This paper is concerned with partial regularity to nonlinear subelliptic systems with Dini continuous coefficients under quadratic controllable growth conditions in the Heisenberg group $\mathbb{H}^n$. Based on a generalization of the technique of $\mathcal{A}$ -harmonic approximation introduced by Duzaar and Steffen, partial regularity to the sub-elliptic system is established in the Heisenberg group. Our result is optimal in the sense that in the case of Hölder continuous coefficients we establish the optimal Hölder exponent for the horizontal gradients of the weak solution on its regular set.

1. Introduction and Statements of Main Results

In this paper, we are concerned with partial regularity of weak solutions to nonlinear sub-elliptic systems of equations of second order in the Heisenberg group $\mathbb{H}^n$ in divergence form, and more precisely, we consider the following systems:

$$-\sum_{i=1}^{2n} X_i A_i^\alpha(\xi, u(\xi), Xu(\xi)) = B^\alpha(\xi, u(\xi), Xu(\xi)) \quad \text{in } \Omega, \quad (1)$$

where Ω is a bounded domain in $\mathbb{H}^n$, $X = \{X_1, \dots, X_{2n}\}$, the definition of X_i ($i = 1, \dots, 2n$) is to be seen in the next section (11), $u = (u^1, \dots, u^N) : \Omega \rightarrow \mathbb{R}^N$, $A_i^\alpha(\xi, u, p) : \mathbb{R}^{2n+1} \times \mathbb{R}^N \times \mathbb{R}^{2nN} \rightarrow \mathbb{R}^{2nN}$, and $B^\alpha(\xi, u, p) : \mathbb{R}^{2n+1} \times \mathbb{R}^N \times \mathbb{R}^{2nN} \rightarrow \mathbb{R}^N$.

Under the coefficients A_i^α assumed to be Dini continuous, the aim of this paper is to establish optimal partial regularity to the sub-elliptic system (1) in the Heisenberg group $\mathbb{H}^n$. Comparing Hölder continuous coefficients (see [1, 2] for the case of sub-elliptic systems), such assumption is weaker. More precisely, we assume for the continuity of A_i^α with respect to the variables (ξ, u) that

$$\begin{aligned} & (1 + |p|)^{-1} |A_i^\alpha(\xi, u, p) - A_i^\alpha(\tilde{\xi}, \tilde{u}, p)| \\ & \leq \kappa(|u|) \mu(d(\xi, \tilde{\xi}) + |u - \tilde{u}|) \end{aligned} \quad (2)$$

for all $\xi, \tilde{\xi} \in \Omega$, $u, \tilde{u} \in \mathbb{R}^N$, and $p \in \mathbb{R}^{2nN}$, where $\kappa : (0, +\infty) \rightarrow [1, +\infty)$ is monotone nondecreasing and $\mu : (0, +\infty) \rightarrow [0, +\infty)$ is monotone nondecreasing and concave with $\mu(0+) = 0$. We also required that $r \rightarrow r^{-\gamma} \mu(r)$ be nonincreasing for some $\gamma \in (0, 1)$ and that

$$M(r) = \int_0^r \frac{\mu(\rho)}{\rho} d\rho < \infty \quad \text{for some } r > 0. \quad (3)$$

We adopt the method of $\mathcal{A}$ -harmonic approximation to the case of sub-elliptic systems in the Heisenberg groups and establish the optimal partial regularity result. Roughly speaking, assume additionally to the standard hypotheses (see precisely (H1), (H2), and (H4)) that $(1 + |p|)^{-1} A_i^\alpha(\xi, u, p)$ satisfies (2) and (3). Let $u \in HW^{1,2}(\Omega, \mathbb{R}^N)$ be a weak solution of the sub-elliptic system (1). Then, u is of class C^1 outside a closed singular set $\text{Sing} u \subset \Omega$ of the Haar measure 0. Furthermore, for $\xi_0 \in \Omega \setminus \text{Sing} u$, the derivative Xu of u has the modulus of continuity $r \rightarrow M(r)$ in a neighborhood of ξ_0 . Our result is optimal in the sense that in the case $\mu(r) = r^\gamma$, $0 < \gamma < 1$, we have $M(r) = \gamma^{-1} r^\gamma$ Hölder continuity $\Gamma^{1,\gamma}$ to be optimal in that case.

As is well known, even under reasonable assumptions on A_i^α and B^α of the systems of equations, one cannot, in general, expect that weak solutions of (1) will be classical, that is, C^2 -solutions. This was first shown by de Giorgi [3];

we also refer the reader to Giaquinta [4] and Chen and Wu [5] for further discussion and additional examples. Then, the goal is to establish partial regularity theory. Moreover, a new method called $\mathcal{A}$ -harmonic approximation technique is introduced by Duzaar and Steffen in [6] and simplified by Duzaar and Grotowski in [7] to study elliptic systems with quadratic growth case. Then, similar results have been proved for more general A_i^α or B^α in the Euclidean setting; see [8–11] for Hölder continuous coefficients and [12–15] for Dini continuous coefficients.

However, turning to sub-elliptic equations and systems in the Heisenberg groups $\mathbb{H}^n$, some new difficulties will arise. Already in the first step, trying to apply the standard difference quotient method, the main difference between Euclidean $\mathbb{R}^n$ and Heisenberg groups $\mathbb{H}^n$ becomes clear. Any time we use horizontal difference quotients (i.e., in the directions X_i), extra terms with derivatives in the T direction will arise due to noncommutativity (see (12)), but these cannot be controlled by using the initial assumptions on the weak solution. Several results were focused on those equations which have a bearing on basic vector fields on the Heisenberg group or, more generally, the Carnot group. Capogna [16, 17] studied the regularities for weak solutions to quasi-linear equations. Concretely, by a technique combining fractional difference quotients and fractional derivatives defined by Fourier transform, differentiability in the nonhorizontal direction, $W^{2,2}$ estimate, and C^∞ continuity of weak solutions are obtained; see [16] for the case of Heisenberg groups and [17] for Carnot groups. To sub-elliptic p -Laplace equations in Heisenberg groups, Marchi in [18–20] showed that $Tu \in L_{\text{loc}}^p$ and $X^2u \in L_{\text{loc}}^2$ for $1 + (1/\sqrt{5}) < p < 1 + \sqrt{5}$ by using theories of Besov space and Bessel potential space. Domokos in [21, 22] improved these results for $1 < p < 4$ employing the A. Zygmund theory related to vector fields. Recently, by meticulous arguments, Manfredi and Mingione in [23] and Mingione et al. in [24] proved Hölder regularity with regard to full Euclidean gradient for weak solutions and further C^∞ continuity under the coefficients assumed to be smooth.

While regularities for weak solutions to sub-elliptic systems concerning vector fields are more complicated, Capogna and Garofalo in [25] showed the partial Hölder regularity for the horizontal gradient of weak solutions to quasilinear sub-elliptic systems $-\sum_{i=1}^k X_i(A_i^\alpha(\xi, u)X_ju) = B^\alpha(\xi, u, Xu)$ with X_i, X_j ($i, j = 1, \dots, k$) being horizontal vector fields in Carnot groups of step two, where A_i^α and B^α satisfy the quadratic structure conditions. Their way relies mainly on generalization of classical direct method in the Euclidean setting. Shores in [26] considered a homogeneous quasilinear system $-\sum_{i=1}^k X_i(A_i^\alpha(\xi, u)X_ju) = 0$ in the Carnot group with general step, where A_i^α also satisfies the quadratic growth condition. She established higher differentiability and smoothness for weak solutions of the system with constant coefficients and deduced partial regularity for weak solutions of the original system. With respect to the case of non-quadratic growth, Föglein in [27] treated the homogeneous nonlinear system $-\sum_{i=1}^{2n} X_i A_i^\alpha(\xi, Xu) = 0$ in the Heisenberg group under superquadratic structure conditions. She got

a priori estimates for weak solutions of the system with constant coefficients and partial regularity for the horizontal gradient of weak solutions to the initial system. Later, Wang and Niu [1] and Wang and Liao [2] treated more general nonlinear sub-elliptic system in the Carnot groups under superquadratic growth conditions and subquadratic growth conditions, respectively.

