad \forall n \in \mathbb{N}. \quad (15)$$

If there exists $n_0 \in \mathbb{N}$ such that $\phi_{n_0}(c) = \phi_{n_0+1}(c) = T\phi_{n_0}$, then ϕ_{n_0} is a PPF dependent fixed point of T and we have nothing to prove. Hence we assume that $\phi_{n-1} \neq \phi_n$ for all $n \in \mathbb{N}$.

Since T is an α_c -admissible non-self-mapping with respect to η_c and

$$\begin{aligned} \alpha(\phi_0(c), \phi_1(c)) &= \alpha(\phi_0(c), T\phi_0) \\ &\geq \eta(\phi_0(c), T\phi_0) = \eta(\phi_0(c), \phi_1(c)), \end{aligned} \quad (16)$$

so,

$$\alpha(\phi_1(c), T\phi_1) \geq \eta(\phi_1(c), T\phi_1). \quad (17)$$

By continuing this process we get

$$\begin{aligned} \alpha(\phi_{n-1}(c), \phi_n(c)) &= \alpha(\phi_{n-1}(c), T\phi_{n-1}) \\ &\geq \eta(\phi_{n-1}(c), T\phi_{n-1}), \end{aligned} \quad (18)$$

for all $n \in \mathbb{N}$. Then from (10) we get

$$\begin{aligned} \|\phi_n - \phi_{n+1}\|_{E_0} &= \|\phi_n(c) - \phi_{n+1}(c)\|_E \\ &= \|T\phi_{n-1} - T\phi_n\|_E \leq \psi(M(\phi_{n-1}, \phi_n)), \end{aligned} \quad (19)$$

where

$$\begin{aligned} M(\phi_{n-1}, \phi_n) &= \max \left\{ \|\phi_{n-1} - \phi_n\|_{E_0}, \right. \\ &\quad \frac{\|\phi_{n-1}(c) - T\phi_{n-1}\|_E + \|\phi_n(c) - T\phi_n\|_E}{2}, \\ &\quad \left. \frac{\|\phi_{n-1}(c) - T\phi_n\|_E + \|\phi_n(c) - T\phi_{n-1}\|_E}{2} \right\} \\ &= \max \left\{ \|\phi_{n-1} - \phi_n\|_{E_0}, \right. \\ &\quad \frac{\|\phi_{n-1}(c) - \phi_n(c)\|_E + \|\phi_n(c) - \phi_{n+1}(c)\|_E}{2}, \\ &\quad \left. \frac{\|\phi_{n-1}(c) - \phi_{n+1}(c)\|_E + \|\phi_n(c) - \phi_n(c)\|_E}{2} \right\} \end{aligned}$$

$$\begin{aligned}
&= \max \left\{ \|\phi_{n-1} - \phi_n\|_{E_0}, \right. \\
&\quad \frac{\|\phi_{n-1} - \phi_n\|_{E_0} + \|\phi_n - \phi_{n+1}\|_{E_0}}{2}, \\
&\quad \left. \frac{\|\phi_{n-1} - \phi_{n+1}\|_{E_0}}{2} \right\} \\
&\leq \max \left\{ \|\phi_{n-1} - \phi_n\|_{E_0}, \right. \\
&\quad \left. \frac{\|\phi_{n-1} - \phi_n\|_{E_0} + \|\phi_n - \phi_{n+1}\|_{E_0}}{2} \right\} \\
&\leq \max \{ \|\phi_{n-1} - \phi_n\|_{E_0}, \|\phi_n - \phi_{n+1}\|_{E_0} \}
\end{aligned} \tag{20}$$

which implies that

$$\begin{aligned}
&\|\phi_n - \phi_{n+1}\|_{E_0} \\
&\leq \psi \left(\max \{ \|\phi_{n-1} - \phi_n\|_{E_0}, \|\phi_n - \phi_{n+1}\|_{E_0} \} \right).
\end{aligned} \tag{21}$$

Now, if $\max\{\|\phi_{n-1} - \phi_n\|_{E_0}, \|\phi_n - \phi_{n+1}\|_{E_0}\} = \|\phi_n - \phi_{n+1}\|_{E_0}$, then

$$\|\phi_n - \phi_{n+1}\|_{E_0} \leq \psi \left(\|\phi_n - \phi_{n+1}\|_{E_0} \right) < \|\phi_n - \phi_{n+1}\|_{E_0} \tag{22}$$

which is a contradiction. Hence,

$$\|\phi_n - \phi_{n+1}\|_{E_0} \leq \psi \left(\|\phi_{n-1} - \phi_n\|_{E_0} \right), \tag{23}$$

for all $n \in \mathbb{N}$. So,

$$\|\phi_n - \phi_{n+1}\|_{E_0} \leq \psi^n \left(\|\phi_0 - \phi_1\|_{E_0} \right), \tag{24}$$

for all $n \in \mathbb{N}$.

