We introduce and analyze hybrid implicit and explicit extragradient methods for finding a zero of an accretive operator and solving a general system of variational inequalities and a fixed point problem of an infinite family of nonexpansive self-mappings in a uniformly convex Banach space X which has a uniformly Gateaux differentiable norm. We establish some strong convergence theorems for hybrid implicit and explicit extra-gradient algorithms under suitable assumptions. Furthermore, we derive the strong convergence of hybrid implicit and explicit extragradient algorithms for finding a common element of the set of zeros of an accretive operator and the common fixed point set of an infinite family of nonexpansive self-mappings and a self-mapping whose complement is strictly pseudocontractive and strongly accretive in X . The results presented in this paper improve, extend, supplement, and develop the corresponding results announced in the earlier and very recent literature.

1. Introduction

Let X be a real Banach space whose dual space is denoted by X^* . Let $U = \{x \in X : \|x\| = 1\}$ denote the unite sphere of X . A Banach space X is said to be uniformly convex if, for each $\epsilon \in (0, 2]$, there exists $\delta > 0$ such that for all $x, y \in U$,

$$\|x - y\| \geq \epsilon \implies \frac{\|x + y\|}{2} \leq 1 - \delta. \quad (1)$$

It is known that a uniformly convex Banach space is reflexive and strict convex. The normalized duality mapping $J : X \rightarrow 2^{X^*}$ is defined by

$$J(x) = \{x^* \in X^* : \langle x, x^* \rangle = \|x\|^2 = \|x^*\|^2\}, \quad \forall x \in X, \quad (2)$$

where $\langle \cdot, \cdot \rangle$ denotes the generalized duality pairing. It is an immediate consequence of the Hahn-Banach theorem that $J(x)$ is nonempty for each $x \in X$. Moreover, it is known

that J is single-valued if and only if X is smooth, whereas if X is uniformly smooth, then J is norm-to-norm uniformly continuous on bounded subsets of X . If X has a uniformly Gateaux differentiable norm, then the duality mapping J is norm-to-weak* uniformly continuous on bounded subsets of X ; see for example [1].

Let C be a nonempty closed convex subset of a real Banach space X . A mapping $T : C \rightarrow C$ is called nonexpansive if

$$\|Tx - Ty\| \leq \|x - y\|, \quad \forall x, y \in C. \quad (3)$$

The set of fixed points of T is denoted by $\text{Fix}(T)$. We use the notation $\rightharpoonup$ to indicate the weak convergence and $\rightarrow$ to indicate the strong convergence.

Recall that (possibly multivalued) operator $A \subset E \times E$ with domain $D(A)$ and range $R(A)$ in E is accretive if, for each $x_i \in D(A)$ and $y_i \in Ax_i$ ($i = 1, 2$), there exists a $j(x_1 - x_2) \in J(x_1 - x_2)$ such that $\langle y_1 - y_2, (x_1 - x_2) \rangle \geq 0$ (here J is the duality mapping). An accretive operator A is said to satisfy the range condition if $\overline{D(A)} \subset R(I + rA)$ for all $r > 0$. An accretive

operator A is m -accretive if $R(I + rA) = E$ for each $r > 0$. If A is an accretive operator which satisfies the range condition, then we can define, for each $r > 0$, a mapping $J_r : R(I + rA) \rightarrow D(A)$ defined by $J_r = (I + rA)^{-1}$, which is called the resolvent of A . We know that J_r is nonexpansive and $\text{Fix}(J_r) = A^{-1}0$ for all $r > 0$. Hence

$$\text{Fix}(J_r) = A^{-1}0 = \{z \in D(A) : 0 \in Az\}. \quad (4)$$

If $A^{-1}0 \neq \emptyset$, then the inclusion $0 \in Az$ is solvable.

The following resolvent identity is well known to us; see [2], where more details on accretive operators can be found.

Proposition 1 (resolvent identity). *For $\lambda > 0, \mu > 0$, and $x \in X$,*

$$J_\lambda x = J_\mu \left(\frac{\mu}{\lambda} x + \left(1 - \frac{\mu}{\lambda}\right) J_\lambda x \right). \quad (5)$$

Recently, Aoyama et al. [3] studied the following iterative scheme in a uniformly convex Banach space having a uniformly Gateaux differentiable norm: for resolvents J_{r_n} of an accretive operator A such that $A^{-1}0 \neq \emptyset$ and $\overline{D(A)} \subset C \subset \bigcap_{r>0} R(I + rA)$ and $\{\alpha_n\} \subset (0, 1)$,

$$x_0 = x \in C, \quad (6)$$

$$x_{n+1} = \alpha_n x + (1 - \alpha_n) J_{r_n} x_n.$$

They proved that the sequence $\{x_n\}$ generated by (6) converges strongly to a zero of A under appropriate assumptions on $\{\alpha_n\}$ and $\{r_n\}$. Subsequently, Ceng et al. [4] introduced and analyzed the following composite iterative scheme in either a uniformly smooth Banach space or a reflexive Banach space having a weakly sequentially continuous duality mapping,

$$x_0 = x \in E, \quad (7)$$

$$y_n = \alpha_n u + (1 - \alpha_n) J_{r_n} x_n,$$

$$x_{n+1} = (1 - \beta_n) y_n + \beta_n J_{r_n} y_n,$$

where $u \in \overline{D(A)}$ is an arbitrary (but fixed) element, under the following control conditions:

(H1) $\lim_{n \rightarrow \infty} \alpha_n = 0$;

(H2) $\sum_{n=0}^{\infty} \alpha_n = \infty$, or, equivalently, $\prod_{n=0}^{\infty} (1 - \alpha_n) = 0$;

(H3) $\sum_{n=1}^{\infty} |\alpha_n - \alpha_{n-1}| < \infty$;

(H4) $r_n \geq \varepsilon$, for all $n \geq 0$, for some $\varepsilon > 0$ and $\sum_{n=1}^{\infty} |r_n - r_{n-1}| < \infty$;

(H5) $\beta_n \in [0, a]$ for some $a \in (0, 1)$ and $\sum_{n=1}^{\infty} |\beta_n - \beta_{n-1}| < \infty$.

Furthermore, as the viscosity approximation method, Jung [5] purposed and analyzed the following composite iterative scheme for finding a zero of an accretive operator A : for resolvent J_{r_n} of an accretive operator A such that $A^{-1}0 \neq \emptyset$

and $\overline{D(A)} \subset C \subset \bigcap_{r>0} R(I + rA)$, $f \in \Xi_C$ (Ξ_C denotes the set of all contractions on C) and $\{\alpha_n\}, \{\beta_n\} \subset (0, 1)$,

$$x_0 = x \in C,$$

$$y_n = \alpha_n f(x_n) + (1 - \alpha_n) J_{r_n} x_n, \quad (8)$$

$$x_{n+1} = (1 - \beta_n) y_n + \beta_n J_{r_n} y_n.$$

He established the strong convergence of the sequence $\{x_n\}$ generated by (8) to a zero of A under certain appropriate conditions.

Theorem 2 (see [5, Theorem 3.1]). *Let X be a strictly convex and reflexive Banach space having a uniformly Gateaux differentiable norm. Let C be a nonempty closed convex subset of X and $A \subset X \times X$ an accretive operator in X such that $A^{-1}0 \neq \emptyset$ and $\overline{D(A)} \subset C \subset \bigcap_{r>0} R(I + rA)$. Let $\{\alpha_n\}$ and $\{\beta_n\}$ be sequences in $(0, 1)$ which satisfy the following conditions:*

(C1) $\lim_{n \rightarrow \infty} \alpha_n = 0$ and $\sum_{n=0}^{\infty} \alpha_n = \infty$;

(B1) $\beta_n \in [0, a]$ for some $0 < a < 1$ for all $n \geq 0$.

Let $f \in \Xi_C$ and $x_0 \in C$ be chosen arbitrarily. Let $\{x_n\}$ be a sequence generated by (8) for $r_n > 0$. If $\{x_n\}$ is asymptotically regular, that is, $\lim_{n \rightarrow \infty} \|x_{n+1} - x_n\| = 0$, then $\{x_n\}$ converges strongly to $q \in A^{-1}0$, which is the unique solution of the variational inequality problem (VIP)

$$\langle (I - f)q, J(q - p) \rangle \leq 0, \quad \forall f \in \Xi_C, p \in A^{-1}0. \quad (9)$$

On the other hand, we first recall the following concepts.

Definition 3. Let C be a nonempty closed convex subset of a real Banach space X and let $A : C \rightarrow X$ be a mapping of C into X . Then A is said to be:

(i) accretive if, for each $x, y \in C$, there exists $j(x - y) \in J(x - y)$ such that

$$\langle Ax - Ay, j(x - y) \rangle \geq 0, \quad (10)$$

where J is the normalized duality mapping;

(ii) α -strongly accretive if, for each $x, y \in C$, there exists $j(x - y) \in J(x - y)$ such that

$$\langle Ax - Ay, j(x - y) \rangle \geq \alpha \|x - y\|^2, \quad (11)$$

for some $\alpha \in (0, 1)$;

(iii) β -inverse-strongly-accretive if, for each $x, y \in C$, there exists $j(x - y) \in J(x - y)$ such that

$$\langle Ax - Ay, j(x - y) \rangle \geq \beta \|Ax - Ay\|^2, \quad (12)$$

for some $\beta > 0$;

(iv) λ -strictly pseudocontractive [6] if, for each $x, y \in C$, there exists $j(x - y) \in J(x - y)$ such that

$$\langle Ax - Ay, j(x - y) \rangle \leq \|x - y\|^2 - \lambda \|x - y - (Ax - Ay)\|^2 \quad (13)$$

for some $\lambda \in (0, 1)$.

It is worth emphasizing that the definition of the inverse strongly accretive mapping is based on that of the inverse strongly monotone mapping, which was studied by so many authors; see, for example, [7–9].

Very recently, Cai and Bu [10] considered the following general system of variational inequalities (GSVI) in a real smooth Banach space X , which involves finding $(x^*, y^*) \in C \times C$ such that

$$\begin{aligned} \langle \mu_1 B_1 y^* + x^* - y^*, J(x - x^*) \rangle &\geq 0, \quad \forall x \in C, \\ \langle \mu_2 B_2 x^* + y^* - x^*, J(x - y^*) \rangle &\geq 0, \quad \forall x \in C, \end{aligned} \quad (14)$$

where C is a nonempty, closed, and convex subset of X , $B_1, B_2 : C \rightarrow X$ are two nonlinear mappings, and μ_1 and μ_2 are two positive constants. Here the set of solutions of GSVI (14) is denoted by $\text{GSVI}(C, B_1, B_2)$. In particular, if $X = H$, a real Hilbert space, then GSVI (14) reduces to the following GSVI of finding $(x^*, y^*) \in C \times C$ such that

$$\begin{aligned} \langle \mu_1 B_1 y^* + x^* - y^*, x - x^* \rangle &\geq 0, \quad \forall x \in C, \\ \langle \mu_2 B_2 x^* + y^* - x^*, x - y^* \rangle &\geq 0, \quad \forall x \in C, \end{aligned} \quad (15)$$

where μ_1 and μ_2 are two positive constants. The set of solutions of problem (15) is still denoted by $\text{GSVI}(C, B_1, B_2)$. In particular, if $B_1 = B_2 = A$, then problem (15) reduces to the new system of variational inequalities (NSVI), introduced and studied by Verma [11]. Furthermore, if $x^* = y^*$ additionally, then the NSVI reduces to the classical variational inequality problem (VIP) of finding $x^* \in C$ such that

$$\langle Ax^*, x - x^* \rangle \geq 0, \quad \forall x \in C. \quad (16)$$

The solution set of the VIP (16) is denoted by $\text{VI}(C, A)$. Variational inequality theory has been studied quite extensively and has emerged as an important tool in the study of a wide class of obstacle, unilateral, free, moving, equilibrium problems. It is now well known that the variational inequalities are equivalent to the fixed point problems, the origin of which can be traced back to Lions and Stampacchia [12]. This alternative formulation has been used to suggest and analyze projection iterative method for solving variational inequalities under the conditions that the involved operator must be strongly monotone and Lipschitz continuous.

Recently, Ceng et al. [13] transformed problem (15) into a fixed point problem in the following way.

Lemma 4 (see [13]). *For a given $\bar{x}, \bar{y} \in C$, $(\bar{x}, \bar{y})$ is a solution of problem (15) if and only if $\bar{x}$ is a fixed point of the mapping $G : C \rightarrow C$ defined by*

$$\begin{aligned} G(x) = P_C [P_C(x - \mu_2 B_2 x) \\ - \mu_1 B_1 P_C(x - \mu_2 B_2 x)], \quad \forall x \in C, \end{aligned} \quad (17)$$

where $\bar{y} = P_C(\bar{x} - \mu_2 B_2 \bar{x})$ and P_C is the projection of H onto C .

In particular, if the mapping $B_i : C \rightarrow H$ is β_i -inverse strongly monotone for $i = 1, 2$, then the mapping G is nonexpansive provided $\mu_i \in (0, 2\beta_i)$ for $i = 1, 2$.

In 1976, Korpelevič [14] proposed an iterative algorithm for solving the VIP (16) in Euclidean space $\mathbf{R}^n$ as follows:

$$\begin{aligned} y_n &= P_C(x_n - \tau Ax_n), \\ x_{n+1} &= P_C(x_n - \tau Ay_n), \quad n \geq 0, \end{aligned} \quad (18)$$

with $\tau > 0$ a given number, which is known as the extragradient method (see also [15]). The literature on the VIP is vast and Korpelevich's extragradient method has received great attention given by many authors, who improved it in various ways; see, for example, [10, 13, 16–23] and references therein, to name but a few.

In particular, whenever X is still a real smooth Banach space, $B_1 = B_2 = A$, and $x^* = y^*$, then GSVI (17) reduces to the variational inequality problem (VIP) of finding $x^* \in C$ such that

$$\langle Ax^*, J(x - x^*) \rangle \geq 0, \quad \forall x \in C. \quad (19)$$

which was considered by Aoyama et al. [24]. Note that VIP (19) is connected with the fixed point problem for nonlinear mapping (see, e.g., [15, 25]), the problem of finding a zero point of a nonlinear operator (see, e.g., [1, 26]), and so on. It is clear that VIP (19) extends VIP (16) from Hilbert spaces to Banach spaces.

In order to find a solution of VIP (19), Aoyama et al. [24] introduced the following iterative scheme for an accretive operator A :

$$x_{n+1} = \alpha_n x_n + (1 - \alpha_n) \Pi_C(x_n - \lambda_n Ax_n), \quad \forall n \geq 1, \quad (20)$$

where Π_C is a sunny nonexpansive retraction from X onto C . Then they proved a weak convergence theorem.

Beyond doubt, it is an interesting and valuable problem of constructing some algorithms with strong convergence for solving GSVI (14) which contains VIP (19) as a special case. Very recently, Cai and Bu [10] constructed an iterative algorithm for solving GSVI (14) and a common fixed point problem of an infinite family of nonexpansive mappings in a uniformly convex and 2-uniformly smooth Banach space. They proved the strong convergence of the proposed algorithm by virtue of the following inequality in a 2-uniformly smooth Banach space X .

Lemma 5 (see [27]). *Let X be a 2-uniformly smooth Banach space. Then*

$$\|x + y\|^2 \leq \|x\|^2 + 2 \langle y, J(x) \rangle + 2 \|\kappa y\|^2, \quad \forall x, y \in X, \quad (21)$$

where κ is the 2-uniformly smooth constant of X and J is the normalized duality mapping from X into X^* .

Define the mapping $G : C \rightarrow C$ as follows:

$$G(x) := \Pi_C(I - \mu_1 B_1) \Pi_C(I - \mu_2 B_2)x, \quad \forall x \in C. \quad (22)$$

The fixed point set of G is denoted by Ω . Then their strong convergence theorem on the proposed method is stated as follows.

Theorem 6 (see [10, Theorem 3.1]). Let C be a nonempty closed convex subset of a uniformly convex and 2-uniformly smooth Banach space X . Let Π_C be a sunny nonexpansive retraction from X onto C . Let the mapping $B_i : C \rightarrow X$ be β_i -inverse strongly accretive with $0 < \mu_i < \beta_i/\kappa^2$ for $i = 1, 2$. Let f be a contraction of C into itself with coefficient $\delta \in (0, 1)$. Let $\{S_n\}_{n=1}^\infty$ be an infinite family of nonexpansive mappings of C into itself such that $F = \bigcap_{i=1}^\infty \text{Fix}(S_i) \cap \Omega \neq \emptyset$, where Ω is the fixed point set of the mapping G defined by (22). For arbitrarily given $x_1 \in C$, let $\{x_n\}$ be the sequence generated by

$$\begin{aligned} x_{n+1} &= \beta_n x_n + (1 - \beta_n) S_n y_n, \\ y_n &= \alpha_n f(x_n) + (1 - \alpha_n) z_n, \\ z_n &= \Pi_C(u_n - \mu_1 B_1 u_n), \\ u_n &= \Pi_C(x_n - \mu_2 B_2 x_n), \quad \forall n \geq 1. \end{aligned} \quad (23)$$

Suppose that $\{\alpha_n\}$ and $\{\beta_n\}$ are two sequences in $(0, 1)$ satisfying the following conditions:

- (i) $\lim_{n \rightarrow \infty} \alpha_n = 0$ and $\sum_{n=1}^\infty \alpha_n = \infty$;
- (ii) $0 < \liminf_{n \rightarrow \infty} \beta_n \leq \limsup_{n \rightarrow \infty} \beta_n < 1$.

Assume that $\sum_{n=1}^\infty \sup_{x \in D} \|S_{n+1}x - S_n x\| < \infty$ for any bounded subset D of C and let S be a mapping of C into X defined by $Sx = \lim_{n \rightarrow \infty} S_n x$ for all $x \in C$ and suppose that $\text{Fix}(S) = \bigcap_{n=1}^\infty \text{Fix}(S_n)$. Then $\{x_n\}$ converges strongly to $q \in F$, which solves the following VIP:

$$\langle q - f(q), J(q - p) \rangle \leq 0, \quad \forall p \in F. \quad (24)$$

Corollary 7 (see [10, Corollary 3.2]). Let C be a nonempty closed convex subset of a uniformly convex and 2-uniformly smooth Banach space X . Let Π_C be a sunny nonexpansive retraction from X onto C . Let the mapping $B_i : C \rightarrow X$ be β_i -inverse strongly accretive with $0 < \mu_i < \beta_i/\kappa^2$ for $i = 1, 2$. Let f be a contraction of C into itself with coefficient $\delta \in (0, 1)$. Let S be a nonexpansive mapping of C into itself such that $F = \text{Fix}(S) \cap \Omega \neq \emptyset$, where Ω is the fixed point set of the mapping G defined by (22). For arbitrarily given $x_1 \in C$, let $\{x_n\}$ be the sequence generated by

$$\begin{aligned} x_{n+1} &= \beta_n x_n + (1 - \beta_n) S y_n, \\ y_n &= \alpha_n f(x_n) + (1 - \alpha_n) z_n, \\ z_n &= \Pi_C(u_n - \mu_1 B_1 u_n), \\ u_n &= \Pi_C(x_n - \mu_2 B_2 x_n), \quad \forall n \geq 1. \end{aligned} \quad (25)$$

Suppose that $\{\alpha_n\}$ and $\{\beta_n\}$ are two sequences in $(0, 1)$ satisfying the following conditions:

- (i) $\lim_{n \rightarrow \infty} \alpha_n = 0$ and $\sum_{n=1}^\infty \alpha_n = \infty$;
- (ii) $0 < \liminf_{n \rightarrow \infty} \beta_n \leq \limsup_{n \rightarrow \infty} \beta_n < 1$.

