This paper is concerned with the nonlinear Klein-Gordon equation with damping term and nonnegative potentials. We introduce a family of potential wells and discuss the invariant sets and vacuum isolating behavior of solutions. Using the potential well argument, we obtain a new existence theorem of global solutions and a blow-up result for solutions in finite time.

1. Introduction

In this paper, we consider the nonlinear Klein-Gordon equation with damping term and a real valued potential $T(x)$

$$u_{tt} - \Delta u + T(x)u + u + |u_t|^{m-2}u_t = |u|^{p-2}u, \quad (1)$$

$$t > 0, \quad x \in \mathbb{R}^n,$$

$$u(0, x) = u_0, \quad u_t(0, x) = u_1, \quad x \in \mathbb{R}^n,$$

where $n \geq 2$, $m \geq 2$, and

$$\begin{aligned} 2 < p < \infty & \quad \text{if } n \leq 2, \\ 2 < p < \frac{2n}{n-2} & \quad \text{if } n \geq 3. \end{aligned} \quad (2)$$

$u = u(t, x)$ is a complex-valued function of $(t, x) \in \mathbb{R}^+ \times \mathbb{R}^n$, Δ is the Laplace operator on $\mathbb{R}^n$, and u_t is called the damping term [1]. Ha and Nakagiri [1] studied the local existence for the Cauchy problem (1). Here we are interested in the sharp criteria for global existence and blow-up of solutions of the Cauchy problem (1).

The Klein-Gordon equation is a relativistic version of the Schrödinger equation, which describes relativistic electrons. Levine [2], Ball [3], Payne and Sattinger [4], Zhang [5], and

Gan and Zhang [6] applied the potential well theory and studied the blowing up properties of the nonlinear Klein-Gordon equations. In [7], Huang and Zhang studied the global existence and blow-up of solutions for the nonlinear Klein-Gordon equation with linear damping term ($m = 2$). In [8, 9], the authors studied the existence of global solutions and decay for the energy of solution for the Klein-Gordon equation.

The case of nonlinear damping and source terms ($m > 2$, $p > 2$) is considered by many authors. For instance, Georgiev and Todorova [10] prove that if $m \geq p$, a global weak solution exists for any initial data; while $2 < m < p$ the solution blows up in finite time when the initial energy is sufficiently negative. Ikehata [11] considers the solutions of (1) with small positive initial energy, using the so-called potential well theory introduced by Payne and Sattinger in [4]. Todorova and Vitillaro [12] prove that for any given numbers $\alpha \geq 0$, $\lambda \geq 0$ there exist infinitely many data $\varphi(x)$, $\psi(x)$ in the energy space such that the initial energy $E(0) = \lambda$, the gradient norm $\|\nabla \varphi\|_2 = \alpha$, and the solution of (1) blows up in finite time.

In this paper, we consider the interaction between the nonlinear damping and source terms ($m > 2$, $p > 2$) for the Cauchy problem (1). For the local well-posedness of the Cauchy problem (1), the readers may refer to [13, 14]. We have

considered the global existence and the finite time blowing up. The potential well theory, which was introduced by Liu [15] and has been used for Schrödinger equations in [16–18], was applied to study the Cauchy problem (1). Based on the results, we show the sharp criteria for global existence and blowing up of its solutions. Applying the perturbed energy method we prove the uniform stabilization for $p \leq m$. And using concavity arguments we prove that the blow-up solutions exist for $p > m$. The results can be extended to the case of more general nonlinearities under suitable assumptions. We extend parts of results in [7] and obtain several new results for system (1).

This paper is organized as follows. In Section 2, a family of potential wells are introduced and a series of properties are given. In Section 3, the invariant sets under the flow of problem (1) and the vacuum isolating behavior of solutions for $0 < E(0) < d$ and $E(0) \leq 0$ are discussed. In Section 4, the global existence and blowing up of solutions for problem (1) are proved. In Section 5, the theorem on asymptotic behavior of solutions when $m = 2$ is proved.

2. Potential Wells and Their Properties

For the Cauchy problem (1), we define the energy space as

$$H := \left\{ u \in H^1(R^n) : \int_{R^n} T(x) \|u\|^2 dx < \infty \right\}. \quad (3)$$

H becomes a Hilbert space, continuously embedded in $H^1(R^n)$, which is endowed with the inner product

$$(u, v)_H := \int_{R^n} [\nabla u \nabla v + T(x) uv + uv] dx, \quad (4)$$

whose associated norm is denoted by $\|\cdot\|_H$.

Throughout this paper, we make the following assumptions on $T(x)$:

$$\begin{aligned} \inf_{x \in R^n} T(x) &= \bar{T}(x) > 0, \\ T(x) &\text{ is positive and } aC^1 \text{ bounded} \\ &\text{measurable function on } R^n, \\ \lim_{x \rightarrow \infty} T(x) &= \infty. \end{aligned} \quad (5)$$

We define the energy functions

$$\begin{aligned} E(t) &= \frac{1}{2} \|u_t\|_2^2 + \frac{1}{2} \|\nabla u\|_2^2 + \frac{1}{2} T(x) \|u\|_2^2 \\ &\quad + \frac{1}{2} \|u\|_2^2 - \frac{1}{p} \|u\|_p^p, \quad t \in [0, T), \end{aligned} \quad (6)$$

$$E(t) + \int_0^t \|u_\tau\|_m^m d\tau = E(0), \quad t \in [0, T), \quad (7)$$

and two functionals

$$S(u) = \frac{1}{2} \|\nabla u\|_2^2 + \frac{1}{2} T(x) \|u\|_2^2 + \frac{1}{2} \|u\|_2^2 - \frac{1}{p} \|u\|_p^p, \quad (8)$$

$$R(u) = \|\nabla u\|_2^2 + T(x) \|u\|_2^2 + \|u\|_2^2 - \|u\|_p^p. \quad (9)$$

Then we define the potential well W as follows:

$$W \equiv \{u \in H(R^n) \mid R(u) > 0, S(u) < d_M\} \cup \{0\}, \quad (10)$$

and the outside set V of the corresponding potential well

$$V \equiv \{u \in H(R^n) \mid R(u) < 0, S(u) < d_M\}, \quad (11)$$

where

$$d_M = \inf_M S(u), \quad (12)$$

$$M = \{u \in H(R^n) \setminus \{0\} \mid R(u) = 0, \|u\|_H \neq 0\}.$$

For $\delta > 0$, we define

$$R_\delta(u) = \delta (\|\nabla u\|_2^2 + T(x) \|u\|_2^2 + \|u\|_2^2) - \|u\|_p^p,$$

$$d_M(\delta) = \inf_{M_\delta} S(u),$$

$$M_\delta = \{u \in H(R^n) \setminus \{0\} \mid R_\delta(u) = 0, \|u\|_H \neq 0\},$$

$$W_\delta \equiv \{u \in H(R^n) \mid R_\delta(u) > 0, S(u) < d_M(\delta)\} \cup \{0\},$$

$$0 < \delta < \frac{p}{2},$$

$$V_\delta \equiv \{u \in H(R^n) \mid R_\delta(u) < 0, S(u) < d_M(\delta)\},$$

$$0 < \delta < \frac{p}{2}. \quad (13)$$

Lemma 1. *If $0 < \|u\|_H < r(\delta)$, then $R_\delta(u) > 0$. Particularly, if $0 < \|u\|_H < r(1)$, then $R(u) > 0$, where*

$$r(\delta) = \left(\frac{\delta}{C_*^p} \right)^{1/(p-2)}, \quad (14)$$

C_* is an embedding constant of $H(R^n) \hookrightarrow L^p(R^n)$.

Proof. If $0 < \|u\|_H < r(\delta)$, then

$$\|u\|_p^p \leq C_*^p \|u\|_H^p = C_*^p \|u\|_H^{p-2} \|u\|_H^2 < \delta \|u\|_H^2. \quad (15)$$

It follows that $R_\delta(u) > 0$. $\square$

Lemma 2. *If $R_\delta(u) < 0$, then $\|u\|_H > r(\delta)$. Particularly, if $R(u) < 0$, then $\|u\|_H > r(1)$.*

Proof. If $R_\delta(u) < 0$, then $\|u\|_H \neq 0$. From

$$\delta \|u\|_H^2 < \|u\|_p^p \leq C_*^p \|u\|_H^{p-2} \|u\|_H^2, \quad (16)$$

we obtain $\|u\|_H > r(\delta)$. $\square$

Lemma 3. *Assume that (2) holds; then*

(1) $d_M(\delta) \geq (1/2 - \delta/p)r(\delta)$ for $0 < \delta < p$. In particular, we have $d \geq 2/\alpha C_*^\alpha$, $\alpha = p/(p-2)$.

(2) $d_M(\delta) = \delta^{2/(p-2)}(1/2 - \delta/p)(2p/(p-2))d$.

Proof. (1) For $u \in M_\delta$, we get $\|u\|_H^2 \geq r(\delta)$ and

$$\begin{aligned} S(u) &= \left(\frac{1}{2} - \frac{\delta}{p} \right) \|u\|_H^2 + \frac{1}{p} R_\delta(u) \\ &= \left(\frac{1}{2} - \frac{\delta}{p} \right) \|u\|_H^2 \geq \left(\frac{1}{2} - \frac{\delta}{p} \right) r(\delta), \end{aligned} \quad (17)$$

which yields $d_M(\delta) \geq (1/2 - \delta/p)r(\delta)$ for $0 < \delta < p/2$.

(2) Let $u \in M$ be a minimizer; that is, $d_M = S(u)$. For any $\delta > 0$, define $\lambda = \lambda(\delta)$ by

$$\delta \| \lambda u \|_H^2 = \| \lambda u \|_p^p; \quad (18)$$

that is,

$$\delta \| u \|_H^2 = \lambda^{p-2} \| u \|_p^p. \quad (19)$$

Then, for each $\delta > 0$, there exists a unique

$$\lambda(\delta) = \left(\frac{\delta \| u \|_H^2}{\| u \|_p^p} \right)^{1/(p-2)}, \quad (20)$$

satisfying (18) which implies $\lambda(\delta)u \in M_\delta$. Since $u \in M$ implies $\|u\|_H^2 = \|u\|_p^p$, we get $\lambda(\delta) = \delta^{1/(p-2)}$. Therefore,

$$\begin{aligned} d_M(\delta) &\leq S(\lambda(\delta)u) \\ &= \frac{1}{2} \delta^{2/(p-2)} \|u\|_H^2 - \frac{1}{p} \delta^{p/(p-2)} \|u\|_p^p \\ &= \left(\frac{1}{2} - \frac{\delta}{p} \right) \delta^{2/(p-2)} \|u\|_H^2. \end{aligned} \quad (21)$$

Noting that

$$S(u) = \frac{1}{2} \|u\|_H^2 - \frac{1}{p} \|u\|_p^p = \frac{p-2}{2p} \|u\|_H^2, \quad (22)$$

we have

$$\begin{aligned} d_M(\delta) &\leq \delta^{2/(p-2)} \left(\frac{1}{2} - \frac{\delta}{p} \right) \frac{p-2}{2p} S(u) \\ &= \delta^{2/(p-2)} \left(\frac{1}{2} - \frac{\delta}{p} \right) \frac{p-2}{2p} d. \end{aligned} \quad (23)$$

On the other hand, let $\delta > 0$, $u \in M_\delta$ be a minimizer; that is, $d_M(\delta) = S(u)$. It follows that

$$d_M(\delta) \geq \delta^{2/(p-2)} \left(\frac{1}{2} - \frac{\delta}{p} \right) \frac{p-2}{2p} d. \quad (24)$$

Therefore, the conclusion follows from the above discussion. $\square$

Lemma 4. Assume that (2) holds; then

- (1) $\lim_{\delta \rightarrow 0} d_M(\delta) = 0$, $d_M(p/2) = 0$. $d_M(\delta)$ is continuous on $0 < \delta \leq p/2$.
- (2) $d_M(\delta)$ is increasing on $0 < \delta \leq 1$, is decreasing on $1 < \delta \leq p/2$, and takes the maximum $d = d_M(1)$ at $\delta = 1$.