Fix $\epsilon > 0$, then there exists $N \in \mathbb{N}$ such that

$$\sum_{n \geq N} \psi^n \left(\|\phi_0 - \phi_1\|_{E_0} \right) < \epsilon \quad \forall n \in \mathbb{N}. \tag{25}$$

Let $m, n \in \mathbb{N}$ with $m > n \geq N$. By triangular inequality we get

$$\begin{aligned}
\|\phi_n - \phi_m\|_{E_0} &\leq \sum_{k=n}^{m-1} \|\phi_k - \phi_{k+1}\|_{E_0} \\
&\leq \sum_{n \geq N} \psi^n \left(\|\phi_0 - \phi_1\|_{E_0} \right) < \epsilon.
\end{aligned} \tag{26}$$

Consequently, $\lim_{m, n \rightarrow +\infty} \|\phi_n - \phi_m\|_{E_0} = 0$. Hence $\{\phi_n\}$ is a Cauchy sequence in $\mathcal{R}_c \subseteq E_0$. By the completeness of E_0 , $\{\phi_n\}$ converges to a point $\phi^* \in E_0$, that is, $\phi_n \rightarrow \phi^*$, as $n \rightarrow \infty$. Since $\mathcal{R}_c$ is topologically closed, we deduce that $\phi^* \in \mathcal{R}_c$.

From (iv) we have $\alpha(\phi_n(c), \phi(c)) \geq \eta(\phi_n(c), T\phi_n)$ for all $n \in \mathbb{N} \cup \{0\}$. By (10) we have

$$\begin{aligned}
&\|T\phi^* - \phi^*(c)\|_E \\
&\leq \|T\phi^* - T\phi_n\|_E + \|T\phi_n - \phi^*(c)\|_E \\
&= \|T\phi^* - T\phi_n\|_E + \|\phi_{n+1}(c) - \phi^*(c)\|_E \\
&\leq \psi(M(\phi^*, \phi_n)) + \|\phi_{n+1} - \phi^*\|_{E_0} \\
&< M(\phi^*, \phi_n) + \|\phi_{n+1} - \phi^*\|_{E_0},
\end{aligned} \tag{27}$$

where

$$\begin{aligned}
&M(\phi^*, \phi_n) \\
&= \max \left\{ \|\phi^* - \phi_n\|_{E_0}, \right. \\
&\quad \frac{\|\phi^*(c) - T\phi^*\|_E + \|\phi_n(c) - T\phi_n\|_E}{2}, \\
&\quad \left. \frac{\|\phi^*(c) - T\phi_n\|_E + \|\phi_n(c) - T\phi^*\|_E}{2} \right\} \\
&= \max \left\{ \|\phi^* - \phi_n\|_{E_0}, \right. \\
&\quad \frac{\|\phi^*(c) - T\phi^*\|_E + \|\phi_n(c) - \phi_{n+1}(c)\|_E}{2}, \\
&\quad \left. \frac{\|\phi^*(c) - \phi_{n+1}(c)\|_E + \|\phi_n(c) - T\phi^*\|_E}{2} \right\}.
\end{aligned} \tag{28}$$

Taking limit as $n \rightarrow \infty$ in the above inequality we get

$$\|T\phi^* - \phi^*(c)\|_E \leq \frac{1}{2} \|T\phi^* - \phi^*(c)\|_E. \tag{29}$$

Therefore, $\|T\phi^* - \phi^*(c)\|_E = 0$. That is, $T\phi^* = \phi^*(c)$. This implies that ϕ^* is a PPF dependent fixed point of T in $\mathcal{R}_c$. $\square$

If in Theorem 12 we take $\eta(\phi, \xi) = 1$ for all $\phi, \xi \in E_0$, then we deduce the following corollary.

Corollary 13. Let $T : E_0 \rightarrow E$ and $\alpha : E \times E \rightarrow [0, \infty)$ be two mappings satisfy that the following assertions:

- (i) there exists $c \in I$ such that $\mathcal{R}_c$ is topologically closed and algebraically closed with respect to difference;
- (ii) T is an α_c -admissible non-self-mapping;
- (iii) T is a modified α_c - ψ -contractive non-self-mapping;
- (iv) if $\{\phi_n\}$ is a sequence in E_0 such that $\phi_n \rightarrow \phi$ as $n \rightarrow \infty$ and $\alpha(\phi_n(c), \phi_{n+1}(c)) \geq 1$ for all $n \in \mathbb{N} \cup \{0\}$, then $\alpha(\phi_n(c), \phi(c)) \geq 1$ for all $n \in \mathbb{N} \cup \{0\}$;
- (v) there exists $\phi_0 \in \mathcal{R}_c$ such that $\alpha(\phi_0(c), T\phi_0) \geq 1$.

