By applying the remarkable orthonormal basis constructed recently by Ausher and Hytönen on spaces of homogeneous type in the sense of Coifman and Weiss, pointwise multipliers of inhomogeneous Besov and Triebel-Lizorkin spaces are obtained. We make no additional assumptions on the quasi-metric or the doubling measure. Hence, the results of this paper extend earlier related results to a more general setting.

1. Introduction

The main purpose of this paper is to provide pointwise multipliers of inhomogeneous Besov and Triebel-Lizorkin spaces on spaces of homogeneous type in the sense of Coifman and Weiss. By a pointwise multiplier from a function space $\mathcal{A}$ into another function space $\mathcal{B}$, we meant that a function defines a bounded linear mapping from $\mathcal{A}$ into $\mathcal{B}$ by pointwise multiplication. Pointwise multipliers arise in many different areas of mathematical analysis and have many applications; for example, coefficients of differential operators and symbols of more general pseudodifferential operators may be considered as pointwise multipliers. For the theory of pointwise multipliers acting on several function spaces such as Sobolev, Besov, and Triebel-Lizorkin spaces on $\mathbb{R}^n$ we refer to [1]. See also [2–5] for more details.

It was well known that the Fourier transform is a crucial tool to study pointwise multipliers on $\mathbb{R}^n$. However, it was not clear how to generalize pointwise multipliers on $\mathbb{R}^n$ to spaces of homogeneous type introduced by Coifman and Weiss [6] because the Fourier transform is no longer available on spaces of homogeneous type. To be more precise, let us first recall briefly these spaces. A quasi-metric d on a set X is a function $d: X \times X \rightarrow [0, \infty)$ satisfying that (i) $d(x, y) = 0$ if and only if $x = y$; (ii) $d(x, y) = d(y, x)$ for all $x, y \in X$; (iii) there exists a constant $A_0 \in [1, \infty)$ such that for all x, y and $z \in X$,

$$d(x, y) \leq A_0 [d(x, z) + d(z, y)]. \quad (1)$$

Any quasi-metric defines a topology, for which the balls

$$B(x, r) = \{y \in X : d(y, x) < r\} \quad (2)$$

for all $x \in X$ and all $r > 0$ form a basis. We say that (X, d, μ) is a space of homogeneous type in sense of Coifman and Weiss if d is a quasi-metric and μ is a nonnegative Borel regular measure on X satisfying the doubling condition; that is, for all $x \in X, r > 0$, then $0 < \mu(B(x, r)) < \infty$ and

$$\mu(B(x, 2r)) \leq C\mu(B(x, r)), \quad (3)$$

where μ is assumed to be defined on a σ -algebra which contains all Borel sets and all balls $B(x, r)$ and the constant $0 < C < \infty$ is independent of $x \in X$ and $r > 0$. Spaces of homogeneous type in the sense of Coifman and Weiss have many applications in analysis. For example, Coifman and Weiss introduced atomic Hardy space H_{at}^p for $p \in (0, 1]$ in [6, 7] that proved that if T is a Calderón-Zygmund singular integral operator and is bounded on L^2 , then T extends a bounded operator from H^p to L^p for suitable $p \leq 1$. However, note that the quasi-metric, in contrast to a metric, may not be Hölder regular and quasi-metric balls may not be open. For this reason, in many applications, the additional assumptions on the quasi-metric d and the measure μ are required. For instance, in order to provide the maximal function characterization of the Hardy spaces H_{at}^p on spaces of homogeneous type, Macías and Segovia in [8] showed that

the quasi-metric d can be replaced by another quasi-metric $\tilde{d}$ such that the topologies induced on X by d and $\tilde{d}$ coincide, and, moreover, $\tilde{d}$ has the following Hölder regularity: there exist positive constant C and $0 < \theta < 1$ such that for all $0 < r < \infty$ and all $x, x', y \in X$

$$\begin{aligned} & |\tilde{d}(x, y) - \tilde{d}(x', y)| \\ & \leq C \tilde{d}(x, x')^\theta [\tilde{d}(x, y) + \tilde{d}(x', y)]^{1-\theta}. \end{aligned} \quad (4)$$

Furthermore, if balls $B(x, r)$ are defined by $\tilde{d}$, that is, $B(x, r) = \{y \in X : \tilde{d}(y, x) < r\}$, then

$$\mu(B(x, r)) \sim r. \quad (5)$$

Macías and Segovia provided the maximal function characterization of the Hardy spaces $H^p(X)$ for $(1 + \theta)^{-1} < p \leq 1$, on spaces of homogeneous type $(X, \tilde{d}, \mu)$ with the regularity condition (4) on $\tilde{d}$ and property (5) on the measure μ .

A fundamental result for these spaces $(X, \tilde{d}, \mu)$ is the $T(b)$ theorem of David-Journé-Semmes [9], where $\tilde{d}$ and μ satisfy (4) and (5), respectively. The crucial tool in the proof of the $T(b)$ theorem is the existence of a suitable approximation to the identity. The construction of such an approximation to the identity is due to Coifman. We would like to point out that for Coifman's construction the additional assumptions (4) on $\tilde{d}$ and (5) on μ are crucial. Later, based on the conditions in (4) and (5), the Calderón reproducing formula, test function spaces and distributions, the Littlewood-Paley theory, and function spaces on $(X, \tilde{d}, \mu)$ were developed in [10–12].

In [13], Nagel and Stein developed the product L^p ($1 < p < \infty$) theory in the setting of the Carnot-Carathéodory spaces formed by vector fields satisfying Hörmander's finite rank condition. The particular Carnot-Carathéodory spaces studied in [13] are spaces of homogeneous type with a smooth quasi-metric d and a measure μ satisfying the conditions

$$\mu(B(x, sr)) \sim s^{m+2} \mu(B(x, r)) \quad (6)$$

for $s \geq 1$ and

$$\mu(B(x, sr)) \sim s^4 \mu(B(x, r)) \quad (7)$$

for $s \leq 1$.

These conditions on the measure are weaker than property in (5) but are still stronger than the original doubling condition in (3).

Recently, pointwise multiplier theorems of Besov and Triebel-Lizorkin spaces were obtained by the first author on spaces of homogeneous type with the additional assumptions (1.3) and (1.4) in [14] and with the conditions (1.3) and (1.5) in [15, 16].

A natural question arises: whether pointwise multipliers still hold on spaces of homogeneous type in the sense of Coifman and Weiss with only the original quasi-metric and a doubling measure?

Very recently, Auscher and Hytönen constructed an orthonormal basis with Hölder regularity and exponential

decay on spaces of homogeneous type [17]. This result is remarkable since there are no additional assumptions other than those defining spaces of homogeneous type in the sense of Coifman and Weiss. Motivated by Auscher and Hytönen's orthonormal basis on spaces of homogeneous type, the purpose of the current paper is to answer the above question. More precisely, in this paper, we will provide pointwise multipliers on spaces of homogeneous type in the sense of Coifman and Weiss with the original quasi-metric d and doubling measure μ .