Proof. From Lemma 3, we obtain

$$\begin{aligned} d'_M(\delta) &= \frac{d}{p-2} [(p-2\delta) \delta^{2/(p-2)}]' \\ &= \frac{d}{p-2} \left[(p-2\delta) \frac{2}{p-2} \delta^{(4-p)/(p-2)} - 2\delta^{2/(p-2)} \right] \\ &= \frac{2dp}{(p-2)^2} \delta^{(4-p)/(p-2)} (1-\delta). \end{aligned} \quad (25)$$

$\square$

3. The Invariant Sets of Solutions

Lemma 5. Assume that $u_0 \in H(R^n)$, $u_1 \in L^m(R^n)$, $0 < E(0) < d_M$, δ_1 , and $\delta_2(\delta_1 < \delta_2)$ are the solutions of the function $d_M(\delta) = E(0)$.

- (1) If $R(u_0) > 0$ or $\|u_0\|_H = 0$, then $u(t) \in W_\delta$ for any $\delta \in (\delta_1, \delta_2)$.
- (2) If $R(u_0) < 0$, then $u(t) \in V_\delta$ for any $\delta \in (\delta_1, \delta_2)$.

Proof. (1) Let $u(t)$ be any solution of the Cauchy problem (1) with

$$E(0) = \frac{1}{2} \|u_1\|_2^2 + S(u_0) + \int_0^t \|u_1\|_m^m d\tau = d_M(\delta) < d_M, \quad (26)$$

which gives $S(u_0) < d_M$. If $R(u_0) > 0$, then from the definition of W_δ we obtain $u_0(x) \in W_\delta$. If $\|u_0\|_H = 0$, then $u_0(x) \in W_\delta$. Therefore $u_0(x) \in W_\delta$, $\forall \delta \in (\delta_1, \delta_2)$.

Next, we prove $u(t) \in W_\delta$, $\forall \delta \in (\delta_1, \delta_2)$, $t \geq 0$. If it is not true, then there must exist a $\tilde{\delta} \in (\delta_1, \delta_2)$ and a $\tilde{t} > 0$ such that $u(\tilde{t}) \in \partial W_{\tilde{\delta}}$; that is,

$$R_{\tilde{\delta}}(u(\tilde{t})) = 0, \quad \|u_0(\tilde{t})\|_H \neq 0, \quad \text{or} \quad S(u(\tilde{t})) = d_M(\tilde{\delta}). \quad (27)$$

From the energy inequality, we have

$$\frac{1}{2} \|u_t\|_2^2 + S(u) + \int_0^t \|u_t\|_m^m d\tau = E(0) = d_M(\delta) < d_M, \quad (28)$$

$$\delta_1 < \delta < \delta_2, \quad t \geq 0.$$

Then $S(u(\tilde{t})) = d_M$ is impossible. On the other hand, if $R_{\tilde{\delta}}(u(\tilde{t})) = 0$, $\|u_0(\tilde{t})\|_H \neq 0$, then we obtain $u(\tilde{t}) \in M$. By the definition of M , we have $S(u(\tilde{t})) \geq d_M$, which contradicts (28). Hence $u(t) \in W_\delta$ is true.

(2) First we prove $u_0 \in V_\delta$. From the energy inequality

$$\frac{1}{2} \|u_1\|_2^2 + S(u_0) + \int_0^t \|u_1\|_m^m d\tau = E(0) = d_M(\delta) < d_M, \quad (29)$$

we have

$$S(u_0) < d_M(\delta), \quad \forall \delta_1 < \delta < \delta_2. \quad (30)$$

Using $R(u_0) < 0$ yields $R_\delta(u_0) < 0$ for $\delta_1 < \delta < \delta_2$. Therefore we obtain $u_0 \in V_\delta$.

Next, we show that $u(t) \in V_\delta$ for $\delta_1 < \delta < \delta_2$ and $t \geq 0$. If it is false, there exist a $\tilde{\delta} \in (\delta_1, \delta_2)$ and a $\tilde{t} > 0$ such that $u(\tilde{t}) \in \partial V_{\tilde{\delta}}$; that is,

$$R_{\tilde{\delta}}(u(\tilde{t})) = 0, \quad \|u_0(\tilde{t})\|_H \neq 0 \quad \text{or} \quad S(u(\tilde{t})) = d_M(\tilde{\delta}). \quad (31)$$

However, from the conservation law we get that $S(u(\tilde{t})) = d_M(\tilde{\delta})$ is impossible. If $R_{\tilde{\delta}}(u(\tilde{t})) = 0$, then $R_{\tilde{\delta}}(u(t)) < 0$ for $0 \leq t < \tilde{t}$. At the same time, Lemma 2 yields that $\|u(t)\|_H > r(\tilde{\delta}) > 0$, $0 \leq t < \tilde{t}$, and $\|u(\tilde{t})\|_H \geq r(\tilde{\delta})$. Hence by the definition of $d_M(\delta)$, we have $S(u(\tilde{t})) \geq d_M(\tilde{\delta})$, which contradicts $S(u(t)) < d_M(\delta)$. So we obtain

$$u(t) \in V_\delta, \quad \forall \delta_1 < \delta < \delta_2, \quad t \geq 0. \quad (32)$$

□

Lemma 6. Assume $u_0 \in H(R^n)$, $u_1 \in L^m(R^n)$, $0 < E(0) < d_M(\delta)$, δ_1 , and δ_2 ($\delta_1 < \delta_2$) are the solutions of the function $d_M(\delta) = E(0)$. Then W_δ and V_δ are invariant sets under the flow generated by (1), $\forall \delta_1 < \delta < \delta_2$.

Proof. Let $u_0 \in V_\delta$ and $u(t)$ satisfy (1). From (6), (7), and (8), we have

$$\begin{aligned} S(u(t)) &\leq E(t) \\ &= E(0) - \int_0^t \|u_\tau\|_m^m d\tau < d_M(\delta), \quad t \in [0, T]. \end{aligned} \quad (33)$$

To check $u(t) \in V_\delta$, we need to prove

$$R(u(t)) < 0, \quad t \in [0, T]. \quad (34)$$

If (34) is not true, by continuity, there would exist a $\tilde{t} > 0$ such that $R(u(\tilde{t})) = 0$ because of $R(u_0) < 0$. It follows that $u(\tilde{t}) \in M_\delta$. This is impossible for $S(u(\tilde{t})) < d_M(\delta)$ and $d_M(\delta) = \inf_{u \in M_\delta} S(u)$. Thus (34) is true. So V_δ is invariant under the flow generated by (1).