Then, T has a PPF dependent fixed point.

We now introduce the notion of α_c -admissible mapping with respect to η_c for the pair of maps (S, T) as follows.

Definition 14. Let $c \in I$, $S : E_0 \rightarrow E_0$, $T : E_0 \rightarrow E$ and let $\alpha, \eta : E \times E \rightarrow [0, \infty)$. We say that the pair (S, T) is an α_c -admissible with respect to η_c , if for $\phi, \xi \in E_0$,

$$\begin{aligned} \alpha((S\phi)(c), (S\xi)(c)) &\geq \eta((S\phi)(c), (S\xi)(c)) \\ \implies \alpha(T\phi, T\xi) &\geq \eta(T\phi, T\xi). \end{aligned} \quad (30)$$

Note that if we take $\eta((S\phi)(c), (S\xi)(c)) = 1$, then we say that the pair (S, T) is an α_c -admissible mapping. Also, if we take $\alpha((S\phi)(c), (S\xi)(c)) = 1$, then we say that the pair (S, T) is an η_c -subadmissible mapping.

Now we introduce the notion of $\alpha_c\eta_c$ - ψ -contractiveness for the pair (S, T) as follows.

Definition 15. Let $c \in I$, $S : E_0 \rightarrow E_0$, $T : E_0 \rightarrow E$ and $\alpha, \eta : E \times E \rightarrow [0, \infty)$. Then,

(i) we say that the pair (S, T) is an $\alpha_c\eta_c$ - ψ -contractive if

$$\begin{aligned} \alpha((S\phi)(c), \xi(c)) &\geq \eta((S\phi)(c), T\phi) \\ \implies \|T\phi - T\xi\|_E &\leq \psi(N(\phi, \xi)); \end{aligned} \quad (31)$$

(ii) we say that the pair (S, T) is a modified α_c - ψ -contractive if

$$\alpha((S\phi)(c), \xi(c)) \geq 1 \implies \|T\phi - T\xi\|_E \leq \psi(N(\phi, \xi)), \quad (32)$$

where $\psi \in \Psi$ and

$$\begin{aligned} N(\phi, \xi) &= \max \left\{ \|S\phi - S\xi\|_{E_0}, \right. \\ &\quad \frac{\|(S\phi)(c) - T(S\phi)\|_E + \|(S\xi)(c) - T(S\xi)\|_E}{2}, \\ &\quad \left. \frac{\|(S\phi)(c) - T(S\xi)\|_E + \|(S\phi)(c) - T(S\xi)\|_E}{2} \right\}. \end{aligned} \quad (33)$$

Theorem 16. Let $S : E_0 \rightarrow E_0$, $T : E_0 \rightarrow E$, $\alpha, \eta : E \times E \rightarrow [0, \infty)$ be four mappings satisfying the following assertions:

- (i) there exists $c \in I$ such that $S(\mathcal{R}_c)$ is topologically closed and algebraically closed with respect to difference;
- (ii) the pair (S, T) is an α_c -admissible with respect to η_c ;
- (iii) the pair (S, T) is an $\alpha_c\eta_c$ - ψ -contractive;
- (iv) if $\{S\phi_n\}$ is a sequence in E_0 such that $S\phi_n \rightarrow S\phi$ as $n \rightarrow \infty$ and $\alpha((S\phi_n)(c), (S\phi_{n+1})(c)) \geq \eta((S\phi_n)(c), (S\phi_{n+1})(c))$ for all $n \in \mathbb{N} \cup \{0\}$, then $\alpha((S\phi_n)(c), S\phi(c)) \geq \eta((S\phi_n)(c), T\phi_n)$ for all $n \in \mathbb{N} \cup \{0\}$;
- (v) there exists $S\phi_0 \in S(\mathcal{R}_c)$ such that $\alpha(S\phi_0(c), T\phi_0) \geq \eta(S\phi_0(c), T\phi_0)$.

Then, S and T have a PPF dependent coincidence point.

