We first introduce and analyze one implicit iterative algorithm for finding a solution of the minimization problem for a convex and continuously Fréchet differentiable functional, with constraints of several problems: the generalized mixed equilibrium problem, the system of generalized equilibrium problems, and finitely many variational inclusions in a real Hilbert space. We prove strong convergence theorem for the iterative algorithm under suitable conditions. On the other hand, we also propose another implicit iterative algorithm for finding a fixed point of infinitely many nonexpansive mappings with the same constraints, and derive its strong convergence under mild assumptions.

1. Introduction

Let C be a nonempty closed convex subset of a real Hilbert space H and let P_C be the metric projection of H onto C . Let $S : C \rightarrow H$ be a nonlinear mapping on C . We denote by $\text{Fix}(S)$ the set of fixed points of S and by $\mathbf{R}$ the set of all real numbers. A mapping V is called strongly positive on H if there exists a constant $\bar{\gamma} > 0$ such that

$$\langle Vx, x \rangle \geq \bar{\gamma} \|x\|^2, \quad \forall x \in H. \quad (1)$$

A mapping $S : C \rightarrow H$ is called L -Lipschitz continuous if there exists a constant $L \geq 0$ such that

$$\|Sx - Sy\| \leq L \|x - y\|, \quad \forall x, y \in C. \quad (2)$$

In particular, if $L = 1$, then S is called a nonexpansive mapping; if $L \in [0, 1)$, then S is called a contraction.

Let $A : C \rightarrow H$ be a nonlinear mapping on C . We consider the following variational inequality problem (VIP): find a point $x \in C$ such that

$$\langle Ax, y - x \rangle \geq 0, \quad \forall y \in C. \quad (3)$$

The solution set of VIP (3) is denoted by $\text{VI}(C, A)$.

Let $\varphi : C \rightarrow \mathbf{R}$ be a real-valued function, $A : H \rightarrow H$ a nonlinear mapping, and $\Theta : C \times C \rightarrow \mathbf{R}$ a bifunction. The generalized mixed equilibrium problem (GMEP) introduced in [1] is to find $x \in C$ such that

$$\Theta(x, y) + \varphi(y) - \varphi(x) + \langle Ax, y - x \rangle \geq 0, \quad \forall y \in C. \quad (4)$$

We denote the set of solutions of GMEP (4) by $\text{GMEP}(\Theta, \varphi, A)$.

We assume as in [1] that $\Theta : C \times C \rightarrow \mathbf{R}$ is a bifunction satisfying conditions (H1)–(H4) and $\varphi : C \rightarrow \mathbf{R}$ is a lower semicontinuous and convex function with restriction (H5), where

$$(H1) \quad \Theta(x, x) = 0 \text{ for all } x \in C;$$

(H2) Θ is monotone, that is, $\Theta(x, y) + \Theta(y, x) \leq 0$ for any $x, y \in C$;

(H3) Θ is upper-hemicontinuous, that is, for each $x, y, z \in C$,

$$\limsup_{t \rightarrow 0^+} \Theta(tz + (1-t)x, y) \leq \Theta(x, y); \quad (5)$$

(H4) $\Theta(x, \cdot)$ is convex and lower semicontinuous for each $x \in C$;

(H5) for each $x \in H$ and $r > 0$, there exist a bounded subset $D_x \subset C$ and $y_x \in C$ such that, for any $z \in C \setminus D_x$,

$$\Theta(z, y_x) + \varphi(y_x) - \varphi(z) + \frac{1}{r} \langle y_x - z, z - x \rangle < 0. \quad (6)$$

Given a positive number, $r > 0$. Let $S_r^{(\Theta, \varphi)} : H \rightarrow C$ be the solution set of the auxiliary mixed equilibrium problem; that is, for each $x \in H$,

$$S_r^{(\Theta, \varphi)}(x) := \left\{ y \in C : \Theta(y, z) + \varphi(z) - \varphi(y) + \frac{1}{r} \langle K'(y) - K'(x), z - y \rangle \geq 0, \forall z \in C \right\}. \quad (7)$$

In particular, whenever $K(x) = (1/2)\|x\|^2$, for all $x \in H$, $S_r^{(\Theta, \varphi)}(x)$ is rewritten as $T_r^{(\Theta, \varphi)}(x)$.

Let $\Theta_1, \Theta_2 : C \times C \rightarrow \mathbf{R}$ be two bifunctions and $A_1, A_2 : C \rightarrow H$ two nonlinear mappings. Consider the following system of generalized equilibrium problems (SGEP) [2]: find $(x^*, y^*) \in C \times C$ such that

$$\begin{aligned} \Theta_1(x^*, x) + \langle A_1 y^*, x - x^* \rangle + \frac{1}{\nu_1} \langle x^* - y^*, x - x^* \rangle &\geq 0, \\ \Theta_2(y^*, y) + \langle A_2 x^*, y - y^* \rangle + \frac{1}{\nu_2} \langle y^* - x^*, y - y^* \rangle &\geq 0, \end{aligned} \quad \begin{aligned} \forall x \in C, \\ \forall y \in C, \end{aligned} \quad (8)$$

where $\nu_1 > 0$ and $\nu_2 > 0$ are two constants.

In 2010, Ceng and Yao [2] transformed the SGEP into a fixed point problem in the following way.

Proposition CY (see [2]). *Let $\Theta_1, \Theta_2 : C \times C \rightarrow \mathbf{R}$ be two bifunctions satisfying conditions (H1)–(H4) and let $A_k : C \rightarrow H$ be ζ_k -inverse-strongly monotone for $k = 1, 2$. Let $\nu_k \in (0, 2\zeta_k)$ for $k = 1, 2$. Then, $(x^*, y^*) \in C \times C$ is a solution of SGEP (8) if and only if x^* is a fixed point of the mapping $G : C \rightarrow C$ defined by $G = T_{\nu_1}^{\Theta_1}(I - \nu_1 A_1)T_{\nu_2}^{\Theta_2}(I - \nu_2 A_2)$ where $y^* = T_{\nu_2}^{\Theta_2}(I - \nu_2 A_2)x^*$. Here, we denote the fixed point set of G by $\text{SGEP}(G)$.*

Let $\{T_n\}_{n=1}^\infty$ be an infinite family of nonexpansive mappings on H and $\{\lambda_n\}_{n=1}^\infty$ a sequence of nonnegative numbers in $[0, 1]$. For any $n \geq 1$, define a mapping W_n on H as follows:

$$\begin{aligned} U_{n,n+1} &= I, \\ U_{n,n} &= \lambda_n T_n U_{n,n+1} + (1 - \lambda_n) I, \\ U_{n,n-1} &= \lambda_{n-1} T_{n-1} U_{n,n} + (1 - \lambda_{n-1}) I, \\ &\vdots \\ U_{n,k} &= \lambda_k T_k U_{n,k+1} + (1 - \lambda_k) I, \\ U_{n,k-1} &= \lambda_{k-1} T_{k-1} U_{n,k} + (1 - \lambda_{k-1}) I, \\ &\vdots \\ U_{n,2} &= \lambda_2 T_2 U_{n,3} + (1 - \lambda_2) I, \\ W_n &= U_{n,1} = \lambda_1 T_1 U_{n,2} + (1 - \lambda_1) I. \end{aligned} \quad (9)$$

Such a mapping W_n is called the W -mapping generated by $T_n, T_{n-1}, \dots, T_1$ and $\lambda_n, \lambda_{n-1}, \dots, \lambda_1$.

Let $Q : H \rightarrow H$ be a contraction and V a strongly positive bounded linear operator on H . Assume that $\varphi : H \rightarrow \mathbf{R}$ is a lower semicontinuous and convex functional, that $\Theta, \Theta_1, \Theta_2 : H \times H \rightarrow \mathbf{R}$ satisfy conditions (H1)–(H4), and that $A, A_1, A_2 : H \rightarrow H$ are inverse-strongly monotone. Let the mapping G be defined as in Proposition CY. Very recently, Ceng et al. [3] introduced the following hybrid extragradient-like iterative scheme:

$$\begin{aligned} z_n &= S_{r_n}^{(\Theta, \varphi)}(x_n - r_n A x_n), \\ x_{n+1} &= \alpha_n (u + \gamma Q x_n) + \beta_n x_n \\ &\quad + ((1 - \beta_n) I - \alpha_n (I + \mu V)) W_n G z_n, \quad \forall n \geq 0, \end{aligned} \quad (10)$$

for finding a common solution of GMEP (4), SGEP (8), and the fixed point problem of an infinite family of nonexpansive mappings $\{T_n\}_{n=1}^\infty$ on H , where $\{r_n\} \subset (0, \infty)$, $\{\alpha_n\}, \{\beta_n\} \subset (0, 1)$, $\nu_k \in (0, 2\zeta_k)$, $k = 1, 2$, and $x_0, u \in H$ are given. The authors proved the strong convergence of the sequence $\{x_n\}$ to a point $x^* \in \Omega := \bigcap_{n=1}^\infty \text{Fix}(T_n) \cap \text{GMEP}(\Theta, \varphi, A) \cap \text{SGEP}(G)$ under some suitable conditions. This point x^* also solves the following optimization problem:

$$\min_{x \in \Omega} \frac{\mu}{2} \langle Vx, x \rangle + \frac{1}{2} \|x - u\|^2 - h(x), \quad (\text{OP1})$$

where $h : H \rightarrow \mathbf{R}$ is the potential function of γQ .

Let B be a single-valued mapping of C into H and R a multivalued mapping with $D(R) = C$. Consider the following variational inclusion: find a point $x \in C$ such that

$$0 \in Bx + Rx. \quad (11)$$

We denote by $I(B, R)$ the solution set of the variational inclusion (11). In 1998, Huang [4] studied problem (11) in

the case where R is maximal monotone and B is strongly monotone and Lipschitz continuous with $D(R) = C = H$.

Let $f : C \rightarrow \mathbf{R}$ be a convex and continuously Fréchet differentiable functional. Consider the convex minimization problem (CMP) of minimizing f over the constraint set C :

$$\text{minimize } \{f(x) : x \in C\}. \quad (12)$$

We denote by Γ the set of minimizers of CMP (12).

Very recently, Ceng and Al-Homidan [5] introduced an implicit iterative algorithm for finding a common solution of the CMP (12), finitely many GMEPs and finitely many variational inclusions, and derived its strong convergence under appropriate conditions.