Similarly, we show that W_δ is also invariant under the flow generated by (1). This completes the proof of Lemma 6. □

Lemma 7. Let the initial data $(u_0, u_1) \in H(R^n) \times L^m(R^n)$, and $u(t, x)$ be a local solution of the Cauchy problem (1) on $[0, T)$. If there exists a $u_0 \in V_\delta$ and a $E(0) < d_M(\delta)$, then the inequality

$$\|\nabla u\|_2^2 + T(x) \|u\|_2^2 + \|u\|_2^2 > \frac{2p}{p-2} d_M(\delta) \quad (35)$$

is fulfilled for $t \in [0, T)$.

Proof. By the definition of $d_M(\delta)$, we have

$$d_M(\delta) = \inf \left\{ \frac{p-2}{2p} (\|\nabla u\|_2^2 + T(x) \|u\|_2^2 + \|u\|_2^2) \right\}. \quad (36)$$

According to Lemma 6, we have $\|u(t, \cdot)\|_p^p > \|\nabla u(t, \cdot)\|_2^2$ for $t \in [0, T)$. From (36) and the identity (8), we get

$$d_M(\delta) < \frac{p-2}{2p} (\|\nabla u\|_2^2 + T(x) \|u\|_2^2 + \|u\|_2^2), \quad (37)$$

which completes the proof of Lemma 7. □

In order to extend the case $E(0) > 0$ to $E(0) \leq 0$ we give the following lemma.

Lemma 8. Let $u_0 \in H(R^n)$, $u_1 \in L^m(R^n)$, and (2) hold. Assume $E(0) = 0$; then the solutions of problem (1) satisfy

$$\|u\|_H^2 \geq r_0 = 2 \left(\frac{p}{C_*^p} \right)^{1/(p-2)}. \quad (38)$$

Proof. Let u be any solution of problem (1) with $E(0) = 0$ and $\|u_0\|_H \neq 0$, $T_{\max}$ the existence time. From (6), (7), and (9), we have

$$E(t) = \frac{1}{2} \|u_t\|_2^2 + S(u) \leq E(0) = 0, \quad (39)$$

and get $S(u) \leq 0$ for $0 \leq t < T_{\max}$. Hence, using

$$\frac{1}{2} \|u\|_H^2 \leq \frac{1}{p} \|u\|_p^p \leq C_*^p \|u\|_H^2 \|u\|_H^{p-2}, \quad (40)$$

we see that either $\|u\|_H^2 = 0$ or (38) hold. If $\|u\|_H^2 = 0$, then $\|u\|_H^2 \equiv 0$ for $0 \leq t < T_{\max}$ (otherwise there exists a $t_0 \in [0, t_{\max})$ such that $0 < \|u(t_0)\|_H^2 < r_0$), which contradicts the condition $\|u_0\|_H \neq 0$. □

Theorem 9. Let $u_0 \in H(R^n)$, $u_1 \in L^m(R^n)$, $2 < m < p$, and (2) hold. Assume $E(0) < 0$ or $E(0) = 0$ and $\|u_0\|_H \neq 0$. Then the solutions of problem (1) belong to V_δ for $0 < \delta < p/2$.

Proof. Let u be any solution of problem (1) with $E(0) < 0$ or $E(0) = 0$ and $\|u_0\|_H \neq 0$, $T_{\max}$ the existence time. From (6), we have

$$\begin{aligned} E(t) &= \frac{1}{2} \|u_t\|_2^2 + \left(\frac{1}{2} - \frac{\delta}{p} \right) \|u\|_H^2 \\ &\quad + \frac{1}{p} R_\delta(u) \leq E(0), \quad 0 < \delta < \frac{p}{2}, \end{aligned} \quad (41)$$

for $0 \leq t < T_{\max}$. From (41) we see that if $E(0) < 0$, then $S(u) \leq E(t) < 0 < d_M(\delta)$ for $0 \leq t < T_{\max}$. If $E(0) = 0$ and $\|u_0\|_H \neq 0$, then by Lemma 8 we obtain $\|u\|_H^2 \geq r_0 > 0$. Therefore, by (41) we have $S(u) \leq E(t) \leq 0 < d_M(\delta)$ for $0 \leq t < T_{\max}$. Hence, for the above two cases, we have $u \in V_\delta$ for $0 < \delta < p/2$. □

4. Sharp Condition for Global Existence and Blow-Up

Definition 10 (weak solution). The function $u(t, x) \in C([0, T); H(R^n))$ with $u_t(t, x) \in C([0, T); L^m(R^n))$ is called a weak solution of problem (1), such that $u(0, x) = u_0(x)$ in $H(R^n)$, $u_t(0, x) = u_1(x)$ in $L^m(R^n)$ and

$$\begin{aligned} \langle u_{tt}, v \rangle + \int_{R^n} \nabla u \cdot \nabla v dx + \int_{R^n} T(x) u v dx \\ + \int_{R^n} u v dx + \int_{R^n} |u_t|^{m-2} u_t v dx = \int_{R^n} |u|^{p-2} u v dx, \end{aligned} \quad (42)$$

for all $v \in H(R^n)$ and $t \in [0, T)$.

Theorem 11. Let $(u_0, u_1) \in H(R^n) \times L^m(R^n)$, $2 < p \leq m$, and (2) hold. Suppose that $0 < E(0) < d_M$, $R(u_0) > 0$, or $\|u_0\|_H = 0$; then Cauchy problem (1) has a global weak solution $u(t, x) \in C([0, T]; H(R^n))$ ($u_t(t, x) \in C([0, T]; L^m(R^n))$) for some $T \in (0, \infty)$ with $u(t) \in W$.