Proof. As $S : E_0 \rightarrow E_0$, so there exists $F_0 \subseteq E_0$ such that $S(F_0) = S(E_0)$ and $S|_{F_0}$ is one-to-one. Since $T(F_0) \subseteq T(E_0) \subseteq E$, we can define the mapping $\mathcal{A} : S(F_0) \rightarrow E$ by $\mathcal{A}(S\phi) = T\phi$ for all $\phi \in F_0$. Since $S|_{F_0}$ is one-to-one, then $\mathcal{A}$ is well defined. Let

$$\begin{aligned} \alpha((S\phi)(c), (S\xi)(c)) &\geq \eta((S\phi)(c), T\phi), \quad \text{then} \\ \alpha((S\phi)(c), (S\xi)(c)) &\geq \eta((S\phi)(c), \mathcal{A}(S\phi)). \end{aligned} \quad (34)$$

Therefore, by (31) we have

$$\|\mathcal{A}(S\phi) - \mathcal{A}(S\xi)\|_E \leq \psi(N(\phi, \xi)), \quad (35)$$

where

$$\begin{aligned} N(\phi, \xi) &= \max \left\{ \|S\phi - S\xi\|_{E_0}, \right. \\ &\quad \frac{\|(S\phi)(c) - \mathcal{A}(S\phi)\|_E + \|(S\xi)(c) - \mathcal{A}(S\xi)\|_E}{2}, \\ &\quad \left. \frac{\|(S\phi)(c) - \mathcal{A}(S\xi)\|_E + \|(S\xi)(c) - \mathcal{A}(S\phi)\|_E}{2} \right\}. \end{aligned} \quad (36)$$

This shows that $\mathcal{A}$ is an $\alpha_c\eta_c$ - ψ -contractive non-self-mapping. Further, all other conditions of Theorem 12 hold true for $\mathcal{A}$. Thus, there exists PPF dependent fixed point $\varphi \in S(F_0)$ of $\mathcal{A}$; that is, $\mathcal{A}\varphi = \varphi(c)$. Since $\varphi \in S(F_0)$, so there exists $\omega \in F_0$ such that $S\omega = \varphi$. Thus,

$$T\omega = \mathcal{A}(S\omega) = \mathcal{A}\varphi = \varphi(c) = (S\omega)(c). \quad (37)$$

That is, ω is a PPF dependent coincidence point of S and T . $\square$

Corollary 17. Let $S : E_0 \rightarrow E_0$, $T : E_0 \rightarrow E$, $\alpha : E \times E \rightarrow [0, \infty)$ be three mappings satisfying the following assertions:

- (i) there exists $c \in I$ such that $S(\mathcal{R}_c)$ is topologically closed and algebraically closed with respect to difference;
- (ii) the pair (S, T) is an α_c -admissible;
- (iii) the pair (S, T) is a modified α_c - ψ -contractive;
- (iv) if $\{S\phi_n\}$ is a sequence in E_0 such that $S\phi_n \rightarrow S\phi$ as $n \rightarrow \infty$ and $\alpha((S\phi_n)(c), (S\phi_{n+1})(c)) \geq 1$ for all $n \in \mathbb{N} \cup \{0\}$, then $\alpha((S\phi_n)(c), S\phi(c)) \geq 1$ for all $n \in \mathbb{N} \cup \{0\}$;
- (v) there exists $S\phi_0 \in S(\mathcal{R}_c)$ such that $\alpha(S\phi_0(c), T\phi_0) \geq 1$.

Then, S and T have a PPF dependent coincidence point.

3. Some Results in Banach Spaces Endowed with a Graph

Consistent with Jachymski [15], let (E, d) be a metric space where $d(x, y) = \|x - y\|_E$ for all $x, y \in E$ and Δ denotes the diagonal of the Cartesian product of $X \times X$. Consider a directed graph G such that the set $V(G)$ of its vertices

coincides with X , and the set $E(G)$ of its edges contains all loops; that is, $E(G) \supseteq \Delta$. We assume that G has no parallel edges, so we can identify G with the pair $(V(G), E(G))$. Moreover, we may treat G as a weighted graph (see [16, page 309]) by assigning to each edge the distance between its vertices. If x and y are vertices in a graph G , then a path in G from x to y of length N ($N \in \mathbb{N}$) is a sequence $\{x_i\}_{i=0}^N$ of $N+1$ vertices such that $x_0 = x$, $x_N = y$ and $(x_{i-1}, x_i) \in E(G)$ for $i = 1, \dots, N$. A graph G is connected if there is a path between any two vertices. G is weakly connected if $\tilde{G}$ is connected (see for more details [6, 11, 15]).