Then $\{x_n\}$ converges strongly to $q \in F$, which solves the following VIP:

$$\langle q - f(q), J(q - p) \rangle \leq 0, \quad \forall p \in F. \quad (26)$$

We remark that in Theorem 6, the Banach space X is both uniformly convex and 2-uniformly smooth. According to Lemma 5, the 2-uniform smoothness of X guarantees the nonexpansivity of the mapping $I - \mu_i B_i$ for α_i -inverse-strongly accretive mapping $B_i : C \rightarrow X$ with $0 \leq \mu_i \leq \alpha_i/\kappa^2$ for $i = 1, 2$, and hence the composite mapping $G : C \rightarrow C$ is nonexpansive where $G = \Pi_C(I - \mu_1 B_1)\Pi_C(I - \mu_2 B_2)$. In the meantime, for the convenience of implementing the argument techniques in [13], they have applied the following inequality in a real smooth and uniform convex Banach space X .

Proposition 8 (see [28]). Let X be a real smooth and uniform convex Banach space and let $r > 0$. Then there exists a strictly increasing, continuous, and convex function $g : [0, 2r] \rightarrow \mathbf{R}$, $g(0) = 0$ such that

$$g(\|x - y\|) \leq \|x\|^2 - 2\langle x, J(y) \rangle + \|y\|^2, \quad \forall x, y \in B_r, \quad (27)$$

where $B_r = \{x \in X : \|x\| \leq r\}$.

Let C be a nonempty closed convex subset of a uniformly convex Banach space X which has a uniformly Gateaux differentiable norm. Let Π_C be a sunny nonexpansive retraction from X onto C . Motivated and inspired by the research going on this area, we introduce and analyze hybrid implicit and explicit extragradient methods for finding a zero of an accretive operator $A \subset X \times X$ such that $\overline{D(A)} \subset C \subset \bigcap_{r>0} R(I + rA)$ and solving GSVI (14) and a fixed point problem of an infinite family of nonexpansive self-mappings on C . We establish some strong convergence theorems for hybrid implicit and explicit extragradient algorithms under suitable assumptions. Furthermore, we derive the strong convergence of hybrid implicit and explicit extragradient algorithms for finding a common element of the set of zeros of an accretive operator and the common fixed point set of an infinite family of nonexpansive self-mappings on C and a self-mapping whose complement is strictly pseudocontractive and strongly accretive on C . The results presented in this paper improve, extend, supplement, and develop the corresponding results announced in the earlier and very recent literature; see, for example, [5, 10, 13, 16].

2. Preliminaries

Let X be a real Banach space. X is said to be smooth if the limit

$$\lim_{t \rightarrow 0} \frac{\|x + ty\| - \|x\|}{t}, \quad (28)$$

exists for all $x, y \in U$; in this case, X is also said to have a Gateaux differentiable norm. X is said to have a uniformly Gateaux differentiable norm if for each $y \in U$, the limit is attained uniformly for $x \in U$. Moreover, it is said to be uniformly smooth if this limit is attained uniformly for $x, y \in U$. The norm of X is said to be the Frechet differential if, for each $x \in U$, this limit is attained uniformly for $y \in U$. In

addition, we define a function $\rho : [0, \infty) \rightarrow [0, \infty)$ called the modulus of smoothness of X as follows:

$$\rho(\tau) = \sup \left\{ \frac{1}{2} (\|x + y\| + \|x - y\|) : x, y \in X, \|x\| = 1, \|y\| = \tau \right\}. \quad (29)$$

It is known that X is uniformly smooth if and only if $\lim_{\tau \rightarrow 0} \rho(\tau)/\tau = 0$. Let q be a fixed real number with $1 < q \leq 2$. Then a Banach space X is said to be q -uniformly smooth if there exists a constant $c > 0$ such that $\rho(\tau) \leq c\tau^q$ for all $\tau > 0$. As pointed out in [29], no Banach space is q -uniformly smooth for $q > 2$.

We list some lemmas that will be used in the sequel. Lemma 9 can be found in [30]. Lemma 10 is an immediate consequence of the subdifferential inequality of the function $(1/2)\|\cdot\|^2$.

Lemma 9. Let $\{s_n\}$ be a sequence of nonnegative real numbers satisfying

$$s_{n+1} \leq (1 - \alpha_n) s_n + \alpha_n \beta_n + \gamma_n, \quad \forall n \geq 0, \quad (30)$$

where $\{\alpha_n\}$, $\{\beta_n\}$, and $\{\gamma_n\}$ satisfy the following conditions:

- (i) $\{\alpha_n\} \subset [0, 1]$ and $\sum_{n=0}^{\infty} \alpha_n = \infty$;
- (ii) $\limsup_{n \rightarrow \infty} \beta_n \leq 0$;
- (iii) $\gamma_n \geq 0$, for all $n \geq 0$, and $\sum_{n=0}^{\infty} \gamma_n < \infty$.

Then $\limsup_{n \rightarrow \infty} s_n = 0$.

Lemma 10. In a smooth Banach space X , there holds the inequality

$$\|x + y\|^2 \leq \|x\|^2 + 2 \langle y, J(x + y) \rangle, \quad \forall x, y \in X. \quad (31)$$

Lemma 11 (see [6]). Let C be a nonempty closed convex subset of a real smooth Banach space X and let $A : C \rightarrow X$ be a λ -strictly pseudocontractive mapping. Then A is Lipschitz continuous with constant $1 + 1/\lambda$.

Proof. Since $A : C \rightarrow X$ is a λ -strictly pseudocontractive mapping, we have for all $x, y \in C$

$$\langle Ax - Ay, J(x - y) \rangle \leq \|x - y\|^2 - \lambda \|x - y - (Ax - Ay)\|^2, \quad (32)$$

and hence

$$\begin{aligned} & \lambda \|(I - A)x - (I - A)y\|^2 \\ & \leq \langle (I - A)x - (I - A)y, J(x - y) \rangle. \end{aligned} \quad (33)$$

This yields

$$\|(I - A)x - (I - A)y\| \leq \frac{1}{\lambda} \|x - y\|, \quad \forall x, y \in C. \quad (34)$$

Therefore,

$$\begin{aligned} \|Ax - Ay\| & \leq \|x - y\| + \|(I - A)x - (I - A)y\| \\ & \leq \left(1 + \frac{1}{\lambda}\right) \|x - y\|, \quad \forall x, y \in C. \end{aligned} \quad (35)$$

□

Let D be a subset of C and let Π be a mapping of C into D . Then Π is said to be sunny if

$$\Pi[\Pi(x) + t(x - \Pi(x))] = \Pi(x), \quad (36)$$

whenever $\Pi(x) + t(x - \Pi(x)) \in C$ for $x \in C$ and $t \geq 0$. A mapping Π of C into itself is called a retraction if $\Pi^2 = \Pi$. If a mapping Π of C into itself is a retraction, then $\Pi(z) = z$ for every $z \in R(\Pi)$ where $R(\Pi)$ is the range of Π . A subset D of C is called a sunny nonexpansive retract of C if there exists a sunny nonexpansive retraction from C onto D . The following lemma concerns the sunny nonexpansive retraction.

Lemma 12 (see [31]). Let C be a nonempty closed convex subset of a real smooth Banach space X . Let D be a nonempty subset of C . Let Π be a retraction of C onto D . Then the following are equivalent:

- (i) Π is sunny and nonexpansive;
- (ii) $\|\Pi(x) - \Pi(y)\|^2 \leq \langle x - y, J(\Pi(x) - \Pi(y)) \rangle$, for all $x, y \in C$;
- (iii) $\langle x - \Pi(x), J(y - \Pi(x)) \rangle \leq 0$, for all $x \in C, y \in D$.

It is well known that if $X = H$ a Hilbert space, then a sunny nonexpansive retraction Π_C is coincident with the metric projection from X onto C ; that is, $\Pi_C = P_C$. If C is a nonempty closed convex subset of a strictly convex and uniformly smooth Banach space X and if $T : C \rightarrow C$ is a nonexpansive mapping with the fixed point set $\text{Fix}(T) \neq \emptyset$, then the set $\text{Fix}(T)$ is a sunny nonexpansive retract of C .

Lemma 13 (see [32]). Let X be a uniformly convex Banach space and $B_r = \{x \in X : \|x\| \leq r\}$, $r > 0$. Then there exists a continuous, strictly increasing, and convex function $g : [0, \infty) \rightarrow [0, \infty]$, $g(0) = 0$ such that

$$\begin{aligned} \|\alpha x + \beta y + \gamma z\|^2 & \leq \alpha \|x\|^2 + \beta \|y\|^2 \\ & + \gamma \|z\|^2 - \alpha \beta g(\|x - y\|) \end{aligned} \quad (37)$$

for all $x, y, z \in B_r$ and all $\alpha, \beta, \gamma \in [0, 1]$ with $\alpha + \beta + \gamma = 1$.

Lemma 14 (see [33]). Let C be a nonempty closed convex subset of a Banach space X . Let $S_0, S_1, \dots$ be a sequence of mappings of C into itself. Suppose that $\sum_{n=1}^{\infty} \sup\{\|S_n x - S_{n-1} x\| : x \in C\} < \infty$. Then for each $y \in C$, $\{S_n y\}$ converges strongly to some point of C . Moreover, let S be a mapping of C into itself defined by $Sy = \lim_{n \rightarrow \infty} S_n y$ for all $y \in C$. Then $\lim_{n \rightarrow \infty} \sup\{\|Sx - S_n x\| : x \in C\} = 0$.

Let C be a nonempty closed convex subset of a Banach space X and let $T : C \rightarrow C$ be a nonexpansive mapping with $\text{Fix}(T) \neq \emptyset$. As previously mentioned, let Ξ_C be the set of all contractions on C . For $t \in (0, 1)$ and $f \in \Xi_C$, let $x_t \in C$ be the unique fixed point of the contraction $x \mapsto tf(x) + (1 - t)Tx$ on C ; that is,

$$x_t = tf(x_t) + (1 - t)Tx_t. \quad (38)$$

Lemma 15 (see [15]). Let X be a reflexive and strictly convex Banach space with a uniformly Gateaux differentiable norm. Let C a nonempty closed convex subset of X , $T : C \rightarrow C$ a nonexpansive mapping with $\text{Fix}(T) \neq \emptyset$, and $f \in \Xi_C$. Then the net $\{x_t\}$ defined by $x_t = tf(x_t) + (1-t)Tx_t$ converges strongly to a point in $\text{Fix}(T)$. If we define a mapping $Q : \Xi_C \rightarrow \text{Fix}(T)$ by $Q(f) := s - \lim_{t \rightarrow 0} x_t$, for all $f \in \Xi_C$, then $Q(f)$ solves the following VIP:

$$\begin{aligned} \langle (I-f)Q(f), J(Q(f)-p) \rangle &\leq 0, \\ \forall f \in \Xi_C, p \in \text{Fix}(T). \end{aligned} \quad (39)$$

Lemma 16 (see [34]). Let C be a nonempty closed convex subset of a strictly convex Banach space X . Let $\{T_n\}_{n=0}^\infty$ be a sequence of nonexpansive mappings on C . Suppose $\bigcap_{n=0}^\infty \text{Fix}(T_n)$ is nonempty. Let $\{\lambda_n\}$ be a sequence of positive numbers with $\sum_{n=0}^\infty \lambda_n = 1$. Then a mapping S on C defined by $Sx = \sum_{n=0}^\infty \lambda_n T_n x$ for $x \in C$ is well defined, nonexpansive and $\text{Fix}(S) = \bigcap_{n=0}^\infty \text{Fix}(T_n)$ holds.

Lemma 17 (see [27]). Given a number $r > 0$. A real Banach space X is uniformly convex if and only if there exists a continuous strictly increasing function $g : [0, \infty) \rightarrow [0, \infty)$, $g(0) = 0$, such that

$$\begin{aligned} \|\lambda x + (1-\lambda)y\|^2 &\leq \lambda\|x\|^2 + (1-\lambda)\|y\|^2 \\ &\quad - \lambda(1-\lambda)g(\|x-y\|) \end{aligned} \quad (40)$$

for all $\lambda \in [0, 1]$ and $x, y \in X$ such that $\|x\| \leq r$ and $\|y\| \leq r$.

Lemma 18 (see [24]). Let C be a nonempty closed convex subset of a smooth Banach space X . Let Π_C be a sunny nonexpansive retraction from X onto C and let A be an accretive operator of C into X . Then, for all $\lambda > 0$,

$$\text{VI}(C, A) = \text{Fix}(\Pi_C(I - \lambda A)). \quad (41)$$

Lemma 19. Let C be a nonempty closed convex subset of a smooth Banach space X and let the mapping $B_i : C \rightarrow X$ be ζ_i strictly pseudocontractive and θ_i strongly accretive with $\theta_i + \zeta_i \geq 1$ for $i = 1, 2$. Then, for $\mu_i \in (0, 1]$, we have

$$\begin{aligned} &\|(I - \mu_i B_i)x - (I - \mu_i B_i)y\| \\ &\leq \left\{ \sqrt{\frac{1-\theta_i}{\zeta_i}} + (1-\mu_i) \left(1 + \frac{1}{\zeta_i}\right) \right\} \\ &\quad \times \|x - y\|, \quad \forall x, y \in C, \end{aligned} \quad (42)$$

for $i = 1, 2$. In particular, if $1 - (\zeta_i/(1 + \zeta_i))(1 - \sqrt{(1-\theta_i)/\zeta_i}) \leq \mu_i \leq 1$, then $I - \mu_i B_i$ is nonexpansive for $i = 1, 2$.

Proof. Taking into account the ζ_i -strict pseudocontractivity of B_i , by Lemma 11 we derive for every $x, y \in C$

$$\|B_i x - B_i y\| \leq \left(1 + \frac{1}{\zeta_i}\right) \|x - y\|. \quad (43)$$

Utilizing the θ_i -strong accretivity and ζ_i -strict pseudocontractivity of B_i , we get

$$\begin{aligned} &\zeta_i \|(I - B_i)x - (I - B_i)y\|^2 \\ &\leq \|x - y\|^2 - \langle B_i x - B_i y, J(x - y) \rangle \\ &\leq (1 - \theta_i) \|x - y\|^2. \end{aligned} \quad (44)$$

So, we have

$$\|(I - B_i)x - (I - B_i)y\| \leq \sqrt{\frac{1-\theta_i}{\zeta_i}} \|x - y\|. \quad (45)$$

Therefore, for $\mu_i \in (0, 1]$, we have

$$\begin{aligned} &\|(I - \mu_i B_i)x - (I - \mu_i B_i)y\| \\ &\leq \|(I - B_i)x - (I - B_i)y\| \\ &\quad + (1 - \mu_i) \|B_i x - B_i y\| \\ &\leq \sqrt{\frac{1-\theta_i}{\zeta_i}} \|x - y\| + (1 - \mu_i) \left(1 + \frac{1}{\zeta_i}\right) \|x - y\| \\ &= \left\{ \sqrt{\frac{1-\theta_i}{\zeta_i}} + (1 - \mu_i) \left(1 + \frac{1}{\zeta_i}\right) \right\} \|x - y\|. \end{aligned} \quad (46)$$

Since $1 - (\zeta_i/(1 + \zeta_i))(1 - \sqrt{(1-\theta_i)/\zeta_i}) \leq \mu_i \leq 1$, it follows immediately that

$$\sqrt{\frac{1-\theta_i}{\zeta_i}} + (1 - \mu_i) \left(1 + \frac{1}{\zeta_i}\right) \leq 1. \quad (47)$$

This implies that $I - \mu_i B_i$ is nonexpansive for $i = 1, 2$. $\square$

Lemma 20. Let C be a nonempty closed convex subset of a smooth Banach space X . Let Π_C be a sunny nonexpansive retraction from X onto C and let the mapping $B_i : C \rightarrow X$ be ζ_i strictly pseudocontractive and θ_i strongly accretive with $\theta_i + \zeta_i \geq 1$ for $i = 1, 2$. Let $G : C \rightarrow C$ be the mapping defined by

$$\begin{aligned} G(x) &= \Pi_C [\Pi_C(x - \mu_2 B_2 x) \\ &\quad - \mu_1 B_1 \Pi_C(x - \mu_2 B_2 x)], \quad \forall x \in C. \end{aligned} \quad (48)$$

If $1 - (\zeta_i/(1 + \zeta_i))(1 - \sqrt{(1-\theta_i)/\zeta_i}) \leq \mu_i \leq 1$, then $G : C \rightarrow C$ is nonexpansive.

Proof. According to Lemma 19, we know that $I - \mu_i B_i$ is nonexpansive for $i = 1, 2$. Hence, for all $x, y \in C$, we have

$$\begin{aligned}
 \|G(x) - G(y)\| &= \|\Pi_C [\Pi_C (x - \mu_2 B_2 x) \\
 &\quad - \mu_1 B_1 \Pi_C (x - \mu_2 B_2 x)] \\
 &\quad - \Pi_C [\Pi_C (y - \mu_2 B_2 y) \\
 &\quad - \mu_1 B_1 \Pi_C (y - \mu_2 B_2 y)]\| \\
 &= \|\Pi_C (I - \mu_1 B_1) \Pi_C (I - \mu_2 B_2) x \\
 &\quad - \Pi_C (I - \mu_1 B_1) \Pi_C (I - \mu_2 B_2) y\| \\
 &\leq \|(I - \mu_1 B_1) \Pi_C (I - \mu_2 B_2) x \\
 &\quad - (I - \mu_1 B_1) \Pi_C (I - \mu_2 B_2) y\| \\
 &\leq \|\Pi_C (I - \mu_2 B_2) x - \Pi_C (I - \mu_2 B_2) y\| \\
 &\leq \|(I - \mu_2 B_2) x - (I - \mu_2 B_2) y\| \\
 &\leq \|x - y\|.
 \end{aligned} \tag{49}$$

This shows that $G : C \rightarrow C$ is nonexpansive. This completes the proof. $\square$

Lemma 21. Let C be a nonempty closed convex subset of a smooth Banach space X . Let Π_C be a sunny nonexpansive retraction from X onto C and let $B_1, B_2 : C \rightarrow X$ be two nonlinear mappings. For a given $x^*, y^* \in C$, (x^*, y^*) is a solution of GSVI (14) if and only if $x^* = \Pi_C(y^* - \mu_1 B_1 y^*)$ where $y^* = \Pi_C(x^* - \mu_2 B_2 x^*)$.

Proof. We can rewrite GSVI (14) as

$$\begin{aligned}
 \langle x^* - (y^* - \mu_1 B_1 y^*), J(x - x^*) \rangle &\geq 0, \quad \forall x \in C, \\
 \langle y^* - (x^* - \mu_2 B_2 x^*), J(x - y^*) \rangle &\geq 0, \quad \forall x \in C,
 \end{aligned} \tag{50}$$

which is obviously equivalent to

$$\begin{aligned}
 x^* &= \Pi_C(y^* - \mu_1 B_1 y^*), \\
 y^* &= \Pi_C(x^* - \mu_2 B_2 x^*),
 \end{aligned} \tag{51}$$

because of Lemma 12. This completes the proof. $\square$

Remark 22. By Lemma 21, we observe that

$$x^* = \Pi_C [\Pi_C (x^* - \mu_2 B_2 x^*) - \mu_1 B_1 \Pi_C (x^* - \mu_2 B_2 x^*)], \tag{52}$$

which implies that x^* is a fixed point of the mapping $G = \Pi_C(I - \mu_1 B_1) \Pi_C(I - \mu_2 B_2)$. Throughout this paper, the set of fixed points of the mapping G is denoted by Ω .

3. Hybrid Implicit Extragradient Algorithm

In this section, let C be a nonempty closed convex subset of a uniformly convex Banach space X which has a uniformly

Gateaux differentiable norm. We suggest and analyze a hybrid implicit extragradient algorithm for finding a zero of $A \subset X \times X$ an accretive operator in X with $\overline{D(A)} \subset C \subset \bigcap_{r>0} R(I + rA)$ and solving a general system of variational inequalities and a common fixed point problem of an infinite family of nonexpansive self-mappings in X .