Algorithm CA (see [5, Theorem 18]). Let C be a nonempty closed convex subset of a real Hilbert space H . Let $f : C \rightarrow \mathbf{R}$ be a convex functional with L -Lipschitz continuous gradient ∇f . Let M, N be two integers. Let Θ_k be a bifunction from $C \times C$ to $\mathbf{R}$ satisfying (H1)–(H4) and $\varphi_k : C \rightarrow \mathbf{R} \cup \{+\infty\}$ a proper lower semicontinuous and convex function, where $k \in \{1, 2, \dots, M\}$. Let $R_i : C \rightarrow 2^H$ be a maximal monotone mapping and let $A_k : H \rightarrow H$ and $B_i : C \rightarrow H$ be μ_k -inverse strongly monotone and η_i -inverse strongly monotone, respectively, where $k \in \{1, 2, \dots, M\}$, $i \in \{1, 2, \dots, N\}$. Let $F : H \rightarrow H$ be a κ -Lipschitzian and η -strongly monotone operator with positive constants $\kappa, \eta > 0$. Let $Q : H \rightarrow H$ be an l -Lipschitzian mapping with constant $l \geq 0$. Let $0 < \mu < (2\eta/\kappa^2)$ and $0 \leq \gamma l < \tau$, where $\tau = 1 - \sqrt{1 - \mu(2\eta - \mu\kappa^2)}$. Let $\{x_n\}$ be a sequence generated by

$$\begin{aligned} u_n &= T_{r_{M,n}}^{(\Theta_M, \varphi_M)} (I - r_{M,n} A_M) T_{r_{M-1,n}}^{(\Theta_{M-1}, \varphi_{M-1})} \\ &\quad \times (I - r_{M-1,n} A_{M-1}) \cdots T_{r_{1,n}}^{(\Theta_1, \varphi_1)} (I - r_{1,n} A_1) x_n, \\ v_n &= J_{R_N, \lambda_{N,n}} (I - \lambda_{N,n} B_N) J_{R_{N-1}, \lambda_{N-1,n}} \\ &\quad \times (I - \lambda_{N-1,n} B_{N-1}) \cdots J_{R_1, \lambda_{1,n}} (I - \lambda_{1,n} B_1) u_n, \\ x_n &= s_n \gamma Q x_n + (I - s_n \mu F) T_n v_n, \quad \forall n \geq 1, \end{aligned} \quad (13)$$

where $P_C(I - \lambda_n \nabla f) = s_n I + (1 - s_n) T_n$ (here T_n is nonexpansive, $s_n = ((2 - \lambda_n L)/4) \in (0, (1/2))$ for each $\lambda_n \in (0, (2/L))$), and the following conditions hold:

- (i) $s_n \in (0, (1/2))$ for each $\lambda_n \in (0, (2/L))$, $\lim_{n \rightarrow \infty} s_n = 0$ ($\Leftrightarrow \lim_{n \rightarrow \infty} \lambda_n = (2/L)$);
- (ii) $\{\lambda_{i,n}\} \subset [a_i, b_i] \subset (0, 2\eta_i)$, for all $i \in \{1, 2, \dots, N\}$;
- (iii) $\{r_{k,n}\} \subset [e_k, f_k] \subset (0, 2\mu_k)$, for all $k \in \{1, 2, \dots, M\}$.

Motivated and inspired by the above facts, we first introduce and analyze one implicit iterative algorithm for finding a solution of the CMP (12) with constraints of several problems: the GMEP (4), the SGEP (8), and finitely many variational inclusions in a real Hilbert space. We prove strong convergence theorem for the iterative algorithm under suitable conditions. The iterative algorithm is based on Korpelevich's extragradient method, hybrid steepest-descent

method in [6], viscosity approximation method, averaged mapping approach to the GPA in [7], and strongly positive bounded linear operator technique. On the other hand, we also propose another implicit iterative algorithm for finding a fixed point of infinitely many nonexpansive mappings with the same constraints. We derive its strong convergence under mild assumptions.

2. Preliminaries

Throughout this paper, we assume that H is a real Hilbert space whose inner product and norm are denoted by $\langle \cdot, \cdot \rangle$ and $\| \cdot \|$, respectively. Let C be a nonempty closed convex subset of H . We write $x_n \rightharpoonup x$ to indicate that the sequence $\{x_n\}$ converges weakly to x and $x_n \rightarrow x$ to indicate that the sequence $\{x_n\}$ converges strongly to x . Moreover, we use $\omega_w(x_n)$ to denote the weak ω -limit set of the sequence $\{x_n\}$; that is,

$$\begin{aligned} \omega_w(x_n) &:= \{x \in H : x_{n_i} \rightarrow x \text{ for some subsequence } \{x_{n_i}\} \text{ of } \{x_n\}\}. \end{aligned} \quad (14)$$

Recall that a mapping $A : C \rightarrow H$ is called

(i) monotone if

$$\langle Ax - Ay, x - y \rangle \geq 0, \quad \forall x, y \in C; \quad (15)$$

(ii) η -strongly monotone if there exists a constant $\eta > 0$ such that

$$\langle Ax - Ay, x - y \rangle \geq \eta \|x - y\|^2, \quad \forall x, y \in C; \quad (16)$$

(iii) α -inverse-strongly monotone if there exists a constant $\alpha > 0$ such that

$$\langle Ax - Ay, x - y \rangle \geq \alpha \|Ax - Ay\|^2, \quad \forall x, y \in C. \quad (17)$$

It is obvious that if A is α -inverse-strongly monotone, then A is monotone and $(1/\alpha)$ -Lipschitz continuous.

The metric (or nearest point) projection from H onto C is the mapping $P_C : H \rightarrow C$ which assigns to each point $x \in H$ the unique point $P_C x \in C$ satisfying the property

$$\|x - P_C x\| = \inf_{y \in C} \|x - y\| =: d(x, C). \quad (18)$$

Some important properties of projections are gathered in the following proposition.

Proposition 1. For given $x \in H$ and $z \in C$,

- (i) $z = P_C x \Leftrightarrow \langle x - z, y - z \rangle \leq 0$, for all $y \in C$;
- (ii) $z = P_C x \Leftrightarrow \|x - z\|^2 \leq \|x - y\|^2 - \|y - z\|^2$, for all $y \in C$;
- (iii) $\langle P_C x - P_C y, x - y \rangle \geq \|P_C x - P_C y\|^2$, for all $y \in H$.

Consequently, P_C is nonexpansive and monotone.

If A is an α -inverse-strongly monotone mapping of C into H , then it is obvious that A is $(1/\alpha)$ -Lipschitz continuous. If $\lambda \leq 2\alpha$, then it is easy to see that $I - \lambda A$ is a nonexpansive mapping from C to H .

Definition 2. A mapping $T : H \rightarrow H$ is said to be

(a) nonexpansive if

$$\|Tx - Ty\| \leq \|x - y\|, \quad \forall x, y \in H; \quad (19)$$

(b) firmly nonexpansive if $2T - I$ is nonexpansive, or equivalently, if T is 1-inverse strongly monotone (1-ism),

$$\langle x - y, Tx - Ty \rangle \geq \|Tx - Ty\|^2, \quad \forall x, y \in H; \quad (20)$$

alternatively, T is firmly nonexpansive if and only if T can be expressed as

$$T = \frac{1}{2} (I + S), \quad (21)$$

where $S : H \rightarrow H$ is nonexpansive; projections are firmly nonexpansive.

It can be easily seen that if T is nonexpansive, then $I - T$ is monotone. It is also easy to see that a projection P_C is 1-ism.

Definition 3. A mapping $T : H \rightarrow H$ is said to be an averaged mapping if it can be written as the average of the identity I and a nonexpansive mapping; that is,

$$T \equiv (1 - \alpha)I + \alpha S, \quad (22)$$

where $\alpha \in (0, 1)$ and $S : H \rightarrow H$ is nonexpansive. More precisely, when the last equality holds, we say that T is α -averaged. Thus firmly nonexpansive mappings (in particular, projections) are $(1/2)$ -averaged mappings.

Proposition 4 (see [8]). Let $T : H \rightarrow H$ be a given mapping.

- (i) T is nonexpansive if and only if the complement $I - T$ is $(1/2)$ -ism.
- (ii) If T is ν -ism, then, for $\gamma > 0$, γT is (ν/γ) -ism.
- (iii) T is averaged if and only if the complement $I - T$ is ν -ism for some $\nu > 1/2$. Indeed, for $\alpha \in (0, 1)$, T is α -averaged if and only if $I - T$ is $(1/2\alpha)$ -ism.

Proposition 5 (see [8]). Let $S, T, V : H \rightarrow H$ be given operators.

- (i) If $T = (1 - \alpha)S + \alpha V$ for some $\alpha \in (0, 1)$ and if S is averaged and V is nonexpansive, then T is averaged.
- (ii) T is firmly nonexpansive if and only if the complement $I - T$ is firmly nonexpansive.
- (iii) If $T = (1 - \alpha)S + \alpha V$ for some $\alpha \in (0, 1)$ and if S is firmly nonexpansive and V is nonexpansive, then T is averaged.

(iv) The composite of finitely many averaged mappings is averaged. That is, if each of the mappings $\{T_i\}_{i=1}^N$ is averaged, then so is the composite $T_1 \cdots T_N$. In particular, if T_1 is α_1 -averaged and T_2 is α_2 -averaged, where $\alpha_1, \alpha_2 \in (0, 1)$, then the composite $T_1 T_2$ is α -averaged, where $\alpha = \alpha_1 + \alpha_2 - \alpha_1 \alpha_2$.

(v) If the mappings $\{T_i\}_{i=1}^N$ are averaged and have a common fixed point, then

$$\bigcap_{i=1}^N \text{Fix}(T_i) = \text{Fix}(T_1 \cdots T_N). \quad (23)$$

The notation $\text{Fix}(T)$ denotes the set of all fixed points of the mapping T ; that is, $\text{Fix}(T) = \{x \in H : Tx = x\}$.

By using the technique in [9], we can readily obtain the following elementary result.

Proposition 6 (see [3, Lemma 1 and Proposition 1]). Let C be a nonempty closed convex subset of a real Hilbert space H and let $\varphi : C \rightarrow \mathbf{R}$ be a lower semicontinuous and convex function. Let $\Theta : C \times C \rightarrow \mathbf{R}$ be a bifunction satisfying the conditions (H1)–(H4). Assume that

- (i) $K : H \rightarrow \mathbf{R}$ is strongly convex with constant $\sigma > 0$ and the function $x \mapsto \langle y - x, K'(x) \rangle$ is weakly upper semicontinuous for each $y \in H$;
- (ii) for each $x \in H$ and $r > 0$, there exists a bounded subset $D_x \subset C$ and $y_x \in C$ such that, for any $z \in C \setminus D_x$,

$$\Theta(z, y_x) + \varphi(y_x) - \varphi(z) + \frac{1}{r} \langle K'(z) - K'(x), y_x - z \rangle < 0. \quad (24)$$

Then the following hold:

- (a) for each $x \in H$, $S_r^{(\Theta, \varphi)}(x) \neq \emptyset$;
- (b) $S_r^{(\Theta, \varphi)}$ is single-valued;
- (c) $S_r^{(\Theta, \varphi)}$ is nonexpansive if K' is Lipschitz continuous with constant $\nu > 0$ and

$$\begin{aligned} & \langle K'(x_1) - K'(x_2), u_1 - u_2 \rangle \\ & \leq \langle K'(u_1) - K'(u_2), u_1 - u_2 \rangle, \quad \forall (x_1, x_2) \in H \times H, \end{aligned} \quad (25)$$

where $u_i = S_r^{(\Theta, \varphi)}(x_i)$ for $i = 1, 2$;

- (d) for all $s, t > 0$ and $x \in H$

$$\begin{aligned} & \langle K'(S_s^{(\Theta, \varphi)} x) - K'(S_t^{(\Theta, \varphi)} x), S_s^{(\Theta, \varphi)} x - S_t^{(\Theta, \varphi)} x \rangle \\ & \leq \frac{s-t}{s} \langle K'(S_s^{(\Theta, \varphi)} x) - K'(x), S_s^{(\Theta, \varphi)} x - S_t^{(\Theta, \varphi)} x \rangle; \end{aligned} \quad (26)$$

- (e) $\text{Fix}(S_r^{(\Theta, \varphi)}) = \text{MEP}(\Theta, \varphi)$;
- (f) $\text{MEP}(\Theta, \varphi)$ is closed and convex.