The main tool used in this paper is the orthonormal basis constructed by Auscher and Hytönen [17]. We now briefly recall the orthonormal basis constructed in [17] and inhomogeneous Besov and Triebel-Lizorkin spaces obtained in [18] on spaces of homogeneous type in the sense of Coifman and Weiss.

The orthonormal basis of $L^2(X)$ constructed by Auscher and Hytönen [17] is given by the following.

Theorem 1 (see [17] Theorem 7.1). *Let (X, d, μ) be a space of homogeneous type in the sense of Coifman and Weiss. There exists an orthonormal basis ψ_α^k , $k \in \mathbb{Z}$, $y_\alpha^k \in \mathcal{Y}^k$, of $L^2(X)$, having exponential decay*

$$|\psi_\alpha^k(x)| \leq \frac{C}{\sqrt{\mu(B(y_\alpha^k, \delta^k))}} \exp\left(-\nu \left(\frac{d(y_\alpha^k, x)}{\delta^k}\right)^a\right), \quad (8)$$

Hölder-regularity

$$\begin{aligned} & |\psi_\alpha^k(x) - \psi_\alpha^k(y)| \\ & \leq \frac{C}{\sqrt{\mu(B(y_\alpha^k, \delta^k))}} \left(\frac{d(x, y)}{\delta^k}\right)^\eta \exp\left(-\nu \left(\frac{d(y_\alpha^k, x)}{\delta^k}\right)^a\right) \end{aligned} \quad (9)$$

for some $\eta \in (0, 1)$ and for $d(x, y) \leq \delta^k$, and the cancellation property

$$\int_X \psi_\alpha^k(x) d\mu(x) = 0, \quad k \in \mathbb{Z}, \quad y_\alpha^k \in \mathcal{Y}^k. \quad (10)$$

Moreover,

$$f(x) = \sum_{k \in \mathbb{Z}} \sum_{\alpha \in \mathcal{Y}^k} \langle f, \psi_\alpha^k \rangle \psi_\alpha^k(x) \quad (11)$$

in the sense of $L^2(X)$.

Here $a = (1 + 2 \log 2^{A_0})^{-1}$, δ is a fixed small parameter, say $\delta \leq 10^{-3} A_0^{-10}$, and $\nu > 0$ and $C < \infty$ are constants independent of k , α , x , and y_α^k ; see [17] for more details. In what follows, we also refer to the functions ψ_α^k as wavelets.

To develop function spaces such as the Hardy, Besov and Triebel-Lizorkin spaces, the key point is to introduce test function and distributions spaces. For this purpose, the following definitions were introduced in [18, 19].

Definition 2. For fixed $x_0 \in X$, $r > 0$, $\gamma, \beta \in (0, \eta]$, where η is given in Theorem 1. A function f is said to be a test function of type (x_0, r, β, γ) centered at $x_0 \in X$ with width r if f satisfies the following decay and Hölder regularity properties.

(i) For all $x \in X$,

$$|f(x)| \leq C \frac{1}{V_r(x_0) + V(x, x_0)} \left(\frac{r}{r + d(x, x_0)} \right)^\gamma. \quad (12)$$

(ii) For all $x, y \in X$ with $d(x, y) \leq (1/2A_0)(r + d(x, x_0))$,

$$|f(x) - f(y)| \leq C \left(\frac{d(x, y)}{r + d(x, x_0)} \right)^\beta \frac{1}{V_r(x_0) + V(x, x_0)} \left(\frac{r}{r + d(x, x_0)} \right)^\gamma. \quad (13)$$

If f is a test function of type (x_0, r, β, γ) centered at $x_0 \in X$ with width $r > 0$, we write $f \in \mathcal{G}(x_0, r, \beta, \gamma)$. The norm of f on $\mathcal{G}(x_0, r, \beta, \gamma)$ is defined by

$$\|f\|_{\mathcal{G}(x_0, r, \beta, \gamma)} = \inf \{C > 0 : \text{(i) and (ii) hold}\}. \quad (14)$$

We denote by $\mathcal{G}(\beta, \gamma)$ the class of all $f \in \mathcal{G}(x_0, 1, \beta, \gamma)$. It is easy to check that $\mathcal{G}(x_1, r, \beta, \gamma) = \mathcal{G}(\beta, \gamma)$ with equivalent norms for any fixed $x_1 \in X$ and $r > 0$. Furthermore, it is also easy to see that $\mathcal{G}(\beta, \gamma)$ is a Banach space with respect to the norm on $\mathcal{G}(\beta, \gamma)$.

For given $\lambda \in (0, \eta]$, let $\widetilde{\mathcal{G}}(\beta, \gamma)$ be the completion of the space $\mathcal{G}(\lambda, \lambda)$ in $\mathcal{G}(\beta, \gamma)$ with $0 < \beta, \gamma \leq \lambda$. Obviously, $\widetilde{\mathcal{G}}(\lambda, \lambda) = \mathcal{G}(\lambda, \lambda)$. Moreover, $f \in \widetilde{\mathcal{G}}(\beta, \gamma)$ if and only if $f \in \mathcal{G}(\beta, \gamma)$ with $0 < \beta, \gamma \leq \lambda$ and there exists $\{f_j\}_{j \in \mathbb{N}} \subset \mathcal{G}(\lambda, \lambda)$ such that $\|f - f_j\|_{\mathcal{G}(\beta, \gamma)} \rightarrow 0$ as $j \rightarrow \infty$. If $f \in \widetilde{\mathcal{G}}(\beta, \gamma)$, we define $\|f\|_{\widetilde{\mathcal{G}}(\beta, \gamma)} = \|f\|_{\mathcal{G}(\beta, \gamma)}$. Obviously, $\widetilde{\mathcal{G}}(\beta, \gamma)$ is a Banach space and we also have $\|f\|_{\widetilde{\mathcal{G}}(\beta, \gamma)} = \lim_{j \rightarrow \infty} \|f_j\|_{\mathcal{G}(\beta, \gamma)}$ for the above chosen $\{f_j\}_{j \in \mathbb{N}}$.

We denote by $(\widetilde{\mathcal{G}}(\beta, \gamma))'$ the dual space of $\widetilde{\mathcal{G}}(\beta, \gamma)$ consisting of all linear functional $\mathcal{E}$ from $\widetilde{\mathcal{G}}(\beta, \gamma)$ to $\mathbb{C}$ with the property that there exists a constant C , for all $f \in \widetilde{\mathcal{G}}(\beta, \gamma)$,

$$|\mathcal{E}(f)| \leq C \|f\|_{\widetilde{\mathcal{G}}(\beta, \gamma)}. \quad (15)$$

We denote by $\langle f, h \rangle$ the natural pairing of elements $h \in (\widetilde{\mathcal{G}}(\beta, \gamma))'$ and $f \in \widetilde{\mathcal{G}}(\beta, \gamma)$. Since $\widetilde{\mathcal{G}}(x_1, r, \beta, \gamma) = \widetilde{\mathcal{G}}(\beta, \gamma)$ with the equivalent norms for all $x_1 \in X$ and $r > 0$. Thus, for all $h \in (\widetilde{\mathcal{G}}(\beta, \gamma))'$, $\langle f, h \rangle$ is well defined for all $f \in \widetilde{\mathcal{G}}(x_0, r, \beta, \gamma)$ with $x_0 \in X$ and $r > 0$.