Theorem 23. Let C be a nonempty closed convex subset of a uniformly convex Banach space X which has a uniformly Gateaux differentiable norm. Let Π_C be a sunny nonexpansive retraction from X onto C . Let $A \subset X \times X$ be an accretive operator in X such that $\overline{D(A)} \subset C \subset \bigcap_{r>0} R(I + rA)$. Let $B_i : C \rightarrow X$ be ζ_i strictly pseudocontractive and θ_i strongly accretive with $\theta_i + \zeta_i \geq 1$ for each $i = 1, 2$. Define the mapping $G : C \rightarrow C$ by $G = \Pi_C(I - \mu_1 B_1) \Pi_C(I - \mu_2 B_2)$ where $1 - (\zeta_i/(1 + \zeta_i))(1 - \sqrt{(1 - \theta_i)/\zeta_i}) \leq \mu_i \leq 1$ for $i = 1, 2$. Let $f : C \rightarrow C$ be a contraction with coefficient $\rho \in (0, 1)$. Let $\{S_i\}_{i=0}^\infty$ be an infinite family of nonexpansive mappings of C into itself such that $F = \bigcap_{i=0}^\infty \text{Fix}(S_i) \cap \Omega \cap A^{-1}0 \neq \emptyset$ where $\Omega = \text{Fix}(G)$. For arbitrarily given $x_0 \in C$, let $\{x_n\}$ be the sequence generated by

$$\begin{aligned}
 y_n &= \alpha_n f(x_n) + \beta_n x_n + \gamma_n J_{r_n} x_n + \delta_n S_n y_n, \\
 x_{n+1} &= \sigma_n y_n + (1 - \sigma_n) \Pi_C(I - \mu_1 B_1) \\
 &\quad \times \Pi_C(I - \mu_2 B_2) y_n, \quad \forall n \geq 0.
 \end{aligned} \tag{53}$$

Suppose that $\{r_n\} \subset (0, \infty)$, $\{\sigma_n\}, \{\alpha_n\}, \{\beta_n\}, \{\gamma_n\}, \{\delta_n\} \subset [0, 1]$, $\alpha_n + \beta_n + \gamma_n + \delta_n = 1$ and the following conditions hold:

- (i) $\lim_{n \rightarrow \infty} \alpha_n = 0$ and $\sum_{n=0}^\infty \alpha_n = \infty$;
- (ii) $\{\gamma_n\}, \{\delta_n\} \subset [c, d]$ for some $c, d \in (0, 1)$;
- (iii) $\sum_{n=1}^\infty (|\sigma_n - \sigma_{n-1}| + |\alpha_n - \alpha_{n-1}| + |\beta_n - \beta_{n-1}| + |\gamma_n - \gamma_{n-1}| + |\delta_n - \delta_{n-1}|) < \infty$;
- (iv) $\sum_{n=1}^\infty |r_n - r_{n-1}| < \infty$ and $r_n \geq \varepsilon > 0$, for all $n \geq 0$ for some $\varepsilon > 0$;
- (v) $0 < \liminf_{n \rightarrow \infty} \beta_n \leq \limsup_{n \rightarrow \infty} \beta_n < 1$ and $0 < \liminf_{n \rightarrow \infty} \sigma_n \leq \limsup_{n \rightarrow \infty} \sigma_n < 1$.

Assume that $\sum_{n=0}^\infty \sup_{x \in D} \|S_{n+1}x - S_nx\| < \infty$ for any bounded subset D of C and let S be a mapping of C into itself defined by $Sx = \lim_{n \rightarrow \infty} S_nx$ for all $x \in C$ and suppose that $\text{Fix}(S) = \bigcap_{i=0}^\infty \text{Fix}(S_i)$. Then $\{x_n\}$ converges strongly to $q \in F$, which solves the following VIP:

$$\langle q - f(q), J(q - p) \rangle \leq 0, \quad \forall p \in F. \tag{54}$$

Proof. It is easy to see that (53) can be rewritten as follows:

$$\begin{aligned}
 y_n &= \alpha_n f(x_n) + \beta_n J_{r_n} x_n + \gamma_n Bx_n + \delta_n S_n y_n, \\
 x_{n+1} &= \sigma_n y_n + (1 - \sigma_n) Gy_n, \quad \forall n \geq 0,
 \end{aligned} \tag{55}$$

where $G = \Pi_C(I - \mu_1 B_1) \Pi_C(I - \mu_2 B_2)$. By Lemma 20 we know that G is a nonexpansive self-mapping on C .

Now, let us show that the sequence $\{x_n\}$ is bounded. Indeed, take a fixed $p \in F$ arbitrarily. Then from (55), we have

$$\begin{aligned}
 \|y_n - p\| &\leq \alpha_n \|f(x_n) - p\| + \beta_n \|x_n - p\| \\
 &\quad + \gamma_n \|J_{r_n} x_n - p\| + \delta_n \|S_n y_n - p\| \\
 &\leq \alpha_n (\|f(x_n) - f(p)\| + \|f(p) - p\|) \\
 &\quad + \beta_n \|x_n - p\| + \gamma_n \|x_n - p\| \\
 &\quad + \delta_n \|y_n - p\| \\
 &\leq \alpha_n (\rho \|x_n - p\| + \|f(p) - p\|) \\
 &\quad + \beta_n \|x_n - p\| + \gamma_n \|x_n - p\| \\
 &\quad + \delta_n \|y_n - p\| \\
 &= (1 - \delta_n - (1 - \rho)\alpha_n) \|x_n - p\| \\
 &\quad + \alpha_n \|f(p) - p\| + \delta_n \|y_n - p\|,
 \end{aligned} \tag{56}$$

which hence implies that

$$\begin{aligned}
 \|y_n - p\| &\leq \left(1 - \frac{(1 - \rho)\alpha_n}{1 - \delta_n}\right) \|x_n - p\| \\
 &\quad + \frac{\alpha_n}{1 - \delta_n} \|f(p) - p\|.
 \end{aligned} \tag{57}$$

So, we have

$$\begin{aligned}
 \|x_{n+1} - p\| &\leq \sigma_n \|y_n - p\| \\
 &\quad + (1 - \sigma_n) \|Gy_n - p\| \\
 &\leq \sigma_n \|y_n - p\| + (1 - \sigma_n) \|y_n - p\| \\
 &= \|y_n - p\| \\
 &\leq \left(1 - \frac{(1 - \rho)\alpha_n}{1 - \delta_n}\right) \|x_n - p\| \\
 &\quad + \frac{\alpha_n}{1 - \delta_n} \|f(p) - p\| \\
 &= \left(1 - \frac{(1 - \rho)\alpha_n}{1 - \delta_n}\right) \|x_n - p\| \\
 &\quad + \frac{(1 - \rho)\alpha_n}{1 - \delta_n} \frac{\|f(p) - p\|}{1 - \rho} \\
 &\leq \max \left\{ \|x_n - p\|, \frac{\|f(p) - p\|}{1 - \rho} \right\}.
 \end{aligned} \tag{58}$$

By induction, we obtain

$$\|x_n - p\| \leq \max \left\{ \|x_0 - p\|, \frac{\|f(p) - p\|}{1 - \rho} \right\}, \quad \forall n \geq 0. \tag{59}$$

Hence $\{x_n\}$ is bounded and so are $\{y_n\}$, $\{Gy_n\}$, $\{f(x_n)\}$, $\{J_{r_n} x_n\}$, and $\{S_n y_n\}$.

Let us show that

$$\lim_{n \rightarrow \infty} \|x_{n+1} - x_n\| = 0. \tag{60}$$

As a matter of fact, observe that y_n can be rewritten as follows:

$$y_n = \beta_n x_n + (1 - \beta_n) z_n, \tag{61}$$

where $z_n = (\alpha_n f(x_n) + \gamma_n J_{r_n} x_n + \delta_n S_n y_n) / (1 - \beta_n)$. Observe that

$$\begin{aligned}
 \|z_n - z_{n-1}\| &= \left\| \frac{\alpha_n f(x_n) + \gamma_n J_{r_n} x_n + \delta_n S_n y_n}{1 - \beta_n} \right. \\
 &\quad \left. - \frac{\alpha_{n-1} f(x_{n-1}) + \gamma_{n-1} J_{r_{n-1}} x_{n-1} + \delta_{n-1} S_{n-1} y_{n-1}}{1 - \beta_{n-1}} \right\| \\
 &= \left\| \frac{y_n - \beta_n x_n}{1 - \beta_n} - \frac{y_{n-1} - \beta_{n-1} x_{n-1}}{1 - \beta_{n-1}} \right\| \\
 &= \left\| \frac{y_n - \beta_n x_n}{1 - \beta_n} - \frac{y_{n-1} - \beta_{n-1} x_{n-1}}{1 - \beta_n} \right. \\
 &\quad \left. + \frac{y_{n-1} - \beta_{n-1} x_{n-1}}{1 - \beta_n} - \frac{y_{n-1} - \beta_{n-1} x_{n-1}}{1 - \beta_{n-1}} \right\| \\
 &\leq \left\| \frac{y_n - \beta_n x_n}{1 - \beta_n} - \frac{y_{n-1} - \beta_{n-1} x_{n-1}}{1 - \beta_n} \right\| \\
 &\quad + \left\| \frac{y_{n-1} - \beta_{n-1} x_{n-1}}{1 - \beta_n} - \frac{y_{n-1} - \beta_{n-1} x_{n-1}}{1 - \beta_{n-1}} \right\| \\
 &= \frac{1}{1 - \beta_n} \|y_n - \beta_n x_n - (y_{n-1} - \beta_{n-1} x_{n-1})\| \\
 &\quad + \left| \frac{1}{1 - \beta_n} - \frac{1}{1 - \beta_{n-1}} \right| \|y_{n-1} - \beta_{n-1} x_{n-1}\| \\
 &= \frac{1}{1 - \beta_n} \|y_n - \beta_n x_n - (y_{n-1} - \beta_{n-1} x_{n-1})\| \\
 &\quad + \frac{|\beta_n - \beta_{n-1}|}{(1 - \beta_{n-1})(1 - \beta_n)} \|y_{n-1} - \beta_{n-1} x_{n-1}\| \\
 &= \frac{1}{1 - \beta_n} \|\alpha_n f(x_n) + \gamma_n J_{r_n} x_n + \delta_n S_n y_n \\
 &\quad - \alpha_{n-1} f(x_{n-1}) - \gamma_{n-1} J_{r_{n-1}} x_{n-1} \\
 &\quad - \delta_{n-1} S_{n-1} y_{n-1}\| \\
 &\quad + \frac{|\beta_n - \beta_{n-1}|}{(1 - \beta_{n-1})(1 - \beta_n)} \|y_{n-1} - \beta_{n-1} x_{n-1}\| \\
 &\leq \frac{1}{1 - \beta_n} [\alpha_n \|f(x_n) - f(x_{n-1})\| \\
 &\quad + \gamma_n \|J_{r_n} x_n - J_{r_{n-1}} x_{n-1}\| \\
 &\quad + \delta_n \|S_n y_n - S_{n-1} y_{n-1}\|]
 \end{aligned}$$

$$\begin{aligned}
& + |\alpha_n - \alpha_{n-1}| \|f(x_{n-1})\| \\
& + |\gamma_n - \gamma_{n-1}| \|J_{r_{n-1}} x_{n-1}\| \\
& + |\delta_n - \delta_{n-1}| \|S_{n-1} y_{n-1}\| \\
& + \frac{|\beta_n - \beta_{n-1}|}{(1 - \beta_{n-1})(1 - \beta_n)} \\
& \times \|y_{n-1} - \beta_{n-1} x_{n-1}\|.
\end{aligned} \tag{62}$$

On the other hand, if $r_{n-1} \leq r_n$, using the resolvent identity in Proposition 1,

$$J_{r_n} x_n = J_{r_{n-1}} \left(\frac{r_{n-1}}{r_n} x_n + \left(1 - \frac{r_{n-1}}{r_n} \right) J_{r_n} x_n \right), \tag{63}$$

we get

$$\begin{aligned}
& \|J_{r_n} x_n - J_{r_{n-1}} x_{n-1}\| \\
& = \left\| J_{r_{n-1}} \left(\frac{r_{n-1}}{r_n} x_n + \left(1 - \frac{r_{n-1}}{r_n} \right) J_{r_n} x_n \right) - J_{r_{n-1}} x_{n-1} \right\| \\
& \leq \frac{r_{n-1}}{r_n} \|x_n - x_{n-1}\| + \left(1 - \frac{r_{n-1}}{r_n} \right) \|J_{r_n} x_n - x_{n-1}\| \\
& \leq \|x_n - x_{n-1}\| + \frac{r_n - r_{n-1}}{r_n} \|J_{r_n} x_n - x_{n-1}\| \\
& \leq \|x_n - x_{n-1}\| + \frac{1}{\varepsilon} |r_n - r_{n-1}| \|J_{r_n} x_n - x_{n-1}\|.
\end{aligned} \tag{64}$$

If $r_n \leq r_{n-1}$, we derive in a similar way

$$\begin{aligned}
& \|J_{r_n} x_n - J_{r_{n-1}} x_{n-1}\| \leq \|x_{n-1} - x_n\| \\
& + \frac{1}{\varepsilon} |r_{n-1} - r_n| \|J_{r_{n-1}} x_{n-1} - x_n\|.
\end{aligned} \tag{65}$$

Thus, combining the above cases we obtain

$$\begin{aligned}
& \|J_{r_n} x_n - J_{r_{n-1}} x_{n-1}\| \leq \|x_{n-1} - x_n\| \\
& + M_0 |r_{n-1} - r_n|, \quad \forall n \geq 1,
\end{aligned} \tag{66}$$

where $\sup_{n \geq 1} \{(1/\varepsilon)(\|J_{r_n} x_n - x_{n-1}\| + \|J_{r_{n-1}} x_{n-1} - x_n\|)\} \leq M_0$ for some $M_0 > 0$. Substituting (66) into (62), we have

$$\begin{aligned}
\|z_n - z_{n-1}\| & \leq \frac{1}{1 - \beta_n} [\alpha_n \|f(x_n) - f(x_{n-1})\| \\
& + \gamma_n (\|x_{n-1} - x_n\| + M_0 |r_{n-1} - r_n|) \\
& + \delta_n \|S_n y_n - S_{n-1} y_{n-1}\| \\
& + |\alpha_n - \alpha_{n-1}| \|f(x_{n-1})\| \\
& + |\gamma_n - \gamma_{n-1}| \|J_{r_{n-1}} x_{n-1}\| \\
& + |\delta_n - \delta_{n-1}| \|S_{n-1} y_{n-1}\|] \\
& + \frac{|\beta_n - \beta_{n-1}|}{(1 - \beta_{n-1})(1 - \beta_n)} \|y_{n-1} - \beta_{n-1} x_{n-1}\| \\
& \leq \frac{1}{1 - \beta_n} [\alpha_n \rho \|x_n - x_{n-1}\| \\
& + \gamma_n (\|x_{n-1} - x_n\| + M_0 |r_{n-1} - r_n|) \\
& + \delta_n \|S_n y_n - S_{n-1} y_{n-1}\| \\
& + |\alpha_n - \alpha_{n-1}| \|f(x_{n-1})\| \\
& + |\gamma_n - \gamma_{n-1}| \|J_{r_{n-1}} x_{n-1}\| \\
& + |\delta_n - \delta_{n-1}| \|S_{n-1} y_{n-1}\| \\
& + \delta_n \|S_n y_{n-1} - S_{n-1} y_{n-1}\|] \\
& + \frac{|\beta_n - \beta_{n-1}|}{(1 - \beta_{n-1})(1 - \beta_n)} \\
& \times \|\alpha_{n-1} f(x_{n-1}) + \gamma_{n-1} J_{r_{n-1}} x_{n-1} \\
& + \delta_{n-1} S_{n-1} x_{n-1}\| \\
& \leq \frac{1}{1 - \beta_n} [(\alpha_n \rho + \gamma_n) \|x_n - x_{n-1}\| \\
& + \delta_n \|y_n - y_{n-1}\| \\
& + M(|\alpha_n - \alpha_{n-1}| + |\gamma_n - \gamma_{n-1}| \\
& + |\delta_n - \delta_{n-1}| + |r_{n-1} - r_n|) \\
& + \delta_n \|S_n y_{n-1} - S_{n-1} y_{n-1}\|] \\
& + \frac{1}{(1 - \beta_{n-1})(1 - \beta_n)} |\beta_n - \beta_{n-1}| M,
\end{aligned} \tag{67}$$

where $\sup_{n \geq 0} \{M_0 + \|f(x_n)\| + \|J_{r_n} x_n\| + \|S_n y_n\|\} \leq M$ for some $M > 0$. In the meantime, simple calculations show that

$$\begin{aligned}
y_n - y_{n-1} & = \beta_n (x_n - x_{n-1}) + (1 - \beta_n) (z_n - z_{n-1}) \\
& + (\beta_n - \beta_{n-1}) (x_{n-1} - z_{n-1}).
\end{aligned} \tag{68}$$

Taking into account condition (iv), we may assume, without loss of generality, that $\{\beta_n\} \subset [a, b]$ for some $a, b \in (0, 1)$. Hence, from (67) and (68) we deduce that

$$\begin{aligned}
\|y_n - y_{n-1}\| &\leq \beta_n \|x_n - x_{n-1}\| \\
&\quad + (1 - \beta_n) \|z_n - z_{n-1}\| \\
&\quad + |\beta_n - \beta_{n-1}| \|x_{n-1} - z_{n-1}\| \\
&\leq \beta_n \|x_n - x_{n-1}\| + (1 - \beta_n) \\
&\quad \times \left\{ \frac{1}{1 - \beta_n} [(\alpha_n \rho + \gamma_n) \|x_n - x_{n-1}\| \right. \\
&\quad \quad + \delta_n \|y_n - y_{n-1}\| \\
&\quad \quad + M(|\alpha_n - \alpha_{n-1}| + |\gamma_n - \gamma_{n-1}| \\
&\quad \quad \quad + |\delta_n - \delta_{n-1}| + |r_{n-1} - r_n|) \\
&\quad \quad \quad \left. + \delta_n \|S_n y_{n-1} - S_{n-1} y_{n-1}\| \right] \\
&\quad \quad + \frac{1}{(1 - \beta_{n-1})(1 - \beta_n)} |\beta_n - \beta_{n-1}| M \Big\} \\
&\quad + |\beta_n - \beta_{n-1}| \|x_{n-1} - z_{n-1}\| \\
&= (\alpha_n \rho + \beta_n + \gamma_n) \|x_n - x_{n-1}\| \\
&\quad + \delta_n \|y_n - y_{n-1}\| \\
&\quad + M(|\alpha_n - \alpha_{n-1}| + |\gamma_n - \gamma_{n-1}| \\
&\quad \quad + |\delta_n - \delta_{n-1}| + |r_{n-1} - r_n|) \\
&\quad + \delta_n \|S_n y_{n-1} - S_{n-1} y_{n-1}\| \\
&\quad + \frac{1}{1 - \beta_{n-1}} |\beta_n - \beta_{n-1}| M \\
&\quad + |\beta_n - \beta_{n-1}| \|x_{n-1} - z_{n-1}\| \\
&= (1 - \delta_n - \alpha_n(1 - \rho)) \|x_n - x_{n-1}\| \\
&\quad + \delta_n \|y_n - y_{n-1}\| \\
&\quad + M(|\alpha_n - \alpha_{n-1}| + |\gamma_n - \gamma_{n-1}| \\
&\quad \quad + |\delta_n - \delta_{n-1}| + |r_{n-1} - r_n|) \\
&\quad + \delta_n \|S_n y_{n-1} - S_{n-1} y_{n-1}\| \\
&\quad + \frac{1}{1 - \beta_{n-1}} |\beta_n - \beta_{n-1}| M \\
&\quad + |\beta_n - \beta_{n-1}| \|x_{n-1} - z_{n-1}\| \\
&\leq (1 - \delta_n - \alpha_n(1 - \rho)) \|x_n - x_{n-1}\| \\
&\quad + \delta_n \|y_n - y_{n-1}\| \\
&\quad + \widetilde{M}_0 (|\alpha_n - \alpha_{n-1}| \\
&\quad \quad + |\beta_n - \beta_{n-1}| + |\gamma_n - \gamma_{n-1}|
\end{aligned}$$

$$\begin{aligned}
&\quad + |\delta_n - \delta_{n-1}| + |r_{n-1} - r_n|) \\
&\quad + \delta_n \|S_n y_{n-1} - S_{n-1} y_{n-1}\|,
\end{aligned} \tag{69}$$

where $\sup_{n \geq 0} \{(M/(1-b)) + \|x_n - z_n\|\} \leq \widetilde{M}_0$ for some $\widetilde{M}_0 > 0$. Thus, from condition (ii) we immediately get

$$\begin{aligned}
\|y_n - y_{n-1}\| &\leq \left(1 - \frac{1 - \rho}{1 - \delta_n} \alpha_n\right) \|x_n - x_{n-1}\| \\
&\quad + \frac{\widetilde{M}_0}{1 - \delta_n} (|\alpha_n - \alpha_{n-1}| \\
&\quad \quad + |\beta_n - \beta_{n-1}| + |\gamma_n - \gamma_{n-1}| \\
&\quad \quad + |\delta_n - \delta_{n-1}| + |r_{n-1} - r_n|) \\
&\quad + \frac{\delta_n}{1 - \delta_n} \|S_n y_{n-1} - S_{n-1} y_{n-1}\| \\
&\leq \left(1 - \frac{1 - \rho}{1 - \delta_n} \alpha_n\right) \|x_n - x_{n-1}\| \\
&\quad + \frac{\widetilde{M}_0}{1 - d} (|\alpha_n - \alpha_{n-1}| \\
&\quad \quad + |\beta_n - \beta_{n-1}| + |\gamma_n - \gamma_{n-1}| \\
&\quad \quad + |\delta_n - \delta_{n-1}| + |r_{n-1} - r_n|) \\
&\quad + \frac{d}{1 - d} \|S_n y_{n-1} - S_{n-1} y_{n-1}\|.
\end{aligned} \tag{70}$$