Remark 7. In Proposition 4, whenever $\Theta : C \times C \rightarrow \mathbf{R}$ is a bifunction satisfying the conditions (H1)–(H4) and $K(x) = (1/2)\|x\|^2$, for all $x \in H$, we have for any $x, y \in H$,

$$\|S_r^{(\Theta, \varphi)} x - S_r^{(\Theta, \varphi)} y\|^2 \leq \langle S_r^{(\Theta, \varphi)} x - S_r^{(\Theta, \varphi)} y, x - y \rangle \quad (27)$$

($S_r^{(\Theta, \varphi)}$ is firmly nonexpansive) and

$$\|S_s^{(\Theta, \varphi)} x - S_t^{(\Theta, \varphi)} x\| \leq \frac{|s - t|}{s} \|S_s^{(\Theta, \varphi)} x - x\|, \quad (28)$$

$$\forall s, t > 0, x \in H.$$

In this case, $S_r^{(\Theta, \varphi)}$ is rewritten as $T_r^{(\Theta, \varphi)}$. If, in addition, $\varphi \equiv 0$, then $T_r^{(\Theta, \varphi)}$ is rewritten as T_r^Θ ; see [2, Lemma 2.1] for more details.

We need some facts and tools in a real Hilbert space H which are listed as lemmas below.

Lemma 8. Let X be a real inner product space. Then there holds the following inequality:

$$\|x + y\|^2 \leq \|x\|^2 + 2 \langle y, x + y \rangle, \quad \forall x, y \in X. \quad (29)$$

Lemma 9. Let $A : C \rightarrow H$ be a monotone mapping. In the context of the variational inequality problem the characterization of the projection (see Proposition 1(i)) implies

$$u \in VI(C, A) \iff u = P_C(u - \lambda Au), \quad \lambda > 0. \quad (30)$$

Lemma 10 (see [10, demiclosedness principle]). Let C be a nonempty closed convex subset of a real Hilbert space H . Let T be a nonexpansive self-mapping on C . Then $I - T$ is demiclosed. That is, whenever $\{x_n\}$ is a sequence in C weakly converging to some $x \in C$ and the sequence $\{(I - T)x_n\}$ strongly converges to some y , it follows that $(I - T)x = y$. Here I is the identity operator of H .

Lemma 11 (see [11, Lemma 3.2]). Let C be a nonempty closed convex subset of a real Hilbert space H . Let $\{T_n\}_{n=1}^\infty$ be a sequence of nonexpansive self-mappings on C such that $\cap_{n=1}^\infty \text{Fix}(T_n) \neq \emptyset$ and let $\{\lambda_n\}$ be a sequence in $(0, b]$ for some $b \in (0, 1)$. Then, for every $x \in C$ and $k \geq 1$ the limit $\lim_{n \rightarrow \infty} U_{n,k}x$ exists where $U_{n,k}$ is defined as in (9).

Lemma 12 (see [11, Lemma 3.3]). Let C be a nonempty closed convex subset of a real Hilbert space H . Let $\{T_n\}_{n=1}^\infty$ be a sequence of nonexpansive self-mappings on C such that $\cap_{n=1}^\infty \text{Fix}(T_n) \neq \emptyset$, and let $\{\lambda_n\}$ be a sequence in $(0, b]$ for some $b \in (0, 1)$. Then, $\text{Fix}(W) = \cap_{n=1}^\infty \text{Fix}(T_n)$.

The following lemma can be easily proved and, therefore, we omit the proof.

Lemma 13. Let $V : H \rightarrow H$ be a $\bar{\gamma}$ -strongly positive bounded linear operator with constant $\bar{\gamma} > 1$. Then for $\bar{\gamma} - 1 > 0$,

$$\langle (V - I)x - (V - I)y, x - y \rangle \geq (\bar{\gamma} - 1) \|x - y\|^2, \quad (31)$$

$$\forall x, y \in H.$$

That is, $V - I$ is strongly monotone with constant $\bar{\gamma} - 1$.

Let C be a nonempty closed convex subset of a real Hilbert space H . We introduce some notations. Let λ be a number in $(0, 1]$ and let $\mu > 0$. Associating with a nonexpansive mapping $T : C \rightarrow H$, we define the mapping $T^\lambda : C \rightarrow H$ by

$$T^\lambda x := Tx - \lambda \mu F(Tx), \quad \forall x \in C, \quad (32)$$

where $F : H \rightarrow H$ is an operator such that, for some positive constants $\kappa, \eta > 0$, F is κ -Lipschitzian and η -strongly monotone on H ; that is, F satisfies the conditions

$$\|Fx - Fy\| \leq \kappa \|x - y\|, \quad \langle Fx - Fy, x - y \rangle \geq \eta \|x - y\|^2 \quad (33)$$

for all $x, y \in H$.

Lemma 14 (see [12, Lemma 3.1]). T^λ is a contraction provided $0 < \mu < (2\eta/\kappa^2)$; that is,

$$\|T^\lambda x - T^\lambda y\| \leq (1 - \lambda\tau) \|x - y\|, \quad \forall x, y \in C, \quad (34)$$

where $\tau = 1 - \sqrt{1 - \mu(2\eta - \mu\kappa^2)} \in (0, 1]$.

We observe that since F is κ -Lipschitzian and η -strongly monotone on H , we get $0 < \eta \leq \kappa$. Hence, whenever $0 < \mu < (2\eta/\kappa^2)$, we have $\tau = 1 - \sqrt{1 - \mu(2\eta - \mu\kappa^2)} \in (0, 1]$. Also in Lemma 14, put $F = (1/2)I$ and $\mu = 2$. Then we know that $\kappa = \eta = (1/2)$, $0 < \mu = 2 < (2\eta/\kappa^2) = 4$ and $\tau = 1$.

Recall that a set-valued mapping $R : D(R) \subset H \rightarrow 2^H$ is called monotone if for all $x, y \in D(R)$, $f \in R(x)$ and $g \in R(y)$ imply

$$\langle f - g, x - y \rangle \geq 0. \quad (35)$$

A set-valued mapping R is called maximal monotone if R is monotone and $(I + \lambda R)D(R) = H$ for each $\lambda > 0$, where I is the identity mapping of H . We denote by $G(R)$ the graph of R . It is known that a monotone mapping R is maximal if and only if, for $(x, f) \in H \times H$, $\langle f - g, x - y \rangle \geq 0$ for every $(y, g) \in G(R)$ implies $f \in R(x)$.

Let $A : C \rightarrow H$ be a monotone, k -Lipschitz-continuous mapping and let $N_C v$ be the normal cone to C at $v \in C$; that is,

$$N_C v = \{w \in H : \langle v - u, w \rangle \geq 0, \forall u \in C\}. \quad (36)$$

Define

$$Tv = \begin{cases} Av + N_C v, & \text{if } v \in C, \\ \emptyset, & \text{if } v \notin C. \end{cases} \quad (37)$$

It is well known that T is maximal monotone and $0 \in Tv$ if and only if $v \in VI(C, A)$.

Assume that $R : D(R) \subset H \rightarrow 2^H$ is a maximal monotone mapping. Then, for $\lambda > 0$, associated with R , the resolvent operator $J_{R, \lambda}$ can be defined as

$$J_{R, \lambda} x = (I + \lambda R)^{-1} x, \quad \forall x \in H. \quad (38)$$

From Huang [4] (see also [13]), there holds the following property for the resolvent operator $J_{R, \lambda} : H \rightarrow \overline{D(R)}$.

Lemma 15. $J_{R,\lambda}$ is single-valued and firmly nonexpansive; that is,

$$\langle J_{R,\lambda}x - J_{R,\lambda}y, x - y \rangle \geq \|J_{R,\lambda}x - J_{R,\lambda}y\|^2, \quad \forall x, y \in H. \quad (39)$$

Consequently, $J_{R,\lambda}$ is nonexpansive and monotone.

Lemma 16 (see [14]). Let R be a maximal monotone mapping with $D(R) = C$. Then for any given $\lambda > 0$, $u \in C$ is a solution of problem (11) if and only if $u \in C$ satisfies

$$u = J_{R,\lambda}(u - \lambda Bu). \quad (40)$$

Lemma 17 (see [13]). Let R be a maximal monotone mapping with $D(R) = C$ and let $B : C \rightarrow H$ be a strongly monotone, continuous, and single-valued mapping. Then for each $z \in H$, the equation $z \in (B + \lambda R)x$ has a unique solution x_λ for $\lambda > 0$.

Lemma 18 (see [14]). Let R be a maximal monotone mapping with $D(R) = C$ and $B : C \rightarrow H$ a monotone, continuous, and single-valued mapping. Then $(I + \lambda(R + B))C = H$ for each $\lambda > 0$. In this case, $R + B$ is maximal monotone.

3. Convex Minimization Problems with Constraints

In this section, we will introduce and analyze one implicit iterative algorithm for finding a solution of the CMP (12) with constraints of several problems: the GMEP (4), the SGEP (8), and finitely many variational inclusions in a real Hilbert space. We prove strong convergence theorem for the iterative algorithm under suitable conditions.

Theorem 19. Let C be a nonempty closed convex subset of a real Hilbert space H . Let N be an integer. Let $f : C \rightarrow \mathbf{R}$ be a convex functional with L -Lipschitz continuous gradient ∇f . Let $\Theta, \Theta_1, \Theta_2$ be three bifunctions from $C \times C$ to $\mathbf{R}$ satisfying (H1)–(H4) and $\varphi : C \rightarrow \mathbf{R}$ a lower semicontinuous and convex functional. Let $R_i : C \rightarrow 2^H$ be a maximal monotone mapping and let $A : H \rightarrow H$ and let $A_k, B_i : C \rightarrow H$ be ζ -inverse strongly monotone, ζ_k -inverse strongly monotone, and η_i -inverse-strongly monotone, respectively, for $k = 1, 2$ and $i = 1, 2, \dots, N$. Let V be a $\bar{\gamma}$ -strongly positive bounded linear operator with $\bar{\gamma} > 1$. Let $F : H \rightarrow H$ be a κ -Lipschitzian and η -strongly monotone operator with positive constants $\kappa, \eta > 0$. Let $Q : H \rightarrow H$ be an l -Lipschitzian mapping with constant $l \geq 0$. Let $0 < \mu < (2\eta/\kappa^2)$ and $0 \leq \gamma l < \tau$, where $\tau = 1 - \sqrt{1 - \mu(2\eta - \mu\kappa^2)}$. Assume that $\Omega := \text{GMEP}(\Theta, \varphi, A) \cap \text{SGEP}(G) \cap \bigcap_{i=1}^N I(B_i, R_i) \cap \Gamma \neq \emptyset$ where G is defined as in Proposition CY. Let $\{r_n\}$ be a sequence in $(0, 2\zeta]$ and $\{\alpha_n\}$ a sequence in $(0, 1]$ such that $\lim_{n \rightarrow \infty} \alpha_n = 0$. Let $\{x_n\}$ be the sequence generated by

$$\begin{aligned} u_n &= S_r^{(\Theta, \varphi)}(I - r_n A)x_n, \\ v_n &= J_{R_N, \lambda_{N,n}}(I - \lambda_{N,n} B_N) J_{R_{N-1}, \lambda_{N-1,n}} \\ &\quad \times (I - \lambda_{N-1,n} B_{N-1}) \cdots J_{R_1, \lambda_{1,n}}(I - \lambda_{1,n} B_1) u_n, \end{aligned}$$

$$\begin{aligned} x_n &= (I - s_n V) T_n G v_n \\ &\quad + s_n [T_n x_n - \alpha_n (\mu F(T_n x_n) - \gamma Q x_n)], \quad \forall n \geq 1, \end{aligned} \quad (41)$$

where $P_C(I - \lambda_n \nabla f) = s_n I + (1 - s_n) T_n$ (here T_n is nonexpansive, $s_n = ((2 - \lambda_n L)/4) \in (0, (1/2))$ for each $\lambda_n \in (0, (2/L))$). Suppose that the following conditions hold.