We now give definitions of inhomogeneous Besov and Triebel-Lizorkin spaces on spaces of homogeneous type in the sense of Coifman and Weiss. Denote $P_0(x, y) = \sum_{k \leq -1, \alpha} \psi_\alpha^k(x) \psi_\alpha^k(y)$ and $Q_k(x, y) = \sum_\alpha \psi_\alpha^k(x) \psi_\alpha^k(y)$. Let $P_0(f)(x) = \int P_0(x, y) f(y) d\mu(y)$ and $Q_k(f)(x) = \int Q_k(x, y) f(y) d\mu(y)$.

Definition 3 (see [18]). Let $1 < p, q < \infty$ and $|s| < \eta$. The inhomogeneous Besov space $B_p^{s,q}(X)$ is defined by

$$B_p^{s,q}(X) = \left\{ f \in (\widetilde{\mathcal{G}}(\beta, \gamma))' : \|f\|_{B_p^{s,q}} < \infty \right\}, \quad (16)$$

where

$$\|f\|_{B_p^{s,q}} = \|P_0(f)\|_p + \left\{ \sum_{k \geq 0} (\delta^{-ks} \|Q_k(f)\|_p)^q \right\}^{1/q}. \quad (17)$$

The inhomogeneous Triebel-Lizorkin space $F_p^{s,q}(X)$ is defined by

$$F_p^{s,q}(X) = \left\{ f \in (\widetilde{\mathcal{G}}(\beta, \gamma))' : \|f\|_{F_p^{s,q}} < \infty \right\}, \quad (18)$$

where

$$\|f\|_{F_p^{s,q}} = \|P_0(f)\|_p + \left\| \left\{ \sum_{k \geq 0} (\delta^{-ks} |Q_k(f)|)^q \right\}^{1/q} \right\|_p. \quad (19)$$

We would like to point out that on $\mathbb{R}^n$, $H_p^s(\mathbb{R}^n) = F_p^{s,2}(\mathbb{R}^n)$ are the Bessel-potential spaces (Lebesgue spaces, Liouville spaces). If $m = 0, 1, 2, \dots$ and $1 < p < \infty$, then $W_p^m(\mathbb{R}^n) = H_p^m(\mathbb{R}^n) = F_p^{m,2}(\mathbb{R}^n)$ are the usual Sobolev spaces. If $0 < s, 1 < p < \infty$ and $1 \leq q \leq \infty$, then $B_p^{s,q}(\mathbb{R}^n)$ coincides with the classical Besov spaces (Lipschitz spaces $A_p^{s,q}(\mathbb{R}^n)$).

In this paper, we will consider the following.

Definition 4. Suppose that g is a given function on X . Then g is called a pointwise multiplier for $B_p^{s,q}(X)$ if $f \rightarrow gf$ admits a bounded linear mapping from $B_p^{s,q}(X)$ into itself. Similarly, g is called a pointwise multiplier for $F_p^{s,q}(X)$ if $f \rightarrow gf$ admits a bounded linear mapping from $F_p^{s,q}(X)$ into itself.

The main results in this paper are as follows.

Theorem 5. Let $|s| < \eta$, $1 < p, q < \infty$; then $g \in \mathcal{C}^\alpha$ is a multiplier for $B_p^{s,q}$ with $\alpha > |s|$. Moreover, there exists a positive constant C such that

$$\|gf\|_{B_p^{s,q}} \leq C \|g\|_{\mathcal{C}^\alpha} \|f\|_{B_p^{s,q}} \quad (20)$$

for all $g \in \mathcal{C}^\alpha$ and all $f \in B_p^{s,q}$.

Theorem 6. Let $|s| < \eta$, $1 < p, q < \infty$; then $g \in \mathcal{C}^\alpha$ is a multiplier for $F_p^{s,q}$ with $\alpha > |s|$. Moreover, there exists a positive constant C such that

$$\|gf\|_{F_p^{s,q}} \leq C \|g\|_{\mathcal{C}^\alpha} \|f\|_{F_p^{s,q}} \quad (21)$$

for all $g \in \mathcal{C}^\alpha$ and all $f \in F_p^{s,q}$.

Here, the Hölder space $\mathcal{C}^\alpha(X)$ is defined as the collection of f such that

$$\|f\|_{\mathcal{C}^\alpha} = \|f\|_\infty + \sup_{x \neq y} \frac{|f(x) - f(y)|}{d(x, y)^\alpha} < \infty. \quad (22)$$

We remark that Theorems 5 and 6 were proved in [4] on $\mathbb{R}^n$ based on Fourier transform. As mentioned before, the Fourier transform on spaces of homogeneous type is not available and hence the idea used in [4] does not work for this more general setting. A recent work on pointwise multipliers of Besov and Triebel-Lizorkin spaces on Carnot-Carathéodory spaces was developed in [14–16]. However, all results in those papers require the additional assumptions on both the quasi-metric d and the measure μ . Therefore, results in the present paper extend all results given in [4, 14–16].

Throughout this paper, we use C to denote positive constants, whose value may change from one occurrence to the next. For the measure of ball $B(x, r) = \{y \in X : d(x, y) < r\}$, we sometimes use the abbreviations

$$V_r(x) := \mu(B(x, r)), \quad V(x, y) := V(x, d(x, y)). \quad (23)$$

A brief description of the contents of this paper is as follows. In Section 2 we prove Theorem 5. The proof of Theorem 6 will be given in Section 3.

2. Proof of Theorem 5

Let P_0 and Q_k be orthogonal projections onto V_0 and W_k with $k \in \mathbb{N}$, respectively. The next lemma gives some estimates on kernels of operators P_0 and Q_k .

Lemma 7 (see [17, 18]). *Let η be the Hölder regularity, $k \in \mathbb{N}$ and $\epsilon > 0$. Suppose that $P_0(x, y)$ and $Q_k(x, y)$ are kernels of P_0 and Q_k , respectively. Then there exists a constant C such that*

(i)

$$|P_0(x, y)| \leq C \frac{1}{V_1(x) + V(x, y)} \left(\frac{1}{1 + d(x, y)} \right)^\epsilon, \quad (24)$$

(ii) for $d(y, y') \leq (1/2A_0)(1 + d(x, y))$,

$$\begin{aligned} & |P_0(x, y) - P_0(x, y')| \\ & \leq C \left(\frac{d(y, y')}{1 + d(x, y)} \right)^\eta \frac{1}{V_1(x) + V(x, y)} \left(\frac{1}{1 + d(x, y)} \right)^\epsilon, \end{aligned} \quad (25)$$

(iii)

$$\int_X P_0(x, y) d\mu(x) = 1, \quad (26)$$

(iv)

$$|Q_k(x, y)| \leq C \frac{1}{V_{\delta^k}(x) + V(x, y)} \left(\frac{\delta^k}{\delta^k + d(x, y)} \right)^\epsilon, \quad (27)$$

(v) for $d(y, y') \leq (1/2A_0)(\delta^k + d(x, y))$,

$$\begin{aligned} & |Q_k(x, y) - Q_k(x, y')| \\ & \leq C \left(\frac{d(y, y')}{\delta^k + d(x, y)} \right)^\eta \frac{1}{V_{\delta^k}(x) + V(x, y)} \left(\frac{\delta^k}{\delta^k + d(x, y)} \right)^\epsilon, \end{aligned} \quad (28)$$

(vi)

$$\int_X Q_k(x, y) d\mu(x) = 0. \quad (29)$$

Note that (ii), (iii), (v), and (vi) still hold with x and y interchanged.