Also, from (55) we have

$$\begin{aligned}
x_{n+1} - x_n &= \sigma_n (y_n - y_{n-1}) \\
&\quad + (\sigma_n - \sigma_{n-1}) (y_{n-1} - G y_{n-1}) \\
&\quad + (1 - \sigma_n) (G y_n - G y_{n-1}).
\end{aligned} \tag{71}$$

Taking into account condition (v), we may assume, without loss of generality, that $\{\beta_n\} \subset [a, b]$ for some $a, b \in (0, 1)$. This together with (70) implies that

$$\begin{aligned}
\|x_{n+1} - x_n\| &\leq \sigma_n \|y_n - y_{n-1}\| \\
&\quad + |\sigma_n - \sigma_{n-1}| \|y_{n-1} - G y_{n-1}\| \\
&\quad + (1 - \sigma_n) \|G y_n - G y_{n-1}\| \\
&\leq \sigma_n \|y_n - y_{n-1}\| \\
&\quad + |\sigma_n - \sigma_{n-1}| \|y_{n-1} - G y_{n-1}\| \\
&\quad + (1 - \sigma_n) \|y_n - y_{n-1}\| \\
&= \|y_n - y_{n-1}\| \\
&\quad + |\sigma_n - \sigma_{n-1}| \|y_{n-1} - G y_{n-1}\|
\end{aligned}$$

$$\begin{aligned}
 & \leq \left(1 - \frac{1-\rho}{1-\delta_n} \alpha_n\right) \|x_n - x_{n-1}\| \\
 & \quad + \frac{\widetilde{M}_0}{1-d} (|\alpha_n - \alpha_{n-1}| \\
 & \quad \quad + |\beta_n - \beta_{n-1}| + |\gamma_n - \gamma_{n-1}| \\
 & \quad \quad + |\delta_n - \delta_{n-1}| + |r_{n-1} - r_n|) \\
 & \quad + \frac{d}{1-d} \|S_n y_{n-1} - S_{n-1} y_{n-1}\| \\
 & \quad + |\sigma_n - \sigma_{n-1}| \|y_{n-1} - G y_{n-1}\| \\
 & \leq \left(1 - \frac{1-\rho}{1-\delta_n} \alpha_n\right) \|x_n - x_{n-1}\| \\
 & \quad + M_1 (|\sigma_n - \sigma_{n-1}| + |\alpha_n - \alpha_{n-1}| \\
 & \quad \quad + |\beta_n - \beta_{n-1}| + |\gamma_n - \gamma_{n-1}| \\
 & \quad \quad + |\delta_n - \delta_{n-1}| + |r_{n-1} - r_n|) \\
 & \quad + \frac{d}{1-d} \|S_n y_{n-1} - S_{n-1} y_{n-1}\|, \tag{72}
 \end{aligned}$$

where $\sup_{n \geq 0} \{(\widetilde{M}_0/(1-d)) + \|y_n - G y_n\|\} \leq M_1$ for some $M_1 > 0$. Since $\sum_{n=0}^{\infty} \alpha_n = \infty$ and $((1-\rho)/(1-\delta_n))\alpha_n \geq (1-\rho)\alpha_n$, we know that $\sum_{n=0}^{\infty} ((1-\rho)/(1-\delta_n))\alpha_n = \infty$. So, applying Lemma 9 to (72), we obtain from conditions (iii), (iv), and the assumption on $\{S_n\}$ that

$$\lim_{n \rightarrow \infty} \|x_{n+1} - x_n\| = 0. \tag{73}$$

Next we show that $\|x_n - G x_n\| \rightarrow 0$ as $n \rightarrow \infty$. Indeed, according to Lemma 10 we have from (55)

$$\begin{aligned}
 \|y_n - p\|^2 &= \|\alpha_n (f(x_n) - f(p)) \\
 & \quad + \beta_n (x_n - p) + \gamma_n (J_{r_n} x_n - p) \\
 & \quad + \delta_n (S_n y_n - p) + \alpha_n (f(p) - p)\|^2 \\
 & \leq \|\alpha_n (f(x_n) - f(p)) + \beta_n (x_n - p) \\
 & \quad + \gamma_n (J_{r_n} x_n - p) + \delta_n (S_n y_n - p)\|^2 \\
 & \quad + 2\alpha_n \langle f(p) - p, J(y_n - p) \rangle \\
 & \leq \alpha_n \|f(x_n) - f(p)\|^2 \\
 & \quad + \beta_n \|x_n - p\|^2 + \gamma_n \|J_{r_n} x_n - p\|^2 \\
 & \quad + \delta_n \|S_n y_n - p\|^2 \\
 & \quad + 2\alpha_n \langle f(p) - p, J(y_n - p) \rangle
 \end{aligned}$$

$$\begin{aligned}
 & \leq \alpha_n \rho \|x_n - p\|^2 + \beta_n \|x_n - p\|^2 \\
 & \quad + \gamma_n \|x_n - p\|^2 + \delta_n \|y_n - p\|^2 \\
 & \quad + 2\alpha_n \langle f(p) - p, J(y_n - p) \rangle \\
 & = (\alpha_n \rho + \beta_n + \gamma_n) \|x_n - p\|^2 \\
 & \quad + \delta_n \|y_n - p\|^2 + 2\alpha_n \langle f(p) - p, J(y_n - p) \rangle \\
 & \leq (1 - \delta_n - \alpha_n (1 - \rho)) \|x_n - p\|^2 \\
 & \quad + \delta_n \|y_n - p\|^2 + 2\alpha_n \langle f(p) - p, J(y_n - p) \rangle, \tag{74}
 \end{aligned}$$

which hence implies that

$$\begin{aligned}
 \|y_n - p\|^2 & \leq \left(1 - \frac{\alpha_n (1-\rho)}{1-\delta_n}\right) \|x_n - p\|^2 \\
 & \quad + \frac{\alpha_n}{1-\delta_n} 2 \langle f(p) - p, J(y_n - p) \rangle \\
 & \leq \left(1 - \frac{\alpha_n (1-\rho)}{1-\delta_n}\right) \|x_n - p\|^2 \\
 & \quad + \frac{\alpha_n}{1-\delta_n} 2 \|f(p) - p\| \|y_n - p\|. \tag{75}
 \end{aligned}$$

Utilizing Lemma 17, we get from (55) and (75)

$$\begin{aligned}
 \|x_{n+1} - p\|^2 &= \|\sigma_n (y_n - p) \\
 & \quad + (1 - \sigma_n) (G y_n - p)\|^2 \\
 & \leq \sigma_n \|y_n - p\|^2 + (1 - \sigma_n) \|G y_n - p\|^2 \\
 & \quad - \sigma_n (1 - \sigma_n) g_1 (\|y_n - G y_n\|) \\
 & \leq \sigma_n \|y_n - p\|^2 + (1 - \sigma_n) \|y_n - p\|^2 \\
 & \quad - \sigma_n (1 - \sigma_n) g_1 (\|y_n - G y_n\|) \\
 & = \|y_n - p\|^2 - \sigma_n (1 - \sigma_n) g_1 (\|y_n - G y_n\|) \\
 & \leq \left(1 - \frac{\alpha_n (1-\rho)}{1-\delta_n}\right) \|x_n - p\|^2 \\
 & \quad + \frac{\alpha_n}{1-\delta_n} 2 \|f(p) - p\| \|y_n - p\| \\
 & \quad - \sigma_n (1 - \sigma_n) g_1 (\|y_n - G y_n\|) \\
 & \leq \|x_n - p\|^2 \\
 & \quad + \frac{\alpha_n}{1-\delta_n} 2 \|f(p) - p\| \|y_n - p\| \\
 & \quad - \sigma_n (1 - \sigma_n) g_1 (\|y_n - G y_n\|), \tag{76}
 \end{aligned}$$

which hence yields

$$\begin{aligned}
 & \sigma_n (1 - \sigma_n) g_1 (\|y_n - Gy_n\|) \\
 & \leq \|x_n - p\|^2 - \|x_{n+1} - p\|^2 \\
 & \quad + \frac{\alpha_n}{1 - \delta_n} 2 \|f(p) - p\| \|y_n - p\| \\
 & \leq (\|x_n - p\| + \|x_{n+1} - p\|) \\
 & \quad \times \|x_n - x_{n+1}\| \\
 & \quad + \frac{\alpha_n}{1 - d} 2 \|f(p) - p\| \|y_n - p\|.
 \end{aligned} \tag{77}$$

Since $\alpha_n \rightarrow 0$ and $\|x_{n+1} - x_n\| \rightarrow 0$, from condition (iv) and the boundedness of $\{x_n\}$ and $\{y_n\}$, it follows that

$$\lim_{n \rightarrow \infty} g_1 (\|y_n - Gy_n\|) = 0. \tag{78}$$

Utilizing the properties of g_1 , we have

$$\lim_{n \rightarrow \infty} \|y_n - Gy_n\| = 0. \tag{79}$$

Observe that

$$\begin{aligned}
 \|x_n - y_n\| & \leq \|x_n - x_{n+1}\| \\
 & \quad + \|x_{n+1} - y_n\| = \|x_n - x_{n+1}\| \\
 & \quad + (1 - \sigma_n) \|Gy_n - y_n\| \rightarrow 0, \quad \text{as } n \rightarrow \infty,
 \end{aligned} \tag{80}$$

and hence

$$\begin{aligned}
 \|x_n - Gx_n\| & \leq \|x_n - y_n\| + \|y_n - Gy_n\| \\
 & \quad + \|Gy_n - Gx_n\| \leq 2 \|x_n - y_n\| \\
 & \quad + \|y_n - Gy_n\| \rightarrow 0, \quad \text{as } n \rightarrow \infty.
 \end{aligned} \tag{81}$$

That is,

$$\lim_{n \rightarrow \infty} \|x_n - y_n\| = 0, \quad \lim_{n \rightarrow \infty} \|x_n - Gx_n\| = 0. \tag{82}$$

Next, let us show that

$$\lim_{n \rightarrow \infty} \|J_{r_n} x_n - x_n\| = 0, \quad \lim_{n \rightarrow \infty} \|S_n x_n - x_n\| = 0. \tag{83}$$

Indeed, observe that y_n can be rewritten as follows:

$$\begin{aligned}
 y_n & = \alpha_n f(x_n) + \beta_n x_n + \gamma_n J_{r_n} x_n + \delta_n S_n y_n \\
 & = \alpha_n f(x_n) + \beta_n x_n \\
 & \quad + (\gamma_n + \delta_n) \frac{\gamma_n J_{r_n} x_n + \delta_n S_n y_n}{\gamma_n + \delta_n} \\
 & = \alpha_n f(x_n) + \beta_n x_n + e_n \hat{z}_n,
 \end{aligned} \tag{84}$$

where $e_n = \gamma_n + \delta_n$ and $\hat{z}_n = (\gamma_n J_{r_n} x_n + \delta_n S_n y_n) / (\gamma_n + \delta_n)$. Utilizing Lemma 13 and (84), we have

$$\begin{aligned}
 \|y_n - p\|^2 & = \|\alpha_n (f(x_n) - p) \\
 & \quad + \beta_n (x_n - p) + e_n (\hat{z}_n - p)\|^2 \\
 & \leq \alpha_n \|f(x_n) - p\|^2 \\
 & \quad + \beta_n \|x_n - p\|^2 + e_n \|\hat{z}_n - p\|^2 \\
 & \quad - \beta_n e_n g_3 (\|\hat{z}_n - x_n\|) \\
 & = \alpha_n \|f(x_n) - p\|^2 \\
 & \quad + \beta_n \|x_n - p\|^2 - \beta_n e_n g_2 (\|\hat{z}_n - x_n\|) \\
 & \quad + e_n \left\| \frac{\gamma_n J_{r_n} x_n + \delta_n S_n y_n}{\gamma_n + \delta_n} - p \right\|^2 \\
 & = \alpha_n \|f(x_n) - p\|^2 + \beta_n \|x_n - p\|^2 \\
 & \quad - \beta_n e_n g_2 (\|\hat{z}_n - x_n\|) \\
 & \quad + e_n \left\| \frac{\gamma_n}{\gamma_n + \delta_n} (J_{r_n} x_n - p) \right. \\
 & \quad \left. + \frac{\delta_n}{\gamma_n + \delta_n} (S_n y_n - p) \right\|^2 \\
 & \leq \alpha_n \|f(x_n) - p\|^2 + \beta_n \|x_n - p\|^2 \\
 & \quad - \beta_n e_n g_2 (\|\hat{z}_n - x_n\|) \\
 & \quad + e_n \left[\frac{\gamma_n}{\gamma_n + \delta_n} \|J_{r_n} x_n - p\|^2 \right. \\
 & \quad \left. + \frac{\delta_n}{\gamma_n + \delta_n} \|S_n y_n - p\|^2 \right] \\
 & \leq \alpha_n \|f(x_n) - p\|^2 + \beta_n \|x_n - p\|^2 \\
 & \quad - \beta_n e_n g_2 (\|\hat{z}_n - x_n\|) \\
 & \quad + e_n \left[\frac{\gamma_n}{\gamma_n + \delta_n} \|x_n - p\| \right. \\
 & \quad \left. + \frac{\delta_n}{\gamma_n + \delta_n} \|y_n - p\|^2 \right] \\
 & = \alpha_n \|f(x_n) - p\|^2 + (\beta_n + \gamma_n) \|x_n - p\|^2 \\
 & \quad + \delta_n \|y_n - p\|^2 - \beta_n e_n g_2 (\|\hat{z}_n - x_n\|) \\
 & = \alpha_n \|f(x_n) - p\|^2 \\
 & \quad + (1 - \alpha_n - \delta_n) \|x_n - p\|^2 \\
 & \quad + \delta_n \|y_n - p\|^2 - \beta_n e_n g_2 (\|\hat{z}_n - x_n\|)
 \end{aligned}$$

$$\begin{aligned} &\leq \alpha_n \|f(x_n) - p\|^2 + (1 - \delta_n) \|x_n - p\|^2 \\ &\quad + \delta_n \|y_n - p\|^2 - \beta_n e_n g_2(\|\tilde{z}_n - x_n\|), \end{aligned} \quad (85)$$

which hence implies that

$$\begin{aligned} \beta_n e_n g_2(\|\tilde{z}_n - x_n\|) &\leq \alpha_n \|f(x_n) - p\|^2 \\ &\quad + (1 - \delta_n) (\|x_n - p\|^2 - \|y_n - p\|^2) \\ &\leq \alpha_n \|f(x_n) - p\|^2 \\ &\quad + (1 - \delta_n) (\|x_n - p\| \\ &\quad \quad + \|y_n - p\|) \|x_n - y_n\| \\ &\leq \alpha_n \|f(x_n) - p\|^2 \\ &\quad + (\|x_n - p\| + \|y_n - p\|) \|x_n - y_n\|. \end{aligned} \quad (86)$$

Utilizing (82), conditions (i), (ii), and (v), and the boundedness of $\{x_n\}$, $\{y_n\}$, and $\{f(x_n)\}$, we get

$$\lim_{n \rightarrow \infty} g_2(\|\tilde{z}_n - x_n\|) = 0. \quad (87)$$

From the properties of g_2 , we have

$$\lim_{n \rightarrow \infty} \|\tilde{z}_n - x_n\| = 0. \quad (88)$$

Utilizing Lemma 17 and the definition of $\tilde{z}_n$, we have

$$\begin{aligned} \|\tilde{z}_n - p\|^2 &= \left\| \frac{\gamma_n J_{r_n} x_n + \delta_n S_n y_n}{\gamma_n + \delta_n} - p \right\|^2 \\ &= \left\| \frac{\gamma_n}{\gamma_n + \delta_n} (J_{r_n} x_n - p) \right. \\ &\quad \left. + \frac{\delta_n}{\gamma_n + \delta_n} (S_n y_n - p) \right\|^2 \\ &\leq \frac{\gamma_n}{\gamma_n + \delta_n} \|J_{r_n} x_n - p\|^2 \\ &\quad + \frac{\delta_n}{\gamma_n + \delta_n} \|S_n y_n - p\|^2 \\ &\quad - \frac{\gamma_n \delta_n}{(\gamma_n + \delta_n)^2} g_3(\|J_{r_n} x_n - S_n y_n\|) \\ &\leq \frac{\gamma_n}{\gamma_n + \delta_n} \|x_n - p\|^2 \\ &\quad + \frac{\delta_n}{\gamma_n + \delta_n} \|y_n - p\|^2 \\ &\quad - \frac{\gamma_n \delta_n}{(\gamma_n + \delta_n)^2} g_3(\|J_{r_n} x_n - S_n y_n\|), \end{aligned} \quad (89)$$

which leads to

$$\begin{aligned} &\frac{\gamma_n \delta_n}{(\gamma_n + \delta_n)^2} g_3(\|J_{r_n} x_n - S_n y_n\|) \\ &\leq \frac{\gamma_n}{\gamma_n + \delta_n} (\|x_n - p\|^2 - \|\tilde{z}_n - p\|^2) \\ &\quad + \frac{\delta_n}{\gamma_n + \delta_n} (\|y_n - p\|^2 - \|\tilde{z}_n - p\|^2) \\ &\leq \frac{\gamma_n}{\gamma_n + \delta_n} (\|x_n - p\| + \|\tilde{z}_n - p\|) \|x_n - \tilde{z}_n\| \\ &\quad + \frac{\delta_n}{\gamma_n + \delta_n} (\|y_n - p\| + \|\tilde{z}_n - p\|) \|y_n - \tilde{z}_n\| \\ &\leq \frac{\gamma_n}{\gamma_n + \delta_n} (\|x_n - p\| + \|\tilde{z}_n - p\|) \|x_n - \tilde{z}_n\| \\ &\quad + \frac{\delta_n}{\gamma_n + \delta_n} (\|y_n - p\| + \|\tilde{z}_n - p\|) \\ &\quad \times (\|y_n - x_n\| + \|x_n - \tilde{z}_n\|). \end{aligned} \quad (90)$$