Definition 18 (see [15]). Let (X, d) be a metric space endowed with a graph G . We say that a self-mapping $T : X \rightarrow X$ is a Banach G -contraction or simply a G -contraction if T preserves the edges of G ; that is,

$$\forall x, y \in X, \quad (x, y) \in E(G) \implies (Tx, Ty) \in E(G) \quad (38)$$

and T decreases weights of the edges of G in the following way:

$$\begin{aligned} \exists \alpha \in (0, 1) \text{ such that } \forall x, y \in X, \\ (x, y) \in E(G) \implies d(Tx, Ty) \leq \alpha d(x, y). \end{aligned} \quad (39)$$

Theorem 19. Let $T : E_0 \rightarrow E$ and E endowed with a graph G . Suppose that the following assertions hold true:

- (i) there exists $c \in I$ such that $\mathcal{R}_c$ is topologically closed and algebraically closed with respect to difference;
- (ii) if $(\phi(c), \xi(c)) \in E(G)$, then $(T\phi, T\xi) \in E(G)$;
- (iii) assume that

$$(\phi(c), \xi(c)) \in E(G) \implies \|T\phi - T\xi\|_E \leq \psi(M(\phi, \xi)), \quad (40)$$

$$\phi, \xi \in E_0, \quad \text{where } \psi \in \Psi;$$

- (iv) if $\{\phi_n\}$ is a sequence in E_0 such that $\phi_n \rightarrow \phi$ as $n \rightarrow \infty$ and $(\phi_n(c), \phi_{n+1}(c)) \in E(G)$ for all $n \in \mathbb{N} \cup \{0\}$, then $(\phi_n(c), \phi(c)) \in E(G)$ for all $n \in \mathbb{N} \cup \{0\}$;
- (v) there exists $\phi_0 \in \mathcal{R}_c$ such that $(\phi_0(c), T\phi_0) \in E(G)$.

Then, T has a PPF dependent fixed point.

Proof. Define $\alpha : E \times E \rightarrow [0, +\infty)$ by

$$\alpha(x, y) = \begin{cases} 1, & \text{if } (x, y) \in E(G) \\ \frac{1}{2} & \text{otherwise.} \end{cases} \quad (41)$$

First, we prove that T is an α_c -admissible non-self-mapping. Assume that $\alpha(\phi(c), \xi(c)) \geq 1$. Then, we have $(\phi(c), \xi(c)) \in E(G)$. From (ii), we have $(T\phi, T\xi) \in E(G)$; that is, $\alpha(T\phi, T\xi) \geq 1$. Thus T is an α_c -admissible non-self-mapping. From (v) there exists $\phi_0 \in \mathcal{R}_c$ such that $\alpha(\phi_0(c), T\phi_0) \geq 1$. Let, $\{\phi_n\}$ be a sequence in E_0 such that $\phi_n \rightarrow \phi$ as $n \rightarrow \infty$ and $(\phi_n(c), \phi_{n+1}(c)) \in E(G)$ for all $n \in \mathbb{N} \cup \{0\}$. Then, $\alpha(\phi_n(c), \phi_{n+1}(c)) \geq 1$ for all $n \in \mathbb{N} \cup \{0\}$. Thus, from (iv) we get, $(\phi_n(c), \phi) \in E(G)$ for all $n \in \mathbb{N} \cup \{0\}$. That is, $\alpha(\phi_n(c), \phi) \geq 1$ for all $n \in \mathbb{N} \cup \{0\}$. Therefore all conditions of Corollary 13 hold true and T has a PPF dependent fixed point. $\square$

Similarly as an application of Corollary 17, we can prove the following Theorem.

Theorem 20. Let $c \in I$, $S : E_0 \rightarrow E_0$, $T : E_0 \rightarrow E$ and E endowed with a graph G . Suppose that the following assertions hold true:

- (i) there exists $c \in I$ such that $S(\mathcal{R}_c)$ is topologically closed and algebraically closed with respect to difference;
- (ii) if $((S\phi)(c), (S\xi)(c)) \in E(G)$, then $(T\phi, T\xi) \in E(G)$;
- (iii) assume that

$$((S\phi)(c), (S\xi)(c)) \in E(G) \implies \|T\phi - T\xi\|_E \leq \psi(N(\phi, \xi)) \quad (42)$$

for $\phi, \xi \in E_0$, where $\psi \in \Psi$;

- (iv) if $\{S\phi_n\}$ is a sequence in E_0 such that $S\phi_n \rightarrow S\phi$ as $n \rightarrow \infty$ and $((S\phi_n)(c), (S\phi_{n+1})(c)) \in E(G)$ for all $n \in \mathbb{N} \cup \{0\}$, then $((S\phi_n)(c), S\phi(c)) \in E(G)$ for all $n \in \mathbb{N} \cup \{0\}$;
- (v) there exists $S\phi_0 \in S(\mathcal{R}_c)$ such that $(S\phi_0(c), T\phi_0) \in E(G)$.

Then, S and T have a PPF dependent coincidence point.