The regularity results for sub-elliptic systems mentioned above require Hölder continuity with respect to the coefficients A_i^α . When the assumption of Hölder continuity on A_i^α is weakened to Dini continuity, how to establish partial regularity of weak solutions to nonlinear sub-elliptic systems in the Heisenberg group. This paper is devoted to this topic. To define weak solution to (1), we assume the following structure conditions on A_i^α and B^α .

(H1) $A_i^\alpha(\xi, u, p)$ is differentiable in p , and there exist some constants L such that

$$\left| A_{i,p_\beta}^\alpha(\xi, u, p) \right| \leq L, \quad (\xi, u, p) \in \Omega \times \mathbb{R}^N \times \mathbb{R}^{2nN}. \quad (4)$$

Here, we write down $A_{i,p_\beta}^\alpha(\xi, u, p) = (\partial A_i^\alpha(\xi, u, p) / \partial p_\beta^j)$.

(H2) $A_i^\alpha(\xi, u, p)$ is uniformly elliptic; that is, for some $\lambda > 0$, we have

$$A_{i,p_\beta}^\alpha(\xi, u, p) \eta_i^\alpha \eta_j^\beta \geq \lambda |\eta|^2, \quad \forall \eta \in \mathbb{R}^{2nN}. \quad (5)$$

(H3) There exist a modulus of continuity $\mu : (0, +\infty) \rightarrow [0, +\infty)$ and a nondecreasing function $\kappa : [0, +\infty) \rightarrow [1, +\infty)$ such that

$$(1 + |p|)^{-1} \left| A_i^\alpha(\xi, u, p) - A_i^\alpha(\tilde{\xi}, \tilde{u}, p) \right| \leq \kappa(|u|) \mu(d(\xi, \tilde{\xi}) + |u - \tilde{u}|). \quad (6)$$

(H4) B^α satisfies quadratic controllable growth condition

$$|B^\alpha(\xi, u, p)| \leq C \left(1 + |u|^{r-1} + |p|^{2(1-1/r)} \right), \quad (7)$$

where $r = 2Q/(Q-2)$ because $Q > 2$; see (16).

Without loss of generality, we can assume that $\kappa \geq 1$ and the following.

(μ1) μ is nondecreasing with $\mu(0+) = 0$.

(μ2) μ is concave; in the proof of the regularity theorem, we have to require that $r \rightarrow r^{-\gamma} \mu(r)$ is nonincreasing for some exponent $\gamma \in (0, 1)$. We also require Dini's condition (2) which was already mentioned in the introduction.

(μ3) $M(r) = \int_0^r (\mu(\rho)/\rho) d\rho < \infty$ for some $r > 0$.

In the present paper, we will apply the method of $\mathcal{A}$ -harmonic approximation adapting to the setting of Heisenberg groups to study partial regularity for the system (1). Since

basic vector fields X_i of Lie algebras corresponding to the Heisenberg group are more complicated than gradient vector fields in the Euclidean setting, we have to find a different auxiliary function in proving Caccioppoli type inequality. Besides, the nonhorizontal derivatives of weak solutions will happen in the Taylor type formula in the Heisenberg group and cannot be effectively controlled in the present hypotheses. So, the method employing Taylor's formula in [12] is not appropriate in our setting. In order to obtain the desired decay estimate, we use the Poincaré type inequality in [28] as a replacement. And we obtain the following main result.

Theorem 1. Assume that coefficients A_i^α and B^α satisfy (H1)–(H4), $(\mu 1)$ – $(\mu 3)$ and that $u \in HW^{1,2}(\Omega, \mathbb{R}^N)$ is a weak solution to the system (1); that is,

$$\int_{\Omega} A_i^\alpha(\xi, u, Xu) X_i \phi^\alpha d\xi = \int_{\Omega} B^\alpha(\xi, u, Xu) \phi^\alpha d\xi \quad (8)$$

$$\forall \phi \in C_0^\infty(\Omega, \mathbb{R}^N).$$

Then, there exists a relatively closed set $\text{Sing } u \subset \Omega$ such that $u \in C^1(\Omega \setminus \text{Sing } u, \mathbb{R}^N)$. Furthermore, $\text{Sing } u \subset \Sigma_1 \cup \Sigma_2$ and $\text{Haar meas}(\Omega \setminus \text{Sing } u) = 0$, where

$$\Sigma_1 = \left\{ \xi_0 \in \Omega : \sup_{r>0} \left(|u_{\xi_0, r}| + |(Xu)_{\xi_0, r}| \right) = \infty \right\},$$

$$\Sigma_2 = \left\{ \xi_0 \in \Omega : \lim_{r \rightarrow 0^+} \inf |B_r(\xi_0)|_{\mathbb{H}^n}^{-1} \right. \quad (9)$$

$$\left. \times \int_{B_r(\xi_0)} |Xu - (Xu)_{\xi_0, r}|^2 d\xi > 0 \right\}.$$

In addition, for $\tau \in [\gamma, 1)$ and $\xi_0 \in \Omega \setminus \text{Sing } u$, the derivative Xu has the modulus of continuity $r \rightarrow r^\tau + M(r)$ in a neighborhood of ξ_0 .

2. Preliminaries

The Heisenberg group $\mathbb{H}^n$ is defined as $\mathbb{R}^{2n+1}$ endowed with the following group multiplication:

$$\cdot : \mathbb{H}^n \times \mathbb{H}^n \longrightarrow \mathbb{H}^n,$$

$$((\xi^1, t), (\tilde{\xi}^1, \tilde{t})) \mapsto \left(\xi^1 + \tilde{\xi}^1, t + \tilde{t} + \frac{1}{2} \sum_{i=1}^n (x_i \tilde{y}_i - \tilde{x}_i y_i) \right), \quad (10)$$

for all $\xi = (\xi^1, t) = (x_1, x_2, \dots, x_n, y_1, y_2, \dots, y_n, t)$, $\tilde{\xi} = (\tilde{\xi}^1, \tilde{t}) = (\tilde{x}_1, \tilde{x}_2, \dots, \tilde{x}_n, \tilde{y}_1, \tilde{y}_2, \dots, \tilde{y}_n, \tilde{t})$. This multiplication corresponds to addition in Euclidean $\mathbb{R}^{2n+1}$. Its neutral element is $(0, 0)$, and its inverse to (ξ^1, t) is given by $(-\xi^1, -t)$. Particularly, the mapping $(\xi, \tilde{\xi}) \mapsto \xi \cdot \tilde{\xi}^{-1}$ is smooth, so $(\mathbb{H}^n, \cdot)$ is a Lie group.

The basic vector corresponding to its Lie algebra can be explicitly calculated by the exponential map and is given by

$$X_i = \frac{\partial}{\partial x_i} - \frac{y_i}{2} \frac{\partial}{\partial t}, \quad X_{i+n} = \frac{\partial}{\partial y_i} + \frac{x_i}{2} \frac{\partial}{\partial t}, \quad T = \frac{\partial}{\partial t} \quad (11)$$

for $i = 1, 2, \dots, n$, and note that the special structure of the commutators:

$$[X_i, X_{i+n}] = -[X_{i+n}, X_i] = T, \quad \text{else } [X_i, X_j] = 0, \quad (12)$$

$$[T, T] = [T, X_i] = 0,$$

that is, $(\mathbb{H}^n, \cdot)$, is a nilpotent Lie group of step 2. $X = (X_1, \dots, X_{2n})$ is called the horizontal gradient and T the vertical derivative.

The pseudonorm is defined by

$$\|(\xi^1, t)\| = \left(|\xi^1|^4 + t^2 \right)^{1/4}, \quad (13)$$

and the metric induced by this pseudonorm is given by

$$d(\tilde{\xi}, \xi) = \|\xi^{-1} \cdot \tilde{\xi}\|. \quad (14)$$

The measure used on $\mathbb{H}^n$ is Haar measure, and the volume of the pseudoball $B_R(\xi_0) = \{\xi \in \mathbb{H}^n : d(\xi_0, \xi) < R\}$ is given by

$$|B_R(\xi_0)|_{\mathbb{H}^n} = R^{2n+2} |B_1(\xi_0)|_{\mathbb{H}^n} \triangleq \omega_n R^{2n+2}. \quad (15)$$

The number

$$Q = 2n + 2 \quad (16)$$

is called the homogeneous dimension of $\mathbb{H}^n$.