Since $\{x_n\}$, $\{y_n\}$, and $\{\tilde{z}_n\}$ are bounded, $\|x_n - y_n\| \rightarrow 0$, and $\|\tilde{z}_n - x_n\| \rightarrow 0$ as $n \rightarrow \infty$, we deduce from condition (ii) that

$$\lim_{n \rightarrow \infty} g_3(\|J_{r_n} x_n - S_n y_n\|) = 0. \quad (91)$$

From the properties of g_3 , we have

$$\lim_{n \rightarrow \infty} \|J_{r_n} x_n - S_n y_n\| = 0. \quad (92)$$

On the other hand, y_n can also be rewritten as follows:

$$\begin{aligned} y_n &= \alpha_n f(x_n) + \beta_n x_n + \gamma_n J_{r_n} x_n + \delta_n S_n y_n \\ &= \beta_n x_n + \gamma_n J_{r_n} x_n \\ &\quad + (\alpha_n + \delta_n) \frac{\alpha_n f(x_n) + \delta_n S_n y_n}{\alpha_n + \delta_n} \\ &= \beta_n x_n + \gamma_n J_{r_n} x_n + d_n \tilde{z}_n, \end{aligned} \quad (93)$$

where $d_n = \alpha_n + \delta_n$ and $\tilde{z}_n = (\alpha_n f(x_n) + \delta_n S_n y_n) / (\alpha_n + \delta_n)$. Utilizing Lemma 13 and the convexity of $\|\cdot\|^2$, we have

$$\begin{aligned}
\|y_n - p\|^2 &= \|\beta_n(x_n - p) \\
&\quad + \gamma_n(J_{r_n}x_n - p) + d_n(\tilde{z}_n - p)\|^2 \\
&\leq \beta_n\|x_n - p\|^2 + \gamma_n\|J_{r_n}x_n - p\|^2 \\
&\quad + d_n\|\tilde{z}_n - p\|^2 - \beta_n\gamma_n g_4(\|x_n - J_{r_n}x_n\|) \\
&= \beta_n\|x_n - p\|^2 + \gamma_n\|J_{r_n}x_n - p\|^2 \\
&\quad + d_n\left\|\frac{\alpha_n f(x_n) + \delta_n S_n y_n}{\alpha_n + \delta_n} - p\right\|^2 \\
&\quad - \beta_n\gamma_n g_4(\|x_n - J_{r_n}x_n\|) \\
&= \beta_n\|x_n - p\|^2 + \gamma_n\|J_{r_n}x_n - p\|^2 \\
&\quad + d_n\left\|\frac{\alpha_n}{\alpha_n + \delta_n}(f(x_n) - p) \right. \\
&\quad \left. + \frac{\delta_n}{\alpha_n + \delta_n}(S_n y_n - p)\right\|^2 \\
&\quad - \beta_n\gamma_n g_4(\|x_n - J_{r_n}x_n\|) \\
&\leq \beta_n\|x_n - p\|^2 + \gamma_n\|x_n - p\|^2 \tag{94} \\
&\quad + d_n\left[\frac{\alpha_n}{\alpha_n + \delta_n}\|f(x_n) - p\|^2 \right. \\
&\quad \left. + \frac{\delta_n}{\alpha_n + \delta_n}\|S_n y_n - p\|^2\right] \\
&\quad - \beta_n\gamma_n g_4(\|x_n - J_{r_n}x_n\|) \\
&\leq \alpha_n\|f(x_n) - p\|^2 \\
&\quad + (\beta_n + \gamma_n)\|x_n - p\|^2 + \delta_n\|y_n - p\|^2 \\
&\quad - \beta_n\gamma_n g_4(\|x_n - J_{r_n}x_n\|) \\
&= \alpha_n\|f(x_n) - p\|^2 \\
&\quad + (1 - \alpha_n - \delta_n)\|x_n - p\|^2 \\
&\quad + \delta_n\|y_n - p\|^2 - \beta_n\gamma_n g_4(\|x_n - J_{r_n}x_n\|) \\
&\leq \alpha_n\|f(x_n) - p\|^2 \\
&\quad + (1 - \delta_n)\|x_n - p\|^2 + \delta_n\|y_n - p\|^2 \\
&\quad - \beta_n\gamma_n g_4(\|x_n - J_{r_n}x_n\|),
\end{aligned}$$

which hence implies that

$$\begin{aligned}
\beta_n\gamma_n g_4(\|x_n - J_{r_n}x_n\|) &\leq \alpha_n\|f(x_n) - p\|^2 \\
&\quad + (1 - \delta_n)(\|x_n - p\|^2 - \|y_n - p\|^2) \\
&\leq \alpha_n\|f(x_n) - p\|^2 \\
&\quad + (1 - \delta_n)(\|x_n - p\| + \|y_n - p\|) \\
&\quad \times \|x_n - y_n\| \leq \alpha_n\|f(x_n) - p\|^2 \\
&\quad + (\|x_n - p\| + \|y_n - p\|)\|x_n - y_n\|. \tag{95}
\end{aligned}$$

From (82), conditions (i), (ii), and (v), and the boundedness of $\{x_n\}$, $\{y_n\}$, and $\{f(x_n)\}$, we have

$$\lim_{n \rightarrow \infty} g_4(\|x_n - J_{r_n}x_n\|) = 0. \tag{96}$$

Utilizing the properties of g_4 , we have

$$\lim_{n \rightarrow \infty} \|x_n - J_{r_n}x_n\| = 0. \tag{97}$$

Note that

$$\begin{aligned}
\|x_n - S_n x_n\| &\leq \|x_n - J_{r_n}x_n\| \\
&\quad + \|J_{r_n}x_n - S_n y_n\| \\
&\quad + \|S_n y_n - S_n x_n\| \\
&\leq \|x_n - J_{r_n}x_n\| \\
&\quad + \|J_{r_n}x_n - S_n y_n\| \\
&\quad + \|y_n - x_n\|. \tag{98}
\end{aligned}$$

From (82), (92), and (97), we get

$$\lim_{n \rightarrow \infty} \|x_n - S_n x_n\| = 0. \tag{99}$$

In terms of (99) and Lemma 14, we have

$$\begin{aligned}
\|x_n - Sx_n\| &\leq \|x_n - S_n x_n\| \\
&\quad + \|S_n x_n - Sx_n\| \longrightarrow 0, \quad \text{as } n \longrightarrow \infty. \tag{100}
\end{aligned}$$

That is,

$$\lim_{n \rightarrow \infty} \|x_n - Sx_n\| = 0. \tag{101}$$

Furthermore, we claim that $\lim_{n \rightarrow \infty} \|x_n - J_r x_n\| = 0$ for a fixed number r such that $\varepsilon > r > 0$. In fact, from the resolvent identity in Proposition 1, we have

$$\begin{aligned}
&\|J_{r_n}x_n - J_r x_n\| \\
&= \left\|J_r \left(\frac{r}{r_n}x_n + \left(1 - \frac{r}{r_n}\right)J_{r_n}x_n\right) - J_r x_n\right\| \\
&\leq \left(1 - \frac{r}{r_n}\right)\|x_n - J_{r_n}x_n\| \\
&\leq \|x_n - J_{r_n}x_n\|. \tag{102}
\end{aligned}$$

So, we get from (102)

$$\begin{aligned}\|x_n - J_r x_n\| &\leq \|x_n - J_{r_n} x_n\| + \|J_{r_n} x_n - J_r x_n\| \\ &\leq \|x_n - J_{r_n} x_n\| + \|x_n - J_{r_n} x_n\| \\ &= 2 \|x_n - J_{r_n} x_n\|.\end{aligned}\quad (103)$$

Thus, from (97) it follows that

$$\lim_{n \rightarrow \infty} \|x_n - J_r x_n\| = 0. \quad (104)$$

Define a mapping $Wx = (1 - \theta_1 - \theta_2)J_r x + \theta_1 Sx + \theta_2 Gx$, where $\theta_1, \theta_2 \in (0, 1)$ are two constants with $\theta_1 + \theta_2 < 1$. Then, by Lemma 16, we have that $\text{Fix}(W) = \text{Fix}(J_r) \cap \text{Fix}(S) \cap \text{Fix}(G) = F$. We observe that

$$\begin{aligned}\|x_n - Wx_n\| &= \|(1 - \theta_1 - \theta_2)(x_n - J_r x_n) \\ &\quad + \theta_1(x_n - Sx_n) + \theta_2(x_n - Gx_n)\| \\ &\leq (1 - \theta_1 - \theta_2)\|x_n - J_r x_n\| \\ &\quad + \theta_1\|x_n - Sx_n\| + \theta_2\|x_n - Gx_n\|.\end{aligned}\quad (105)$$

From (82), (101), and (104), we obtain

$$\lim_{n \rightarrow \infty} \|x_n - Wx_n\| = 0. \quad (106)$$

Now, we claim that

$$\limsup_{n \rightarrow \infty} \langle f(q) - q, J(x_n - q) \rangle \leq 0, \quad (107)$$

where $q = s - \lim_{t \rightarrow 0} x_t$ with x_t being the fixed point of the contraction

$$x \mapsto tf(x) + (1 - t)Wx. \quad (108)$$

Then x_t solves the fixed point equation $x_t = tf(x_t) + (1 - t)Wx_t$. Thus we have

$$x_t - x_n = (1 - t)(Wx_t - x_n) + t(f(x_t) - x_n). \quad (109)$$

By Lemma 10, we conclude that

$$\begin{aligned}\|x_t - x_n\|^2 &= \|(1 - t)(Wx_t - x_n) \\ &\quad + t(f(x_t) - x_n)\|^2 \\ &\leq (1 - t)^2 \|Wx_t - x_n\|^2 \\ &\quad + 2t \langle f(x_t) - x_n, J(x_t - x_n) \rangle \\ &\leq (1 - t)^2 (\|Wx_t - Wx_n\| \\ &\quad + \|Wx_n - x_n\|)^2 \\ &\quad + 2t \langle f(x_t) - x_n, J(x_t - x_n) \rangle \\ &\leq (1 - t)^2 (\|x_t - x_n\| \\ &\quad + \|Wx_n - x_n\|)^2 \\ &\quad + 2t \langle f(x_t) - x_n, J(x_t - x_n) \rangle \\ &= (1 - t)^2 [\|x_t - x_n\|^2 \\ &\quad + 2\|x_t - x_n\| \|Wx_n - x_n\| \\ &\quad + \|Wx_n - x_n\|^2] \\ &\quad + 2t \langle f(x_t) - x_t, J(x_t - x_n) \rangle \\ &\quad + 2t \langle x_t - x_n, J(x_t - x_n) \rangle \\ &= (1 - 2t + t^2) \|x_t - x_n\|^2 \\ &\quad + f_n(t) + 2t \langle f(x_t) - x_t, J(x_t - x_n) \rangle \\ &\quad + 2t \|x_t - x_n\|^2,\end{aligned}\quad (110)$$

where

$$\begin{aligned}f_n(t) &= (1 - t)^2 (2\|x_t - x_n\| + \|x_n - Wx_n\|) \\ &\quad \times \|x_n - Wx_n\| \longrightarrow 0, \quad \text{as } n \longrightarrow \infty.\end{aligned}\quad (111)$$

It follows from (110) that

$$\langle x_t - f(x_t), J(x_t - x_n) \rangle \leq \frac{t}{2} \|x_t - x_n\|^2 + \frac{1}{2t} f_n(t). \quad (112)$$

Letting $n \rightarrow \infty$ in (112) and noticing (111), we derive

$$\limsup_{n \rightarrow \infty} \langle x_t - f(x_t), J(x_t - x_n) \rangle \leq \frac{t}{2} M_2, \quad (113)$$

where $M_2 > 0$ is a constant such that $\|x_t - x_n\|^2 \leq M_2$ for all $t \in (0, 1)$ and $n \geq 0$. Taking $t \rightarrow 0$ in (113), we have

$$\limsup_{t \rightarrow 0} \limsup_{n \rightarrow \infty} \langle x_t - f(x_t), J(x_t - x_n) \rangle \leq 0. \quad (114)$$

On the other hand, we have

$$\begin{aligned}
\langle f(q) - q, J(x_n - q) \rangle &= \langle f(q) - q, J(x_n - q) \rangle \\
&\quad - \langle f(q) - q, J(x_n - x_t) \rangle \\
&\quad + \langle f(q) - q, J(x_n - x_t) \rangle \\
&\quad - \langle f(q) - x_t, J(x_n - x_t) \rangle \\
&\quad + \langle f(q) - x_t, J(x_n - x_t) \rangle \\
&\quad - \langle f(x_t) - x_t, J(x_n - x_t) \rangle \\
&\quad + \langle f(x_t) - x_t, J(x_n - x_t) \rangle \\
&= \langle f(q) - q, J(x_n - q) - J(x_n - x_t) \rangle \\
&\quad + \langle x_t - q, J(x_n - x_t) \rangle \\
&\quad + \langle f(q) - f(x_t), J(x_n - x_t) \rangle \\
&\quad + \langle f(x_t) - x_t, J(x_n - x_t) \rangle.
\end{aligned} \tag{115}$$

It follows that

$$\begin{aligned}
\limsup_{n \rightarrow \infty} \langle f(q) - q, J(x_n - q) \rangle \\
\leq \limsup_{n \rightarrow \infty} \langle f(q) - q, J(x_n - q) - J(x_n - x_t) \rangle \\
\quad + \|x_t - q\| \limsup_{n \rightarrow \infty} \|x_n - x_t\| \\
\quad + \rho \|q - x_t\| \limsup_{n \rightarrow \infty} \|x_n - x_t\| \\
\quad + \limsup_{n \rightarrow \infty} \langle f(x_t) - x_t, J(x_n - x_t) \rangle.
\end{aligned} \tag{116}$$

Taking into account that $x_t \rightarrow q$ as $t \rightarrow 0$, we have

$$\begin{aligned}
\limsup_{n \rightarrow \infty} \langle f(q) - q, J(x_n - q) \rangle \\
= \limsup_{t \rightarrow 0} \limsup_{n \rightarrow \infty} \langle f(q) - q, J(x_n - q) \rangle \\
\leq \limsup_{t \rightarrow 0} \limsup_{n \rightarrow \infty} \langle f(q) - q, J(x_n - q) \\
\quad - J(x_n - x_t) \rangle.
\end{aligned} \tag{117}$$

Since X has a uniformly Gateaux differentiable norm, the duality mapping J is norm-to-weak* uniformly continuous on bounded subsets of X . Consequently, the two limits are interchangeable and hence (107) holds. From (82), we get $(y_n - q) - (x_n - q) \rightarrow 0$. Noticing the norm-to-weak* uniform

continuity of J on bounded subsets of X , we deduce from (107) that

$$\begin{aligned}
\limsup_{n \rightarrow \infty} \langle f(q) - q, J(y_n - q) \rangle \\
= \limsup_{n \rightarrow \infty} (\langle f(q) - q, J(x_n - q) \rangle \\
\quad + \langle f(q) - q, J(y_n - q) - J(x_n - q) \rangle) \\
= \limsup_{n \rightarrow \infty} \langle f(q) - q, J(x_n - q) \rangle \leq 0.
\end{aligned} \tag{118}$$

Finally, let us show that $x_n \rightarrow q$ as $n \rightarrow \infty$. Indeed, observe that

$$\begin{aligned}
\|y_n - q\|^2 &= \|\alpha_n(f(x_n) - f(q)) \\
&\quad + \beta_n(x_n - q) + \gamma_n(J_{r_n}x_n - q) \\
&\quad + \delta_n(S_n y_n - q) + \alpha_n(f(q) - q)\|^2 \\
&\leq \|\alpha_n(f(x_n) - f(q)) \\
&\quad + \beta_n(x_n - q) + \gamma_n(J_{r_n}x_n - q) \\
&\quad + \delta_n(S_n y_n - q)\|^2 \\
&\quad + 2\alpha_n \langle f(q) - q, J(y_n - q) \rangle \\
&\leq \alpha_n \|f(x_n) - f(q)\|^2 \\
&\quad + \beta_n \|x_n - q\|^2 + \gamma_n \|J_{r_n}x_n - q\|^2 \\
&\quad + \delta_n \|S_n y_n - q\|^2 \\
&\quad + 2\alpha_n \langle f(q) - q, J(y_n - q) \rangle \\
&\leq \alpha_n \rho \|x_n - q\|^2 \\
&\quad + \beta_n \|x_n - q\|^2 + \gamma_n \|x_n - q\| \\
&\quad + \delta_n \|y_n - q\|^2 \\
&\quad + 2\alpha_n \langle f(q) - q, J(y_n - q) \rangle \\
&= (1 - \delta_n - \alpha_n(1 - \rho)) \|x_n - q\|^2 \\
&\quad + \delta_n \|y_n - q\|^2 \\
&\quad + 2\alpha_n \langle f(q) - q, J(y_n - q) \rangle,
\end{aligned} \tag{119}$$

which implies that

$$\begin{aligned}
\|y_n - q\|^2 &\leq \left(1 - \frac{\alpha_n(1 - \rho)}{1 - \delta_n}\right) \|x_n - q\|^2 \\
&\quad + \frac{2\alpha_n}{1 - \delta_n} \langle f(q) - q, J(y_n - q) \rangle.
\end{aligned} \tag{120}$$

Thus, we have

$$\begin{aligned}
 \|x_{n+1} - q\|^2 &\leq \sigma_n \|y_n - q\|^2 \\
 &\quad + (1 - \sigma_n) \|Gy_n - q\|^2 \leq \|y_n - q\|^2 \\
 &\leq \left(1 - \frac{\alpha_n(1 - \rho)}{1 - \delta_n}\right) \|x_n - q\|^2 \\
 &\quad + \frac{2\alpha_n}{1 - \delta_n} \langle f(q) - q, J(y_n - q) \rangle \quad (121) \\
 &\leq \left(1 - \frac{\alpha_n(1 - \rho)}{1 - \delta_n}\right) \|x_n - q\|^2 \\
 &\quad + \frac{\alpha_n(1 - \rho)}{1 - \delta_n} \frac{2 \langle f(q) - q, J(y_n - q) \rangle}{1 - \rho}.
 \end{aligned}$$

Applying Lemma 9 to (121), we conclude from condition (i) and (118) that $x_n \rightarrow q$ as $n \rightarrow \infty$. This completes the proof. $\square$

The following results can be obtained from Theorem 23. We, therefore, omit the proof.

Corollary 24. Let C be a nonempty closed convex subset of a uniformly convex Banach space X which has a uniformly Gateaux differentiable norm. Let Π_C be a sunny nonexpansive retraction from X onto C . Let $A \subset X \times X$ be an accretive operator in X such that $\overline{D(A)} \subset C \subset \bigcap_{r>0} R(I + rA)$. Let $B_i : C \rightarrow X$ be ζ_i strictly pseudocontractive and θ_i strongly accretive with $\theta_i + \zeta_i \geq 1$ for each $i = 1, 2$. Define the mapping $G : C \rightarrow C$ by $G = \Pi_C(I - \mu_1 B_1)\Pi_C(I - \mu_2 B_2)$ where $1 - (\zeta_i/(1 + \zeta_i))(1 - \sqrt{(1 - \theta_i)/\zeta_i}) \leq \mu_i \leq 1$ for $i = 1, 2$. Let $f : C \rightarrow C$ be a contraction with coefficient $\rho \in (0, 1)$. Let $S : C \rightarrow C$ be a nonexpansive mapping such that $F = \text{Fix}(S) \cap \Omega \cap A^{-1}0 \neq \emptyset$ where $\Omega = \text{Fix}(G)$. For arbitrarily given $x_0 \in C$, let $\{x_n\}$ be the sequence generated by

$$\begin{aligned}
 y_n &= \alpha_n f(x_n) + \beta_n x_n + \gamma_n J_{r_n} x_n + \delta_n S y_n, \\
 x_{n+1} &= \sigma_n y_n + (1 - \sigma_n) \Pi_C(I - \mu_1 B_1) \\
 &\quad \times \Pi_C(I - \mu_2 B_2) y_n, \quad \forall n \geq 0.
 \end{aligned} \quad (122)$$

Suppose that $\{r_n\} \subset (0, \infty)$, $\{\sigma_n\}, \{\alpha_n\}, \{\beta_n\}, \{\gamma_n\}, \{\delta_n\} \subset [0, 1]$, $\alpha_n + \beta_n + \gamma_n + \delta_n = 1$, and the following conditions hold:

- (i) $\lim_{n \rightarrow \infty} \alpha_n = 0$ and $\sum_{n=0}^{\infty} \alpha_n = \infty$;
- (ii) $\{\gamma_n\}, \{\delta_n\} \subset [c, d]$ for some $c, d \in (0, 1)$;
- (iii) $\sum_{n=1}^{\infty} (|\sigma_n - \sigma_{n-1}| + |\alpha_n - \alpha_{n-1}| + |\beta_n - \beta_{n-1}| + |\gamma_n - \gamma_{n-1}| + |\delta_n - \delta_{n-1}|) < \infty$;
- (iv) $\sum_{n=1}^{\infty} |r_n - r_{n-1}| < \infty$ and $r_n \geq \varepsilon > 0$, for all $n \geq 0$ for some $\varepsilon > 0$;
- (v) $0 < \liminf_{n \rightarrow \infty} \beta_n \leq \limsup_{n \rightarrow \infty} \beta_n < 1$ and $0 < \liminf_{n \rightarrow \infty} \sigma_n \leq \limsup_{n \rightarrow \infty} \sigma_n < 1$.