(i) $K : H \rightarrow \mathbf{R}$ is strongly convex with constant $\sigma > 0$ and its derivative K' is Lipschitz continuous with constant $\nu > 0$ such that the function $x \mapsto \langle y - x, K'(x) \rangle$ is weakly upper semicontinuous for each $y \in H$;

(ii) for each $x \in H$, there exist a bounded subset $D_x \subset C$ and $z_x \in C$ such that, for any $y \notin D_x$,

$$\Theta(y, z_x) + \varphi(z_x) - \varphi(y) + \frac{1}{r} \langle K'(y) - K'(x), z_x - y \rangle < 0; \quad (42)$$

(iii) $s_n \in (0, (1/2))$ for each $\lambda_n \in (0, (2/L))$, $\lim_{n \rightarrow \infty} s_n = 0$ ($\Leftrightarrow \lim_{n \rightarrow \infty} \lambda_n = (2/L)$);

(iv) $v_k \in (0, 2\zeta_k)$, $k = 1, 2$ and $\{\lambda_{i,n}\} \subset [a_i, b_i] \subset (0, 2\eta_i)$, $i = 1, 2, \dots, N$;

(v) $0 < \liminf_{n \rightarrow \infty} r_n \leq \limsup_{n \rightarrow \infty} r_n < 2\zeta$.

Assume that $S_r^{(\Theta, \varphi)}$ is firmly nonexpansive. Then $\{x_n\}$ converges strongly as $\lambda_n \rightarrow (2/L)$ ($\Leftrightarrow s_n \rightarrow 0$) to a point $q \in \Omega$, which is a unique solution in Ω to the VIP:

$$\langle (I - V)q, p - q \rangle \leq 0, \quad \forall p \in \Omega. \quad (43)$$

Proof. First of all, let us show that the sequence $\{x_n\}$ is well defined. Indeed, since ∇f is L -Lipschitzian, it follows that ∇f is $1/L$ -ism. By Proposition 4(ii) we know that, for $\lambda > 0$, $\lambda \nabla f$ is $(1/\lambda L)$ -ism. So by Proposition 4(iii) we deduce that $I - \lambda \nabla f$ is $(\lambda L/2)$ -averaged. Now since the projection P_C is $(1/2)$ -averaged, it is easy to see from Proposition 5(iv) that the composite $P_C(I - \lambda \nabla f)$ is $((2 + \lambda L)/4)$ -averaged for $\lambda \in (0, (2/L))$. Hence we obtain that, for each $n \geq 1$, $P_C(I - \lambda_n \nabla f)$ is $((2 + \lambda_n L)/4)$ -averaged for each $\lambda_n \in (0, (2/L))$. Therefore, we can write

$$P_C(I - \lambda_n \nabla f) = \frac{2 - \lambda_n L}{4} I + \frac{2 + \lambda_n L}{4} T_n = s_n I + (1 - s_n) T_n, \quad (44)$$

where T_n is nonexpansive and $s_n := s_n(\lambda_n) = ((2 - \lambda_n L)/4) \in (0, (1/2))$ for each $\lambda_n \in (0, (2/L))$. It is clear that

$$\lambda_n \rightarrow \frac{2}{L} \iff s_n \rightarrow 0. \quad (45)$$

As $\lim_{n \rightarrow \infty} s_n = 0$ and $0 < \liminf_{n \rightarrow \infty} r_n \leq \limsup_{n \rightarrow \infty} r_n < 2\zeta$, we may assume, without loss of generality, that $\{r_n\} \subset [a, \bar{a}] \subset (0, 2\zeta)$ and $s_n \|V\| \leq 1$ for all $n \geq 1$. Since V is a $\bar{\gamma}$ -strongly positive bounded linear operator on H , we know that

$$\|V\| = \sup \{ \langle Vu, u \rangle : u \in H, \|u\| = 1 \} \geq \bar{\gamma} > 1. \quad (46)$$

Taking into account that $s_n \|V\| \leq 1$ for all $n \geq 1$, we have

$$\langle (I - s_n V)u, u \rangle = 1 - s_n \langle Vu, u \rangle \geq 1 - s_n \|V\| \geq 0, \quad (47)$$

that is, $(1 - \beta_n)I - s_n V$ is positive. It follows that

$$\begin{aligned} \|I - s_n V\| &= \sup \{ \langle (I - s_n V)u, u \rangle : u \in H, \|u\| = 1 \} \\ &= \sup \{ 1 - s_n \langle Vu, u \rangle : u \in H, \|u\| = 1 \} \\ &\leq 1 - s_n \bar{\gamma}. \end{aligned} \quad (48)$$

Put

$$\begin{aligned} \Lambda_n^i &= J_{R_i, \lambda_{i,n}} (I - \lambda_{i,n} B_i) J_{R_{i-1}, \lambda_{i-1,n}} \\ &\quad \times (I - \lambda_{i-1,n} B_{i-1}) \cdots J_{R_1, \lambda_{1,n}} (I - \lambda_{1,n} B_1) \end{aligned} \quad (49)$$

for all $i \in \{1, 2, \dots, N\}$, and $\Lambda_n^0 = I$, where I is the identity mapping on H . Then we have $v_n = \Lambda_n^N u_n$.

Consider the following mapping G_n on H defined by

$$\begin{aligned} G_n x &= (I - s_n V) T_n G \Lambda_n^N S_{r_n}^{(\Theta, \varphi)} (I - r_n A) x \\ &\quad + s_n [T_n x - \alpha_n (\mu F(T_n x) - \gamma Qx)], \quad \forall x \in H, \quad n \geq 1, \end{aligned} \quad (50)$$

where $s_n = ((2 - \lambda_n L)/4) \in (0, (1/2))$ for each $\lambda_n \in (0, (2/L))$. Since A_k is ζ_k -inverse-strongly monotone with $0 \leq \gamma_k \leq 2\zeta_k$ for $k = 1, 2$, we deduce that, for any $x, y \in H$,

$$\begin{aligned} \|Gx - Gy\|^2 &= \|T_{\nu_1}^{\Theta_1} (I - \nu_1 A_1) T_{\nu_2}^{\Theta_2} (I - \nu_2 A_2) x \\ &\quad - T_{\nu_1}^{\Theta_1} (I - \nu_1 A_1) T_{\nu_2}^{\Theta_2} (I - \nu_2 A_2) y\|^2 \\ &\leq \|(I - \nu_1 A_1) T_{\nu_2}^{\Theta_2} (I - \nu_2 A_2) x \\ &\quad - (I - \nu_1 A_1) T_{\nu_2}^{\Theta_2} (I - \nu_2 A_2) y\|^2 \\ &= \|[T_{\nu_2}^{\Theta_2} (I - \nu_2 A_2) x - T_{\nu_2}^{\Theta_2} (I - \nu_2 A_2) y] \\ &\quad - \nu_1 [A_1 T_{\nu_2}^{\Theta_2} (I - \nu_2 A_2) x - A_1 T_{\nu_2}^{\Theta_2} (I - \nu_2 A_2) y]\|^2 \\ &\leq \|T_{\nu_2}^{\Theta_2} (I - \nu_2 A_2) x - T_{\nu_2}^{\Theta_2} (I - \nu_2 A_2) y\|^2 + \nu_1 (\nu_1 - 2\zeta_1) \\ &\quad \times \|A_1 T_{\nu_2}^{\Theta_2} (I - \nu_2 A_2) x - A_1 T_{\nu_2}^{\Theta_2} (I - \nu_2 A_2) y\|^2 \\ &\leq \|T_{\nu_2}^{\Theta_2} (I - \nu_2 A_2) x - T_{\nu_2}^{\Theta_2} (I - \nu_2 A_2) y\|^2 \\ &\leq \|(I - \nu_2 A_2) x - (I - \nu_2 A_2) y\|^2 \\ &= \|(x - y) - \nu_2 (A_2 x - A_2 y)\|^2 \\ &\leq \|x - y\|^2 + \nu_2 (\nu_2 - 2\zeta_2) \|A_2 x - A_2 y\|^2 \\ &\leq \|x - y\|^2. \end{aligned} \quad (51)$$

By the nonexpansivity of $S_r^{(\Theta, \varphi)}$ and Lemma 14 we obtain from (41), (48), and (51) that for all $x, y \in C$

$$\begin{aligned} \|G_n x - G_n y\| &\leq \|(I - s_n V) (T_n G \Lambda_n^N S_{r_n}^{(\Theta, \varphi)} (I - r_n A)) x \\ &\quad - T_n G \Lambda_n^N S_{r_n}^{(\Theta, \varphi)} (I - r_n A) y\| \\ &\quad + s_n \|(I - \alpha_n \mu F) T_n x - (I - \alpha_n \mu F) T_n y\| \\ &\quad + s_n \alpha_n \gamma \|Qx - Qy\| \\ &\leq (1 - s_n \bar{\gamma}) \\ &\quad \times \|T_n G \Lambda_n^N S_{r_n}^{(\Theta, \varphi)} (I - r_n A) x \\ &\quad - T_n G \Lambda_n^N S_{r_n}^{(\Theta, \varphi)} (I - r_n A) y\| \\ &\quad + s_n (1 - \alpha_n \tau) \|x - y\| + s_n \alpha_n \gamma l \|x - y\| \\ &\leq (1 - s_n \bar{\gamma}) \\ &\quad \times \|G \Lambda_n^N S_{r_n}^{(\Theta, \varphi)} (I - r_n A) x - G \Lambda_n^N S_{r_n}^{(\Theta, \varphi)} (I - r_n A) y\| \\ &\quad + s_n (1 - \alpha_n \tau) \|x - y\| + s_n \alpha_n \gamma l \|x - y\| \\ &\leq (1 - s_n \bar{\gamma}) \\ &\quad \times \|\Lambda_n^N S_{r_n}^{(\Theta, \varphi)} (I - r_n A) x - \Lambda_n^N S_{r_n}^{(\Theta, \varphi)} (I - r_n A) y\| \\ &\quad + s_n (1 - \alpha_n \tau) \|x - y\| + s_n \alpha_n \gamma l \|x - y\| \\ &\leq (1 - s_n \bar{\gamma}) \\ &\quad \times \|(I - \lambda_{N,n} B_N) \Lambda_n^{N-1} S_{r_n}^{(\Theta, \varphi)} (I - r_n A) x \\ &\quad - (I - \lambda_{N,n} B_N) \Lambda_n^{N-1} S_{r_n}^{(\Theta, \varphi)} (I - r_n A) y\| \\ &\quad + s_n (1 - \alpha_n \tau) \|x - y\| + s_n \alpha_n \gamma l \|x - y\| \\ &\leq (1 - s_n \bar{\gamma}) \\ &\quad \times \|\Lambda_n^{N-1} S_{r_n}^{(\Theta, \varphi)} (I - r_n A) x - \Lambda_n^{N-1} S_{r_n}^{(\Theta, \varphi)} (I - r_n A) y\| \\ &\quad + s_n (1 - \alpha_n \tau) \|x - y\| + s_n \alpha_n \gamma l \|x - y\| \\ &\vdots \\ &\leq (1 - s_n \bar{\gamma}) \|\Lambda_n^0 S_{r_n}^{(\Theta, \varphi)} (I - r_n A) x - \Lambda_n^0 S_{r_n}^{(\Theta, \varphi)} (I - r_n A) y\| \\ &\quad + s_n (1 - \alpha_n \tau) \|x - y\| + s_n \alpha_n \gamma l \|x - y\| \\ &= (1 - s_n \bar{\gamma}) \|S_{r_n}^{(\Theta, \varphi)} (I - r_n A) x - S_{r_n}^{(\Theta, \varphi)} (I - r_n A) y\| \\ &\quad + s_n (1 - \alpha_n \tau) \|x - y\| + s_n \alpha_n \gamma l \|x - y\| \\ &\leq (1 - s_n \bar{\gamma}) \|(I - r_n A) x - (I - r_n A) y\| \\ &\quad + s_n (1 - \alpha_n \tau) \|x - y\| + s_n \alpha_n \gamma l \|x - y\| \end{aligned}$$

$$\begin{aligned}
&\leq (1 - s_n \bar{\gamma}) \|x - y\| + s_n (1 - \alpha_n \tau) \|x - y\| \\
&\quad + s_n \alpha_n \gamma l \|x - y\| \\
&\leq (1 - s_n) \|x - y\| \\
&\quad + s_n (1 - \alpha_n \tau) \|x - y\| + s_n \alpha_n \gamma l \|x - y\| \\
&= (1 - s_n \alpha_n (\tau - \gamma l)) \|x - y\|.
\end{aligned} \tag{52}$$

Since $0 < 1 - s_n \alpha_n (\tau - \gamma l) < 1$, $G_n : H \rightarrow H$ is a contraction. Therefore, by the Banach contraction principle, G_n has a unique fixed point $x_n \in H$, which uniquely solves the fixed point equation

$$x_n = (I - s_n V) T_n G v_n + s_n [T_n x_n - \alpha_n (\mu F(T_n x_n) - \gamma Q x_n)]. \tag{53}$$

This shows that the sequence $\{x_n\}$ is defined well.