The study of existence of fixed points in partially ordered sets has been initiated by Ran and Reurings [27] with applications to matrix equations. Agarwal et al. [1, 2], Ćirić et al. [7], and Hussain et al. [11, 12] presented some new results for nonlinear contractions in partially ordered Banach and metric spaces with applications. Here as an application of our results we deduce some new PPF dependent fixed and coincidence point results whenever the range space is endowed with a partial order.

Definition 21. Let $c \in I$, $T : E_0 \rightarrow E$ and E endowed with a partial order $\leq$. We say that T is a c -increasing non-self-mapping if for $\phi, \xi \in E_0$ with $\phi(c) \leq \xi(c)$ we have $T\phi \leq T\xi$.

Definition 22. Let $c \in I$, $S : E_0 \rightarrow E_0$, $T : E_0 \rightarrow E$ and E endowed with a partial order $\leq$. We say that the pair (S, T) is c -increasing if for $\phi, \xi \in E_0$ with $(S\phi)(c) \leq (S\xi)(c)$ we have $T\phi \leq T\xi$.

Theorem 23. Let $T : E_0 \rightarrow E$ and E endowed with a partial order $\leq$. Suppose that the following assertions holds true:

- (i) there exists $c \in I$ such that $\mathcal{R}_c$ is topologically closed and algebraically closed with respect to difference;
- (ii) T is a c -increasing non-self-mapping;
- (iii) Assume that

$$\|T\phi - T\xi\|_E \leq \psi(M(\phi, \xi)) \quad (43)$$

holds for all $\phi, \xi \in E_0$ with $\phi(c) \leq \xi(c)$ where $\psi \in \Psi$;

- (iv) if $\{\phi_n\}$ is a sequence in E_0 such that $\phi_n \rightarrow \phi$ as $n \rightarrow \infty$ and $\phi_n(c) \leq \phi_{n+1}(c)$ for all $n \in \mathbb{N} \cup \{0\}$, then $\phi_n(c) \leq \phi(c)$ for all $n \in \mathbb{N} \cup \{0\}$;
- (v) there exists $\phi_0 \in \mathcal{R}_c$ such that $\phi_0(c) \leq T\phi_0$.

Then, T has a PPF dependent fixed point.

Proof. Define $\alpha : E \times E \rightarrow [0, +\infty)$ by

$$\alpha(x, y) = \begin{cases} 1, & \text{if } x \leq y \\ \frac{1}{2} & \text{otherwise.} \end{cases} \quad (44)$$

First, we prove that T is an α_c -admissible non-self-mapping. Assume that $\alpha(\phi(c), \xi(c)) \geq 1$. Then, we have $\phi(c) \leq \xi(c)$. Since T is c -increasing, we get $T\phi \leq T\xi$; that is, $\alpha(T\phi, T\xi) \geq 1$. Thus T is an α_c -admissible non-self-mapping. From (v) there exists $\phi_0 \in \mathcal{R}_c$ such that $\phi_0(c) \leq T\phi_0$. That is, $\alpha(\phi_0(c), T\phi_0) \geq 1$. Let $\{\phi_n\}$ be a sequence in E_0 such that $\phi_n \rightarrow \phi$ as $n \rightarrow \infty$ and $\alpha(\phi_n(c), \phi_{n+1}(c)) \geq 1$ for all $n \in \mathbb{N} \cup \{0\}$. Then, $\phi_n(c) \leq \phi_{n+1}(c)$ for all $n \in \mathbb{N} \cup \{0\}$. Thus, from (iv) we get $\phi_n(c) \leq \phi(c)$ for all $n \in \mathbb{N} \cup \{0\}$. That is, $\alpha(\phi_n(c), \phi(c)) \geq 1$ for all $n \in \mathbb{N} \cup \{0\}$. Therefore all conditions of Corollary 13 hold true and T has a PPF dependent fixed point. $\square$

Similarly we can prove following Theorem.

Theorem 24. Let $c \in I$, $S : E_0 \rightarrow E_0$, $T : E_0 \rightarrow E$ and E endowed with a partial order $\leq$. Suppose that the following assertions hold true:

- (i) there exists $c \in I$ such that $S(\mathcal{R}_c)$ is topologically closed and algebraically closed with respect to difference;
- (ii) the pair (S, T) is a c -increasing mapping;
- (iii) assume that

$$\|T\phi - T\xi\|_E \leq \psi(N(\phi, \xi)) \quad (45)$$

holds for all $\phi, \xi \in E_0$ with $(S\phi)(c) \leq (S\xi)(c)$, where $\psi \in \Psi$;

- (iv) if $\{\phi_n\}$ is a sequence in E_0 such that $S\phi_n \rightarrow S\phi$ as $n \rightarrow \infty$ and $(S\phi_n)(c) \leq (S\phi_{n+1})(c)$ for all $n \in \mathbb{N} \cup \{0\}$, then $(S\phi_n)(c) \leq S\phi(c)$ for all $n \in \mathbb{N} \cup \{0\}$;
- (v) there exists $S\phi_0 \in S(\mathcal{R}_c)$ such that $S\phi_0(c) \leq T\phi_0$.