Then $\{x_n\}$ converges strongly to $q \in F$, which solves the following VIP:

$$\langle q - f(q), J(q - p) \rangle \leq 0, \quad \forall p \in F. \quad (123)$$

Corollary 25. Let C be a nonempty closed convex subset of a uniformly convex Banach space X which has a uniformly Gateaux differentiable norm. Let Π_C be a sunny nonexpansive retraction from X onto C . Let $A \subset X \times X$ be an accretive operator in X such that $\overline{D(A)} \subset C \subset \bigcap_{r>0} R(I + rA)$. Let $f : C \rightarrow C$ be a contraction with coefficient $\rho \in (0, 1)$. Let $V : C \rightarrow C$ be a self-mapping such that $I - V : C \rightarrow X$ is ζ strictly pseudocontractive and θ strongly accretive with $\theta + \zeta \geq 1$. Let $\{S_i\}_{i=0}^{\infty}$ be an infinite family of nonexpansive mappings of C into itself such that $F = \bigcap_{i=0}^{\infty} \text{Fix}(S_i) \cap \text{Fix}(V) \cap A^{-1}0 \neq \emptyset$. For arbitrarily given $x_0 \in C$, let $\{x_n\}$ be the sequence generated by

$$\begin{aligned}
 y_n &= \alpha_n f(x_n) + \beta_n x_n + \gamma_n J_{r_n} x_n + \delta_n S_n y_n, \\
 x_{n+1} &= \sigma_n y_n + (1 - \sigma_n) \\
 &\quad \times ((1 - \alpha)I + \alpha V) y_n, \quad \forall n \geq 0,
 \end{aligned} \quad (124)$$

where $1 - (\zeta/(1 + \zeta))(1 - \sqrt{(1 - \theta)/\zeta}) \leq \alpha \leq 1$. Suppose that $\{r_n\} \subset (0, \infty)$, $\{\sigma_n\}, \{\alpha_n\}, \{\beta_n\}, \{\gamma_n\}, \{\delta_n\} \subset [0, 1]$, $\alpha_n + \beta_n + \gamma_n + \delta_n = 1$, and the following conditions hold:

- (i) $\lim_{n \rightarrow \infty} \alpha_n = 0$ and $\sum_{n=0}^{\infty} \alpha_n = \infty$;
- (ii) $\{\gamma_n\}, \{\delta_n\} \subset [c, d]$ for some $c, d \in (0, 1)$;
- (iii) $\sum_{n=1}^{\infty} (|\sigma_n - \sigma_{n-1}| + |\alpha_n - \alpha_{n-1}| + |\beta_n - \beta_{n-1}| + |\gamma_n - \gamma_{n-1}| + |\delta_n - \delta_{n-1}|) < \infty$;
- (iv) $\sum_{n=1}^{\infty} |r_n - r_{n-1}| < \infty$ and $r_n \geq \varepsilon > 0$, for all $n \geq 0$ for some $\varepsilon > 0$;
- (v) $0 < \liminf_{n \rightarrow \infty} \beta_n \leq \limsup_{n \rightarrow \infty} \beta_n < 1$ and $0 < \liminf_{n \rightarrow \infty} \sigma_n \leq \limsup_{n \rightarrow \infty} \sigma_n < 1$.

Assume that $\sum_{n=0}^{\infty} \sup_{x \in D} \|S_{n+1}x - S_nx\| < \infty$ for any bounded subset D of C and let S be a mapping of C into itself defined by $Sx = \lim_{n \rightarrow \infty} S_nx$ for all $x \in C$ and suppose that $\text{Fix}(S) = \bigcap_{i=0}^{\infty} \text{Fix}(S_i)$. Then $\{x_n\}$ converges strongly to $q \in F$, which solves the following VIP:

$$\langle q - f(q), J(q - p) \rangle \leq 0, \quad \forall p \in F. \quad (125)$$

Proof. In Theorem 23, we put $B_1 = I - V$, $B_2 = 0$, and $\mu_1 = \alpha$ where $1 - (\zeta/(1 + \zeta))(1 - \sqrt{(1 - \theta)/\zeta}) \leq \alpha \leq 1$. Then GSVI (14) is equivalent to the VIP of finding $x^* \in C$ such that

$$\langle B_1 x^*, J(x - x^*) \rangle \geq 0, \quad \forall x \in C. \quad (126)$$

In this case, $B_1 : C \rightarrow X$ is ζ strictly pseudocontractive and θ strongly accretive. It is not hard to see that $\text{Fix}(V) = \text{VI}(C, B_1)$. As a matter of fact, we have, for $\alpha > 0$,

$$\begin{aligned}
 u \in \text{VI}(C, B_1) &\iff \langle B_1 u, J(y - u) \rangle \geq 0, \quad \forall y \in C \\
 &\iff \langle u - \alpha B_1 u - u, J(u - y) \rangle \geq 0, \\
 &\quad \forall y \in C \\
 &\iff u = \Pi_C(u - \alpha B_1 u) \\
 &\iff u = \Pi_C(u - \alpha u + \alpha V u) \\
 &\iff \langle u - \alpha u + \alpha V u - u, J(u - y) \rangle \geq 0, \\
 &\quad \forall y \in C \\
 &\iff \langle u - V u, J(u - y) \rangle \leq 0, \quad \forall y \in C \\
 &\iff u = V u \\
 &\iff u \in \text{Fix}(V).
 \end{aligned} \tag{127}$$

Accordingly, we know that $F = \bigcap_{i=1}^{\infty} \text{Fix}(S_i) \cap \Omega \cap A^{-1}0 = \bigcap_{i=0}^{\infty} \text{Fix}(S_i) \cap \text{Fix}(V) \cap A^{-1}0$, and

$$\begin{aligned}
 &\Pi_C(I - \mu_1 B_1) \Pi_C(I - \mu_2 B_2) y_n \\
 &= \Pi_C(I - \mu_1 B_1) y_n \\
 &= \Pi_C((1 - \alpha) y_n + \alpha V y_n) \\
 &= (1 - \alpha) y_n + \alpha V y_n.
 \end{aligned} \tag{128}$$

So, the scheme (53) reduces to (124). Therefore, the desired result follows from Theorem 23. $\square$

Corollary 26. *Let C be a nonempty closed convex subset of a uniformly convex Banach space X which has a uniformly Gateaux differentiable norm. Let Π_C be a sunny nonexpansive retraction from X onto C . Let $A \subset X \times X$ be an accretive operator in X such that $\overline{D(A)} \subset C \subset \bigcap_{r>0} R(I + rA)$. Let $f : C \rightarrow C$ be a contraction with coefficient $\rho \in (0, 1)$. Let $V : C \rightarrow C$ be a self-mapping such that $I - V : C \rightarrow X$ is ζ strictly pseudocontractive and θ strongly accretive with $\theta + \zeta \geq 1$. Let $S : C \rightarrow C$ be a nonexpansive mapping such that $F = \text{Fix}(S) \cap \text{Fix}(V) \cap A^{-1}0 \neq \emptyset$. For arbitrarily given $x_0 \in C$, let $\{x_n\}$ be the sequence generated by*

$$\begin{aligned}
 y_n &= \alpha_n f(x_n) + \beta_n x_n + \gamma_n J_{r_n} x_n + \delta_n S y_n, \\
 x_{n+1} &= \sigma_n y_n + (1 - \sigma_n) ((1 - \alpha) I + \alpha V) y_n, \quad \forall n \geq 0,
 \end{aligned} \tag{129}$$

where $1 - (\zeta/(1 + \zeta))(1 - \sqrt{(1 - \theta)/\zeta}) \leq \alpha \leq 1$. Suppose that $\{r_n\} \subset (0, \infty)$, $\{\sigma_n\}$, $\{\alpha_n\}$, $\{\beta_n\}$, $\{\gamma_n\}$, $\{\delta_n\} \subset [0, 1]$, $\alpha_n + \beta_n + \gamma_n + \delta_n = 1$, and the following conditions hold:

- (i) $\lim_{n \rightarrow \infty} \alpha_n = 0$ and $\sum_{n=0}^{\infty} \alpha_n = \infty$;
- (ii) $\{\gamma_n\}, \{\delta_n\} \subset [c, d]$ for some $c, d \in (0, 1)$;

- (iii) $\sum_{n=1}^{\infty} (|\sigma_n - \sigma_{n-1}| + |\alpha_n - \alpha_{n-1}| + |\beta_n - \beta_{n-1}| + |\gamma_n - \gamma_{n-1}| + |\delta_n - \delta_{n-1}|) < \infty$;
- (iv) $\sum_{n=1}^{\infty} |r_n - r_{n-1}| < \infty$ and $r_n \geq \varepsilon > 0$, for all $n \geq 0$ for some $\varepsilon > 0$;
- (v) $0 < \liminf_{n \rightarrow \infty} \beta_n \leq \limsup_{n \rightarrow \infty} \beta_n < 1$ and $0 < \liminf_{n \rightarrow \infty} \sigma_n \leq \limsup_{n \rightarrow \infty} \sigma_n < 1$.

Then $\{x_n\}$ converges strongly to $q \in F$, which solves the following VIP:

$$\langle q - f(q), J(q - p) \rangle \leq 0, \quad \forall p \in F. \tag{130}$$

Remark 27. Our Theorem 23 improves, extends, supplements, and develops Cai and Bu [10, Theorem 3.1 and Corollary 3.2] and Jung [5, Theorems 3.1] in the following aspects.

(i) The problem of finding a point $q \in \bigcap_n \text{Fix}(S_n) \cap \Omega \cap A^{-1}0$ in our Theorem 23 is more general and more subtle than every one of both the problem of finding a point $q \in \bigcap_n \text{Fix}(S_n) \cap \Omega$ in Cai and Bu [10, Theorem 3.1] and the problem of finding a point $q \in A^{-1}0$ in Jung [5, Theorem 3.1].

(ii) Our Theorem 23 drops the assumption of the asymptotical regularity of $\{x_n\}$ in [5, Theorems 3.1] (i.e., $\lim_{n \rightarrow \infty} \|x_n - x_{n+1}\| = 0$).

(iii) Cai and Bu's proof in [10, Theorem 3.1] depends on the argument techniques in [13], inequality (21) in 2-uniformly smooth Banach spaces, and inequality (27) in smooth and uniform convex Banach spaces. Jung's proof in [5, Theorem 3.1] depends on the resolvent identity in Proposition 1. It is worth emphasizing that the proof of our Theorem 23 does not depend on the argument techniques in [13], inequality (21) in 2-uniformly smooth Banach spaces, and inequality (27) in smooth and uniform convex Banach spaces. However, it depends on the resolvent identity in Proposition 1 and the inequalities in uniform convex Banach spaces; see Lemmas 13 and 17 in Section 2 of this paper.

(iv) The assumption of the uniformly convex and 2-uniformly smooth Banach space X in [10, Theorem 3.1] is weakened to the one of the uniformly convex Banach space X having a uniformly Gateaux differentiable norm in our Theorem 23.

(v) The iterative scheme in our Theorem 23 is very different from every one in both [10, Theorem 3.1] and [5, Theorem 3.1] because the first iteration step in our iterative scheme is implicit.

(vi) The problem of finding a point $q \in \text{Fix}(S) \cap \Omega$ in [10, Corollary 3.2] is extended to develop the problem of finding a point $q \in \text{Fix}(S) \cap \Omega \cap A^{-1}0$ in our Corollary 24.

4. Hybrid Explicit Extragradient Algorithm

In this section, let C be a nonempty closed convex subset of a uniformly convex Banach space X which has a uniformly Gateaux differentiable norm. We suggest and analyze a hybrid explicit extragradient algorithm for finding a zero of $A \subset X \times X$ an accretive operator in X with $\overline{D(A)} \subset C \subset \bigcap_{r>0} R(I + rA)$ and solving a general system of variational inequalities and a common fixed point problem of an infinite family of nonexpansive self-mappings in X .

Theorem 28. Let C be a nonempty closed convex subset of a uniformly convex Banach space X which has a uniformly Gateaux differentiable norm. Let Π_C be a sunny nonexpansive retraction from X onto C . Let $A \subset X \times X$ be an accretive operator in X such that $\overline{D(A)} \subset C \subset \bigcap_{r>0} R(I + rA)$. Let $B_i : C \rightarrow X$ be ζ_i strictly pseudocontractive and θ_i strongly accretive with $\theta_i + \zeta_i \geq 1$ for each $i = 1, 2$. Define the mapping $G : C \rightarrow C$ by $G = \Pi_C(I - \mu_1 B_1)\Pi_C(I - \mu_2 B_2)$ where $1 - (\zeta_i/(1 + \zeta_i))(1 - \sqrt{(1 - \theta_i)/\zeta_i}) \leq \mu_i \leq 1$ for $i = 1, 2$. Let $f : C \rightarrow C$ be a contraction with coefficient $\rho \in (0, 1)$. Let $\{S_i\}_{i=0}^\infty$ be an infinite family of nonexpansive mappings of C into itself such that $F = \bigcap_{i=0}^\infty \text{Fix}(S_i) \cap \Omega \cap A^{-1}0 \neq \emptyset$ where $\Omega = \text{Fix}(G)$. For arbitrarily given $x_0 \in C$, let $\{x_n\}$ be the sequence generated by

$$\begin{aligned} y_n &= \alpha_n f(x_n) + \beta_n x_n + \gamma_n J_{r_n} x_n + \delta_n S_n x_n, \\ x_{n+1} &= \sigma_n y_n + (1 - \sigma_n) \Pi_C(I - \mu_1 B_1) \\ &\quad \times \Pi_C(I - \mu_2 B_2) y_n, \quad \forall n \geq 0. \end{aligned} \quad (131)$$

Suppose that $\{r_n\} \subset (0, \infty)$, $\{\sigma_n\}, \{\alpha_n\}, \{\beta_n\}, \{\gamma_n\}, \{\delta_n\} \subset [0, 1]$, $\alpha_n + \beta_n + \gamma_n + \delta_n = 1$, and the following conditions hold:

- (i) $\lim_{n \rightarrow \infty} \alpha_n = 0$ and $\sum_{n=0}^\infty \alpha_n = \infty$;
- (ii) $\{\gamma_n\}, \{\delta_n\} \subset [c, d]$ for some $c, d \in (0, 1)$;
- (iii) $\sum_{n=1}^\infty (|\sigma_n - \sigma_{n-1}| + |\alpha_n - \alpha_{n-1}| + |\beta_n - \beta_{n-1}| + |\gamma_n - \gamma_{n-1}| + |\delta_n - \delta_{n-1}|) < \infty$;
- (iv) $\sum_{n=1}^\infty |r_n - r_{n-1}| < \infty$ and $r_n \geq \varepsilon > 0$, for all $n \geq 0$ for some $\varepsilon > 0$;
- (v) $0 < \liminf_{n \rightarrow \infty} \beta_n \leq \limsup_{n \rightarrow \infty} \beta_n < 1$ and $0 < \liminf_{n \rightarrow \infty} \sigma_n \leq \limsup_{n \rightarrow \infty} \sigma_n < 1$.

Assume that $\sum_{n=0}^\infty \sup_{x \in D} \|S_{n+1}x - S_n x\| < \infty$ for any bounded subset D of C and let S be a mapping of C into itself defined by $Sx = \lim_{n \rightarrow \infty} S_n x$ for all $x \in C$ and suppose that $\text{Fix}(S) = \bigcap_{i=0}^\infty \text{Fix}(S_i)$. Then $\{x_n\}$ converges strongly to $q \in F$, which solves the following VIP:

$$\langle q - f(q), J(q - p) \rangle \leq 0, \quad \forall p \in F. \quad (132)$$

Proof. It is easy to see that (131) can be rewritten as follows

$$\begin{aligned} y_n &= \alpha_n f(x_n) + \beta_n x_n + \gamma_n J_{r_n} x_n + \delta_n S_n x_n, \\ x_{n+1} &= \sigma_n y_n + (1 - \sigma_n) G y_n, \quad \forall n \geq 0, \end{aligned} \quad (133)$$

where $G = \Pi_C(I - \mu_1 B_1)\Pi_C(I - \mu_2 B_2)$. By Lemma 20 we know that G is a nonexpansive self-mapping on C .

Now, let us show that the sequence $\{x_n\}$ is bounded. Indeed, take a fixed $p \in F$ arbitrarily. Then from (133), we have

$$\begin{aligned} \|y_n - p\| &\leq \alpha_n \|f(x_n) - p\| + \beta_n \|x_n - p\| \\ &\quad + \gamma_n \|J_{r_n} x_n - p\| + \delta_n \|S_n x_n - p\| \\ &\leq \alpha_n (\|f(x_n) - f(p)\| + \|f(p) - p\|) \\ &\quad + \beta_n \|x_n - p\| \\ &\quad + \gamma_n \|x_n - p\| + \delta_n \|x_n - p\| \\ &\leq \alpha_n (\rho \|x_n - p\| + \|f(p) - p\|) \\ &\quad + (1 - \alpha_n) \|x_n - p\| \\ &= (1 - (1 - \rho)\alpha_n) \|x_n - p\| \\ &\quad + \alpha_n \|f(p) - p\| \\ &= (1 - (1 - \rho)\alpha_n) \|x_n - p\| \\ &\quad + (1 - \rho)\alpha_n \frac{\|f(p) - p\|}{1 - \rho}, \end{aligned} \quad (134)$$

and hence

$$\begin{aligned} \|x_{n+1} - p\| &\leq \sigma_n \|y_n - p\| \\ &\quad + (1 - \sigma_n) \|G y_n - p\| \\ &\leq \|y_n - p\| \\ &\leq (1 - (1 - \rho)\alpha_n) \|x_n - p\| \\ &\quad + (1 - \rho)\alpha_n \frac{\|f(p) - p\|}{1 - \rho} \\ &\leq \max \left\{ \|x_n - p\|, \frac{\|f(p) - p\|}{1 - \rho} \right\}. \end{aligned} \quad (135)$$

By induction, we obtain

$$\|x_n - p\| \leq \max \left\{ \|x_0 - p\|, \frac{\|f(p) - p\|}{1 - \rho} \right\}, \quad \forall n \geq 0. \quad (136)$$

It immediately follows that $\{x_n\}$ is bounded and so are $\{y_n\}$, $\{G y_n\}$, $\{f(x_n)\}$, $\{J_{r_n} x_n\}$, and $\{S_n x_n\}$.