The key tool used in this paper, as mentioned, is the following version of the wavelet expansion.

Lemma 8 (see [18]). *Let P_0 and $\{Q_k\}_{k \in \mathbb{Z}_+}$ be the same as in Definition 3. Then*

$$f = P_0^2(f) + \sum_{k \geq 0} Q_k^2(f) \quad (30)$$

holds in L^p with $1 < p < \infty$.

For our purpose, we need the following lemmas.

Lemma 9 (see [18]). *Let $0 < \beta, \gamma < \eta$. Then (30) still holds in $\mathcal{G}(\beta, \gamma)$ and $(\mathcal{G}(\beta, \gamma))'$.*

Lemma 10. *If $f \in \mathcal{G}(\beta, \gamma)$ with $|s| < \beta < \eta$, $0 < \gamma < \eta$, then $f \in B_p^{s, q}$ and $f \in F_p^{s, q}$ with $|s| < \eta$, $1 < p < \infty$, $1 < q < \infty$.*

Proof. Suppose that $f \in \mathcal{G}(\beta, \gamma)$ with $|s| < \beta < \eta$, $0 < \gamma < \eta$. We claim that

$$\begin{aligned} & \left| \int_X P_0(x, y) f(x) d\mu(x) \right| \\ & \leq C \|f\|_{\mathcal{G}(\beta, \gamma)} \frac{1}{V_1(x_0) + V(y, x_0)} \left(\frac{1}{1 + d(x_0, y)} \right)^\gamma \end{aligned} \quad (31)$$

and for $k \in \mathbb{N}$

$$\begin{aligned} & \left| \int_X Q_k(x, y) f(x) d\mu(x) \right| \\ & \leq \delta^{k\beta} \|f\|_{\mathcal{G}(\beta, \gamma)} \frac{1}{V_1(x_0) + V(y, x_0)} \left(\frac{1}{1 + d(x_0, y)} \right)^\gamma. \end{aligned} \quad (32)$$

We first verify (31). By the size condition of P_0 and definition of test functions, we have

$$\begin{aligned} & \left| \int_X P_0(x, y) f(x) d\mu(x) \right| \\ & \leq \int_X \frac{C \|f\|_{\mathcal{G}(\beta, \gamma)}}{V_1(x) + V(x, y)} \left(\frac{1}{1 + d(x, y)} \right)^\gamma \frac{1}{V_1(x_0) + V(x, x_0)} \\ & \quad \times \left(\frac{1}{1 + d(x, x_0)} \right)^\gamma d\mu(x) \\ & \leq C \|f\|_{\mathcal{G}(\beta, \gamma)} \frac{1}{V_1(x_0) + V(y, x_0)} \left(\frac{1}{1 + d(x_0, y)} \right)^\gamma. \end{aligned} \quad (33)$$

To estimate (32), by the cancellation condition on $Q_k(x, y)$, we have

$$\begin{aligned}
 & \left| \int_X Q_k(x, y) f(x) d\mu(x) \right| \\
 &= \left| \int_X Q_k(x, y) [f(x) - f(y)] d\mu(x) \right| \\
 &\leq \int_{W_1} |Q_k(x, y)| |f(x) - f(y)| d\mu(x) \\
 &\quad + \int_{W_2} |Q_k(x, y)| |f(x)| d\mu(x) \\
 &\quad + \int_{W_2} |Q_k(x, y)| |f(y)| d\mu(x) \\
 &:= R_1 + R_2 + R_3,
 \end{aligned} \tag{34}$$

where $W_1 = \{x : d(x, y) \leq (1/2A_0)(1 + d(x_0, y))\}$ and $W_2 = X \setminus W_1$.

For R_1 , for any $\epsilon > 0$, we have

$$\begin{aligned}
 R_1 &\leq C \|f\|_{\mathcal{G}(\beta, \gamma)} \\
 &\quad \times \int_{W_1} \frac{1}{V_{\delta^k}(x) + V(x, y)} \left(\frac{\delta^k}{\delta^k + d(x, y)} \right)^\epsilon \left(\frac{d(x, y)}{1 + d(x_0, y)} \right)^\beta \\
 &\quad \times \frac{1}{V_1(x_0) + V(x_0, y)} \left(\frac{1}{1 + d(x_0, y)} \right)^\gamma d\mu(x) \\
 &\leq C \|f\|_{\mathcal{G}(\beta, \gamma)} \delta^{\beta k} \frac{1}{V_1(x_0) + V(x_0, y)} \left(\frac{1}{1 + d(x_0, y)} \right)^\gamma,
 \end{aligned} \tag{35}$$

where $\epsilon > \beta > 0$.

For R_2 , $d(x, y) \geq (1/2A_0)(1 + d(x_0, y))$ implies $V(x, y) \geq V_1(x_0) + V(y, x_0)$; then

$$\begin{aligned}
 R_2 &\leq C \|f\|_{\mathcal{G}(\beta, \gamma)} \int_{W_2} \frac{1}{V_{\delta^k}(x) + V(x, y)} \left(\frac{\delta^k}{\delta^k + d(x, y)} \right)^\epsilon \\
 &\quad \times \frac{1}{V_1(x_0) + V(x_0, y)} \left(\frac{1}{1 + d(x_0, y)} \right)^\gamma d\mu(x) \\
 &\leq C \|f\|_{\mathcal{G}(\beta, \gamma)} \delta^{\beta k} \frac{1}{V_1(x_0) + V(x_0, y)} \left(\frac{1}{1 + d(x_0, y)} \right)^\gamma,
 \end{aligned} \tag{36}$$

where $\epsilon > \beta > 0$ and $\epsilon > \gamma > 0$.

To estimate R_3 , since $d(x, y)/(d(y, x_0) + 1) \geq 1$, then

$$\begin{aligned}
 R_3 &\leq C \|f\|_{\mathcal{G}(\beta, \gamma)} \\
 &\quad \times \int_{W_2} \frac{1}{V_{\delta^k}(x) + V(x, y)} \left(\frac{\delta^k}{\delta^k + d(x, y)} \right)^\epsilon \left(\frac{d(x, y)}{1 + d(x_0, y)} \right)^\beta \\
 &\quad \times \frac{1}{V_1(x_0) + V(x_0, y)} \left(\frac{1}{1 + d(x_0, y)} \right)^\gamma d\mu(x) \\
 &\leq C \|f\|_{\mathcal{G}(\beta, \gamma)} \delta^{\beta k} \frac{1}{V_1(x_0) + V(x_0, y)} \left(\frac{1}{1 + d(x_0, y)} \right)^\gamma,
 \end{aligned} \tag{37}$$

where $\epsilon > \beta > 0$. The claim is concluded.