Note that

$$\langle (V - I)x - (V - I)y, x - y \rangle \geq (\bar{\gamma} - 1) \|x - y\|^2, \tag{54}$$

$\forall x, y \in H.$

That is, $V - I$ is $(\bar{\gamma} - 1)$ -strongly monotone for $\bar{\gamma} - 1 > 0$. Moreover, it is clear that $V - I$ is Lipschitz continuous. So the VIP (43) has only one solution in Ω . Below we use $q \in \Omega$ to denote the unique solution of the VIP (43).

Now, let us show that $\{x_n\}$ is bounded. In fact, take $p \in \Omega$ arbitrarily. Then from the nonexpansivity of $S_r^{(\Theta, \varphi)}$ and $\{r_n\} \subset [a, \hat{a}] \subset (0, 2\zeta)$ we have

$$\begin{aligned}
&\|u_n - p\|^2 \\
&= \|S_{r_n}^{(\Theta, \varphi)}(I - r_n A)x_n - S_{r_n}^{(\Theta, \varphi)}(I - r_n A)p\|^2 \\
&\leq \|(I - r_n A)x_n - (I - r_n A)p\|^2 \\
&= \|(x_n - p) - r_n(Ax_n - Ap)\|^2 \\
&= \|x_n - p\|^2 - 2r_n \langle x_n - p, Ax_n - Ap \rangle \\
&\quad + r_n^2 \|Ax_n - Ap\|^2 \leq \|x_n - p\|^2 \\
&\quad - 2r_n \zeta \|Ax_n - Ap\|^2 + r_n^2 \|Ax_n - Ap\|^2 \\
&= \|x_n - p\|^2 + r_n(r_n - 2\zeta) \|Ax_n - Ap\|^2 \\
&\leq \|x_n - p\|^2.
\end{aligned} \tag{55}$$

Since $p = J_{R_i, \lambda_{i,n}}(I - \lambda_{i,n} B_i)p$, $\Lambda_n^i p = p$ and B_i is η_i -inverse strongly monotone, where $\lambda_{i,n} \in (0, 2\eta_i)$, $i \in \{1, 2, \dots, N\}$, by Lemma 15 we deduce that for each $n \geq 1$

$$\begin{aligned}
\|v_n - p\|^2 &= \|\Lambda_n^N u_n - p\|^2 \\
&\leq \|\Lambda_n^i u_n - p\|^2 \\
&= \|J_{R_i, \lambda_{i,n}}(I - \lambda_{i,n} B_i) \Lambda_n^{i-1} u_n - J_{R_i, \lambda_{i,n}}(I - \lambda_{i,n} B_i) p\|^2 \\
&\leq \|(I - \lambda_{i,n} B_i) \Lambda_n^{i-1} u_n - (I - \lambda_{i,n} B_i) p\|^2 \\
&\leq \|\Lambda_n^{i-1} u_n - p\|^2 + \lambda_{i,n} (\lambda_{i,n} - 2\eta_i) \\
&\quad \times \|B_i \Lambda_n^{i-1} u_n - B_i p\|^2 \\
&\leq \|u_n - p\|^2 \\
&\quad + \lambda_{i,n} (\lambda_{i,n} - 2\eta_i) \|B_i \Lambda_n^{i-1} u_n - B_i p\|^2 \\
&\leq \|u_n - p\|^2.
\end{aligned} \tag{56}$$

Combining (55) and (56), we have

$$\|v_n - p\| \leq \|x_n - p\|. \tag{57}$$

Since $p = Gp = T_{\nu_1}^{\Theta_1}(I - \nu_1 A_1) T_{\nu_2}^{\Theta_2}(I - \nu_2 A_2)p$, A_k is ζ_k -inverse-strongly monotone for $k = 1, 2$, and $0 \leq \nu_k \leq 2\zeta_k$ for $k = 1, 2$, we deduce that, for any $n \geq 1$,

$$\begin{aligned}
&\|Gv_n - p\|^2 \\
&= \|T_{\nu_1}^{\Theta_1}(I - \nu_1 A_1) T_{\nu_2}^{\Theta_2}(I - \nu_2 A_2) v_n \\
&\quad - T_{\nu_1}^{\Theta_1}(I - \nu_1 A_1) T_{\nu_2}^{\Theta_2}(I - \nu_2 A_2) p\|^2 \\
&\leq \|(I - \nu_1 A_1) T_{\nu_2}^{\Theta_2}(I - \nu_2 A_2) v_n \\
&\quad - (I - \nu_1 A_1) T_{\nu_2}^{\Theta_2}(I - \nu_2 A_2) p\|^2 \\
&= \|[T_{\nu_2}^{\Theta_2}(I - \nu_2 A_2) v_n - T_{\nu_2}^{\Theta_2}(I - \nu_2 A_2) p] \\
&\quad - \nu_1 [A_1 T_{\nu_2}^{\Theta_2}(I - \nu_2 A_2) v_n - A_1 T_{\nu_2}^{\Theta_2}(I - \nu_2 A_2) p]\|^2 \\
&\leq \|T_{\nu_2}^{\Theta_2}(I - \nu_2 A_2) v_n - T_{\nu_2}^{\Theta_2}(I - \nu_2 A_2) p\|^2 + \nu_1 (\nu_1 - 2\zeta_1) \\
&\quad \times \|A_1 T_{\nu_2}^{\Theta_2}(I - \nu_2 A_2) v_n - A_1 T_{\nu_2}^{\Theta_2}(I - \nu_2 A_2) p\|^2 \\
&\leq \|T_{\nu_2}^{\Theta_2}(I - \nu_2 A_2) v_n - T_{\nu_2}^{\Theta_2}(I - \nu_2 A_2) p\|^2 \\
&\leq \|(I - \nu_2 A_2) v_n - (I - \nu_2 A_2) p\|^2 \\
&= \|(v_n - p) - \nu_2 (A_2 v_n - A_2 p)\|^2 \\
&\leq \|v_n - p\|^2 + \nu_2 (\nu_2 - 2\zeta_2) \|A_2 v_n - A_2 p\|^2 \\
&\leq \|v_n - p\|^2.
\end{aligned} \tag{58}$$

Thus, utilizing Lemmas 8 and 14, from (41), (43), (55), (56), and (58) we have

$$\begin{aligned}
& \|x_n - p\|^2 \\
&= \|(I - s_n V)(T_n G v_n - p) \\
&\quad + s_n [T_n x_n - \alpha_n (\mu F(T_n x_n) - \gamma Q x_n) - p] \\
&\quad + (I - s_n V)p - (1 - s_n)p\|^2 \\
&= \|(I - s_n V)(T_n G v_n - p) \\
&\quad + s_n [\alpha_n (\gamma Q x_n - \mu F p) + (I - \alpha_n \mu F) T_n x_n \\
&\quad \quad - (I - \alpha_n \mu F) T_n p] + s_n (I - V)p\|^2 \\
&= \|(I - s_n V)(T_n G v_n - p) \\
&\quad + s_n [\alpha_n \gamma (Q x_n - Q p) + (I - \alpha_n \mu F) T_n x_n \\
&\quad \quad - (I - \alpha_n \mu F) T_n p] \\
&\quad + s_n [(I - V)p + \alpha_n (\gamma Q - \mu F)p]\|^2 \\
&\leq \|(I - s_n V)(T_n G v_n - p) \\
&\quad + s_n [\alpha_n \gamma (Q x_n - Q p) + (I - \alpha_n \mu F) T_n x_n \\
&\quad \quad - (I - \alpha_n \mu F) T_n p]\|^2 \\
&\quad + 2s_n \langle (I - V)p + \alpha_n (\gamma Q - \mu F)p, x_n - p \rangle \\
&\leq [\|(I - s_n V)(T_n G v_n - p)\| \\
&\quad + s_n \|\alpha_n \gamma (Q x_n - Q p) + (I - \alpha_n \mu F) T_n x_n \\
&\quad \quad - (I - \alpha_n \mu F) T_n p\|]^2 \\
&\quad + 2s_n \langle (I - V)p + \alpha_n (\gamma Q - \mu F)p, x_n - p \rangle \\
&\leq [(1 - s_n \bar{\gamma}) \|G v_n - p\| \\
&\quad + s_n (\alpha_n \gamma l \|x_n - p\| + (1 - \alpha_n \tau) \|x_n - p\|)]^2 \\
&\quad + 2s_n \langle (I - V)p + \alpha_n (\gamma Q - \mu F)p, x_n - p \rangle \\
&\leq [(1 - s_n \bar{\gamma}) \|G v_n - p\| + s_n (1 - \alpha_n (\tau - \gamma l)) \|x_n - p\|]^2 \\
&\quad + 2s_n \langle (I - V)p + \alpha_n (\gamma Q - \mu F)p, x_n - p \rangle \\
&= \left[(1 - s_n \bar{\gamma}) \|G v_n - p\| + s_n \bar{\gamma} \frac{(1 - \alpha_n (\tau - \gamma l))}{\bar{\gamma}} \|x_n - p\| \right]^2 \\
&\quad + 2s_n \langle (I - V)p + \alpha_n (\gamma Q - \mu F)p, x_n - p \rangle \\
&\leq (1 - s_n \bar{\gamma}) \|G v_n - p\|^2 + s_n \bar{\gamma} \frac{(1 - \alpha_n (\tau - \gamma l))^2}{\bar{\gamma}^2} \|x_n - p\|^2 \\
&\quad + 2s_n \langle (I - V)p + \alpha_n (\gamma Q - \mu F)p, x_n - p \rangle \\
&\leq (1 - s_n \bar{\gamma}) \|G v_n - p\|^2 + s_n (1 - \alpha_n (\tau - \gamma l)) \|x_n - p\|^2
\end{aligned}$$

$$\begin{aligned}
& + 2s_n \langle (I - V)p + \alpha_n (\gamma Q - \mu F)p, x_n - p \rangle \\
&\leq (1 - s_n \bar{\gamma}) \|G v_n - p\|^2 + s_n \|x_n - p\|^2 \\
&\quad + 2s_n \langle (I - V)p + \alpha_n (\gamma Q - \mu F)p, x_n - p \rangle \\
&\leq (1 - s_n \bar{\gamma}) \|v_n - p\|^2 + s_n \|x_n - p\|^2 \\
&\quad + 2s_n \langle (I - V)p + \alpha_n (\gamma Q - \mu F)p, x_n - p \rangle \\
&\leq (1 - s_n \bar{\gamma}) \|u_n - p\|^2 + s_n \|x_n - p\|^2 \\
&\quad + 2s_n \langle (I - V)p + \alpha_n (\gamma Q - \mu F)p, x_n - p \rangle \\
&= (1 - s_n (\bar{\gamma} - 1)) \|x_n - p\|^2 \\
&\quad + 2s_n (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|) \|x_n - p\|, \tag{59}
\end{aligned}$$

which implies that

$$\|x_n - p\| \leq \frac{2}{\bar{\gamma} - 1} (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|). \tag{60}$$

Hence $\{x_n\}$ is bounded. So, according to (55) and (57) we know that $\{u_n\}$, $\{v_n\}$, $\{G v_n\}$, $\{T_n G v_n\}$, $\{T_n x_n\}$, $\{Q x_n\}$, and $\{F T_n x_n\}$ are bounded.