The horizontal Sobolev spaces $HW^{1,p}(\Omega)$ ($1 \leq p < \infty$) are defined as

$$HW^{1,p}(\Omega) = \{u \in L^p(\Omega) : X_i u \in L^p(\Omega), \quad (17)$$

$$i = 1, 2, \dots, 2n\}.$$

Then, $HW^{1,p}(\Omega)$ is a Banach space with the norm

$$\|u\|_{HW^{1,p}(\Omega)} = \|u\|_{L^p(\Omega)} + \sum_{i=1}^{2n} \|X_i u\|_{L^p(\Omega)}. \quad (18)$$

$HW_0^{1,p}(\Omega)$ is the completion of $C_0^\infty(\Omega)$ under norm (18).

Lu [28] showed the following Poincaré type inequality related to Hörmander's vector fields for $u \in HW^{1,q}(B_R(\xi_0))$, $1 < q < Q$, $1 \leq p \leq qQ/(Q - q)$:

$$\left(\oint_{B_R(\xi_0)} |u - u_{\xi_0, R}|^p d\xi \right)^{1/p} \leq C_p R \left(\oint_{B_R(\xi_0)} |Xu|^q d\xi \right)^{1/q}, \quad (19)$$

where we write down $\oint_{B_R(\xi_0)} u d\xi = |B_R(\xi_0)|_{\mathbb{H}^n}^{-1} \int_{B_R(\xi_0)} u d\xi$ here and there. Note the fact that the horizontal vectors X_i defined

in (11) fit Hörmander's vector fields and that (19) is valid for $p = q = 2$.

Following [12], for technical convenience, letting $\eta(t) = \mu^2(\sqrt{2}t)$, we have the corresponding properties for η : ($\eta 1$) η is continuous, nondecreasing and $\eta(0) = 0$; ($\eta 2$) η is concave, and $r \rightarrow r^{-\gamma}\eta(r)$ is nonincreasing for some exponent $\gamma \in (0, 1)$; ($\eta 3$) $H(r) := 4M^2(\sqrt{2}r) = [\int_0^r (\sqrt{\eta}(\rho)/\rho)d\rho]^2 < \infty$ for some $r > 0$. Changing κ by a constant, but keeping $\kappa \geq 1$, we may assume the following: ($\eta 4$) $\eta(1) = 1$, implying $\eta(t) \geq t$ for $t \in [0, 1]$. Also note that it implies that from ($\eta 2$) and ($\eta 4$), $\eta(t) \leq (\gamma^2/4)H(t)$ for all $t \geq 0$.

Furthermore, the following inequality holds:

$$s\eta(t) \leq s\eta(s) + t, \quad s \in [0, 1], \quad t > 0. \quad (20)$$

The condition (H3) becomes

$$\begin{aligned} & |A_i^\alpha(\xi, u, p) - A_i^\alpha(\tilde{\xi}, \tilde{u}, \tilde{p})| \\ & \leq \kappa(|u|) \sqrt{\eta}(d^2(\xi, \tilde{\xi}) + |u - \tilde{u}|^2)(1 + |p|). \end{aligned} \quad (21)$$

Moreover, we deduce the existence of a nonnegative modulus of continuity with $\omega(t, 0) = 0$ for all t such that $\omega(s, t)$ is nondecreasing with respect to t for fixed s and $\omega^2(s, t)$ is concave and nondecreasing with respect to s for fixed t . Also, we have for $|u| + |Xu| \leq M$,

$$\begin{aligned} & |A_{i,p_\beta}^\alpha(\xi, u, p) - A_{i,p_\beta}^\alpha(\tilde{\xi}, \tilde{u}, \tilde{p})| \\ & \leq \omega(M, d^2(\xi, \tilde{\xi}) + |u - \tilde{u}|^2 + |p - \tilde{p}|^2). \end{aligned} \quad (22)$$

Using (H1) and (H2), we see that

$$|A_i^\alpha(\xi, u, p) - A_i^\alpha(\xi, u, \tilde{p})| \leq L|p - \tilde{p}|, \quad (23)$$

$$(A_i^\alpha(\xi, u, p) - A_i^\alpha(\xi, u, \tilde{p}))(p - \tilde{p}) \geq \lambda|p - \tilde{p}|^2. \quad (24)$$

In the sequel, the constant C may vary from line to line.

3. Caccioppoli Type Inequality

In this section, we present the following $\mathcal{A}$ -harmonic approximation lemma in the Heisenberg group introduced by Föglein [27] with $p = 2$ as a special case and prove a Caccioppoli type inequality in our setting.

Lemma 2. *Let λ and L be fixed positive numbers and $n, N \in \mathbb{N}$ with $n \geq 2$. If for any given $\varepsilon > 0$, there exists $\delta = \delta(n, N, \lambda, \varepsilon) \in (0, 1]$ with the following properties:*

(I) *for any $\mathcal{A} \in \text{Bil}(\mathbb{R}^{2nN})$ satisfying*

$$\mathcal{A}(\nu, \nu) \geq \lambda|\nu|^2, \quad \mathcal{A}(\nu, \bar{\nu}) \leq L|\nu||\bar{\nu}|, \quad \nu, \bar{\nu} \in \mathbb{R}^{2nN}, \quad (25)$$

(II) *for any $w \in HW^{1,2}(B_\rho(\xi_0), \mathbb{R}^N)$ satisfying*

$$\begin{aligned} & \oint_{B_\rho(\xi_0)} |Xw|^2 d\xi \leq 1, \\ & \left| \oint_{B_\rho(\xi_0)} \mathcal{A}(Xw, X\varphi) d\xi \right| \leq \delta \sup_{B_\rho(\xi_0)} |X\varphi|, \\ & \forall \varphi \in C_0^1(B_\rho(\xi_0), \mathbb{R}^N), \end{aligned} \quad (26)$$

then, there exists an $\mathcal{A}$ -harmonic function h such that

$$\oint_{B_\rho(\xi_0)} |Xh|^2 d\xi \leq 1, \quad \rho^{-2} \oint_{B_\rho(\xi_0)} |h - w|^2 d\xi \leq \varepsilon. \quad (27)$$

Föglein [27] established a priori estimate for the weak solution u to homogeneous sub-elliptic systems with constant coefficients in the Heisenberg group (also see [25] for Carnot groups of step 2). We list it as follows:

$$\sup_{B_{\rho/2}(\xi_0)} (|u|^2 + \rho^2 |Xu|^2 + \rho^4 |X^2 u|^2) \leq C_0 \oint_{B_\rho(\xi_0)} |Xu|^2 d\xi. \quad (28)$$

In what follows, we let $\rho_1(s, t) = (1 + s + t)^{-1} \kappa(s + t)^{-1}$ and $K_1(s, t) = (1 + t)^4 \kappa(s + t)^4$ for $s, t \geq 0$. Note that $\rho_1 \leq 1$ and that $s \rightarrow \rho_1(s, t), t \rightarrow \rho_1(s, t)$ are nonincreasing functions.

Lemma 3. *Let $u \in HW^{1,2}(\Omega, \mathbb{R}^N)$ be a weak solution to the system (1) under the conditions (H1)–(H4), ($\mu 1$)–($\mu 3$). Then, for every $\xi_0 = (x_1^0, x_2^0, \dots, x_n^0, y_1^0, y_2^0, \dots, y_n^0, t) \in \Omega$, $u_0 \in \mathbb{R}^N$, $p_0 \in \mathbb{R}^{2nN}$, and $0 < \rho < R < \rho_1(|u_0|, |p_0|) \leq 1$ such that $B_R(\xi_0) \subset \subset \Omega$, the inequality*

$$\begin{aligned} & \int_{B_\rho(\xi_0)} |Xu - p_0|^2 d\xi \\ & \leq C_c \left[\frac{1}{(R - \rho)^2} \int_{B_R(\xi_0)} |u - u_0 - (\xi^1 - \xi_0^1) p_0|^2 d\xi + F \right] \end{aligned} \quad (29)$$

holds, where $\xi^1 = (x_1, x_2, \dots, x_n, y_1, y_2, \dots, y_n)$ is the horizontal component of $\xi = (\xi^1, t) \in \Omega$ and

$$\begin{aligned} & F = \omega_n R^Q K_1(|u_0|, |p_0|) \eta(R^2) \\ & + \left[\int_{B_R(\xi_0)} (1 + u^r + |Xu|^2) d\xi \right]^{2(1-1/r)}. \end{aligned} \quad (30)$$