We now return to the proof of Lemma 10 and only prove that $\mathcal{G}(\beta, \gamma) \subset B_p^{s, q}$ since the proof of $\mathcal{G}(\beta, \gamma) \subset F_p^{s, q}$ is similar. By applying (31) and (32), it follows that

$$\begin{aligned}
 \|f\|_{B_p^{s, q}} &= \|P_0(f)\|_{L^p} + \left\{ \sum_{k=0}^{\infty} (\delta^{-ks} \|Q_k(f)\|_{L^p})^q \right\}^{1/q} \\
 &\leq C \|f\|_{\mathcal{G}(\beta, \gamma)} + C \|f\|_{\mathcal{G}(\beta, \gamma)} \left\{ \sum_{k=0}^{\infty} (\delta^{k(\beta-s)})^q \right\}^{1/q} \\
 &\leq C \|f\|_{\mathcal{G}(\beta, \gamma)},
 \end{aligned} \tag{38}$$

where $\beta > s$. Thus $\mathcal{G}(\beta, \gamma) \subset B_p^{s, q}$. $\square$

Lemma 11. Let $g \in \mathcal{C}^\alpha$ and $k, l \in \mathbb{N}$. For $\epsilon > \eta$,

$$|P_0 g P_0(x, y)| \leq C \|g\|_{\mathcal{C}^\alpha} \frac{1}{V_1(x) + V(x, y)} \left(\frac{1}{1 + d(x, y)} \right)^\epsilon; \tag{39}$$

$$\begin{aligned}
 |Q_k g Q_l(x, y)| &\leq C \|g\|_{\mathcal{C}^\alpha} \delta^{|k-l|(\alpha \wedge \eta)} \\
 &\quad \times \frac{1}{V_{\delta^{(k \wedge l)}}(x) + V(x, y)} \left(\frac{\delta^{(k \wedge l)}}{\delta^{(k \wedge l)} + d(x, y)} \right)^\epsilon;
 \end{aligned} \tag{40}$$

$$\begin{aligned}
 |P_0 g Q_l(x, y)| &\leq C \|g\|_{\mathcal{C}^\alpha} \delta^{l(\alpha \wedge \eta)} \frac{1}{V_1(x) + V(x, y)} \left(\frac{1}{1 + d(x, y)} \right)^\epsilon,
 \end{aligned} \tag{41}$$

$$\begin{aligned}
 |Q_k g P_0(x, y)| &\leq C \|g\|_{\mathcal{C}^\alpha} \delta^{k(\alpha \wedge \eta)} \frac{1}{V_1(x) + V(x, y)} \left(\frac{1}{1 + d(x, y)} \right)^\epsilon,
 \end{aligned} \tag{42}$$

where $a \wedge b$ denotes the minimum of a and b .

Proof. We first consider (39). By the size conditions of P_0 and the definition of Hölder space $\mathcal{E}^\alpha$, we have

$$\begin{aligned} |P_0 g P_0(x, y)| &\leq C \|g\|_{\mathcal{E}^\alpha} \\ &\quad \times \int_X \frac{1}{V_1(x) + V(x, z)} \left(\frac{1}{1 + d(z, x)} \right)^\epsilon \\ &\quad \times \frac{1}{V_1(y) + V(y, z)} \left(\frac{1}{1 + d(z, y)} \right)^\epsilon d\mu(z) \\ &\leq C \frac{1}{V_1(y) + V(y, x)} \left(\frac{1}{1 + d(x, y)} \right)^\epsilon. \end{aligned} \quad (43)$$

For (40), we only consider that the case for $l \geq k \geq 1$ and the proof for $k \geq l \geq 1$ are similar. In fact, if $l \geq k \geq 1$, we have

$$\begin{aligned} |Q_k g Q_l(x, y)| &= \left| \int_X [Q_k(x, z) g(z) - Q_k(x, y) g(y)] Q_l(z, y) d\mu(z) \right| \\ &\leq \int_X |Q_k(x, z) - Q_k(x, y)| |g(z)| |Q_l(z, y)| d\mu(z) \\ &\quad + \int_X |Q_k(x, y)| |g(z) - g(y)| |Q_l(z, y)| d\mu(z) \\ &=: L_1 + L_2. \end{aligned} \quad (44)$$

We estimate L_1 by further splitting it into

$$\begin{aligned} L_1 &= \int_{W_1} |Q_k(x, z) - Q_k(x, y)| |g(z)| |Q_l(z, y)| d\mu(z) \\ &\quad + \int_{W_2} |Q_k(x, z)| |g(z)| |Q_l(z, y)| d\mu(z) \\ &\quad + \int_{W_2} |Q_k(x, y)| |g(z)| |Q_l(z, y)| d\mu(z) \\ &=: L_{11} + L_{12} + L_{13}, \end{aligned} \quad (45)$$

where $W_1 = \{z \in X : d(z, y) \leq (1/2A_0)(\delta^k + d(x, y))\}$ and $W_2 = X \setminus W_1$.

For L_{11} , for any $\epsilon > 0$, we have

$$\begin{aligned} L_{11} &\leq C \|g\|_{\mathcal{E}^\alpha} \\ &\quad \times \int_{W_1} \left(\frac{d(z, y)}{\delta^k + d(x, y)} \right)^\eta \frac{1}{V_{\delta^k}(x) + V(x, y)} \left(\frac{\delta^k}{\delta^k + d(x, y)} \right)^\epsilon \\ &\quad \times \frac{1}{V_{\delta^l}(y) + V(y, z)} \left(\frac{\delta^l}{\delta^l + d(z, y)} \right)^\epsilon d\mu(z) \end{aligned}$$

$$\begin{aligned} &\leq C \|g\|_{\mathcal{E}^\alpha} \delta^{(l-k)\eta} \frac{1}{V_{\delta^k}(x) + V(x, y)} \left(\frac{\delta^k}{\delta^k + d(x, y)} \right)^\epsilon \\ &\quad \times \int_X \frac{1}{V_{\delta^l}(y) + V(y, z)} \left(\frac{\delta^l}{\delta^l + d(z, y)} \right)^{\epsilon-\eta} d\mu(z) \\ &\leq C \|g\|_{\mathcal{E}^\alpha} \delta^{(l-k)\eta} \frac{1}{V_{\delta^k}(x) + V(x, y)} \left(\frac{\delta^k}{\delta^k + d(x, y)} \right)^\epsilon, \end{aligned} \quad (46)$$

where $\epsilon > \eta$.

For L_{12} , note that $(1/2A_0)(\delta^k + d(x, y)) \leq d(z, y)$ implies that $V_{\delta^k}(y) + V(x, y) \leq V(z, y)$; then we have

$$\begin{aligned} L_{12} &\leq C \|g\|_{\mathcal{E}^\alpha} \frac{1}{V_{\delta^k}(x) + V(x, y)} \left(\frac{\delta^l}{\delta^k + d(x, y)} \right)^\epsilon \\ &\quad \times \int_X \frac{1}{V_{\delta^k}(x) + V(y, x)} \left(\frac{\delta^k}{\delta^k + d(z, x)} \right)^\epsilon d\mu(z) \\ &\leq C \|g\|_{\mathcal{E}^\alpha} \delta^{(l-k)\eta} \frac{1}{V_{\delta^k}(x) + V(x, y)} \left(\frac{\delta^k}{\delta^k + d(x, y)} \right)^\epsilon, \end{aligned} \quad (47)$$

where $\epsilon > \eta$.