Proof. Let $\{w_j(x)\}$ be a system of base functions in $H(R^n)$. Construct the approximate solution $u_m(t, x)$ of problem (1)

$$u_m(t, x) = \sum_{j=1}^m g_{jm}(t) w_j(x), \quad m = 1, 2, \dots, \quad (43)$$

satisfying

$$\begin{aligned} & (u_{m_t}, w_s) - (\Delta u_m, w_s) + T(x)(u_m, w_s) \\ & + (u_m, w_s) + (|u_m|^{m-2} u_m, w_s) \\ & = (|u_m|^{p-2} u_m, w_s), \end{aligned} \quad (44)$$

$$u_m(x, 0) = \sum_{j=1}^m a_{jm} w_j(x) \longrightarrow u_0(x) \quad \text{in } H^1(R^n), \quad (45)$$

$$u_{m_t}(x, 0) = \sum_{j=1}^m b_{jm} w_j(x) \longrightarrow u_1(x) \quad \text{in } L^m(R^n). \quad (46)$$

Multiplying (44) by $g'_{jm}(t)$ and summing for s , we have

$$\frac{d}{dt} \left[\frac{1}{2} (\|u_{m_t}\|_2^2 + \|u_m\|_H^2) - \frac{1}{p} \|u_m\|_p^p \right] + \|u_{m_t}\|_m^m = 0. \quad (47)$$

Integrating with respect to t , we get

$$\begin{aligned} & \frac{1}{2} (\|u_{m_t}\|_2^2 + \|u_m\|_H^2) - \frac{1}{p} \|u_m\|_p^p + \int_0^t \|u_{m_t}\|_m^m d\tau \\ & = \frac{1}{2} (\|u_{m_t}(0)\|_2^2 + \|u_m(0)\|_H^2) - \frac{1}{p} \|u_m(0)\|_p^p. \end{aligned} \quad (48)$$

For $E(0) < d_M$ and $R(u_0) > 0$ or $\|u\|_H^2 = 0$, we have

$$\begin{aligned} & \frac{1}{2} \|u_{m_t}\|_2^2 + S(u_m) + \int_0^t \|u_{m_t}\|_m^m d\tau = E_m(0) < d_M, \\ & 0 \leq t < \infty. \end{aligned} \quad (49)$$

From

$$\begin{aligned} & \frac{1}{2} \|u_1\|_2^2 + S(u_0) + \int_0^t \|u_1\|_m^m d\tau = E(0) < d_M, \\ & 0 \leq t < \infty, \end{aligned} \quad (50)$$

we have $S(u_0) < d_M$. Hence from $R(u_0) > 0$, we obtain $u_0 \in W$.

From (45) and (46), for sufficiently large m , we obtain

$$\begin{aligned} & \frac{1}{2} \|u_{m_t}\|_2^2 + S(u_m) + \int_0^t \|u_{m_t}\|_m^m d\tau = E_m(0) < d_M, \\ & 0 \leq t < \infty, \end{aligned} \quad (51)$$

and $u_m(0) \in W$. Similar with the proof of Lemma 5, from (51), for sufficiently large m and $0 \leq t < \infty$, we can prove $u_m(t) \in W$ and

$$\begin{aligned} S(u_m) &= \frac{1}{2} \|u_m\|_H^2 - \frac{1}{p} \|u_m\|_p^p \\ &= \left(\frac{1}{2} - \frac{1}{p} \right) \|u_m\|_H^2 + \frac{1}{p} R(u_m) \geq \frac{p-2}{2p} \|u_m\|_H^2. \end{aligned} \quad (52)$$

Thus we obtain

$$\frac{1}{2} \|u_{m_t}\|_2^2 + \frac{p-2}{2p} \|u_m\|_H^2 < d_M, \quad 0 \leq t < \infty; \quad (53)$$

then

$$\begin{aligned} & \|u_{m_t}\|_2^2 \leq 2d_M, \quad 0 \leq t < \infty, \\ & \|u_m\|_H^2 \leq \frac{2p}{p-2} d_M, \quad 0 \leq t < \infty, \\ & \|u_m\|_p^2 \leq C_*^2 \|u_m\|_H^2 \leq C_*^2 \frac{2p}{p-2} d_M, \quad 0 \leq t < \infty, \\ & \| |u_m|^{p-2} u_m \|_q^q = \|u_m\|_p^p \leq C_*^p \left(\frac{2p}{p-2} d_M \right)^{p/2}, \end{aligned} \quad (54)$$

$$q = \frac{p}{p-1},$$

$$0 \leq t < \infty.$$

Using (54) and the method of compact, we obtain that $u(t, x) \in C([0, T]; H(R^n))$ is a global weak solution of problem (1). From Lemma 5, we have $u(t) \in W$ for $0 \leq t < \infty$. $\square$

Theorem 12. Let $(u_0, u_1) \in H(R^n) \times L^m(R^n)$, $2 < p \leq m$, and (2) hold. Assume that $E(0) < d$, $R_\delta(u_0) > 0$, or $\|u_0\|_H = 0$, where δ_1 and δ_2 ($\delta_1 < \delta_2$) are two roots of equation $d_M(\delta) = e$. Then the problem (1) admits a unique global solution $u \in C([0, T]; H(R^n))$ and $u \in W_\delta$ for $\delta \in (\delta_1, \delta_2)$ and $0 \leq t < \infty$.

Proof. From Theorem 11, we see that to prove Theorem 12 we only need to prove $R_\delta(u_0) > 0$. Indeed, if it is not true, then there exists a $\bar{\delta} \in [\delta_1, \delta_2)$ such that $R_{\bar{\delta}}(u_0) = 0$. Since $R_{\bar{\delta}}(u_0) > 0$ implies $\|u_0\|_H \neq 0$, we obtain $S(u_0) \geq d_M(\bar{\delta})$, which contradicts $S(u_0) \leq E(0) < d_M(\delta)$ for $\delta \in (\delta_1, \delta_2)$. $\square$

Theorem 13. Let $(u_0, u_1) \in H(R^n) \times L^m(R^n)$ and (2) hold. Assume $E(0) < d_M$.