Next let us show that $\|u_n - x_n\| \rightarrow 0$, $\|v_n - u_n\| \rightarrow 0$, $\|v_n - G v_n\| \rightarrow 0$ and $\|v_n - P_C(I - (2/L)\nabla f)v_n\| \rightarrow 0$ as $n \rightarrow \infty$. Indeed, combining (55) and (59), we obtain

$$\begin{aligned}
& \|x_n - p\|^2 \\
&\leq (1 - s_n \bar{\gamma}) \|u_n - p\|^2 + s_n \|x_n - p\|^2 \\
&\quad + 2s_n \langle (I - V)p + \alpha_n (\gamma Q - \mu F)p, x_n - p \rangle \\
&\leq (1 - s_n \bar{\gamma}) [\|x_n - p\|^2 + r_n (r_n - 2\zeta) \|A x_n - A p\|^2] \\
&\quad + s_n \|x_n - p\|^2 \\
&\quad + 2s_n \langle (I - V)p + \alpha_n (\gamma Q - \mu F)p, x_n - p \rangle \\
&\leq (1 - s_n (\bar{\gamma} - 1)) \|x_n - p\|^2 \\
&\quad + (1 - s_n \bar{\gamma}) r_n (r_n - 2\zeta) \|A x_n - A p\|^2 \\
&\quad + 2s_n (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|) \|x_n - p\| \\
&\leq \|x_n - p\|^2 \\
&\quad + (1 - s_n \bar{\gamma}) r_n (r_n - 2\zeta) \|A x_n - A p\|^2 \\
&\quad + 2s_n (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|) \|x_n - p\|, \tag{61}
\end{aligned}$$

which immediately yields

$$\begin{aligned}
& (1 - s_n \bar{\gamma}) a (2\zeta - \hat{a}) \|A x_n - A p\|^2 \\
&\leq (1 - s_n \bar{\gamma}) r_n (2\zeta - r_n) \|A x_n - A p\|^2 \\
&\leq 2s_n (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|) \|x_n - p\|. \tag{62}
\end{aligned}$$

From $\lim_{n \rightarrow \infty} s_n = 0$ and the boundedness of $\{x_n\}$ we conclude that

$$\lim_{n \rightarrow \infty} \|Ax_n - Ap\| = 0. \quad (63)$$

Furthermore, from the firm nonexpansivity of $S_{r_n}^{(\Theta, \varphi)}$, we have

$$\begin{aligned} & \|u_n - p\|^2 \\ &= \|S_{r_n}^{(\Theta, \varphi)}(I - r_n A)x_n - S_{r_n}^{(\Theta, \varphi)}(I - r_n A)p\|^2 \\ &\leq \langle (I - r_n A)x_n - (I - r_n A)p, u_n - p \rangle \\ &= \frac{1}{2} [\|(I - r_n A)x_n - (I - r_n A)p\|^2 + \|u_n - p\|^2 \\ &\quad - \|(I - r_n A)x_n - (I - r_n A)p - (u_n - p)\|^2] \quad (64) \\ &\leq \frac{1}{2} [\|x_n - p\|^2 + \|u_n - p\|^2 \\ &\quad - \|x_n - u_n - r_n(Ax_n - Ap)\|^2] \\ &= \frac{1}{2} [\|x_n - p\|^2 + \|u_n - p\|^2 - \|x_n - u_n\|^2 \\ &\quad + 2r_n \langle Ax_n - Ap, x_n - u_n \rangle - r_n^2 \|Ax_n - Ap\|^2], \end{aligned}$$

which leads to

$$\begin{aligned} \|u_n - p\|^2 &\leq \|x_n - p\|^2 - \|x_n - u_n\|^2 \\ &\quad + 2r_n \|Ax_n - Ap\| \|x_n - u_n\|. \end{aligned} \quad (65)$$

From (59) and (65), we get

$$\begin{aligned} \|x_n - p\|^2 &\leq (1 - s_n \bar{\gamma}) \|u_n - p\|^2 + s_n \|x_n - p\|^2 \\ &\quad + 2s_n \langle (I - V)p + \alpha_n(\gamma Q - \mu F)p, x_n - p \rangle \\ &\leq (1 - s_n \bar{\gamma}) \\ &\quad \times [\|x_n - p\|^2 - \|x_n - u_n\|^2 \\ &\quad + 2r_n \|Ax_n - Ap\| \|x_n - u_n\|] \\ &\quad + s_n \|x_n - p\|^2 \\ &\quad + 2s_n (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|) \|x_n - p\| \\ &\leq (1 - s_n (\bar{\gamma} - 1)) \|x_n - p\|^2 \\ &\quad - (1 - s_n \bar{\gamma}) \|x_n - u_n\|^2 \\ &\quad + 2r_n \|Ax_n - Ap\| \|x_n - u_n\| \\ &\quad + 2s_n (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|) \|x_n - p\| \\ &\leq \|x_n - p\|^2 - (1 - s_n \bar{\gamma}) \|x_n - u_n\|^2 \\ &\quad + 2r_n \|Ax_n - Ap\| \|x_n - u_n\| \\ &\quad + 2s_n (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|) \|x_n - p\|, \end{aligned} \quad (66)$$

which hence implies that

$$\begin{aligned} & (1 - s_n \bar{\gamma}) \|x_n - u_n\|^2 \\ &\leq 2r_n \|Ax_n - Ap\| \|x_n - u_n\| \\ &\quad + 2s_n (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|) \|x_n - p\| \quad (67) \\ &\leq 2\hat{\alpha} \|Ax_n - Ap\| \|x_n - u_n\| \\ &\quad + 2s_n (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|) \|x_n - p\|. \end{aligned}$$

Since $\lim_{n \rightarrow \infty} s_n = 0$ and $\{x_n\}$ and $\{u_n\}$ are bounded sequences, it follows from (63) that

$$\lim_{n \rightarrow \infty} \|x_n - u_n\| = 0. \quad (68)$$

Next we show that $\lim_{n \rightarrow \infty} \|B_i \Lambda_n^{i-1} u_n - B_i p\| = 0$, $i = 1, 2, \dots, N$. As a matter of fact, combining (55), (56), and (59), we have

$$\begin{aligned} & \|x_n - p\|^2 \\ &\leq (1 - s_n \bar{\gamma}) \|v_n - p\|^2 + s_n \|x_n - p\|^2 \\ &\quad + 2s_n \langle (I - V)p + \alpha_n(\gamma Q - \mu F)p, x_n - p \rangle \\ &\leq (1 - s_n \bar{\gamma}) [\|u_n - p\|^2 + \lambda_{i,n} (\lambda_{i,n} - 2\eta_i) \\ &\quad \times \|B_i \Lambda_n^{i-1} u_n - B_i p\|^2] + s_n \|x_n - p\|^2 \\ &\quad + 2s_n (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|) \|x_n - p\| \\ &\leq (1 - s_n \bar{\gamma}) \\ &\quad \times [\|x_n - p\|^2 + \lambda_{i,n} (\lambda_{i,n} - 2\eta_i) \|B_i \Lambda_n^{i-1} u_n - B_i p\|^2] \\ &\quad + s_n \|x_n - p\|^2 \\ &\quad + 2s_n (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|) \|x_n - p\| \\ &= (1 - s_n (\bar{\gamma} - 1)) \|x_n - p\|^2 \\ &\quad + (1 - s_n \bar{\gamma}) \lambda_{i,n} (\lambda_{i,n} - 2\eta_i) \|B_i \Lambda_n^{i-1} u_n - B_i p\|^2 \\ &\quad + 2s_n (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|) \|x_n - p\| \\ &\leq \|x_n - p\|^2 + (1 - s_n \bar{\gamma}) \lambda_{i,n} (\lambda_{i,n} - 2\eta_i) \\ &\quad \times \|B_i \Lambda_n^{i-1} u_n - B_i p\|^2 \\ &\quad + 2s_n (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|) \|x_n - p\|, \end{aligned} \quad (69)$$

which leads to

$$\begin{aligned} & (1 - s_n \bar{\gamma}) \lambda_{i,n} (2\eta_i - \lambda_{i,n}) \|B_i \Lambda_n^{i-1} u_n - B_i p\|^2 \\ &\leq 2s_n (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|) \|x_n - p\|. \end{aligned} \quad (70)$$

Since $\lim_{n \rightarrow \infty} s_n = 0$, $\{\lambda_{i,n}\} \subset [a_i, b_i] \subset (0, 2\eta_i)$, $i = 1, 2, \dots, N$, and $\{x_n\}$ is bounded, it follows that

$$\lim_{n \rightarrow \infty} \|B_i \Lambda_n^{i-1} u_n - B_i p\| = 0. \quad (71)$$

Also, by Lemma 15, we obtain that for each $i \in \{1, 2, \dots, N\}$

$$\begin{aligned} & \|\Lambda_n^i u_n - p\|^2 \\ &= \|J_{R_i, \lambda_{i,n}}(I - \lambda_{i,n} B_i) \Lambda_n^{i-1} u_n - J_{R_i, \lambda_{i,n}}(I - \lambda_{i,n} B_i) p\|^2 \\ &\leq \langle (I - \lambda_{i,n} B_i) \Lambda_n^{i-1} u_n - (I - \lambda_{i,n} B_i) p, \Lambda_n^i u_n - p \rangle \\ &= \frac{1}{2} \left(\|(I - \lambda_{i,n} B_i) \Lambda_n^{i-1} u_n - (I - \lambda_{i,n} B_i) p\|^2 + \|\Lambda_n^i u_n - p\|^2 \right. \\ &\quad \left. - \|(I - \lambda_{i,n} B_i) \Lambda_n^{i-1} u_n - (I - \lambda_{i,n} B_i) p - (\Lambda_n^i u_n - p)\|^2 \right) \\ &\leq \frac{1}{2} \left(\|\Lambda_n^{i-1} u_n - p\|^2 + \|\Lambda_n^i u_n - p\|^2 \right. \\ &\quad \left. - \|\Lambda_n^{i-1} u_n - \Lambda_n^i u_n - \lambda_{i,n} (B_i \Lambda_n^{i-1} u_n - B_i p)\|^2 \right) \\ &\leq \frac{1}{2} \left(\|u_n - p\|^2 + \|\Lambda_n^i u_n - p\|^2 \right. \\ &\quad \left. - \|\Lambda_n^{i-1} u_n - \Lambda_n^i u_n - \lambda_{i,n} (B_i \Lambda_n^{i-1} u_n - B_i p)\|^2 \right), \end{aligned} \quad (72)$$

which yields

$$\begin{aligned} & \|\Lambda_n^i u_n - p\|^2 \leq \|u_n - p\|^2 \\ &\quad - \|\Lambda_n^{i-1} u_n - \Lambda_n^i u_n - \lambda_{i,n} (B_i \Lambda_n^{i-1} u_n - B_i p)\|^2 \\ &= \|u_n - p\|^2 - \|\Lambda_n^{i-1} u_n - \Lambda_n^i u_n\|^2 \\ &\quad - \lambda_{i,n}^2 \|B_i \Lambda_n^{i-1} u_n - B_i p\|^2 \\ &\quad + 2\lambda_{i,n} \langle \Lambda_n^{i-1} u_n - \Lambda_n^i u_n, B_i \Lambda_n^{i-1} u_n - B_i p \rangle \\ &\leq \|u_n - p\|^2 - \|\Lambda_n^{i-1} u_n - \Lambda_n^i u_n\|^2 \\ &\quad + 2\lambda_{i,n} \|\Lambda_n^{i-1} u_n - \Lambda_n^i u_n\| \|B_i \Lambda_n^{i-1} u_n - B_i p\|. \end{aligned} \quad (73)$$