Proof. Let $v = u - u_0 - (\xi^1 - \xi_0^1) p_0$. Take a test function $\varphi = \phi^2 v$ in (8) with $\phi \in C_0^\infty(B_R(\xi_0), \mathbb{R}^N)$ satisfying $0 \leq \phi \leq 1$, $|\nabla \phi| \leq C/(R - \rho)$, and $\phi \equiv 1$ on $B_\rho(\xi_0)$. Then, we have $Xv = Xu - p_0$, $|X\varphi| \leq \phi|Xu - p_0| + C/(R - \rho)|v|$, and

$$\begin{aligned} & \int_{B_R(\xi_0)} A_i^\alpha(\xi, u, Xu) \phi^2 (Xu - p_0) d\xi \\ & = -2 \int_{B_R(\xi_0)} \phi X\phi A_i^\alpha(\xi, u, Xu) v d\xi \\ & + \int_{B_R(\xi_0)} B^\alpha(\xi, u, Xu) \varphi^\alpha d\xi. \end{aligned} \quad (31)$$

Adding this to the equations

$$\begin{aligned}
 & - \int_{B_R(\xi_0)} A_i^\alpha(\xi, u, p_0) \phi^2(Xu - p_0) d\xi \\
 & = 2 \int_{B_R(\xi_0)} \phi X \phi A_i^\alpha(\xi, u, p_0) v d\xi \\
 & \quad - \int_{B_R(\xi_0)} A_i^\alpha(\xi, u, p_0) X \phi^\alpha d\xi, \\
 & 0 = \int_{B_R(\xi_0)} A_i^\alpha(\xi_0, u_0, p_0) X \phi^\alpha.
 \end{aligned} \tag{32}$$

It follows that by using the hypotheses (H1), (H3) (i.e., (23), (21), resp.), and (H4),

$$\begin{aligned}
 & \int_{B_R(\xi_0)} [A_i^\alpha(\xi, u, Xu) \\
 & \quad - A_i^\alpha(\xi, u, p_0)] \phi^2(Xu - p_0) d\xi \\
 & = 2 \int_{B_R(\xi_0)} [A_i^\alpha(\xi, u, p_0) \\
 & \quad - A_i^\alpha(\xi, u, Xu)] \phi v X \phi d\xi \\
 & \quad + \int_{B_R(\xi_0)} [A_i^\alpha(\xi, u_0 + (\xi^1 - \xi_0^1) p_0, p_0) \\
 & \quad - A_i^\alpha(\xi, u, p_0)] X \phi^\alpha d\xi \\
 & \quad + \int_{B_R(\xi_0)} [A_i^\alpha(\xi_0, u_0, p_0) \\
 & \quad - A_i^\alpha(\xi, u_0 + (\xi^1 - \xi_0^1) p_0, p_0)] X \phi^\alpha d\xi \\
 & \quad + \int_{B_R(\xi_0)} B^\alpha(\xi, u, Xu) \phi^\alpha d\xi \\
 & \leq I + II + III + IV + V,
 \end{aligned} \tag{33}$$

where

$$\begin{aligned}
 I & = 2L \int_{B_R(\xi_0)} |Xu - p_0| |\phi| |v| |X\phi| d\xi, \\
 II & = (1 + |p_0|) \kappa(|u_0| + R|p_0|) \\
 & \quad \times \int_{B_R(\xi_0)} \sqrt{\eta}(|v|^2) |Xu - p_0| \phi^2 d\xi,
 \end{aligned}$$

$$\begin{aligned}
 III & = 2(1 + |p_0|) \kappa(|u_0| + R|p_0|) \\
 & \quad \times \int_{B_R(\xi_0)} \sqrt{\eta}(|v|^2) |v| |X\phi| |\phi| d\xi,
 \end{aligned}$$

$$\begin{aligned}
 IV & = (1 + |p_0|) \kappa(|u_0| + R|p_0|) \\
 & \quad \times \int_{B_R(\xi_0)} \sqrt{\eta}(R^2(1 + |p_0|^2)) [|Xu - p_0| \phi^2 \\
 & \quad + 2|\phi| |v| |X\phi|] d\xi,
 \end{aligned}$$

$$V = C \int_{B_R(\xi_0)} (1 + |u|^{r-1} + |Xu|^{2(1-1/r)}) \phi d\xi. \tag{34}$$

Applying (H2), the left hand side of (33) can be estimated as

$$\begin{aligned}
 & \lambda \int_{B_R(\xi_0)} |Xu - p_0|^2 \phi^2 d\xi \\
 & \leq \int_{B_R(\xi_0)} [A_i^\alpha(\xi, u, Xu) - A_i^\alpha(\xi, u, p_0)] \phi^2(Xu - p_0) d\xi.
 \end{aligned} \tag{35}$$

For $\varepsilon > 0$ to be fixed later, we have, using Young's inequality,

$$I \leq \varepsilon \int_{B_R(\xi_0)} |Xu - p_0|^2 |\phi|^2 d\xi + \frac{CL^2}{(R - \rho)^2} \int_{B_R(\xi_0)} |v|^2 d\xi. \tag{36}$$

Using Jensen's inequality, (20), and the fact that $\eta(ts) \leq t\eta(s)$ for $t \geq 1$, we arrive at

$$\begin{aligned}
 & (1 + |p_0|)^2 \kappa^2(\cdot) \int_{B_R(\xi_0)} \eta(|v|^2) d\xi \\
 & \leq \omega_n R^{Q-2} (1 + |p_0|)^2 \kappa^2(\cdot) R^2 \eta \left(\oint_{B_R(\xi_0)} |v|^2 d\xi \right) \\
 & \leq \omega_n R^{Q-2} \left[\oint_{B_R(\xi_0)} |v|^2 d\xi \right. \\
 & \quad \left. + (1 + |p_0|)^2 \kappa^2(\cdot) R^2 \eta \right. \\
 & \quad \left. \times ((1 + |p_0|)^2 \kappa^2(\cdot) R^2) \right] \\
 & \leq R^{-2} \int_{B_R(\xi_0)} |v|^2 d\xi \\
 & \quad + \omega_n R^Q (1 + |p_0|)^4 \kappa^4(\cdot) \eta(R^2),
 \end{aligned} \tag{37}$$

where $\kappa(\cdot)$ is an abbreviation of the function $\kappa(|u_0| + |p_0|)$. Also, note that the application of (20) in the second last inequality is possible by our choice $R \leq \rho_1(|u_0| + |p_0|)$.

Using Young's inequality and (37) in II , we obtain

$$\begin{aligned}
 II &\leq \varepsilon \int_{B_R(\xi_0)} |Xu - p_0|^2 |\phi|^2 d\xi \\
 &\quad + \varepsilon^{-1} (1 + |p_0|)^2 \kappa^2(\cdot) \int_{B_R(\xi_0)} \eta(|v|^2) d\xi \\
 &\leq \varepsilon \int_{B_R(\xi_0)} |Xu - p_0|^2 |\phi|^2 d\xi \\
 &\quad + \frac{1}{\varepsilon(R-\rho)^2} \int_{B_R(\xi_0)} |v|^2 d\xi \\
 &\quad + \varepsilon^{-1} \omega_n R^Q (1 + |p_0|)^4 \kappa^4(\cdot) \eta(R^2).
 \end{aligned} \tag{38}$$

And similarly, we see

$$\begin{aligned}
 III &\leq \frac{4C}{(R-\rho)^2} \int_{B_R(\xi_0)} |v|^2 d\xi \\
 &\quad + (1 + |p_0|)^2 \kappa^2(\cdot) \int_{B_R(\xi_0)} \eta(|v|^2) d\xi \\
 &\leq \frac{C}{(R-\rho)^2} \int_{B_R(\xi_0)} |v|^2 d\xi \\
 &\quad + \omega_n R^Q (1 + |p_0|)^4 \kappa^4(\cdot) \eta(R^2), \\
 IV &\leq \varepsilon \int_{B_R(\xi_0)} |Xu - p_0|^2 |\phi|^2 d\xi \\
 &\quad + \frac{4C\varepsilon}{(R-\rho)^2} \int_{B_R(\xi_0)} |v|^2 d\xi \\
 &\quad + \varepsilon^{-1} \omega_n R^Q (1 + |p_0|)^2 \kappa^2(\cdot) \eta \\
 &\quad \times \left(\oint_{B_R(\xi_0)} R^2 (1 + |p_0|^2) d\xi \right) \\
 &\leq \varepsilon \int_{B_R(\xi_0)} |Xu - p_0|^2 |\phi|^2 d\xi \\
 &\quad + \frac{C\varepsilon}{(R-\rho)^2} \int_{B_R(\xi_0)} |v|^2 d\xi \\
 &\quad + \varepsilon^{-1} \omega_n R^Q (1 + |p_0|)^4 \kappa^4(\cdot) \eta(R^2).
 \end{aligned} \tag{39}$$

Here we have used $\kappa \geq 1$ in the last inequality.