For L_{13} , we have

$$\begin{aligned} L_{13} &\leq C \|g\|_{\mathcal{E}^\alpha} \frac{1}{V_{\delta^k}(x) + V(x, y)} \left(\frac{\delta^k}{\delta^k + d(x, y)} \right)^\epsilon \\ &\quad \times \int_{W_2} \frac{1}{V_{\delta^l}(y) + V(y, z)} \left(\frac{\delta^l}{\delta^l + d(z, y)} \right)^\epsilon d\mu(z). \end{aligned} \quad (48)$$

Denoting $t = (1/2A_0)(\delta^k + d(x, y))$, then

$$\begin{aligned} &\int_{W_2} \frac{1}{V_{\delta^l}(y) + V(y, z)} \left(\frac{\delta^l}{\delta^l + d(z, y)} \right)^\epsilon d\mu(z) \\ &= \sum_{j=0}^{\infty} \int_{2^j t < d(z, y) \leq 2^{j+1} t} \frac{1}{V_{\delta^l}(y) + V(y, z)} \\ &\quad \times \left(\frac{\delta^l}{\delta^l + d(z, y)} \right)^\epsilon d\mu(z) \\ &\leq \sum_{j=0}^{\infty} \left(\frac{\delta^l}{2^j t} \right)^\epsilon \frac{1}{V_{2^j t}(y)} \int_{d(z, y) \leq 2^{j+1} t} d\mu(z) \\ &\leq C \sum_{j=0}^{\infty} \left(\frac{\delta^l}{\delta^k} \right)^\epsilon \frac{V_{2^{j+1} t}(y)}{V_{2^j t}(y)} \leq C \delta^{(l-k)\epsilon}. \end{aligned} \quad (49)$$

Thus

$$L_{13} \leq C \|g\|_{\mathcal{E}^\alpha} \delta^{(l-k)\eta} \frac{1}{V_{\delta^k}(x) + V(x, y)} \left(\frac{\delta^k}{\delta^k + d(x, y)} \right)^\epsilon, \quad (50)$$

where $\epsilon > \eta$ and we obtain

$$L_1 \leq C \|g\|_{\mathcal{C}^\alpha} \delta^{(l-k)\eta} \frac{1}{V_{\delta^k}(x) + V(x, y)} \left(\frac{\delta^k}{\delta^k + d(x, y)} \right)^\epsilon. \quad (51)$$

We now return to verify L_2 . By the size condition of Q_k , Q_l and the definition of $\mathcal{C}^\alpha$, we have

$$\begin{aligned} L_2 &\leq C \|g\|_{\mathcal{C}^\alpha} \frac{1}{V_{\delta^k}(x) + V(x, y)} \left(\frac{\delta^k}{\delta^k + d(x, y)} \right)^\epsilon \\ &\quad \times \int_X d(z, y)^\alpha \frac{1}{V_{\delta^l}(y) + V(z, y)} \left(\frac{\delta^l}{\delta^l + d(z, y)} \right)^\epsilon d\mu(x) \\ &\leq C \|g\|_{\mathcal{C}^\alpha} \delta^{l\alpha} \frac{1}{V_{\delta^k}(x) + V(x, y)} \left(\frac{\delta^k}{\delta^k + d(x, y)} \right)^\epsilon, \end{aligned} \quad (52)$$

where $\epsilon > \alpha$. Then

$$\begin{aligned} L_1 + L_2 &\leq C \|g\|_{\mathcal{C}^\alpha} \delta^{(l-k)(\alpha \wedge \eta)} \frac{1}{V_{\delta^k}(x) + V(x, y)} \left(\frac{\delta^k}{\delta^k + d(x, y)} \right)^\epsilon, \end{aligned} \quad (53)$$

where $l \geq k$.

The proofs of (41) and (42) are similar to the proof of (40) and we omit the details. $\square$

We are now ready to prove Theorem 5.

Proof of Theorem 5. We first show Theorem 5 for the special case; that is, if $f \in \mathcal{G}(\beta, \gamma)$ with $|s| < \beta < \eta$, $0 < \gamma < \eta$ and $g \in \mathcal{C}^\alpha$ with $|s| < \alpha$, then

$$\|fg\|_{B_p^{s,q}} \leq C \|g\|_{\mathcal{C}^\alpha} \|f\|_{B_p^{s,q}}. \quad (54)$$

To verify (54), we write

$$\begin{aligned} \|fg\|_{B_p^{s,q}} &= \|P_0(gf)\|_{L^p} + \left\{ \sum_{k=0}^{\infty} (\delta^{-ks} \|Q_k(gf)\|_{L^p})^q \right\}^{1/q} \\ &=: Y_1 + Y_2. \end{aligned} \quad (55)$$

By the wavelet expansion, Hölder's inequality, and the estimates in (39) and (41), we obtain

$$\begin{aligned} Y_1 &\leq \left\| P_0 g \left(P_0^2(f) + \sum_{l=0}^{\infty} Q_l^2(f) \right) \right\|_{L^p} \\ &\leq \|P_0 g P_0 P_0(f)\|_{L^p} + \left\| \sum_{l=0}^{\infty} P_0 g Q_l Q_l(f) \right\|_{L^p} \\ &\leq C \|g\|_{\mathcal{C}^\alpha} \|E_0(f)\|_{L^p} + C \|g\|_{\mathcal{C}^\alpha} \\ &\quad \times \sum_{l=0}^{\infty} \delta^{l(\alpha \wedge \eta + s)} \delta^{-ls} \|D_l(f)\|_{L^p} \\ &\leq C \|g\|_{\mathcal{C}^\alpha} \|E_0(f)\|_{L^p} + C \|g\|_{\mathcal{C}^\alpha} \\ &\quad \times \left\{ \sum_{l=0}^{\infty} (\delta^{-ls} \|D_l(f)\|_{L^p})^q \right\}^{1/q} \\ &\leq C \|g\|_{\mathcal{C}^\alpha} \|f\|_{B_p^{s,q}}, \end{aligned} \quad (56)$$

where we use the fact that $(\alpha \wedge \eta) + s > 0$ and in the third inequality, by (39) and (41), we use the estimates $\int |P_0 g P_0(x, y)| d\mu(x) \leq C \|g\|_{\mathcal{C}^\alpha}$, $\int |P_0 g P_0(x, y)| d\mu(y) \leq C \|g\|_{\mathcal{C}^\alpha}$, $\int |P_0 g Q_l(x, y)| d\mu(x) \leq C \|g\|_{\mathcal{C}^\alpha} \delta^{l(\alpha \wedge \eta)}$ and $\int |P_0 g Q_l(x, y)| d\mu(y) \leq C \|g\|_{\mathcal{C}^\alpha} \delta^{l(\alpha \wedge \eta)}$.