- (1) If $2 < m < p$, there exists $t_0 \in [0, T)$ such that $u(t_0) \in V$; then the solution $u(x, t)$ of Cauchy problem (1) blows up in a finite time.
- (2) If $2 < p \leq m$, there exists $t_0 \in [0, T)$ such that $u(t_0) \in W$; then the solution $u(x, t)$ of problem (1)

globally exists on $[0, \infty)$. Moreover, for $t \in [0, \infty)$, $u(x, t)$ satisfies

$$\begin{aligned} & \|u_t\|_2^2 + \frac{p-2}{p} \\ & \times \left(\int |\nabla u_0|^2 dx + \int T(x) |u_0|^2 dx + \int |u_0|^2 dx \right) < 2d_M. \end{aligned} \quad (55)$$

Proof. By $E(0) < d_M$, we have $S(u_0) \leq E(0) < d_M$.

Firstly, we prove (1) of Theorem 13. From the energy identity we have

$$\int_0^t \|u_t\|_m^m ds = E(0) - E(t) \leq d_M, \quad (56)$$

for all $t \geq 0$.

Denoting $J(t) = \|u(t, \cdot)\|_2^2$, we have

$$J''(t) = 2\|u_t\|_2^2 - 2R(u) - 2 \int uu_t |u_t|^{m-2} dx. \quad (57)$$

Using the Hölder inequality and the interpolation inequality, we obtain

$$\begin{aligned} \left| \int uu_t |u_t|^{m-2} dx \right| & \leq \|u\|_m \|u_t\|_m^{m-1} \\ & \leq \|u\|_2^\delta \|u\|_p^{1-\delta} \|u_t\|_m^{m-1}, \end{aligned} \quad (58)$$

with $\delta = (1/m - 1/p)/(1/2 - 1/p)$. From $R(u) < 0$, we have

$$\int T(x) |u|^2 dx < \|u\|_p^p, \quad (59)$$

which together with Lemma 6 give

$$\begin{aligned} & \|u\|_2^\delta \|u\|_p^{1-\delta} \|u_t\|_m^{m-1} \\ & \leq C \|u_t\|_m^{m-1} \|u\|_p^{1-p/m-\delta+p\delta/2} \|u\|_p^{p/m}. \end{aligned} \quad (60)$$

Using the Young inequality and $1 - p/m - \delta + p\delta/2 = 0$, we have

$$\|u\|_2^\delta \|u\|_p^{1-\delta} \|u_t\|_m^{m-1} \leq C(\varepsilon) \|u_t\|_m^m + \varepsilon \|u\|_p^p, \quad (61)$$

since

$$\begin{aligned} -R(u) & \geq -R(u) + \delta(E(t) - E(0)) \\ & \geq \left(1 - \frac{\delta}{p}\right) \|u\|_p^p + \frac{\delta}{2} \|u_t\|_2^2 + \left(\frac{\delta}{2} - 1\right) \\ & \quad \times \left(\int |\nabla u|^2 dx + \int T(x) |u|^2 dx + \|u\|_2^2 \right) - \delta E(0), \end{aligned} \quad (62)$$

then

$$\begin{aligned} & \frac{1}{2} J''(t) + C(\varepsilon) \|u_t\|_m^m \\ & \geq \left(1 + \frac{\delta}{2}\right) \|u_t\|_2^2 + \left(1 - \frac{\delta}{p} - \varepsilon\right) \|u\|_p^p \\ & \quad + \left(\frac{\delta}{2} - 1\right) \left(\int |\nabla u|^2 dx + \int T(x) |u|^2 dx + \|u\|_2^2 \right) - \delta E(0), \end{aligned} \quad (63)$$

where the constant $\delta > 2$ is chosen as follows.

Since $E(0) < d_M$, we choose the constant δ so that

$$\frac{2pd_M}{pd_M - (p-2)E(0)} < \delta < p. \quad (64)$$

This guarantees $\delta > 2$. Then, using this choice and Lemma 7 we get

$$\begin{aligned} & \left(\frac{\delta}{2} - 1\right) \left(\int |\nabla u|^2 dx + \int T(x) |u|^2 dx + \|u\|_2^2 \right) - \delta E(0) \\ & \geq \left(\frac{\delta}{2} - 1\right) \frac{2p}{p-2} d_M - \delta E(0) \geq 0. \end{aligned} \quad (65)$$

If the constant δ is fixed, we choose the constant ε such that

$$C_1 = 1 - \frac{\delta}{p} - \varepsilon > 0. \quad (66)$$

Finally, using the inequality (60), (63) and Lemma 7 we have

$$\begin{aligned} J''(t) + C(\varepsilon) \|u_t\|_m^m & \geq C_1 \|u\|_p^p \\ & \geq C_1 \left(\int |\nabla u|^2 dx + \int T(x) |u|^2 dx + \|u\|_2^2 \right) \\ & \geq C_1 \frac{2p}{p-2} d_M, \end{aligned} \quad (67)$$

where $C_1 > 0$. Since (56), integrating (67) over $[0, t]$ we have

$$J'(t) \geq C_1 \frac{pd_M}{p-2} t - C(\varepsilon) d_M + J'(0), \quad (68)$$

which concludes that there exists a t_1 such that $J'(t)|_{t=t_1} > 0$. Hence, $J(t)$ is increasing for $t > t_1$ (which is the interval of existence). Since $R(u) < 0$, there exists a t_2 such that $\|u(t, x)\|_p^p$ is increasing for $t > t_2$. When t is large enough, the quantities $\|u_t(t, x)\|_m^m$ and $\|\nabla u(t, x)\|_2^2$ are small enough. Otherwise, assume that there is t^* such that $\|u_t(t, x)\|_m^m > \|u_t(t^*, x)\|_m^m$ for all $t > t^*$. By integrating the inequality, we obtain a contradiction with (56) and $E(t) \geq 0$.