By Hölder's inequality, (19), and Young's inequality, one gets

$$\begin{aligned}
 V &\leq C \left(\int_{B_R(\xi_0)} |\phi|^r d\xi \right)^{1/r} \\
 &\quad \times \left(\int_{B_R(\xi_0)} (1 + |u|^r + |Xu|^2) d\xi \right)^{(r-1)/r} \\
 &\leq C \left(\int_{B_R(\xi_0)} |X\phi|^2 d\xi \right)^{1/2} \\
 &\quad \times \left(\int_{B_R(\xi_0)} (1 + |u|^r + |Xu|^2) d\xi \right)^{(r-1)/r} \\
 &\leq \varepsilon \int_{B_R(\xi_0)} |X\phi|^2 d\xi + C(\varepsilon) \\
 &\quad \times \left(\int_{B_R(\xi_0)} (1 + |u|^r + |Xu|^2) d\xi \right)^{2(r-1)/r} \\
 &\leq \varepsilon \int_{B_R(\xi_0)} |Xu - p_0|^2 |\phi|^2 d\xi \\
 &\quad + \frac{C\varepsilon}{(R-\rho)^2} \int_{B_R(\xi_0)} |v|^2 d\xi \\
 &\quad + C(\varepsilon) \left(\int_{B_R(\xi_0)} (1 + |u|^r + |Xu|^2) d\xi \right)^{2(r-1)/r},
 \end{aligned} \tag{40}$$

where we have used the fact that $|X\phi| \leq \phi|Xu - p_0| + C/(R-\rho)|v|$.

Applying these estimates to (37), we obtain

$$\begin{aligned}
 &(\lambda - 4\varepsilon) \int_{B_R(\xi_0)} |Xu - p_0|^2 \phi^2 d\xi \\
 &\leq \frac{C(L, \varepsilon)}{(R-\rho)^2} \int_{B_R(\xi_0)} |v|^2 d\xi \\
 &\quad + (\varepsilon^{-1} + 2) \omega_n R^Q (1 + |p_0|)^4 \kappa^4(\cdot) \eta(R^2) \\
 &\quad + C(\varepsilon) \left(\int_{B_R(\xi_0)} (1 + |u|^r + |Xu|^2) d\xi \right)^{2(r-1)/r}.
 \end{aligned} \tag{41}$$

Choosing $\varepsilon = \lambda/8$, we obtain the desired inequality (29). $\square$

4. Proof of the Main Theorem

In this section, we will complete the proof of the partial regularity results via the following lemmas. In the sequel, we always suppose that $u \in HW^{1,2}(\Omega, \mathbb{R}^N)$ is a weak solution to (1) with the assumptions of (H1)–(H4) and $(\mu 1)$ – $(\mu 3)$.

Lemma 4. Let $B_\rho(\xi_0) \subset \subset \Omega$ with $\rho \leq \rho_1(|u_0|, |p_0|)$ and $\varphi \in C_0^\infty(B_\rho(\xi_0), \mathbb{R}^N)$ satisfying $|\varphi| \leq \rho^2$ and $\sup_{B_\rho(\xi_0)} |X\varphi| \leq 1$. Then, there exists a constant $C_1 \geq 1$ such that

$$\begin{aligned} & \oint_{B_\rho(\xi_0)} A_{i,p_\beta}^\alpha(\xi_0, u_0, p_0)(Xu - p_0) X\varphi^\alpha d\xi \\ & \leq C_1 \left[\Phi(\xi_0, \rho, p_0) \right. \\ & \quad + \omega(|u_0| + |p_0|, \Phi(\xi_0, \rho, p_0)) \Phi^{1/2}(\xi_0, \rho, p_0) \\ & \quad \left. + K_1(|u_0|, |p_0|) \sqrt{\eta}(\rho^2) \right] \sup_{B_\rho(\xi_0)} |X\varphi|. \end{aligned} \quad (42)$$

Proof. Using the fact that $\int_{B_\rho(\xi_0)} A_i^\alpha(\xi_0, u_0, p_0) X\varphi^\alpha d\xi = 0$ and the weak form (8), we deduce

$$\begin{aligned} & \oint_{B_\rho(\xi_0)} \left[\int_0^1 A_{i,p_\beta}^\alpha(\xi_0, u_0, \theta Xu + (1-\theta)p_0) \right. \\ & \quad \left. \times (Xu - p_0) d\theta \right] X\varphi^\alpha d\xi \\ & = \oint_{B_\rho(\xi_0)} [A_i^\alpha(\xi_0, u_0, Xu) \\ & \quad - A_i^\alpha(\xi_0, u_0, p_0)] X\varphi^\alpha d\xi \\ & = \oint_{B_\rho(\xi_0)} [A_i^\alpha(\xi_0, u_0, Xu) \\ & \quad - A_i^\alpha(\xi, u, Xu)] X\varphi^\alpha d\xi \\ & \quad + \oint_{B_\rho(\xi_0)} B^\alpha(\xi, u, Xu) \varphi^\alpha d\xi. \end{aligned} \quad (43)$$

It yields

$$\begin{aligned} & \oint_{B_\rho(\xi_0)} A_{i,p_\beta}^\alpha(\xi_0, u_0, p_0)(Xu - p_0) X\varphi^\alpha d\xi \\ & = \oint_{B_\rho(\xi_0)} \left[\int_0^1 \left(A_{i,p_\beta}^\alpha(\xi_0, u_0, p_0) \right. \right. \\ & \quad \left. \left. - A_{i,p_\beta}^\alpha(\xi_0, u_0, \theta Xu + (1-\theta)p_0) \right) \right. \\ & \quad \left. \times (Xu - p_0) d\theta \right] d\xi \sup_{B_\rho(\xi_0)} |X\varphi| \\ & \quad + \oint_{B_\rho(\xi_0)} [A_i^\alpha(\xi_0, u_0, Xu) \end{aligned}$$

$$\begin{aligned} & -A_i^\alpha(\xi, u_0 + p_0(\xi - \xi_0), Xu)] \sup_{B_\rho(\xi_0)} |X\varphi| \\ & + \oint_{B_\rho(\xi_0)} [A_i^\alpha(\xi, u_0 + p_0(\xi - \xi_0), Xu) \\ & \quad - A_i^\alpha(\xi, u, Xu)] \sup_{B_\rho(\xi_0)} |X\varphi| \\ & + \oint_{B_\rho(\xi_0)} B^\alpha(\xi, u, Xu) \varphi^\alpha d\xi \\ & := I' + II' + III' + IV'. \end{aligned} \quad (44)$$

Using (22), Hölder's inequality, the fact that $t \rightarrow \omega^2(s, t)$ is concave, and Jensen's inequality, we have

$$\begin{aligned} I' & \leq \sup_{B_\rho(\xi_0)} |X\varphi| \oint_{B_\rho(\xi_0)} \omega(|u_0| + |p_0|, |Xu - p_0|^2) |Xu - p_0| d\xi \\ & \leq \sup_{B_\rho(\xi_0)} |X\varphi| \left[\oint_{B_\rho(\xi_0)} \omega^2(|u_0| + |p_0|, |Xu - p_0|^2) d\xi \right]^{1/2} \\ & \quad \times \left[\oint_{B_\rho(\xi_0)} |Xu - p_0|^2 d\xi \right]^{1/2} \\ & \leq \omega(|u_0| + |p_0|, \Phi(\xi_0, \rho, p_0)) \Phi^{1/2}(\xi_0, \rho, p_0) \sup_{B_\rho(\xi_0)} |X\varphi|. \end{aligned} \quad (45)$$