For Y_2 , instead of using (40) and (42), we have

$$\begin{aligned} Y_2 &\leq \left\{ \sum_{k=0}^{\infty} \left(\delta^{-ks} \left\| Q_k \left(g \left(P_0^2(f) + \sum_{l=0}^{\infty} Q_l^2(f) \right) \right) \right\|_{L^p} \right)^q \right\}^{1/q} \\ &\leq C \left\{ \sum_{k=0}^{\infty} (\delta^{-ks} \delta^{k(\alpha \wedge \eta)} \|P_0(f)\|_{L^p})^q \right\}^{1/q} \\ &\quad + C \left\{ \sum_{k=0}^{\infty} (\delta^{-ks} \|Q_k g Q_l Q_l(f)\|_{L^p})^q \right\}^{1/q} \\ &\leq C \|g\|_{\mathcal{C}^\alpha} \|P_0(f)\|_{L^p} \\ &\quad + C \left\{ \sum_{k=0}^{\infty} \left(\sum_{l=0}^{\infty} \delta^{-ks} \delta^{|k-l|(\alpha \wedge \eta)} \|g\|_{\mathcal{C}^\alpha} \|Q_l(f)\|_{L^p} \right)^q \right\}^{1/q} \\ &\leq C \|g\|_{\mathcal{C}^\alpha} \|P_0(f)\|_{L^p} \\ &\quad + C \|g\|_{\mathcal{C}^\alpha} \left\{ \sum_{l=0}^{\infty} \sum_{k=0}^{\infty} \delta^{(l-k)s} \delta^{|k-l|(\alpha \wedge \eta)} (\delta^{-ls} \|Q_l(f)\|_{L^p})^q \right\}^{1/q} \\ &\leq C \|g\|_{\mathcal{C}^\alpha} \|P_0(f)\|_{L^p} \\ &\quad + C \|g\|_{\mathcal{C}^\alpha} \left\{ \sum_{l=0}^{\infty} (\delta^{-ls} \|Q_l(f)\|_{L^p})^q \right\}^{1/q} \\ &\leq C \|g\|_{\mathcal{C}^\alpha} \|f\|_{B_p^{s,q}}, \end{aligned} \quad (57)$$

where $|s| < \eta$ and $|s| < \alpha$. Thus,

$$Y_1 + Y_2 \leq C \|g\|_{\mathcal{G}^\alpha} \|f\|_{B_p^{s,q}}. \quad (58)$$

This completes the proof of (54).

To show Theorem 5 for $f \in B_p^{s,q}$, note that if $f \in B_p^{s,q}$, in general, f could be a distribution and the multiplication of gf is not well defined even for $g \in \mathcal{G}^\alpha$. For this purpose, we make the following observation: for any $f \in B_p^{s,q}$ with $1 < p$, $q < \infty$, $|s| < \eta$ and $g \in \mathcal{G}^\alpha$ with $\alpha > |s|$, there exists a sequence $\{f_n\}_{n \in \mathbb{N}}$ such that $f_j \in \mathcal{G}(\lambda, \lambda)$ with $0 < \lambda < \eta$, $\|f_n\|_{B_p^{s,q}} \lesssim \|f\|_{B_p^{s,q}}$ and $\lim_{n \rightarrow \infty} \langle gf_n, h \rangle$ converges for any $h \in \mathcal{G}(\beta, \gamma)$ with β, γ satisfying $|s| < \beta < \eta$, $0 < \gamma < \eta$. Indeed, for any $f \in B_p^{s,q}$ with $1 < p$, $q < \infty$, $|s| < \eta$, set

$$f_n = \sum_{k=-1}^n B_k^2(f), \quad (59)$$

where $B_{-1} = P_0$, $B_k = Q_k$ for $k \in \mathbb{Z}_+$. By the Proposition 4.4 of [18], $f_n \in \mathcal{G}(\lambda, \lambda)$, and $\|f_n\|_{B_p^{s,q}} \leq \|f\|_{B_p^{s,q}}$. Now we prove that $\lim_{n \rightarrow \infty} \langle gf_n, h \rangle$ converges for any $h \in \mathcal{G}(\beta, \gamma)$ with β, γ satisfying $|s| < \beta < \eta$, $0 < \gamma < \eta$. To do this, for $n, m \in \mathbb{N}_+$, $m < n$, by duality in [18] and the estimate in (54), we have

$$\begin{aligned} |\langle f_n - f_m, gh \rangle| &\leq \|f_n - f_m\|_{B_p^{s,q}} \|gh\|_{B_{p'}^{-s,q'}} \\ &\leq C \|g\|_{\mathcal{G}^\alpha} \|f_n - f_m\|_{B_p^{s,q}} \|h\|_{B_{p'}^{-s,q'}}. \end{aligned} \quad (60)$$

Note that $\|h\|_{B_{p'}^{-s,q'}} \leq C \|h\|_{\mathcal{G}(\beta, \gamma)}$ and $\|f_n - f_m\|_{B_p^{s,q}}$ tend to zero as n, m tend to infinity. This implies that $|\langle f_n - f_m, gh \rangle| \rightarrow 0$ as $n, m \rightarrow \infty$ with $1 < p, q < \infty$, $|s| < \eta$.

Now for any $g \in \mathcal{G}^\alpha$ with $|s| < \alpha < \eta$ and $f \in B_p^{s,q}$ with $1 < p, q < \infty$, $|s| < \eta$, by the above observation, $\lim_{n \rightarrow \infty} \langle gf_n, h \rangle$ exists. Therefore, we define

$$\langle gf, h \rangle = \lim_{n \rightarrow \infty} \langle gf_n, h \rangle \quad (61)$$

for $h \in \mathcal{G}(\beta, \gamma)$ with β, γ satisfying $|s| < \beta < \eta$, $0 < \gamma < \eta$. It is easy to see that limit is independent of the choice of f_n . By Fatou's lemma and (54), we have

$$\begin{aligned} \|gf\|_{B_p^{s,q}} &\leq \liminf_{n \rightarrow \infty} \|gf_n\|_{B_p^{s,q}} \\ &\leq \liminf_{n \rightarrow \infty} C \|g\|_{\mathcal{G}^\alpha} \|f_n\|_{B_p^{s,q}} \leq C \|g\|_{\mathcal{G}^\alpha} \|f\|_{B_p^{s,q}}, \end{aligned} \quad (62)$$

which gives the proof of Theorem 5. $\square$

3. Proof of Theorem 6

We first prove the following technical version of Theorem 6.

Lemma 12. For any $g \in \mathcal{G}^\alpha$, $f \in \mathcal{G}(\beta, \gamma)$ when $0 < \beta, \gamma < \eta$, then

$$\|fg\|_{F_p^{s,q}} \leq C \|g\|_{\mathcal{G}^\alpha} \|f\|_{F_p^{s,q}}, \quad (63)$$

where $1 < p < \infty$, $1 < q < \infty$, $-\eta < s < \eta$, and $-\alpha < s < \alpha$.