Thus in these cases, the quantity

$$\begin{aligned} & \left(1 - \frac{\delta}{p} - \varepsilon\right) \|u\|_p^p + \left(\frac{\delta}{2} - 1\right) \\ & \quad \times \left(\int |\nabla u|^2 dx + \int T(x) |u|^2 dx + \|u\|_2^2 \right) \\ & \quad - \delta E(0) - C(\varepsilon) \|u_t\|_m^m \end{aligned} \quad (69)$$

will eventually become positive. Therefore for t large enough, from (63) and (65) we have

$$J''(t) \geq \left(1 + \frac{\delta}{2}\right) \|u_t\|_2^2. \quad (70)$$

Using the Hölder inequality, we get

$$J(t) J''(t) \geq \frac{2+\delta}{8} [J'(t)]^2. \quad (71)$$

Since

$$\begin{aligned} & [J^{-(\delta-6)/8}(t)]'' \\ &= -\frac{\delta-6}{8} J^{-(\delta+10)/8}(t) \left[J(t) J''(t) - \frac{2+\delta}{8} [J'(t)]^2 \right], \end{aligned} \quad (72)$$

from (71) we have $[J^{-(\delta-6)/8}(t)]'' \leq 0$. Therefore $J^{-(\delta-6)/8}(t)$ is concave for sufficiently large t , and there exists a finite time T^* such that

$$\lim_{t \rightarrow T^*} J^{-(\delta-6)/8}(t) = 0. \quad (73)$$

From assumption on $T(x)$, we obtain

$$\int T(x) |u|^2 dx \geq \bar{T} \int |u|^2 dx. \quad (74)$$

Thus one gets $T < \infty$ and

$$\lim_{t \rightarrow T^-} \|u\|_H = \infty. \quad (75)$$

We complete the proof of (1) of Theorem 13.

Next, we prove (2) of Theorem 13.

From (6), (7), and (55), we obtain $E(0) < d_M$. It follows that u_0 satisfies

$$\begin{aligned} R(u_0) &= \int |\nabla u_0|^2 dx + \int T(x) |u_0|^2 dx \\ &\quad + \int |u_0|^2 dx - \int |u_0|^p dx > 0, \end{aligned} \quad (76)$$

which will be proved by contradiction. If (76) is not true, then we have $R(u_0) \leq 0$. Thus there exists $0 < \mu \leq 1$ such that $u_0 \neq 0$ and

$$\begin{aligned} R(\mu u_0) &= \mu^2 \left(\int |\nabla u_0|^2 dx + \int T(x) |u_0|^2 dx + \int |u_0|^2 dx \right) \\ &\quad - \mu^p \int |u_0|^p dx = 0, \end{aligned} \quad (77)$$

which implies $\mu u_0 \in M$.

On the other hand, for $0 < \mu \leq 1$, $u_0 \in W$ and (55) yield

$$\begin{aligned} S(\mu u_0) &< \mu^2 \\ &\times \left(\int |\nabla u_0|^2 dx + \int T(x) |u_0|^2 dx + \int |u_0|^2 dx \right) \\ &\leq d_M, \end{aligned} \quad (78)$$

which is contradictory to Lemma 4.

Therefore, by $R(u_0) > 0$ and Lemma 6, we have $R(u) > 0$ and $E(t) \leq E(0) < d_M$. Thus

$$E(t) - \frac{1}{p} S(u) \leq E(0); \quad (79)$$

namely,

$$\begin{aligned} & \frac{1}{2} \int |u_t|^2 dx + \frac{p-2}{2p} \\ & \times \left(\int |\nabla u|^2 dx + \int T(x) |u|^2 dx + \int |u|^2 dx \right) \leq E(0). \end{aligned} \quad (80)$$

Therefore we have established the bound of $u(x, t)$ in H for $t \in [0, T)$ and thus the solution $u(x, t)$ of (1) exists globally on $t \in [0, \infty)$.

From (76), $E(0) < d_M$, and Lemma 4, we have the estimate (55).

Thus, we complete the proof of Theorem 13. $\square$

5. Asymptotic Behaviour of Solutions

We now state and prove the following theorem on asymptotic behavior of solutions when $m = 2$.

Theorem 14. *Let $m = 2$ in problem (1). Assume $0 < E(0) < d_m$, $R(u_0) > 0$, or $\|u_0\|_H = 0$. For the global solution of the problem (1) given in Theorem 13, we have*

$$E(t) \leq C e^{-kt}, \quad 0 \leq t < \infty, \quad (81)$$

for some positive constants C and k .

Proof. Let u be a global solution of the problem (1); then by Theorem 13, we obtain $u \in W_\delta$ for $\delta_1 < \delta < \delta_2$ and $0 \leq t < \infty$, where δ_1 and δ_2 ($\delta_1 < \delta_2$) are two roots of equation $d_M(\delta) = E(0)$. Differentiating (7) with respect to t and multiplying the obtained equality by $e^{\gamma t}$ ($\gamma > 0$), we have

$$\begin{aligned} \frac{d}{dt} (e^{\gamma t} E(t)) + e^{\gamma t} \|u_t\|_2^2 &= \gamma e^{\gamma t} E(t), \\ 0 \leq t < \infty. \end{aligned} \quad (82)$$

Integrating (82) with respect to t , we get

$$\begin{aligned} e^{\gamma t} E(t) + \int_0^t e^{\gamma \tau} \|u_\tau\|_2^2 d\tau \\ = E(0) + \gamma \int_0^t e^{\gamma \tau} E(\tau) d\tau. \end{aligned} \quad (83)$$

It follows from $u(t) \in W$ and

$$E(t) = \frac{1}{2} \|u_t\|_2^2 + \frac{p-2}{2p} \|u\|_p^p + \frac{1}{2} R(u); \quad (84)$$

then

$$E(t) \leq \frac{1}{2} \|u_\tau\|_2^2 + \frac{1}{2} R(u) + \frac{p-2}{2p} \|u\|_H^2. \quad (85)$$

Moreover, taking $v = u$ in (42), we obtain

$$\frac{d}{dt} (u, u_t) - \|u_t\|_2^2 + \|u\|_H^2 + \frac{1}{2} \frac{d}{dt} \|u\|_2^2 = \|u\|_p^p, \quad (86)$$

which implies

$$R(u) = \|u_t\|_2^2 - \frac{d}{dt}(u, u_t) - \frac{1}{2} \frac{d}{dt} \|u\|_2^2. \quad (87)$$