Similarly, using (21) and the fact that $\eta(ts) \leq t\eta(s)$ for $t \geq 1$, we obtain

$$\begin{aligned} II' & \leq \sup_{B_\rho(\xi_0)} |X\varphi| \kappa(\cdot) \sqrt{\eta}(\rho^2(1 + |p_0|^2)) \\ & \quad \times \oint_{B_\rho(\xi_0)} (1 + |Xu|) d\xi \\ & \leq \sup_{B_\rho(\xi_0)} |X\varphi| \kappa(\cdot) \sqrt{\eta}(\rho^2(1 + |p_0|)^2) \\ & \quad \times \oint_{B_\rho(\xi_0)} (1 + |p_0| + |Xu - p_0|) d\xi \\ & \leq \sup_{B_\rho(\xi_0)} |X\varphi| \left[\left(\oint_{B_\rho(\xi_0)} |Xu - p_0|^2 d\xi \right) \right. \\ & \quad \left. + \kappa^2(\cdot) (1 + |p_0|)^2 \eta(\rho^2) \right. \\ & \quad \left. + \kappa(\cdot) (1 + |p_0|)^3 \sqrt{\eta}(\rho^2) \right] \\ & \leq [\Phi(\xi_0, \rho, p_0) + 2\kappa^2(\cdot) (1 + |p_0|)^3 \sqrt{\eta}(\rho^2)] \\ & \quad \times \sup_{B_\rho(\xi_0)} |X\varphi|, \end{aligned} \quad (46)$$

where we have used the fact that $\eta(\rho^2) \leq \sqrt{\eta}(\rho^2)$ which follows from the nondecreasing property of the function $\eta(t)$, ($\eta 4$), and our assumption $\rho \leq \rho_1 \leq 1$.

In the same way, it follows that by using (21), (37), and (19),

$$\begin{aligned}
 III' &\leq \sup_{B_\rho(\xi_0)} |X\varphi| \kappa(\cdot) \oint_{B_\rho(\xi_0)} \sqrt{\eta}(|v|^2) (1 + |Xu|) d\xi \\
 &\leq \sup_{B_\rho(\xi_0)} |X\varphi| \left[\oint_{B_\rho(\xi_0)} |Xu - p_0|^2 d\xi \right. \\
 &\quad + \kappa^2(\cdot) \oint_{B_\rho(\xi_0)} \eta(|v|^2) d\xi \\
 &\quad \left. + \kappa(\cdot) (1 + |p_0|) \oint_{B_\rho(\xi_0)} \sqrt{\eta}(|v|^2) d\xi \right] \\
 &\leq \sup_{B_\rho(\xi_0)} |X\varphi| \left[\Phi(\xi_0, \rho, p_0) \right. \\
 &\quad + 2\rho^{-2} \oint_{B_\rho(\xi_0)} |v|^2 d\xi + \kappa^4(\cdot) \eta(\rho^2) \\
 &\quad \left. + \kappa^2(\cdot) (1 + |p_0|)^2 \sqrt{\eta}(\rho^2) \right] \\
 &\leq [(1 + 2C_p) \Phi(\xi_0, \rho, p_0) \\
 &\quad + 2\kappa^4(\cdot) (1 + |p_0|)^2 \sqrt{\eta}(\rho^2)] .
 \end{aligned} \tag{47}$$

Using Hölder's inequality, (19), and Young's inequality, we have

$$\begin{aligned}
 IV' &\leq C \oint_{B_\rho(\xi_0)} (1 + |u|^{r-1} + |Xu|^{2(1-1/r)}) |\varphi| d\xi \\
 &\leq C \oint_{B_\rho(\xi_0)} |Xu|^{2(1-1/r)} |\varphi| d\xi \\
 &\quad + C \oint_{B_\rho(\xi_0)} |u - u_0 - p_0(\xi^1 - \xi_0^1)|^{r-1} |\varphi| d\xi \\
 &\quad + C\rho^2 [1 + (|u_0| + |p_0|)^{r-1}] \\
 &\leq C \left(\oint_{B_\rho(\xi_0)} |Xu|^2 d\xi \right)^{(1-1/r)} \left(\oint_{B_\rho(\xi_0)} |\varphi|^r d\xi \right)^{1/r} \\
 &\quad + C \left(\oint_{B_\rho(\xi_0)} |u - u_0 - p_0(\xi^1 - \xi_0^1)|^r d\xi \right)^{(1-1/r)} \\
 &\quad \times \left(\oint_{B_\rho(\xi_0)} |\varphi|^r d\xi \right)^{1/r} \\
 &\quad + C\rho^2 [1 + (|u_0| + |p_0|)^{r-1}]
 \end{aligned}$$

$$\begin{aligned}
 &\leq C \left(\oint_{B_\rho(\xi_0)} |Xu|^2 d\xi \right)^{(1-1/r)} \left(\oint_{B_\rho(\xi_0)} |\varphi|^r d\xi \right)^{1/r} \\
 &\quad + \left(\oint_{B_\rho(\xi_0)} |Xu - p_0|^2 d\xi \right)^{(r/2)(1-1/r)} \\
 &\quad \times \left(\oint_{B_\rho(\xi_0)} |\varphi|^r d\xi \right)^{1/r} + C\rho^2 [1 + (|u_0| + |p_0|)^{r-1}] \\
 &\leq C\|u\|_{HW^{1,2}} \left(\oint_{B_\rho(\xi_0)} |Xu - p_0|^2 d\xi \right)^{(1-1/r)} \\
 &\quad \times \left(\oint_{B_\rho(\xi_0)} |\varphi|^r d\xi \right)^{1/r} + C\rho [1 + (|u_0| + |p_0|)^{r-1}] \\
 &\leq C\|u\|_{HW^{1,2}(B_\rho(\xi_0))} \left(\oint_{B_\rho(\xi_0)} |Xu - p_0|^2 d\xi \right) \\
 &\quad + C\rho^{2r} + C\rho^2 [1 + (|u_0| + |p_0|)^{r-1}] \\
 &\leq C_2 \Phi(\xi_0, \rho, p_0) + C\rho^2 (1 + |u_0| + |p_0|)^{r-1} \\
 &\leq C_2 \Phi(\xi_0, \rho, p_0) + C\kappa(\cdot) (1 + |u_0| + |p_0|)^2 \sqrt{\eta}(\rho^2),
 \end{aligned} \tag{48}$$

where we have used the assumption ($\eta 4$) and the fact that $r = 2Q/(Q-2) = (2n+4)/2n \leq 3$ and $C_2 = C\|u\|_{HW^{1,2}(B_\rho(\xi_0))} \geq 1$. Combining these estimates, we obtain the conclusion with $C_1 = (1 + C_2 + 2C_p) \geq 1$. $\square$

Lemma 5. Assume that the conditions of Lemma 2 and the following smallness conditions hold:

$$\begin{aligned}
 &\omega(|u_{\xi_0, \rho}| + |(Xu)_{\xi_0, \rho}|, \Phi(\xi_0, \rho, (Xu)_{\xi_0, \rho})) \\
 &\quad + \Phi^{1/2}(\xi_0, \rho, (Xu)_{\xi_0, \rho}) \leq \frac{\delta}{2},
 \end{aligned} \tag{49}$$

$$C_3 K_1^2(|u_{\xi_0, \rho}|, |(Xu)_{\xi_0, \rho}|) \eta(\rho^2) \leq \delta^2 \tag{50}$$

with $C_3 = 8C_1^2 C_5$, together with

$$\rho \leq \rho_1 (1 + |u_{\xi_0, \rho}|, 1 + |(Xu)_{\xi_0, \rho}|). \tag{51}$$

Then, the following growth condition holds for $\tau \in [\gamma, 1)$

$$\begin{aligned}
 \Phi(\xi_0, \theta\rho) &\leq \theta^{2\tau} \Phi(\xi_0, \rho) \\
 &\quad + K^*(|u_{\xi_0, 2\theta\rho}|, |(Xu)_{\xi_0, 2\theta\rho}|) \eta(\rho^2),
 \end{aligned} \tag{52}$$

where one abbreviates $\Phi(\xi_0, r) = \Phi(\xi_0, r, (Xu)_{\xi_0, r})$ and $K^*(s, t) = K(s, t) + (2 + s + t)^{2(r-1)}$ with $K(s, t) = (4\delta^{-2} + 2^Q C_c) K_1^2(1 + s, 1 + t)$.