Thus, utilizing Lemma 8, from (41), (55), (56), (59), and (73) we have

$$\begin{aligned} & \|x_n - p\|^2 \\ &\leq (1 - s_n \bar{\gamma}) \|v_n - p\|^2 + s_n \|x_n - p\|^2 \\ &\quad + 2s_n \langle (I - V) p + \alpha_n (\gamma Q - \mu F) p, x_n - p \rangle \\ &\leq (1 - s_n \bar{\gamma}) \|\Lambda_n^i u_n - p\|^2 + s_n \|x_n - p\|^2 \\ &\quad + 2s_n \langle (I - V) p + \alpha_n (\gamma Q - \mu F) p, x_n - p \rangle \end{aligned}$$

$$\begin{aligned} & \leq (1 - s_n \bar{\gamma}) \\ &\quad \times \left[\|u_n - p\|^2 - \|\Lambda_n^{i-1} u_n - \Lambda_n^i u_n\|^2 \right. \\ &\quad \left. + 2\lambda_{i,n} \|\Lambda_n^{i-1} u_n - \Lambda_n^i u_n\| \|B_i \Lambda_n^{i-1} u_n - B_i p\| \right] \\ &\quad + s_n \|x_n - p\|^2 \\ &\quad + 2s_n (\|(I - V) p\| + \alpha_n \|(\gamma Q - \mu F) p\|) \|x_n - p\| \\ &\leq (1 - s_n \bar{\gamma}) \left[\|x_n - p\|^2 - \|\Lambda_n^{i-1} u_n - \Lambda_n^i u_n\|^2 \right. \\ &\quad \left. + 2\lambda_{i,n} \|\Lambda_n^{i-1} u_n - \Lambda_n^i u_n\| \|B_i \Lambda_n^{i-1} u_n - B_i p\| \right] \\ &\quad + s_n \|x_n - p\|^2 + 2s_n (\|(I - V) p\| + \alpha_n \|(\gamma Q - \mu F) p\|) \\ &\quad \times \|x_n - p\| \\ &\leq (1 - s_n (\bar{\gamma} - 1)) \\ &\quad \times \|x_n - p\|^2 - (1 - s_n \bar{\gamma}) \|\Lambda_n^{i-1} u_n - \Lambda_n^i u_n\|^2 \\ &\quad + 2\lambda_{i,n} \|\Lambda_n^{i-1} u_n - \Lambda_n^i u_n\| \|B_i \Lambda_n^{i-1} u_n - B_i p\| \\ &\quad + 2s_n (\|(I - V) p\| + \alpha_n \|(\gamma Q - \mu F) p\|) \|x_n - p\| \\ &\leq \|x_n - p\|^2 - (1 - s_n \bar{\gamma}) \|\Lambda_n^{i-1} u_n - \Lambda_n^i u_n\|^2 \\ &\quad + 2\lambda_{i,n} \|\Lambda_n^{i-1} u_n - \Lambda_n^i u_n\| \|B_i \Lambda_n^{i-1} u_n - B_i p\| \\ &\quad + 2s_n (\|(I - V) p\| + \alpha_n \|(\gamma Q - \mu F) p\|) \|x_n - p\|, \end{aligned} \quad (74)$$

which leads to

$$\begin{aligned} & (1 - s_n \bar{\gamma}) \|\Lambda_n^{i-1} u_n - \Lambda_n^i u_n\|^2 \\ &\leq 2\lambda_{i,n} \|\Lambda_n^{i-1} u_n - \Lambda_n^i u_n\| \|B_i \Lambda_n^{i-1} u_n - B_i p\| \\ &\quad + 2s_n (\|(I - V) p\| + \alpha_n \|(\gamma Q - \mu F) p\|) \|x_n - p\|. \end{aligned} \quad (75)$$

Since $\lim_{n \rightarrow \infty} s_n = 0$, $\{\lambda_{i,n}\} \subset [a_i, b_i] \subset (0, 2\eta_i)$, $i = 1, 2, \dots, N$ and $\{x_n\}$ and $\{u_n\}$ are bounded sequences, it follows from (71) that

$$\lim_{n \rightarrow \infty} \|\Lambda_n^{i-1} u_n - \Lambda_n^i u_n\| = 0. \quad (76)$$

From (76) we get

$$\begin{aligned} & \|u_n - v_n\| = \|\Lambda_n^0 u_n - \Lambda_n^N u_n\| \\ &\leq \|\Lambda_n^0 u_n - \Lambda_n^1 u_n\| + \|\Lambda_n^1 u_n - \Lambda_n^2 u_n\| \\ &\quad + \dots + \|\Lambda_n^{N-1} u_n - \Lambda_n^N u_n\| \\ &\longrightarrow 0 \quad \text{as } n \longrightarrow \infty. \end{aligned} \quad (77)$$

Taking into account that $\|x_n - v_n\| \leq \|x_n - u_n\| + \|u_n - v_n\|$, we conclude from (68) and (77) that

$$\lim_{n \rightarrow \infty} \|x_n - v_n\| = 0. \quad (78)$$

On the other hand, for simplicity, we write $\tilde{p} = T_{\nu_2}^{\Theta_2}(I - \nu_2 A_2)p$, $\tilde{v}_n = T_{\nu_2}^{\Theta_2}(I - \nu_2 A_2)v_n$ and $w_n = Gv_n = T_{\nu_1}^{\Theta_1}(I - \nu_1 A_1)\tilde{v}_n$ for all $n \geq 1$. Then

$$\begin{aligned} p &= Gp = T_{\nu_1}^{\Theta_1}(I - \nu_1 A_1)\tilde{p} \\ &= T_{\nu_1}^{\Theta_1}(I - \nu_1 A_1)T_{\nu_2}^{\Theta_2}(I - \nu_2 A_2)p. \end{aligned} \quad (79)$$

We now show that $\lim_{n \rightarrow \infty} \|Gv_n - v_n\| = 0$, that is, $\lim_{n \rightarrow \infty} \|w_n - v_n\| = 0$. As a matter of fact, for $p \in \Omega$, it follows from (56), (57), and (59) that

$$\begin{aligned} &\|x_n - p\|^2 \\ &\leq (1 - s_n \bar{\gamma}) \|Gv_n - p\|^2 + s_n \|x_n - p\|^2 \\ &\quad + 2s_n \langle (I - V)p + \alpha_n (\gamma Q - \mu F)p, x_n - p \rangle \\ &= (1 - s_n \bar{\gamma}) \|w_n - p\|^2 + s_n \|x_n - p\|^2 \\ &\quad + 2s_n \langle (I - V)p + \alpha_n (\gamma Q - \mu F)p, x_n - p \rangle \\ &\leq (1 - s_n \bar{\gamma}) \|w_n - p\|^2 + s_n \|x_n - p\|^2 \\ &\quad + 2s_n (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|) \|x_n - p\| \\ &\leq (1 - s_n \bar{\gamma}) \\ &\quad \times [\|\tilde{v}_n - \tilde{p}\|^2 + \nu_1 (\nu_1 - 2\zeta_1) \|A_1 \tilde{v}_n - A_1 \tilde{p}\|^2] \\ &\quad + s_n \|x_n - p\|^2 + 2s_n (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|) \\ &\quad \times \|x_n - p\| \\ &\leq (1 - s_n \bar{\gamma}) \\ &\quad \times [\|v_n - p\|^2 + \nu_2 (\nu_2 - 2\zeta_2) \|A_2 v_n - A_2 p\|^2 \\ &\quad + \nu_1 (\nu_1 - 2\zeta_1) \|A_1 \tilde{v}_n - A_1 \tilde{p}\|^2] \\ &\quad + s_n \|x_n - p\|^2 + 2s_n (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|) \\ &\quad \times \|x_n - p\| \\ &\leq (1 - s_n \bar{\gamma}) \\ &\quad \times [\|x_n - p\|^2 + \nu_2 (\nu_2 - 2\zeta_2) \|A_2 v_n - A_2 p\|^2 \\ &\quad + \nu_1 (\nu_1 - 2\zeta_1) \|A_1 \tilde{v}_n - A_1 \tilde{p}\|^2] + s_n \|x_n - p\|^2 \\ &\quad + 2s_n (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|) \|x_n - p\| \\ &= (1 - s_n (\bar{\gamma} - 1)) \|x_n - p\|^2 + (1 - s_n \bar{\gamma}) \\ &\quad \times [\nu_2 (\nu_2 - 2\zeta_2) \|A_2 v_n - A_2 p\|^2 \\ &\quad + \nu_1 (\nu_1 - 2\zeta_1) \|A_1 \tilde{v}_n - A_1 \tilde{p}\|^2] \\ &\quad + 2s_n (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|) \|x_n - p\| \end{aligned}$$

$$\begin{aligned} &\leq \|x_n - p\|^2 + (1 - s_n \bar{\gamma}) \\ &\quad \times [\nu_2 (\nu_2 - 2\zeta_2) \|A_2 v_n - A_2 p\|^2 \\ &\quad + \nu_1 (\nu_1 - 2\zeta_1) \|A_1 \tilde{v}_n - A_1 \tilde{p}\|^2] \\ &\quad + 2s_n (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|) \|x_n - p\|, \end{aligned} \quad (80)$$

which immediately implies that

$$\begin{aligned} &(1 - s_n \bar{\gamma}) [\nu_2 (2\zeta_2 - \nu_2) \|A_2 v_n - A_2 p\|^2 \\ &\quad + \nu_1 (2\zeta_1 - \nu_1) \|A_1 \tilde{v}_n - A_1 \tilde{p}\|^2] \\ &\leq 2s_n (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|) \|x_n - p\|, \end{aligned} \quad (81)$$

Since $\lim_{n \rightarrow \infty} s_n = 0$, $\nu_k \in (0, 2\zeta_k)$, $k = 1, 2$ and $\{x_n\}$ is bounded, it follows that

$$\lim_{n \rightarrow \infty} \|A_2 v_n - A_2 p\| = 0, \quad \lim_{n \rightarrow \infty} \|A_1 \tilde{v}_n - A_1 \tilde{p}\| = 0. \quad (82)$$