Let us show that

$$\lim_{n \rightarrow \infty} \|x_{n+1} - x_n\| = 0. \quad (137)$$

As a matter of fact, observe that y_n can be rewritten as follows:

$$y_n = \beta_n x_n + (1 - \beta_n) z_n, \quad (138)$$

where $z_n = (\alpha_n f(x_n) + \gamma_n J_{r_n} x_n + \delta_n S_n x_n) / (1 - \beta_n)$. Observe that

$$\begin{aligned}
 \|z_n - z_{n-1}\| &= \left\| \frac{\alpha_n f(x_n) + \gamma_n J_{r_n} x_n + \delta_n S_n x_n}{1 - \beta_n} - \frac{\alpha_{n-1} f(x_{n-1}) + \gamma_{n-1} J_{r_{n-1}} x_{n-1} + \delta_{n-1} S_{n-1} x_{n-1}}{1 - \beta_{n-1}} \right\| \\
 &= \left\| \frac{\gamma_n - \beta_n x_n}{1 - \beta_n} - \frac{\gamma_{n-1} - \beta_{n-1} x_{n-1}}{1 - \beta_{n-1}} \right\| \\
 &= \left\| \frac{\gamma_n - \beta_n x_n}{1 - \beta_n} - \frac{\gamma_{n-1} - \beta_{n-1} x_{n-1}}{1 - \beta_n} + \frac{\gamma_{n-1} - \beta_{n-1} x_{n-1}}{1 - \beta_n} - \frac{\gamma_{n-1} - \beta_{n-1} x_{n-1}}{1 - \beta_{n-1}} \right\| \\
 &\leq \left\| \frac{\gamma_n - \beta_n x_n}{1 - \beta_n} - \frac{\gamma_{n-1} - \beta_{n-1} x_{n-1}}{1 - \beta_n} \right\| + \left\| \frac{\gamma_{n-1} - \beta_{n-1} x_{n-1}}{1 - \beta_n} - \frac{\gamma_{n-1} - \beta_{n-1} x_{n-1}}{1 - \beta_{n-1}} \right\| \\
 &= \frac{1}{1 - \beta_n} \|\gamma_n - \beta_n x_n - (\gamma_{n-1} - \beta_{n-1} x_{n-1})\| \\
 &\quad + \left| \frac{1}{1 - \beta_n} - \frac{1}{1 - \beta_{n-1}} \right| \|\gamma_{n-1} - \beta_{n-1} x_{n-1}\| \\
 &= \frac{1}{1 - \beta_n} \|\gamma_n - \beta_n x_n - (\gamma_{n-1} - \beta_{n-1} x_{n-1})\| \\
 &\quad + \frac{|\beta_n - \beta_{n-1}|}{(1 - \beta_{n-1})(1 - \beta_n)} \|\gamma_{n-1} - \beta_{n-1} x_{n-1}\| \\
 &= \frac{1}{1 - \beta_n} \|\alpha_n f(x_n) + \gamma_n J_{r_n} x_n + \delta_n S_n x_n - \alpha_{n-1} f(x_{n-1}) - \gamma_{n-1} J_{r_{n-1}} x_{n-1} - \delta_{n-1} S_{n-1} x_{n-1}\| \\
 &\quad + \frac{|\beta_n - \beta_{n-1}|}{(1 - \beta_{n-1})(1 - \beta_n)} \|\gamma_{n-1} - \beta_{n-1} x_{n-1}\| \\
 &\leq \frac{1}{1 - \beta_n} [\alpha_n \|f(x_n) - f(x_{n-1})\| \\
 &\quad + \gamma_n \|J_{r_n} x_n - J_{r_{n-1}} x_{n-1}\| \\
 &\quad + \delta_n \|S_n x_n - S_{n-1} x_{n-1}\| \\
 &\quad + |\alpha_n - \alpha_{n-1}| \|f(x_{n-1})\| \\
 &\quad + |\gamma_n - \gamma_{n-1}| \|J_{r_{n-1}} x_{n-1}\| \\
 &\quad + |\delta_n - \delta_{n-1}| \|S_{n-1} x_{n-1}\|] \\
 &\quad + \frac{|\beta_n - \beta_{n-1}|}{(1 - \beta_{n-1})(1 - \beta_n)} \|\gamma_{n-1} - \beta_{n-1} x_{n-1}\|.
 \end{aligned} \tag{139}$$

On the other hand, repeating the same arguments as those of (66) in the proof of Theorem 23, we can derive

$$\begin{aligned}
 \|J_{r_n} x_n - J_{r_{n-1}} x_{n-1}\| &\leq \|x_{n-1} - x_n\| \\
 &\quad + M_0 |r_{n-1} - r_n|, \quad \forall n \geq 1,
 \end{aligned} \tag{140}$$

where $\sup_{n \geq 1} \{(1/\varepsilon)(\|J_{r_n} x_n - x_{n-1}\| + \|J_{r_{n-1}} x_{n-1} - x_n\|)\} \leq M_0$ for some $M_0 > 0$. Substituting (140) into (139), we have

$$\begin{aligned}
 \|z_n - z_{n-1}\| &\leq \frac{1}{1 - \beta_n} [\alpha_n \|f(x_n) - f(x_{n-1})\| \\
 &\quad + \gamma_n (\|x_{n-1} - x_n\| + M_0 |r_{n-1} - r_n|) \\
 &\quad + \delta_n \|S_n x_n - S_{n-1} x_{n-1}\| \\
 &\quad + |\alpha_n - \alpha_{n-1}| \|f(x_{n-1})\| \\
 &\quad + |\gamma_n - \gamma_{n-1}| \|J_{r_{n-1}} x_{n-1}\| \\
 &\quad + |\delta_n - \delta_{n-1}| \|S_{n-1} x_{n-1}\|] \\
 &\quad + \frac{|\beta_n - \beta_{n-1}|}{(1 - \beta_{n-1})(1 - \beta_n)} \|\gamma_{n-1} - \beta_{n-1} x_{n-1}\| \\
 &\leq \frac{1}{1 - \beta_n} [\alpha_n \rho \|x_n - x_{n-1}\| \\
 &\quad + \gamma_n (\|x_{n-1} - x_n\| + M_0 |r_{n-1} - r_n|) \\
 &\quad + \delta_n \|S_n x_n - S_{n-1} x_{n-1}\| \\
 &\quad + |\alpha_n - \alpha_{n-1}| \|f(x_{n-1})\| \\
 &\quad + |\gamma_n - \gamma_{n-1}| \|J_{r_{n-1}} x_{n-1}\| \\
 &\quad + |\delta_n - \delta_{n-1}| \|S_{n-1} x_{n-1}\| \\
 &\quad + \delta_n \|S_n x_{n-1} - S_{n-1} x_{n-1}\|] \\
 &\quad + \frac{|\beta_n - \beta_{n-1}|}{(1 - \beta_{n-1})(1 - \beta_n)} \\
 &\quad \times \|\alpha_{n-1} f(x_{n-1}) + \gamma_{n-1} J_{r_{n-1}} x_{n-1} + \delta_{n-1} S_{n-1} x_{n-1}\| \\
 &\leq \frac{1}{1 - \beta_n} [(\alpha_n \rho + \gamma_n) \|x_n - x_{n-1}\| \\
 &\quad + \delta_n \|x_n - x_{n-1}\| \\
 &\quad + M(|\alpha_n - \alpha_{n-1}| + |\gamma_n - \gamma_{n-1}| \\
 &\quad + |\delta_n - \delta_{n-1}| + |r_{n-1} - r_n|) \\
 &\quad + \delta_n \|S_n x_{n-1} - S_{n-1} x_{n-1}\|] \\
 &\quad + \frac{1}{(1 - \beta_{n-1})(1 - \beta_n)} |\beta_n - \beta_{n-1}| M
 \end{aligned}$$

$$\begin{aligned}
 &= \frac{1}{1-\beta_n} [(1-\alpha_n-\beta_n+\alpha_n\rho)\|x_n-x_{n-1}\| \\
 &\quad + M(|\alpha_n-\alpha_{n-1}|+|\gamma_n-\gamma_{n-1}| \\
 &\quad + |\delta_n-\delta_{n-1}|+|r_{n-1}-r_n|) \\
 &\quad + \delta_n\|S_n x_{n-1}-S_{n-1}x_{n-1}\|] \\
 &\quad + \frac{1}{(1-\beta_{n-1})(1-\beta_n)}|\beta_n-\beta_{n-1}|M \\
 &= \left(1-\frac{1-\rho}{1-\beta_n}\alpha_n\right)\|x_n-x_{n-1}\| \\
 &\quad + \frac{M}{1-\beta_n}(|\alpha_n-\alpha_{n-1}|+|\gamma_n-\gamma_{n-1}| \\
 &\quad + |\delta_n-\delta_{n-1}|+|r_{n-1}-r_n|) \\
 &\quad + \frac{\delta_n}{1-\beta_n}\|S_n x_{n-1}-S_{n-1}x_{n-1}\| \\
 &\quad + \frac{1}{(1-\beta_{n-1})(1-\beta_n)}|\beta_n-\beta_{n-1}|M,
 \end{aligned} \tag{141}$$

where $\sup_{n \geq 0}\{M_0 + \|f(x_n)\| + \|J_{r_n}x_n\| + \|S_n x_n\|\} \leq M$ for some $M > 0$. Also, from (133) we have

$$\begin{aligned}
 x_{n+1}-x_n &= \sigma_n(y_n-y_{n-1}) \\
 &\quad + (\sigma_n-\sigma_{n-1})(y_{n-1}-Gy_{n-1}) \\
 &\quad + (1-\sigma_n)(Gy_n-Gy_{n-1}).
 \end{aligned} \tag{142}$$

Taking into account condition (v), we may assume, without loss of generality, that $\{\beta_n\} \subset [a, b]$ for some $a, b \in (0, 1)$. This together with (141) implies that

$$\begin{aligned}
 \|x_{n+1}-x_n\| &\leq \sigma_n\|y_n-y_{n-1}\| \\
 &\quad + |\sigma_n-\sigma_{n-1}|\|y_{n-1}-Gy_{n-1}\| \\
 &\quad + (1-\sigma_n)\|Gy_n-Gy_{n-1}\| \\
 &\leq \sigma_n\|y_n-y_{n-1}\| \\
 &\quad + |\sigma_n-\sigma_{n-1}|\|y_{n-1}-Gy_{n-1}\| \\
 &\quad + (1-\sigma_n)\|y_n-y_{n-1}\| \\
 &= \|y_n-y_{n-1}\| \\
 &\quad + |\sigma_n-\sigma_{n-1}|\|y_{n-1}-Gy_{n-1}\| \\
 &\leq \left(1-\frac{1-\rho}{1-\beta_n}\alpha_n\right)\|x_n-x_{n-1}\|
 \end{aligned}$$

$$\begin{aligned}
 &\quad + \frac{M}{1-\beta_n}(|\alpha_n-\alpha_{n-1}|+|\gamma_n-\gamma_{n-1}| \\
 &\quad + |\delta_n-\delta_{n-1}|+|r_{n-1}-r_n|) \\
 &\quad + \frac{\delta_n}{1-\beta_n}\|S_n x_{n-1}-S_{n-1}x_{n-1}\| \\
 &\quad + \frac{1}{(1-\beta_{n-1})(1-\beta_n)}|\beta_n-\beta_{n-1}|M \\
 &\quad + |\sigma_n-\sigma_{n-1}|\|y_{n-1}-Gy_{n-1}\| \\
 &\leq \left(1-\frac{1-\rho}{1-\beta_n}\alpha_n\right)\|x_n-x_{n-1}\| \\
 &\quad + M_1(|\alpha_n-\alpha_{n-1}|+|\gamma_n-\gamma_{n-1}| \\
 &\quad + |\delta_n-\delta_{n-1}|+|r_{n-1}-r_n|) \\
 &\quad + \|S_n x_{n-1}-S_{n-1}x_{n-1}\| \\
 &\quad + |\beta_n-\beta_{n-1}|M_1+|\sigma_n-\sigma_{n-1}|M_1 \\
 &= \left(1-\frac{1-\rho}{1-\beta_n}\alpha_n\right)\|x_n-x_{n-1}\| \\
 &\quad + M_1(|\sigma_n-\sigma_{n-1}|+|\alpha_n-\alpha_{n-1}| \\
 &\quad + |\beta_n-\beta_{n-1}|+|\gamma_n-\gamma_{n-1}| \\
 &\quad + |\delta_n-\delta_{n-1}|+|r_{n-1}-r_n|) \\
 &\quad + \|S_n x_{n-1}-S_{n-1}x_{n-1}\|,
 \end{aligned} \tag{143}$$

where $\sup_{n \geq 0}\{M/(1-b)^2 + \|y_n-Gy_n\|\} \leq M_1$ for some $M_1 > 0$. Since $\sum_{n=0}^{\infty}\alpha_n = \infty$ and $((1-\rho)/(1-\beta_n))\alpha_n \geq (1-\rho)\alpha_n$, we know that $\sum_{n=0}^{\infty}((1-\rho)/(1-\delta_n))\alpha_n = \infty$. So, applying Lemma 9 to (143), we obtain from conditions (iii) and (iv) and the assumption on $\{S_n\}$ that

$$\lim_{n \rightarrow \infty} \|x_{n+1}-x_n\| = 0. \tag{144}$$

Next we show that $\|x_n-Gx_n\| \rightarrow 0$ as $n \rightarrow \infty$. Indeed, according to Lemma 10 we have from (133)

$$\begin{aligned}
 \|y_n-p\|^2 &= \|\alpha_n(f(x_n)-f(p)) \\
 &\quad + \beta_n(x_n-p) + \gamma_n(J_{r_n}x_n-p) \\
 &\quad + \delta_n(S_n x_n-p) + \alpha_n(f(p)-p)\|^2 \\
 &\leq \|\alpha_n(f(x_n)-f(p)) + \beta_n(x_n-p) \\
 &\quad + \gamma_n(J_{r_n}x_n-p) + \delta_n(S_n x_n-p)\|^2 \\
 &\quad + 2\alpha_n\langle f(p)-p, J(y_n-p) \rangle
 \end{aligned}$$

$$\begin{aligned}
& \leq \alpha_n \|f(x_n) - f(p)\|^2 + \beta_n \|x_n - p\|^2 \\
& \quad + \gamma_n \|J_{r_n} x_n - p\|^2 + \delta_n \|S_n x_n - p\|^2 \\
& \quad + 2\alpha_n \langle f(p) - p, J(y_n - p) \rangle \\
& \leq \alpha_n \rho \|x_n - p\|^2 + \beta_n \|x_n - p\|^2 \\
& \quad + \gamma_n \|x_n - p\|^2 + \delta_n \|x_n - p\|^2 \\
& \quad + 2\alpha_n \langle f(p) - p, J(y_n - p) \rangle \\
& = (\alpha_n \rho + \beta_n + \gamma_n + \delta_n) \|x_n - p\|^2 \\
& \quad + 2\alpha_n \langle f(p) - p, J(y_n - p) \rangle \\
& \leq (1 - \alpha_n (1 - \rho)) \|x_n - p\|^2 \\
& \quad + 2\alpha_n \langle f(p) - p, J(y_n - p) \rangle.
\end{aligned} \tag{145}$$

Utilizing Lemma 17 we get from (133) and (145)

$$\begin{aligned}
\|x_{n+1} - p\|^2 &= \|\sigma_n (y_n - p)\|^2 \\
& \quad + (1 - \sigma_n) \|Gy_n - p\|^2 \\
& \leq \sigma_n \|y_n - p\|^2 + (1 - \sigma_n) \|Gy_n - p\|^2 \\
& \quad - \sigma_n (1 - \sigma_n) g_1 (\|y_n - Gy_n\|) \\
& \leq \sigma_n \|y_n - p\|^2 + (1 - \sigma_n) \|y_n - p\|^2 \\
& \quad - \sigma_n (1 - \sigma_n) g_1 (\|y_n - Gy_n\|) \\
& = \|y_n - p\|^2 - \sigma_n (1 - \sigma_n) g_1 (\|y_n - Gy_n\|) \\
& \leq (1 - \alpha_n (1 - \rho)) \|x_n - p\|^2 \\
& \quad + 2\alpha_n \langle f(p) - p, J(y_n - p) \rangle \\
& \quad - \sigma_n (1 - \sigma_n) g_1 (\|y_n - Gy_n\|) \\
& \leq \|x_n - p\|^2 + 2\alpha_n \|f(p) - p\| \|y_n - p\| \\
& \quad - \sigma_n (1 - \sigma_n) g_1 (\|y_n - Gy_n\|),
\end{aligned} \tag{146}$$

which hence yields

$$\begin{aligned}
& \sigma_n (1 - \sigma_n) g_1 (\|y_n - Gy_n\|) \\
& \leq \|x_n - p\|^2 - \|x_{n+1} - p\|^2 \\
& \quad + 2\alpha_n \|f(p) - p\| \|y_n - p\| \\
& \leq (\|x_n - p\| + \|x_{n+1} - p\|) \|x_n - x_{n+1}\| \\
& \quad + 2\alpha_n \|f(p) - p\| \|y_n - p\|.
\end{aligned} \tag{147}$$

Since $\alpha_n \rightarrow 0$ and $\|x_{n+1} - x_n\| \rightarrow 0$, from condition (v) and the boundedness of $\{x_n\}$ and $\{y_n\}$, it follows that

$$\lim_{n \rightarrow \infty} g_1 (\|y_n - Gy_n\|) = 0. \tag{148}$$

Utilizing the properties of g_1 , we have

$$\lim_{n \rightarrow \infty} \|y_n - Gy_n\| = 0. \tag{149}$$

Observe that

$$\begin{aligned}
\|x_n - y_n\| &\leq \|x_n - x_{n+1}\| \\
& \quad + \|x_{n+1} - y_n\| = \|x_n - x_{n+1}\| \\
& \quad + (1 - \sigma_n) \|Gy_n - y_n\| \rightarrow 0, \quad \text{as } n \rightarrow \infty,
\end{aligned} \tag{150}$$

and hence

$$\begin{aligned}
\|x_n - Gx_n\| &\leq \|x_n - y_n\| \\
& \quad + \|y_n - Gy_n\| + \|Gy_n - Gx_n\| \\
& \leq 2 \|x_n - y_n\| \\
& \quad + \|y_n - Gy_n\| \rightarrow 0, \quad \text{as } n \rightarrow \infty.
\end{aligned} \tag{151}$$

That is,

$$\lim_{n \rightarrow \infty} \|x_n - y_n\| = 0, \quad \lim_{n \rightarrow \infty} \|x_n - Gx_n\| = 0. \tag{152}$$

Next, let us show that

$$\lim_{n \rightarrow \infty} \|J_{r_n} x_n - x_n\| = 0, \quad \lim_{n \rightarrow \infty} \|S_n x_n - x_n\| = 0. \tag{153}$$