Proof. We define $w = [u - u_{\xi_0, \rho} - p_0(\xi^1 - \xi_0^1)]\sigma^{-1}$, where

$$\sigma = C_1 \sqrt{\Phi(\xi_0, \rho, p_0) + 4\delta^{-2} K_1^2(|u_0|, |p_0|) \eta(\rho^2)}. \tag{53}$$

Then, we have $Xw = \sigma^{-1}(Xu - p_0)$. Now, we consider $B_\rho(\xi_0) \subset \subset \Omega$ such that $\rho \leq \rho_1(|u_0|, |p_0|)$. Applying Lemma 4 on $B_\rho(\xi_0)$ to u , we have for any $\varphi \in C_0^\infty(B_\rho(\xi_0), \mathbb{R}^N)$,

$$\oint_{B_\rho(\xi_0)} |Xw|^2 d\xi = \sigma^{-2} \Phi(\xi_0, \rho, p_0) \leq \frac{1}{C_1^2} \leq 1, \quad (54)$$

$$\begin{aligned} & \oint_{B_\rho(\xi_0)} A_{i,p_\beta}^\alpha(\xi_0, u_0, p_0) Xw X \varphi d\xi \\ & \leq \left[\Phi^{1/2}(\xi_0, \rho, p_0) \right. \\ & \quad \left. + \omega(|u_0| + |p_0|, \Phi(\xi_0, \rho, p_0)) + \frac{\delta}{2} \right] \sup_{B_\rho(\xi_0)} |X\varphi|. \end{aligned} \quad (55)$$

In consideration of the small condition (49), we see that (54) and (55) imply conditions (26) in Lemma 2. Also note that (H1) and (H3) imply condition (25). So, there exists an $A_{i,p_\beta}^\alpha(\xi_0, u_0, p_0)$ -harmonic function $h \in HW^{1,2}(B_\rho(\xi_0), \mathbb{R}^N)$ such that

$$\oint_{B_\rho(\xi_0)} |Xh|^2 d\xi \leq 1, \quad \rho^{-2} \oint_{B_\rho(\xi_0)} |w - h|^2 d\xi \leq \varepsilon. \quad (56)$$

Taking $u_0 = u_{\xi_0, 2\theta\rho}$, $\theta \in (0, 1/4]$ and replacing p_0 by $p_0 + \sigma(Xh)_{\xi_0, 2\theta\rho}$, we use Lemma 3 to obtain

$$\begin{aligned} & \int_{B_{2\theta\rho}(\xi_0)} |Xu - p_0 - \sigma(Xh)_{\xi_0, 2\theta\rho}|^2 d\xi \\ & \leq C_c \left[\frac{1}{(\theta\rho)^2} \int_{B_{2\theta\rho}(\xi_0)} |u - u_{\xi_0, 2\theta\rho} \right. \\ & \quad \left. - (p_0 + \sigma(Xh)_{\xi_0, 2\theta\rho}) \right. \\ & \quad \left. \times (\xi^1 - \xi_0^1)^2 d\xi + F \right], \end{aligned} \quad (57)$$

where

$$\begin{aligned} F &= \omega_n(2\theta\rho)^Q K_1(|u_{\xi_0, 2\theta\rho}|, |p_0 + \sigma(Xh)_{\xi_0, 2\theta\rho}|) \eta((2\theta\rho)^2) \\ &+ \left[\int_{B_{2\theta\rho}(\xi_0)} (1 + u^r + |Xu|^2) d\xi \right]^{2(1-1/r)}. \end{aligned} \quad (58)$$

Using the fact that $u - (p_0 + \sigma(Xh)_{\xi_0, 2\theta\rho})(\xi^1 - \xi_0^1)$ has mean value $u_{\xi_0, 2\theta\rho}$ on the ball $B_{2\theta\rho}(\xi_0)$, the definition of w , and (19), we have

$$\begin{aligned} & \frac{1}{(\theta\rho)^2} \oint_{B_{2\theta\rho}(\xi_0)} |u - u_{\xi_0, 2\theta\rho} - (p_0 + \sigma(Xh)_{\xi_0, 2\theta\rho})(\xi^1 - \xi_0^1)|^2 d\xi \\ & \leq \frac{4\sigma^2}{(2\theta\rho)^2} \oint_{B_{2\theta\rho}(\xi_0)} |w - h_{\xi_0, 2\theta\rho} \\ & \quad - (Xh)_{\xi_0, 2\theta\rho}(\xi^1 - \xi_0^1)|^2 d\xi \\ & \leq \frac{4\sigma^2}{(2\theta\rho)^2} \left[\oint_{B_{2\theta\rho}(\xi_0)} |w - h|^2 d\xi \right. \\ & \quad \left. + \oint_{B_{2\theta\rho}(\xi_0)} |h - h_{\xi_0, 2\theta\rho} \right. \\ & \quad \left. - (Xh)_{\xi_0, 2\theta\rho}(\xi^1 - \xi_0^1)|^2 d\xi \right] \\ & \leq 4\sigma^2 \left[(2\theta)^{-Q-2} \varepsilon + C_\rho \oint_{B_{2\theta\rho}(\xi_0)} |Xh - (Xh)_{\xi_0, 2\theta\rho}|^2 d\xi \right] \\ & \leq 4\sigma^2 \left[(2\theta)^{-Q-2} \varepsilon + C_\rho^2 (2\theta\rho)^2 \oint_{B_{2\theta\rho}(\xi_0)} |X^2 h|^2 d\xi \right] \\ & \leq 4\sigma^2 \left[(2\theta)^{-Q-2} \varepsilon + C_\rho^2 (2\theta)^2 C_0 \right] \\ & \leq C_4 (\theta^{-Q-2} \varepsilon + \theta^2) [\Phi(\xi_0, \rho, p_0) \\ & \quad + 4\delta^{-2} K_1^2(|u_{\xi_0, 2\theta\rho}|, |p_0|) \eta(\rho^2)], \end{aligned} \quad (59)$$

where $C_4 := C_4(Q, \lambda, L) \geq 1$. Note that in the second last inequality we have used the fact that

$$\begin{aligned} & \oint_{B_{2\theta\rho}(\xi_0)} |X^2 h| d\xi \leq \sup_{B_\rho(\xi_0)} |X^2 h| \\ & \leq C_0 \rho^{-2} \oint_{B_\rho(\xi_0)} |Xh|^2 d\xi \leq C_0 \rho^{-2}. \end{aligned} \quad (60)$$

In consideration of the fact that $r = 2Q/(Q-2) > 2$, $Q \geq 4$ and the assumptions $\theta \in (0, 1/4]$ and $\Phi \leq 1$, it follows that

$$\begin{aligned} & \left[\oint_{B_{2\theta\rho}(\xi_0)} (1 + u^r + |Xu|^2) d\xi \right]^{2(1-1/r)} \\ & \leq C \left[\oint_{B_{2\theta\rho}(\xi_0)} |Xu - p_0|^2 d\xi \right]^{2(1-1/r)} \\ & \quad + C \left(\oint_{B_{2\theta\rho}(\xi_0)} |Xu|^2 d\xi \right)^{r-1} \\ & \quad + (1 + |p_0|)^{4(1-1/r)} \end{aligned}$$

$$\begin{aligned}
&\leq C \left[(2\theta)^{-2Q(1-1/r)} \Phi(\xi_0, \rho, p_0)^{2(1-1/r)} \right. \\
&\quad \left. + (2\theta)^{-Q(r-1)} \Phi(\xi_0, \rho, p_0)^{r-1} \right] \\
&\quad + \left(1 + |p_0|^{2(1-1/r)} + |p_0|^{4(1-1/r)} \right) \\
&\leq C(2\theta)^{-Q(r-1)} \Phi(\xi_0, \rho, p_0)^{2(1-1/r)} \\
&\quad + \left(1 + |p_0|^{2(1-1/r)} \right)^2.
\end{aligned} \tag{61}$$