Then, S and T have a PPF dependent coincidence point.

4. Further Consequences

4.1. Consequences of Corollary 13

Theorem 25. Let $T : E_0 \rightarrow E$ and $\alpha : E \times E \rightarrow [0, \infty)$ be two mappings that satisfy the following assertions:

- (i) there exists $c \in I$ such that $\mathcal{R}_c$ is topologically closed and algebraically closed with respect to difference;
- (ii) T is an α_c -admissible mapping;
- (iii) assume that

$$\alpha(\phi(c), \xi(c)) \|T\phi - T\xi\|_E \leq \psi(M(\phi, \xi)) \quad (46)$$

holds for all $\phi, \xi \in E_0$, where $\psi \in \Psi$;

- (iv) if $\{\phi_n\}$ is a sequence in E_0 such that $\phi_n \rightarrow \phi$ as $n \rightarrow \infty$ and $\alpha(\phi_n(c), \phi_{n+1}(c)) \geq 1$ for all $n \in \mathbb{N} \cup \{0\}$, then $\alpha(\phi_n(c), \phi(c)) \geq 1$ for all $n \in \mathbb{N} \cup \{0\}$;
- (v) there exists $\phi_0 \in \mathcal{R}_c$ such that $\alpha(\phi_0(c), T\phi_0) \geq 1$.

Then, T has a PPF dependent fixed point.

Proof. Let $\alpha(\phi(c), \xi(c)) \geq 1$. Hence, from (iii) we have

$$\|T\phi - T\xi\|_E \leq \alpha(\phi(c), \xi(c)) \|T\phi - T\xi\|_E \leq \psi(M(\phi, \xi)). \quad (47)$$

That is, all conditions of Corollary 13 are satisfied and T has a PPF dependent fixed point. $\square$

Similarly we can prove the following results.

Theorem 26. Let $T : E_0 \rightarrow E$ and $\alpha : E \times E \rightarrow [0, \infty)$ be two mappings that satisfy the following assertions:

- (i) there exists $c \in I$ such that $\mathcal{R}_c$ is topologically closed and algebraically closed with respect to difference;
- (ii) T is an α_c -admissible mapping;
- (iii) assume that

$$(\|T\phi - T\xi\|_E + \epsilon)^{\alpha(\phi(c), \xi(c))} \leq \psi(M(\phi, \xi)) + \epsilon \quad (48)$$

holds for all $\phi, \xi \in E_0$, where $\epsilon \geq 1$ and $\psi \in \Psi$;

- (iv) if $\{\phi_n\}$ is a sequence in E_0 such that $\phi_n \rightarrow \phi$ as $n \rightarrow \infty$ and $\alpha(\phi_n(c), \phi_{n+1}(c)) \geq 1$ for all $n \in \mathbb{N} \cup \{0\}$, then $\alpha(\phi_n(c), \phi(c)) \geq 1$ for all $n \in \mathbb{N} \cup \{0\}$;
- (v) there exists $\phi_0 \in \mathcal{R}_c$ such that $\alpha(\phi_0(c), T\phi_0) \geq 1$.

Then, T has a PPF dependent fixed point.

Theorem 27. Let $T : E_0 \rightarrow E$ and $\alpha : E \times E \rightarrow [0, \infty)$ be two mappings that satisfy the following assertions:

- (i) there exists $c \in I$ such that $\mathcal{R}_c$ is topologically closed and algebraically closed with respect to difference;
- (ii) T is an α_c -admissible mapping;
- (iii) assume that

$$(\alpha(\phi(c), \xi(c)) - 1 + \epsilon')^{\|T\phi - T\xi\|_E} \leq \epsilon^{\psi(M(\phi, \xi))} \quad (49)$$

holds for all $\phi, \xi \in E_0$, where $1 < \epsilon \leq \epsilon'$ and $\psi \in \Psi$;

- (iv) if $\{\phi_n\}$ is a sequence in E_0 such that $\phi_n \rightarrow \phi$ as $n \rightarrow \infty$ and $\alpha(\phi_n(c), \phi_{n+1}(c)) \geq 1$ for all $n \in \mathbb{N} \cup \{0\}$, then $\alpha(\phi_n(c), \phi(c)) \geq 1$ for all $n \in \mathbb{N} \cup \{0\}$;
- (v) there exists $\phi_0 \in \mathcal{R}_c$ such that $\alpha(\phi_0(c), T\phi_0) \geq 1$.