Indeed, observe that y_n can be rewritten as follows:

$$\begin{aligned}
y_n &= \alpha_n f(x_n) + \beta_n x_n \\
& \quad + \gamma_n J_{r_n} x_n + \delta_n S_n x_n \\
& = \alpha_n f(x_n) + \beta_n x_n \\
& \quad + (\gamma_n + \delta_n) \frac{\gamma_n J_{r_n} x_n + \delta_n S_n x_n}{\gamma_n + \delta_n} \\
& = \alpha_n f(x_n) + \beta_n x_n + e_n \hat{z}_n,
\end{aligned} \tag{154}$$

where $e_n = \gamma_n + \delta_n$ and $\widehat{z}_n = (\gamma_n J_{r_n} x_n + \delta_n S_n x_n) / (\gamma_n + \delta_n)$. Utilizing Lemma 13 and (154), we have

$$\begin{aligned}
\|y_n - p\|^2 &= \|\alpha_n (f(x_n) - p) \\
&\quad + \beta_n (x_n - p) + e_n (\widehat{z}_n - p)\|^2 \\
&\leq \alpha_n \|f(x_n) - p\|^2 + \beta_n \|x_n - p\|^2 \\
&\quad + e_n \|\widehat{z}_n - p\|^2 - \beta_n e_n g_3 (\|\widehat{z}_n - x_n\|) \\
&= \alpha_n \|f(x_n) - p\|^2 + \beta_n \|x_n - p\|^2 \\
&\quad - \beta_n e_n g_2 (\|\widehat{z}_n - x_n\|) \\
&\quad + e_n \left\| \frac{\gamma_n J_{r_n} x_n + \delta_n S_n x_n}{\gamma_n + \delta_n} - p \right\|^2 \\
&= \alpha_n \|f(x_n) - p\|^2 + \beta_n \|x_n - p\|^2 \\
&\quad - \beta_n e_n g_2 (\|\widehat{z}_n - x_n\|) \\
&\quad + e_n \left\| \frac{\gamma_n}{\gamma_n + \delta_n} (J_{r_n} x_n - p) \right. \\
&\quad \quad \left. + \frac{\delta_n}{\gamma_n + \delta_n} (S_n x_n - p) \right\|^2 \\
&\leq \alpha_n \|f(x_n) - p\|^2 + \beta_n \|x_n - p\|^2 \\
&\quad - \beta_n e_n g_2 (\|\widehat{z}_n - x_n\|) \\
&\quad + e_n \left[\frac{\gamma_n}{\gamma_n + \delta_n} \|J_{r_n} x_n - p\|^2 \right. \\
&\quad \quad \left. + \frac{\delta_n}{\gamma_n + \delta_n} \|S_n x_n - p\|^2 \right] \\
&\leq \alpha_n \|f(x_n) - p\|^2 + \beta_n \|x_n - p\|^2 \\
&\quad - \beta_n e_n g_2 (\|\widehat{z}_n - x_n\|) \\
&\quad + e_n \left[\frac{\gamma_n}{\gamma_n + \delta_n} \|x_n - p\| \right. \\
&\quad \quad \left. + \frac{\delta_n}{\gamma_n + \delta_n} \|x_n - p\| \right] \\
&= \alpha_n \|f(x_n) - p\|^2 \\
&\quad + (\beta_n + \gamma_n + \delta_n) \|x_n - p\|^2 \\
&\quad - \beta_n e_n g_2 (\|\widehat{z}_n - x_n\|) \\
&\leq \alpha_n \|f(x_n) - p\|^2 + \|x_n - p\|^2 \\
&\quad - \beta_n e_n g_2 (\|\widehat{z}_n - x_n\|),
\end{aligned} \tag{155}$$

which hence implies that

$$\begin{aligned}
\beta_n e_n g_2 (\|\widehat{z}_n - x_n\|) &\leq \alpha_n \|f(x_n) - p\|^2 \\
&\quad + \|x_n - p\|^2 - \|y_n - p\|^2 \\
&\leq \alpha_n \|f(x_n) - p\|^2 \\
&\quad + (\|x_n - p\| + \|y_n - p\|) \|x_n - y_n\|.
\end{aligned} \tag{156}$$

Utilizing (152), conditions (i), (ii), and (v) and the boundedness of $\{x_n\}$, $\{y_n\}$, and $\{f(x_n)\}$, we get

$$\lim_{n \rightarrow \infty} g_2 (\|\widehat{z}_n - x_n\|) = 0. \tag{157}$$

From the properties of g_2 , we have

$$\lim_{n \rightarrow \infty} \|\widehat{z}_n - x_n\| = 0. \tag{158}$$

Utilizing Lemma 17 and the definition of $\widehat{z}_n$, we have

$$\begin{aligned}
\|\widehat{z}_n - p\|^2 &= \left\| \frac{\gamma_n J_{r_n} x_n + \delta_n S_n x_n}{\gamma_n + \delta_n} - p \right\|^2 \\
&= \left\| \frac{\gamma_n}{\gamma_n + \delta_n} (J_{r_n} x_n - p) + \frac{\delta_n}{\gamma_n + \delta_n} (S_n x_n - p) \right\|^2 \\
&\leq \frac{\gamma_n}{\gamma_n + \delta_n} \|J_{r_n} x_n - p\|^2 + \frac{\delta_n}{\gamma_n + \delta_n} \|S_n x_n - p\|^2 \\
&\quad - \frac{\gamma_n \delta_n}{(\gamma_n + \delta_n)^2} g_3 (\|J_{r_n} x_n - S_n x_n\|) \\
&\leq \frac{\gamma_n}{\gamma_n + \delta_n} \|x_n - p\|^2 + \frac{\delta_n}{\gamma_n + \delta_n} \|x_n - p\|^2 \\
&\quad - \frac{\gamma_n \delta_n}{(\gamma_n + \delta_n)^2} g_3 (\|J_{r_n} x_n - S_n x_n\|) \\
&= \|x_n - p\|^2 - \frac{\gamma_n \delta_n}{(\gamma_n + \delta_n)^2} g_3 (\|J_{r_n} x_n - S_n x_n\|),
\end{aligned} \tag{159}$$

which leads to

$$\begin{aligned}
&\frac{\gamma_n \delta_n}{(\gamma_n + \delta_n)^2} g_3 (\|J_{r_n} x_n - S_n x_n\|) \\
&\leq \|x_n - p\|^2 - \|\widehat{z}_n - p\|^2 \\
&\leq (\|x_n - p\| + \|\widehat{z}_n - p\|) \|x_n - \widehat{z}_n\|.
\end{aligned} \tag{160}$$

Since $\{x_n\}$ and $\{\widehat{z}_n\}$ are bounded and $\|\widehat{z}_n - x_n\| \rightarrow 0$ as $n \rightarrow \infty$, we deduce from condition (ii) that

$$\lim_{n \rightarrow \infty} g_3 (\|J_{r_n} x_n - S_n x_n\|) = 0. \tag{161}$$

From the properties of g_3 , we have

$$\lim_{n \rightarrow \infty} \|J_{r_n} x_n - S_n x_n\| = 0. \tag{162}$$

On the other hand, y_n can also be rewritten as follows:

$$\begin{aligned}
 y_n &= \alpha_n f(x_n) + \beta_n x_n \\
 &\quad + \gamma_n J_{r_n} x_n + \delta_n S_n x_n \\
 &= \beta_n x_n + \gamma_n J_{r_n} x_n \\
 &\quad + (\alpha_n + \delta_n) \frac{\alpha_n f(x_n) + \delta_n S_n x_n}{\alpha_n + \delta_n} \\
 &= \beta_n x_n + \gamma_n J_{r_n} x_n + d_n \tilde{z}_n,
 \end{aligned} \tag{163}$$

where $d_n = \alpha_n + \delta_n$ and $\tilde{z}_n = (\alpha_n f(x_n) + \delta_n S_n x_n)/(\alpha_n + \delta_n)$. Utilizing Lemma 13 and the convexity of $\|\cdot\|^2$, we have

$$\begin{aligned}
 \|y_n - p\|^2 &= \|\beta_n(x_n - p) \\
 &\quad + \gamma_n(J_{r_n} x_n - p) + d_n(\tilde{z}_n - p)\|^2 \\
 &\leq \beta_n \|x_n - p\|^2 + \gamma_n \|J_{r_n} x_n - p\|^2 \\
 &\quad + d_n \|\tilde{z}_n - p\|^2 - \beta_n \gamma_n g_4(\|x_n - J_{r_n} x_n\|) \\
 &= \beta_n \|x_n - p\|^2 + \gamma_n \|J_{r_n} x_n - p\|^2 \\
 &\quad + d_n \left\| \frac{\alpha_n f(x_n) + \delta_n S_n x_n}{\alpha_n + \delta_n} - p \right\|^2 \\
 &\quad - \beta_n \gamma_n g_4(\|x_n - J_{r_n} x_n\|) \\
 &= \beta_n \|x_n - p\|^2 + \gamma_n \|J_{r_n} x_n - p\|^2 \\
 &\quad + d_n \left\| \frac{\alpha_n}{\alpha_n + \delta_n} (f(x_n) - p) \right. \\
 &\quad \left. + \frac{\delta_n}{\alpha_n + \delta_n} (S_n x_n - p) \right\|^2 \\
 &\quad - \beta_n \gamma_n g_4(\|x_n - J_{r_n} x_n\|) \\
 &\leq \beta_n \|x_n - p\|^2 + \gamma_n \|x_n - p\|^2 \\
 &\quad + d_n \left[\frac{\alpha_n}{\alpha_n + \delta_n} \|f(x_n) - p\|^2 \right. \\
 &\quad \left. + \frac{\delta_n}{\alpha_n + \delta_n} \|S_n x_n - p\|^2 \right] \\
 &\quad - \beta_n \gamma_n g_4(\|x_n - J_{r_n} x_n\|) \\
 &\leq \alpha_n \|f(x_n) - p\|^2 \\
 &\quad + (\beta_n + \gamma_n + \delta_n) \|x_n - p\|^2 \\
 &\quad - \beta_n \gamma_n g_4(\|x_n - J_{r_n} x_n\|) \\
 &\leq \alpha_n \|f(x_n) - p\|^2 + \|x_n - p\|^2 \\
 &\quad - \beta_n \gamma_n g_4(\|x_n - J_{r_n} x_n\|),
 \end{aligned} \tag{164}$$

which hence implies that

$$\begin{aligned}
 \beta_n \gamma_n g_4(\|x_n - J_{r_n} x_n\|) &\leq \alpha_n \|f(x_n) - p\|^2 \\
 &\quad + \|x_n - p\|^2 - \|y_n - p\|^2 \\
 &\leq \alpha_n \|f(x_n) - p\|^2 \\
 &\quad + (\|x_n - p\| + \|y_n - p\|) \|x_n - y_n\|.
 \end{aligned} \tag{165}$$

From (152), conditions (i), (ii), and (v), and the boundedness of $\{x_n\}$, $\{y_n\}$, and $\{f(x_n)\}$, we have

$$\lim_{n \rightarrow \infty} g_4(\|x_n - J_{r_n} x_n\|) = 0. \tag{166}$$

Utilizing the properties of g_4 , we have

$$\lim_{n \rightarrow \infty} \|x_n - J_{r_n} x_n\| = 0. \tag{167}$$

Note that

$$\|x_n - S_n x_n\| \leq \|x_n - J_{r_n} x_n\| + \|J_{r_n} x_n - S_n x_n\|. \tag{168}$$

From (162) and (167), we get

$$\lim_{n \rightarrow \infty} \|x_n - S_n x_n\| = 0. \tag{169}$$

In terms of (169) and Lemma 14, we have

$$\begin{aligned}
 \|x_n - Sx_n\| &\leq \|x_n - S_n x_n\| \\
 &\quad + \|S_n x_n - Sx_n\| \longrightarrow 0 \quad \text{as } n \longrightarrow \infty.
 \end{aligned} \tag{170}$$

That is,

$$\lim_{n \rightarrow \infty} \|x_n - Sx_n\| = 0. \tag{171}$$

Furthermore, repeating the same arguments as those of (104) in the proof of Theorem 23, we can conclude that

$$\lim_{n \rightarrow \infty} \|x_n - J_r x_n\| = 0 \tag{172}$$

for a fixed number r such that $\varepsilon > r > 0$.

Define a mapping $Wx = (1 - \theta_1 - \theta_2)J_r x + \theta_1 Sx + \theta_2 Gx$, where $\theta_1, \theta_2 \in (0, 1)$ are two constants with $\theta_1 + \theta_2 < 1$. Then by Lemma 16, we have that $\text{Fix}(W) = \text{Fix}(J_r) \cap \text{Fix}(S) \cap \text{Fix}(G) = F$. We observe that

$$\begin{aligned}
 \|x_n - Wx_n\| &= \|(1 - \theta_1 - \theta_2)(x_n - J_r x_n) \\
 &\quad + \theta_1(x_n - Sx_n) + \theta_2(x_n - Gx_n)\| \\
 &\leq (1 - \theta_1 - \theta_2) \|x_n - J_r x_n\| \\
 &\quad + \theta_1 \|x_n - Sx_n\| + \theta_2 \|x_n - Gx_n\|.
 \end{aligned} \tag{173}$$

From (152), (171), and (172), we obtain

$$\lim_{n \rightarrow \infty} \|x_n - Wx_n\| = 0. \tag{174}$$

Repeating the same arguments as those of (107) in the proof of Theorem 23, we can deduce that

$$\limsup_{n \rightarrow \infty} \langle f(q) - q, J(x_n - q) \rangle \leq 0. \quad (175)$$

Since J is norm-to-weak* uniformly continuous over bounded subsets of X , we obtain from $\|x_n - y_n\| \rightarrow 0$ that

$$\limsup_{n \rightarrow \infty} \langle f(q) - q, J(y_n - q) \rangle \leq 0. \quad (176)$$

Finally, let us show that $x_n \rightarrow q$ as $n \rightarrow \infty$. Indeed, observe that

$$\begin{aligned} \|y_n - q\|^2 &= \|\alpha_n(f(x_n) - f(q)) \\ &\quad + \beta_n(x_n - q) + \gamma_n(J_{r_n}x_n - q) \\ &\quad + \delta_n(S_nx_n - q) + \alpha_n(f(q) - q)\|^2 \\ &\leq \|\alpha_n(f(x_n) - f(q)) + \beta_n(x_n - q) \\ &\quad + \gamma_n(J_{r_n}x_n - q) + \delta_n(S_nx_n - q)\|^2 \\ &\quad + 2\alpha_n \langle f(q) - q, J(y_n - q) \rangle \\ &\leq \alpha_n \|f(x_n) - f(q)\|^2 + \beta_n \|x_n - q\|^2 \\ &\quad + \gamma_n \|J_{r_n}x_n - q\|^2 + \delta_n \|S_nx_n - q\|^2 \\ &\quad + 2\alpha_n \langle f(q) - q, J(y_n - q) \rangle \\ &\leq \alpha_n \rho \|x_n - q\|^2 + \beta_n \|x_n - q\|^2 \\ &\quad + \gamma_n \|x_n - q\|^2 + \delta_n \|x_n - q\|^2 \\ &\quad + 2\alpha_n \langle f(q) - q, J(y_n - q) \rangle \\ &= (\alpha_n \rho + \beta_n + \gamma_n + \delta_n) \|x_n - q\|^2 \\ &\quad + 2\alpha_n \langle f(q) - q, J(y_n - q) \rangle \\ &= (1 - \alpha_n(1 - \rho)) \|x_n - q\|^2 \\ &\quad + 2\alpha_n \langle f(q) - q, J(y_n - q) \rangle, \end{aligned} \quad (177)$$

and hence

$$\begin{aligned} \|x_{n+1} - q\|^2 &\leq \sigma_n \|y_n - q\|^2 \\ &\quad + (1 - \sigma_n) \|Gy_n - q\|^2 \\ &\leq \|y_n - q\|^2 \\ &\leq (1 - \alpha_n(1 - \rho)) \|x_n - q\|^2 \\ &\quad + 2\alpha_n \langle f(q) - q, J(y_n - q) \rangle. \end{aligned} \quad (178)$$

Applying Lemma 9 to (178), we conclude from condition (i) and (178) that $x_n \rightarrow q$ as $n \rightarrow \infty$. This completes the proof. $\square$

The following results can be obtained from Theorem 28. We, therefore, omit the proof.

Corollary 29. Under the same conditions as those in Corollary 24, let $\{x_n\}$ be the sequence generated from any given $x_0 \in C$ by

$$\begin{aligned} y_n &= \alpha_n f(x_n) + \beta_n x_n + \gamma_n J_{r_n} x_n + \delta_n S_n x_n, \\ x_{n+1} &= \sigma_n y_n + (1 - \sigma_n) \Pi_C(I - \mu_1 B_1) \\ &\quad \times \Pi_C(I - \mu_2 B_2) y_n, \quad \forall n \geq 0. \end{aligned} \quad (179)$$

Then $\{x_n\}$ converges strongly to $q \in F = \text{Fix}(S) \cap \Omega \cap A^{-1}0$, which solves the following VIP:

$$\langle q - f(q), J(q - p) \rangle \leq 0, \quad \forall p \in F. \quad (180)$$

Corollary 30. Under the same conditions as those in Corollary 25, let $\{x_n\}$ be the sequence generated from any given $x_0 \in C$ by

$$\begin{aligned} y_n &= \alpha_n f(x_n) + \beta_n x_n + \gamma_n J_{r_n} x_n + \delta_n S_n x_n, \\ x_{n+1} &= \sigma_n y_n + (1 - \sigma_n) ((1 - \alpha)I + \alpha V) y_n, \quad \forall n \geq 0. \end{aligned} \quad (181)$$

Then $\{x_n\}$ converges strongly to $q \in F = \bigcap_{i=0}^{\infty} \text{Fix}(S_i) \cap \text{Fix}(V) \cap A^{-1}0$, which solves the following VIP:

$$\langle q - f(q), J(q - p) \rangle \leq 0, \quad \forall p \in F. \quad (182)$$

Corollary 31. Under the same conditions as those in Corollary 26, let $\{x_n\}$ be the sequence generated from any given $x_0 \in C$ by

$$\begin{aligned} y_n &= \alpha_n f(x_n) + \beta_n x_n + \gamma_n J_{r_n} x_n + \delta_n S_n x_n, \\ x_{n+1} &= \sigma_n y_n + (1 - \sigma_n) ((1 - \alpha)I + \alpha V) y_n, \quad \forall n \geq 0. \end{aligned} \quad (183)$$

Then $\{x_n\}$ converges strongly to $q \in F = \text{Fix}(S) \cap \text{Fix}(V) \cap A^{-1}0$, which solves the following VIP:

$$\langle q - f(q), J(q - p) \rangle \leq 0, \quad \forall p \in F. \quad (184)$$

Remark 32. Our Theorem 28 improves, extends, supplements, and develops Cai and Bu [10, Theorem 3.1 and Corollary 3.2] and Jung [5, Theorems 3.1] in the following aspects.

(i) The problem of finding a point $q \in \bigcap_n \text{Fix}(S_n) \cap \Omega \cap A^{-1}0$ in our Theorem 28 is more general and more subtle than every one of both the problem of finding a point $q \in \bigcap_n \text{Fix}(S_n) \cap \Omega$ in Cai and Bu [10, Theorem 3.1] and the problem of finding a point $q \in A^{-1}0$ in Jung [5, Theorem 3.1].

(ii) Our Theorem 28 drops the assumption of the asymptotical regularity of $\{x_n\}$ in [5, Theorems 3.1] (i.e., $\lim_{n \rightarrow \infty} \|x_n - x_{n+1}\| = 0$).

(iii) Cai and Bu's proof in [10, Theorem 3.1] depends on the argument techniques in [13], inequality (21) in 2-uniformly smooth Banach spaces, and inequality (27) in smooth and uniform convex Banach spaces. Jung's proof in

[5, Theorem 3.1] depends on the resolvent identity in Proposition 1. It is worth emphasizing that the proof of our Theorem 28 does not depend on the argument techniques in [13], inequality (21) in 2-uniformly smooth Banach spaces, and inequality (27) in smooth and uniform convex Banach spaces. However, it depends on the resolvent identity in Proposition 1 and the inequalities in uniform convex Banach spaces; see Lemmas 13 and 17 in Section 2 of this paper.

(iv) The assumption of the uniformly convex and 2-uniformly smooth Banach space X in [10, Theorem 3.1] is weakened to the one of the uniformly convex Banach space X having a uniformly Gateaux differentiable norm in our Theorem 28.

(v) The iterative scheme in our Theorem 28 is very different from every one in both [10, Theorem 3.1] and [5, Theorem 3.1] because the first iteration step in the iterative scheme of [10, Theorem 3.1] is given by $y_n = \alpha_n f(x_n) + (1 - \alpha_n)\Pi_C(I - \mu_1 B_1)\Pi_C(I - \mu_2 B_2)x_n$ and the first iteration step in the iterative scheme of [5, Theorem 3.1] is given by $y_n = \alpha_n f(x_n) + (1 - \alpha_n)J_{r_n}x_n$. In the meantime, it is clear that the second iteration steps for x_{n+1} in three iterative schemes are completely different.

(vi) The problem of finding a point $q \in \text{Fix}(S) \cap \Omega$ in [10, Corollary 3.2] is extended to develop the problem of finding a point $q \in \text{Fix}(S) \cap \Omega \cap A^{-1}0$ in our Corollary 29.