From (83), (85), and (87), we get

$$\begin{aligned} & e^{\gamma\tau} E(\tau) d\tau + \int_0^t e^{\gamma\tau} \|u_\tau\|_2^2 d\tau \\ & \leq E(0) + \gamma \int_0^t e^{\gamma\tau} \left(\frac{1}{2} \|u_\tau\|_2^2 d\tau + \frac{1}{2} R(u) + \frac{p-2}{2p} \|u\|_H^2 \right) d\tau \\ & \leq E(0) + \gamma \int_0^t e^{\gamma\tau} \\ & \quad \times \left(\frac{1}{2} \|u_\tau\|_2^2 d\tau + \frac{p-2}{2p} \|u\|_H^2 \right) d\tau \\ & \quad - \frac{\gamma}{4} \int_0^t e^{\gamma\tau} \frac{d}{d\tau} ((u, u_\tau) + \|u\|_2^2) d\tau, \end{aligned} \quad (88)$$

$$\begin{aligned} & \int_0^t e^{\gamma\tau} \frac{d}{d\tau} ((u, u_t) + \|u\|_2^2) d\tau \\ & = 2(u_0, u_1) + \|u_0\|_2^2 - e^{\gamma t} (2(u, u_t) + \|u\|_2^2) \\ & \quad + \gamma \int_0^t e^{\gamma\tau} (2(u, u_\tau) + \|u\|_2^2) d\tau \\ & \leq 2\|u_0\|_2^2 + \|u_1\|_2^2 + e^{\gamma t} (2\|u\|_2^2 + \|u_t\|_2^2) \\ & \quad + \gamma \int_0^t e^{\gamma\tau} (2\|u\|_2^2 + \|u_\tau\|_2^2) d\tau. \end{aligned} \quad (89)$$

From (88) and (89), it follows that

$$\begin{aligned} & e^{\gamma\tau} E(\tau) d\tau + \int_0^t e^{\gamma\tau} \|u_\tau\|_2^2 d\tau \\ & \leq E(0) + \gamma \int_0^t e^{\gamma\tau} \\ & \quad \times \left(\frac{1}{2} \|u_\tau\|_2^2 d\tau + \frac{p-2}{2p} \|u\|_H^2 \right) d\tau \\ & \quad + \frac{\gamma}{4} (2\|u_0\|_2^2 + \|u_1\|_2^2) \\ & \quad + \frac{\gamma}{4} e^{\gamma t} (2\|u\|_2^2 + \|u_t\|_2^2) \\ & \quad + \frac{\gamma^2}{4} \int_0^t e^{\gamma\tau} (2\|u\|_2^2 + \|u_\tau\|_2^2) d\tau \\ & \leq E(0) + C_0 + \frac{\gamma}{4} e^{\gamma t} (2\|u\|_2^2 + \|u_t\|_2^2) \\ & \quad + \frac{\gamma^2}{4} \int_0^t e^{\gamma\tau} \left\{ \left(2 + \frac{2(p-2)}{\gamma p} \right) \|u\|_2^2 + \left(1 + \frac{\gamma}{4} \right) \|u_\tau\|_2^2 \right\} d\tau, \end{aligned} \quad (90)$$

where $C_0 = (\gamma/4)(2\|u_0\|_2^2 + \|u_1\|_2^2)$; then

$$\begin{aligned} e^{\gamma t} E(t) & \leq E(0) + C_0 + \frac{\gamma}{4} e^{\gamma t} (2\|u\|_2^2 + \|u_t\|_2^2) \\ & \quad + \frac{\gamma^2}{4} \int_0^t e^{\gamma\tau} \left\{ \left(2 + \frac{2(p-2)}{\gamma p} \right) \|u\|_2^2 \right. \\ & \quad \left. + \left(1 + \frac{4(\gamma-1)}{\gamma^2} \right) \|u_\tau\|_2^2 \right\} d\tau. \end{aligned} \quad (91)$$

Furthermore, from

$$\begin{aligned} E(t) & = \frac{1}{2} \|u_t\|_2^2 + \frac{p-2}{2p} \|u\|_H^2 + \frac{1}{p} R(u) \\ & > \frac{1}{2} \|u_t\|_2^2 + \frac{p-2}{2p} \|u\|_H^2 > \frac{p-2}{2p} (\|u_t\|_2^2 + \|u\|_H^2), \end{aligned} \quad (92)$$

we obtain

$$\|u_t\|_2^2 + \|u\|_H^2 < \frac{2p}{p-2} E(t). \quad (93)$$

Let $\delta_1 = \max\{2 + (2(p-2))/\gamma p, 1 + (4(\gamma-1))/\gamma^2\}$; then

$$\begin{aligned} e^{\gamma t} E(t) & \leq E(0) + C_0 + \frac{2\gamma}{4} e^{\gamma t} (2\|u\|_H^2 + \|u_t\|_2^2) \\ & \quad + \frac{\gamma^2 \delta_1}{4} \int_0^t e^{\gamma\tau} (2\|u\|_H^2 + \|u_\tau\|_2^2) d\tau \\ & \leq E(0) + C_0 + \frac{2\gamma p}{2(p-2)} e^{\gamma t} E(t) \\ & \quad + \frac{\gamma^2 \delta_1 p}{2(p-2)} \int_0^t e^{\gamma\tau} E(\tau) d\tau. \end{aligned} \quad (94)$$

From (93), we obtain

$$e^{\gamma t} E(t) \leq C_1 + C_2 \int_0^t e^{\gamma\tau} E(\tau) d\tau, \quad (95)$$

where $C_1 = (E(0) + C_0)/(1 - 2\gamma p/2(p-2))$, $C_2 = \gamma^2 \delta_1 p/2(p-2)(1 - 2\gamma p/2(p-2))$. Choosing k sufficiently small and together with Gronwall inequality, we have

$$E(t) \leq C_1 e^{-kt}, \quad (96)$$

where $k = \gamma(1 - \gamma \delta_1 p/2(p-2)(1 - 2\gamma p/2(p-2))) > 0$. $\square$

Conflict of Interests

The authors declare that there is no conflict of interests regarding the publication of this paper.