Then, T has a PPF dependent fixed point.

4.2. Consequences of Corollary 17

Theorem 28. Let $S : E_0 \rightarrow E_0$, $T : E_0 \rightarrow E$ and $\alpha : E \times E \rightarrow [0, \infty)$ be three mappings that satisfy the following assertions:

- (i) there exists $c \in I$ such that $S(\mathcal{R}_c)$ is topologically closed and algebraically closed with respect to difference;
- (ii) the pair (S, T) is an α_c -admissible;
- (iii) assume that

$$\alpha((S\phi)(c), (S\xi)(c)) \|T\phi - T\xi\|_E \leq \psi(N(\phi, \xi)) \quad (50)$$

holds for all $\phi, \xi \in E_0$, where $\psi \in \Psi$;

- (iv) if $\{S\phi_n\}$ is a sequence in E_0 such that $S\phi_n \rightarrow S\phi$ as $n \rightarrow \infty$ and $\alpha((S\phi_n)(c), (S\phi_{n+1})(c)) \geq 1$ for all $n \in \mathbb{N} \cup \{0\}$, then $\alpha((S\phi_n)(c), S\phi(c)) \geq 1$ for all $n \in \mathbb{N} \cup \{0\}$;
- (v) there exists $S\phi_0 \in S(\mathcal{R}_c)$ such that $\alpha(S\phi_0(c), T\phi_0) \geq 1$.

Then, S and T have a PPF dependent coincidence point.

Theorem 29. Let $S : E_0 \rightarrow E_0$, $T : E_0 \rightarrow E$ and $\alpha : E \times E \rightarrow [0, \infty)$ be three mappings that satisfy the following assertions:

- (i) there exists $c \in I$ such that $S(\mathcal{R}_c)$ is topologically closed and algebraically closed with respect to difference;
- (ii) the pair (S, T) is an α_c -admissible;
- (iii) assume that

$$(\|T\phi - T\xi\|_E + \epsilon)^{\alpha((S\phi)(c), (S\xi)(c))} \leq \psi(N(\phi, \xi)) + \epsilon \quad (51)$$

holds for all $\phi, \xi \in E_0$, where $\epsilon \geq 1$ and $\psi \in \Psi$;

- (iv) if $\{S\phi_n\}$ is a sequence in E_0 such that $S\phi_n \rightarrow S\phi$ as $n \rightarrow \infty$ and $\alpha((S\phi_n)(c), (S\phi_{n+1})(c)) \geq 1$ for all $n \in \mathbb{N} \cup \{0\}$, then $\alpha((S\phi_n)(c), S\phi(c)) \geq 1$ for all $n \in \mathbb{N} \cup \{0\}$;
- (v) there exists $S\phi_0 \in S(\mathcal{R}_c)$ such that $\alpha(S\phi_0(c), T\phi_0) \geq 1$.

Then, S and T have a PPF dependent coincidence point.

Theorem 30. Let $S : E_0 \rightarrow E_0$, $T : E_0 \rightarrow E$ and $\alpha : E \times E \rightarrow [0, \infty)$ be three mappings that satisfy the following assertions:

- (i) there exists $c \in I$ such that $S(\mathcal{R}_c)$ is topologically closed and algebraically closed with respect to difference;
- (ii) the pair (S, T) is an α_c -admissible;
- (iii) assume that

$$(\alpha((S\phi)(c), (S\xi)(c)) - 1 + \epsilon')^{\|T\phi - T\xi\|_E} \leq \epsilon^{\psi(N(\phi, \xi))} \quad (52)$$

holds for all $\phi, \xi \in E_0$, where $1 < \epsilon \leq \epsilon'$ and $\psi \in \Psi$;

- (iv) if $\{S\phi_n\}$ is a sequence in E_0 such that $S\phi_n \rightarrow S\phi$ as $n \rightarrow \infty$ and $\alpha((S\phi_n)(c), (S\phi_{n+1})(c)) \geq 1$ for all $n \in \mathbb{N} \cup \{0\}$, then $\alpha((S\phi_n)(c), S\phi(c)) \geq 1$ for all $n \in \mathbb{N} \cup \{0\}$;
- (v) there exists $S\phi_0 \in S(\mathcal{R}_c)$ such that $\alpha(S\phi_0(c), T\phi_0) \geq 1$.

Then, S and T have a PPF dependent coincidence point.

Conflict of Interests

The authors declare that there is no conflict of interests regarding the publication of this paper.