Proof. Applying the wavelet expansion, for any $g \in \mathcal{G}^\alpha$, $f \in \mathcal{G}(\beta, \gamma)$ when $0 < \beta, \gamma < \eta$, we have

$$\begin{aligned} \|fg\|_{F_p^{s,q}} &\leq \|P_0 g P_0^2(f)\|_{L^p} + \left\| P_0 g \left(\sum_{l=0}^{\infty} Q_l^2(f) \right) \right\|_{L^p} \\ &\quad + \left\| \left\{ \sum_{k=0}^{\infty} [\delta^{-ks} |Q_k g P_0^2(f)|]^q \right\}^{1/q} \right\|_{L^p} \\ &\quad + \left\| \left\{ \sum_{k=0}^{\infty} \left[\delta^{-ks} \left| Q_k g \sum_{l=0}^{\infty} Q_l^2(f) \right| \right]^q \right\}^{1/q} \right\|_{L^p} \\ &=: Z_1 + Z_2 + Z_3 + Z_4. \end{aligned} \quad (64)$$

The estimate of Z_1 is the same as in the proof of Theorem 5. We only estimate Z_2, Z_3 , and Z_4 . By applying the inequality (39)–(42), the Hölder inequality and the Fefferman–Stein vector-valued maximal function inequality for $1 < p < \infty$, $1 < q < \infty$ in [20], it follows that

$$\begin{aligned} Z_2 &\leq C \|g\|_{\mathcal{G}^\alpha} \left\| \sum_{l=0}^{\infty} \delta^{l((\alpha \wedge \eta) + s)} \delta^{-ls} M(Q_l(f)) \right\|_{L^p} \\ &\leq C \|g\|_{\mathcal{G}^\alpha} \left\| \left\{ \sum_{l=0}^{\infty} [\delta^{-ls} |Q_l(f)|]^q \right\}^{1/q} \right\|_{L^p} \\ &\leq C \|g\|_{\mathcal{G}^\alpha} \|f\|_{F_p^{s,q}}; \\ Z_3 &\leq C \|g\|_{\mathcal{G}^\alpha} \left\| \left\{ \sum_{k=0}^{\infty} [\delta^{k((\alpha \wedge \eta) - s)} M(P_0(f))]^q \right\}^{1/q} \right\|_{L^p} \\ &\leq C \|g\|_{\mathcal{G}^\alpha} \|P_0 f\|_{L^p} \leq C \|g\|_{\mathcal{G}^\alpha} \|f\|_{F_p^{s,q}}; \\ Z_4 &\leq C \|g\|_{\mathcal{G}^\alpha} \left\| \left\{ \sum_{k=0}^{\infty} \left[\delta^{-ks} \sum_{l=0}^{\infty} \delta^{-|k-l|(\eta \wedge \alpha)} M(Q_l(f)) \right]^q \right\}^{1/q} \right\|_{L^p} \\ &\leq C \|g\|_{\mathcal{G}^\alpha} \left\| \left\{ \sum_{k=0}^{\infty} \left[\sum_{l=0}^{\infty} \delta^{-(k-l)s} \delta^{|k-l|(\eta \wedge \alpha)} \right]^{q/q'} \right\}^{1/q} \right\|_{L^p} \\ &\quad \times \left\| \sum_{l=0}^{\infty} \delta^{-(k-l)s} \delta^{|k-l|(\eta \wedge \alpha)} (\delta^{-ls} M(Q_l f))^q \right\|_{L^p}^{1/q} \\ &\leq C \|g\|_{\mathcal{G}^\alpha} \left\| \left\{ \sum_{l=0}^{\infty} (\delta^{-ks} M(D_l f))^q \right\}^{1/q} \right\|_{L^p} \\ &\leq C \|g\|_{\mathcal{G}^\alpha} \|f\|_{F_p^{s,q}}, \end{aligned} \quad (65)$$

where we use the fact that $-(\eta \wedge \alpha) < s < (\eta \wedge \alpha)$. This verifies Lemma 12. $\square$

To show Theorem 6, we also need the following technical lemma.

Lemma 13 (see [18]). For any $f \in F_p^{s,q}$, there exists a sequence $\{f_n\}_{n \in \mathbb{Z}_+} \in \mathcal{G}(\beta, \gamma)$ for $0 < \beta, \gamma < \eta$, such that $f_n \rightarrow f$ in $F_p^{s,q}$ with $\|f_n\|_{F_p^{s,q}} \leq C\|f\|_{F_p^{s,q}}$, where $1 < p < \infty$, $1 < q < \infty$, $-\eta < s < \eta$.

Suppose that f, f_n are given as in Lemma 13 and $g \in \mathcal{C}^\alpha$. Note that if $|s| < \beta < \eta$, $0 < \gamma < \eta$, then $h \in \mathcal{G}(\beta, \gamma) \subset F_p^{s,q} \cap F_{p'}^{-s,q'}$. By duality given in [18] and Lemma 12, it follows that

$$\begin{aligned} |\langle g(f_j - f_k), h \rangle| &\leq \|g(f_j - f_k)\|_{F_p^{s,q}} \|h\|_{F_{p'}^{-s,q'}} \\ &\leq \|g\|_{\mathcal{C}^\alpha} \|f_j - f_k\|_{F_p^{s,q}} \|h\|_{\mathcal{G}(\beta, \gamma)} \rightarrow 0 \\ &\text{as } j, k \rightarrow \infty. \end{aligned} \quad (66)$$

The above estimate implies that $\lim_{n \rightarrow \infty} \langle gf_n, h \rangle$ exists and the limit is independent of the choice of f_n . Therefore, for $g \in \mathcal{C}^\alpha$, $f \in F_p^{s,q}$ we define

$$\langle gf, h \rangle = \lim_{n \rightarrow \infty} \langle gf_n, h \rangle, \quad (67)$$

where $h \in \mathcal{G}(\beta, \gamma)$ for $0 < \beta, \gamma < \eta$ and f_n is a sequence defined in Lemma 13.

We now apply Fatou's lemma and Lemma 13 to show Theorem 6.

Proof of Theorem 6. For any $g \in \mathcal{C}^\alpha$, $f \in F_p^{s,q}$, applying Fatou's lemma and Lemma 13 implies that

$$\begin{aligned} \|gf\|_{F_p^{s,q}} &\leq \left\| \left\{ \sum_{k=0}^{\infty} \left[\delta^{-ks} \lim_{n \rightarrow \infty} B_k(gf_n) \right]^q \right\}^{1/q} \right\|_p \\ &\leq \liminf_{n \rightarrow \infty} \|gf_n\|_{F_p^{s,q}} \\ &\leq C \liminf_{n \rightarrow \infty} \|g\|_{\mathcal{C}^\alpha} \|f_n\|_{F_p^{s,q}} \\ &\leq C \|g\|_{\mathcal{C}^\alpha} \|f\|_{F_p^{s,q}}, \end{aligned} \quad (68)$$

where, as before, $B_{-1} = P_0$, $B_k = Q_k$ for $k \in \mathbb{Z}_+$.

The proof of Theorem 6 is concluded. $\square$

Conflict of Interests

The authors declare that there is no conflict of interests regarding the publication of this paper.