Let $P = p_0 + \sigma(Xh)_{\xi_0, 2\theta\rho}$ with $p_0 = (Xu)_{\xi_0, 2\theta\rho}$. Combining these estimates (57)–(61) and considering the small condition (51) (it implies $\rho \leq \rho_1(|u_{\xi_0, 2\theta\rho}|, |P|)$; see (64) and (65)), we deduce that

$$\begin{aligned}
\Phi(\xi_0, \theta\rho) &\leq |B_{\theta\rho}(\xi_0)|^{-1} \int_{B_{2\theta\rho}(\xi_0)} |Xu - P|^2 d\xi \\
&\leq C_c \frac{2^Q}{(\theta\rho)^2} \oint_{B_{2\theta\rho}(\xi_0)} |u - u_{\xi_0, 2\theta\rho} \\
&\quad - (p_0 + \sigma(Xh)_{\xi_0, 2\theta\rho}) \\
&\quad \times (\xi^1 - \xi_0^1)|^2 d\xi \\
&\quad + 2^Q C_c K_1 (|u_{\xi_0, 2\theta\rho}|, |p_0 + \sigma(Xh)_{\xi_0, 2\theta\rho}|) \eta(\rho^2) \\
&\quad + C_c \frac{(2\theta\rho)^{2Q(1-1/r)}}{(\theta\rho)^Q} \\
&\quad \times \left[\oint_{B_{2\theta\rho}(\xi_0)} (1 + u^r + |Xu|^2) d\xi \right]^{2(1-1/r)} \\
&\leq 2^Q C_4 C_c (\theta^{-Q-2} \varepsilon + \theta^2) \\
&\quad \times [\Phi(\xi_0, \rho) + 4\delta^{-2} K_1^2 \\
&\quad \times (|u_{\xi_0, 2\theta\rho}|, |(Xu)_{\xi_0, 2\theta\rho}|) \eta(\rho^2)] \\
&\quad + 2^Q C_c K_1 (|u_{\xi_0, 2\theta\rho}|, |(Xu)_{\xi_0, 2\theta\rho} \\
&\quad \quad + \sigma(Xh)_{\xi_0, 2\theta\rho}|) \eta(\rho^2) \\
&\quad + \left[2^Q C_c (2\theta)^{2-Q(r-1)} \Phi(\xi_0, \rho)^{2(1-1/r)} \right. \\
&\quad \left. + (1 + |(Xu)_{\xi_0, 2\theta\rho}|^{2(1-1/r)})^2 \right] \rho^2.
\end{aligned} \tag{62}$$

We now specify $\varepsilon = \theta^{Q+4}$, $\theta \in (0, 1/4]$ such that $2^{Q+1} C_4 C_c \theta^2 \leq \theta^{2\tau}$. Note that the small condition (50) implies $\sigma^2 C_5 \leq 1$ with $C_5 = \max\{C_0, C_c 2^Q (2\theta)^{-(Q^2+4)/(Q-2)}\}$, and it yields

$$2^Q C_c (2\theta)^{2-Q(r-1)} \Phi(\xi_0, \rho)^{2(1-1/r)} \leq 1, \tag{63}$$

$$\begin{aligned}
|\sigma(Xh)_{\xi_0, 2\theta\rho}| &\leq \sigma \sup_{B_{2\theta\rho}(\xi_0)} |Xh| \\
&\leq \sigma \sqrt{C_0} \left(\oint_{B_{\rho}(\xi_0)} |Xh|^2 d\xi \right) \leq \sigma \sqrt{C_0} \leq 1,
\end{aligned} \tag{64}$$

where we have used the a priori estimate (28) for the $\mathcal{A}$ -harmonic function h . Furthermore, using (19) and recalling the definition of σ and C_1 , we have

$$\begin{aligned}
|u_{\xi_0, 2\theta\rho}| &\leq |u_{\xi_0, \rho}| + |u_{\xi_0, 2\theta\rho} - u_{\xi_0, \rho}| \\
&\leq |u_{\xi_0, \rho}| + (2\theta)^{-Q/2} \\
&\quad \times \left(\oint_{B_{\rho}(\xi_0)} |u - (Xu)_{\xi_0, \rho} (\xi^1 - \xi_0^1) - u_{\xi_0, \rho}|^2 d\xi \right)^{1/2} \\
&\leq |u_{\xi_0, \rho}| + (2\theta)^{-Q/2} \rho \sqrt{C_p} \Phi^{1/2}(\xi_0, \rho) \\
&\leq |u_{\xi_0, \rho}| + \frac{\sigma \sqrt{C_p}}{C_1 (2\theta)^{Q/2}} \\
&\leq |u_{\xi_0, \rho}| + \sigma \sqrt{C_5} \leq |u_{\xi_0, \rho}| + 1.
\end{aligned} \tag{65}$$

Combining these estimates with (62), we have

$$\begin{aligned}
\Phi(\xi_0, \theta\rho) &\leq \theta^{2\tau} \Phi(\xi_0, \rho) \\
&\quad + [4\delta^{-2} K_1^2 (|u_{\xi_0, 2\theta\rho}|, |(Xu)_{\xi_0, 2\theta\rho}|) \\
&\quad + 2^Q C_c K_1 (|u_{\xi_0, 2\theta\rho}|, |(Xu)_{\xi_0, 2\theta\rho} \\
&\quad \quad + \sigma(Xh)_{\xi_0, 2\theta\rho}|) \eta(\rho^2) \\
&\quad + [1 + (1 + |(Xu)_{\xi_0, 2\theta\rho}|^{2(1-1/r)})^2] \eta(\rho^2) \\
&\leq \theta^{2\tau} \Phi(\xi_0, \rho) + K (|u_{\xi_0, 2\theta\rho}|, |(Xu)_{\xi_0, 2\theta\rho}|) \eta(\rho^2) \\
&\quad + (2 + |u_{\xi_0, 2\theta\rho}| + |(Xu)_{\xi_0, 2\theta\rho}|)^{2(r-1)} \eta(\rho^2) \\
&\leq \theta^{2\tau} \Phi(\xi_0, \rho) + K^* (|u_{\xi_0, 2\theta\rho}|, |(Xu)_{\xi_0, 2\theta\rho}|) \eta(\rho^2).
\end{aligned} \tag{66}$$

(62) Then, the proof of Lemma 5 is complete. $\square$

For $T > 0$, we find $\Phi_0(T) > 0$ (depending on Q, N, λ, L, τ , and ω) such that

$$\omega^2 (2T, 2\Phi_0(T)) + 2\Phi_0(T) \leq \frac{1}{2}\delta^2, \quad (67)$$

$$C_1 \Phi_0(T) \leq \theta^Q (1 - \theta^\tau)^2 T^2.$$

With $\Phi_0(T)$ from (67), we choose $\rho_0(T) \in (0, 1]$ (depending on $Q, N, \lambda, L, \tau, \omega, \eta$, and κ) such that

$$\rho_0(T) \leq \rho_1(1 + 2T, 1 + 2T),$$

$$C_3 K_1^2(2T, 2T) \eta (\rho_0(T)^2) \leq \delta^2,$$

$$K_0(T) \eta (\rho_0(T)^2) \leq (\theta^{2\gamma} - \theta^{2\tau}) \Phi_0(T),$$

$$2(1 + C_p) K_0(T) H(\rho_0(T)^2) \leq \theta^Q (1 - \theta^\gamma)^2 (\theta^{2\gamma} - \theta^{2\tau}) T^2, \quad (68)$$

where $K_0(T) := K^*(2T, 2T)$.

By the proof method of of Lemma 5.1 in [12] and conditions (67)-(68), Lemma 6 can be proved. As is well known, it is sufficient to complete the proof of Theorem 1 once we obtain Lemma 6.

Lemma 6. Assume that for some $T_0 > 0$ and $B_\rho(\xi_0) \subset\subset \Omega$ one has

- (1) $|u_{\xi_0, \rho}| + |(Xu)_{\xi_0, \rho}| \leq T_0$,
- (2) $\rho \leq \rho_0(T_0)$,
- (3) $\Phi(\xi_0, \rho) \leq \Phi_0(T_0)$.

Then, the small conditions (49)–(51) are satisfied on the balls $B_{\theta^j \rho}(\xi_0)$ for $j \in N \cup \{0\}$. Moreover, the limit $\Lambda_{\xi_0} = \lim_{j \rightarrow \infty} (Xu)_{\xi_0, \theta^j \rho}$ exists, and the inequality

$$\oint_{B_\rho(\xi_0)} |Xu - \Lambda_{\xi_0}|^2 d\xi \leq C_6 \left(\left(\frac{r}{\rho} \right)^{2\tau} \Phi(\xi_0, \rho) + H(r^2) \right) \quad (69)$$

is valid for $0 < r \leq \rho$ with a constant $C_6 = C_6(Q, N, \lambda, L, \tau, \text{and } T_0)$.

Proof. The proof is very similar to the proof of Lemma 5.1 in [12]. We omit it here. $\square$