Also, in terms of the firm nonexpansivity of $T_{\nu_k}^{\Theta_k}$ and the ζ_k -inverse strong monotonicity of A_k for $k = 1, 2$, we obtain from $\nu_k \in (0, 2\zeta_k)$, $k = 1, 2$, and (58) that

$$\begin{aligned} &\|\tilde{v}_n - \tilde{p}\|^2 \\ &= \|T_{\nu_2}^{\Theta_2}(I - \nu_2 A_2)v_n - T_{\nu_2}^{\Theta_2}(I - \nu_2 A_2)p\|^2 \\ &\leq \langle (I - \nu_2 A_2)v_n - (I - \nu_2 A_2)p, \tilde{v}_n - \tilde{p} \rangle \\ &= \frac{1}{2} [\|(I - \nu_2 A_2)v_n - (I - \nu_2 A_2)p\|^2 + \|\tilde{v}_n - \tilde{p}\|^2 \\ &\quad - \|(I - \nu_2 A_2)v_n - (I - \nu_2 A_2)p - (\tilde{v}_n - \tilde{p})\|^2] \\ &\leq \frac{1}{2} [\|v_n - p\|^2 + \|\tilde{v}_n - \tilde{p}\|^2 \\ &\quad - \|(v_n - \tilde{v}_n) - \nu_2 (A_2 v_n - A_2 p) - (p - \tilde{p})\|^2] \\ &= \frac{1}{2} [\|v_n - p\|^2 + \|\tilde{v}_n - \tilde{p}\|^2 - \|(v_n - \tilde{v}_n) - (p - \tilde{p})\|^2 \\ &\quad + 2\nu_2 \langle (v_n - \tilde{v}_n) - (p - \tilde{p}), A_2 v_n - A_2 p \rangle \\ &\quad - \nu_2^2 \|A_2 v_n - A_2 p\|^2], \\ &\|w_n - p\|^2 \\ &= \|T_{\nu_1}^{\Theta_1}(I - \nu_1 A_1)\tilde{v}_n - T_{\nu_1}^{\Theta_1}(I - \nu_1 A_1)\tilde{p}\|^2 \\ &\leq \langle (I - \nu_1 A_1)\tilde{v}_n - (I - \nu_1 A_1)\tilde{p}, w_n - p \rangle \\ &= \frac{1}{2} [\|(I - \nu_1 A_1)\tilde{v}_n - (I - \nu_1 A_1)\tilde{p}\|^2 + \|w_n - p\|^2 \\ &\quad - \|(I - \nu_1 A_1)\tilde{v}_n - (I - \nu_1 A_1)\tilde{p} - (w_n - p)\|^2] \end{aligned}$$

$$\begin{aligned}
 &\leq \frac{1}{2} [\|\tilde{v}_n - \tilde{p}\|^2 + \|w_n - p\|^2 \\
 &\quad - \|(\tilde{v}_n - w_n) + (p - \tilde{p})\|^2 \\
 &\quad + 2\gamma_1 \langle A_1 \tilde{v}_n - A_1 \tilde{p}, (\tilde{v}_n - w_n) + (p - \tilde{p}) \rangle \\
 &\quad - \gamma_1^2 \|A_1 \tilde{v}_n - A_1 \tilde{p}\|^2] \\
 &\leq \frac{1}{2} [\|v_n - p\|^2 + \|w_n - p\|^2 \\
 &\quad - \|(\tilde{v}_n - w_n) + (p - \tilde{p})\|^2 \\
 &\quad + 2\gamma_1 \langle A_1 \tilde{v}_n - A_1 \tilde{p}, (\tilde{v}_n - w_n) + (p - \tilde{p}) \rangle] .
 \end{aligned} \tag{83}$$

Thus, we have

$$\begin{aligned}
 \|\tilde{v}_n - \tilde{p}\|^2 &\leq \|v_n - p\|^2 - \|(v_n - \tilde{v}_n) - (p - \tilde{p})\|^2 \\
 &\quad + 2\gamma_2 \langle (v_n - \tilde{v}_n) - (p - \tilde{p}), A_2 v_n - A_2 p \rangle \\
 &\quad - \gamma_2^2 \|A_2 v_n - A_2 p\|^2, \\
 \|w_n - p\|^2 &\leq \|v_n - p\|^2 - \|(\tilde{v}_n - w_n) + (p - \tilde{p})\|^2 \\
 &\quad + 2\gamma_1 \|A_1 \tilde{v}_n - A_1 \tilde{p}\| \|(\tilde{v}_n - w_n) + (p - \tilde{p})\|.
 \end{aligned} \tag{84}$$

Consequently, from (57), (80), and (84) it follows that

$$\begin{aligned}
 \|x_n - p\|^2 &\leq (1 - s_n \bar{\gamma}) \\
 &\quad \times [\|\tilde{v}_n - \tilde{p}\|^2 + \gamma_1 (\gamma_1 - 2\zeta_1) \|A_1 \tilde{v}_n - A_1 \tilde{p}\|^2] \\
 &\quad + s_n \|x_n - p\|^2 \\
 &\quad + 2s_n (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|) \|x_n - p\| \\
 &\leq (1 - s_n \bar{\gamma}) \\
 &\quad \times \|\tilde{v}_n - \tilde{p}\|^2 + s_n \|x_n - p\|^2 \\
 &\quad + 2s_n (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|) \|x_n - p\| \\
 &\leq (1 - s_n \bar{\gamma}) \\
 &\quad \times [\|v_n - p\|^2 - \|(v_n - \tilde{v}_n) - (p - \tilde{p})\|^2 \\
 &\quad + 2\gamma_2 \langle (v_n - \tilde{v}_n) - (p - \tilde{p}), A_2 v_n - A_2 p \rangle \\
 &\quad - \gamma_2^2 \|A_2 v_n - A_2 p\|^2] + s_n \|x_n - p\|^2 \\
 &\quad + 2s_n (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|) \|x_n - p\| \\
 &\leq (1 - s_n \bar{\gamma}) \\
 &\quad \times [\|x_n - p\|^2 - \|(v_n - \tilde{v}_n) - (p - \tilde{p})\|^2 \\
 &\quad + 2\gamma_2 \|(v_n - \tilde{v}_n) - (p - \tilde{p})\| \|A_2 v_n - A_2 p\|] \\
 &\quad + s_n \|x_n - p\|^2
 \end{aligned} \tag{85}$$

$$\begin{aligned}
 &\quad + 2s_n (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|) \|x_n - p\| \\
 &\leq (1 - s_n (\bar{\gamma} - 1)) \\
 &\quad \times \|x_n - p\|^2 - (1 - s_n \bar{\gamma}) \|(v_n - \tilde{v}_n) - (p - \tilde{p})\|^2 \\
 &\quad + 2\gamma_2 \|(v_n - \tilde{v}_n) - (p - \tilde{p})\| \|A_2 v_n - A_2 p\| \\
 &\quad + 2s_n (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|) \|x_n - p\| \\
 &\leq \|x_n - p\|^2 - (1 - s_n \bar{\gamma}) \|(v_n - \tilde{v}_n) - (p - \tilde{p})\|^2 \\
 &\quad + 2\gamma_2 \|(v_n - \tilde{v}_n) - (p - \tilde{p})\| \|A_2 v_n - A_2 p\| \\
 &\quad + 2s_n (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|) \|x_n - p\|,
 \end{aligned} \tag{86}$$

which hence leads to

$$\begin{aligned}
 &(1 - s_n \bar{\gamma}) \|(v_n - \tilde{v}_n) - (p - \tilde{p})\|^2 \\
 &\leq 2\gamma_2 \|(v_n - \tilde{v}_n) - (p - \tilde{p})\| \|A_2 v_n - A_2 p\| \\
 &\quad + 2s_n (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|) \|x_n - p\|.
 \end{aligned} \tag{87}$$

Since $\lim_{n \rightarrow \infty} s_n = 0$ and $\{x_n\}$, $\{v_n\}$, and $\{\tilde{v}_n\}$ are bounded sequences, we conclude from (82) that

$$\lim_{n \rightarrow \infty} \|(v_n - \tilde{v}_n) - (p - \tilde{p})\| = 0. \tag{88}$$

Consequently, from (57), (80), and (85) it follows that

$$\begin{aligned}
 \|x_n - p\|^2 &\leq (1 - s_n \bar{\gamma}) \|w_n - p\|^2 + s_n \|x_n - p\|^2 \\
 &\quad + 2s_n (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|) \|x_n - p\| \\
 &\leq (1 - s_n \bar{\gamma}) [\|v_n - p\|^2 - \|(\tilde{v}_n - w_n) + (p - \tilde{p})\|^2 \\
 &\quad + 2\gamma_1 \|A_1 \tilde{v}_n - A_1 \tilde{p}\| \|(\tilde{v}_n - w_n) + (p - \tilde{p})\|] \\
 &\quad + s_n \|x_n - p\|^2 + 2s_n (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|) \\
 &\quad \times \|x_n - p\| \\
 &\leq (1 - s_n \bar{\gamma}) \\
 &\quad \times [\|x_n - p\|^2 - \|(\tilde{v}_n - w_n) + (p - \tilde{p})\|^2 \\
 &\quad + 2\gamma_1 \|A_1 \tilde{v}_n - A_1 \tilde{p}\| \|(\tilde{v}_n - w_n) + (p - \tilde{p})\|] \\
 &\quad + s_n \|x_n - p\|^2 + 2s_n (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|) \\
 &\quad \times \|x_n - p\| \\
 &\leq (1 - s_n (\bar{\gamma} - 1)) \\
 &\quad \times \|x_n - p\|^2 - (1 - s_n \bar{\gamma}) \|(\tilde{v}_n - w_n) + (p - \tilde{p})\|^2 \\
 &\quad + 2\gamma_1 \|A_1 \tilde{v}_n - A_1 \tilde{p}\| \|(\tilde{v}_n - w_n) + (p - \tilde{p})\| \\
 &\quad + 2s_n (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|) \|x_n - p\|
 \end{aligned}$$

$$\begin{aligned}
&\leq \|x_n - p\|^2 - (1 - s_n \bar{\gamma}) \|(\bar{v}_n - w_n) + (p - \bar{p})\|^2 \\
&\quad + 2\gamma_1 \|A_1 \bar{v}_n - A_1 \bar{p}\| \|(\bar{v}_n - w_n) + (p - \bar{p})\| \\
&\quad + 2s_n (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|) \|x_n - p\|,
\end{aligned} \tag{89}$$

which hence yields

$$\begin{aligned}
&(1 - s_n \bar{\gamma}) \|(\bar{v}_n - w_n) + (p - \bar{p})\|^2 \\
&\leq 2\gamma_1 \|A_1 \bar{v}_n - A_1 \bar{p}\| \|(\bar{v}_n - w_n) + (p - \bar{p})\| \\
&\quad + 2s_n (\|(I - V)p\| + \|(\gamma Q - \mu F)p\|) \|x_n - p\|.
\end{aligned} \tag{90}$$

Since $\lim_{n \rightarrow \infty} s_n = 0$ and $\{x_n\}$, $\{w_n\}$, and $\{\bar{v}_n\}$ are bounded sequences, we conclude from (82) that

$$\lim_{n \rightarrow \infty} \|(\bar{v}_n - w_n) + (p - \bar{p})\| = 0. \tag{91}$$

Note that

$$\|v_n - w_n\| \leq \|(v_n - \bar{v}_n) - (p - \bar{p})\| + \|(\bar{v}_n - w_n) + (p - \bar{p})\|. \tag{92}$$

Hence from (88) and (91) we get

$$\lim_{n \rightarrow \infty} \|v_n - Gv_n\| = \lim_{n \rightarrow \infty} \|v_n - w_n\| = 0. \tag{93}$$

Also, it is clear from (41) that

$$\begin{aligned}
&x_n - T_n Gv_n \\
&= s_n [T_n x_n - \alpha_n (\mu F(T_n x_n) - \gamma Q x_n) - V T_n Gv_n].
\end{aligned} \tag{94}$$

So, it follows from $\lim_{n \rightarrow \infty} s_n = 0$ that

$$\lim_{n \rightarrow \infty} \|x_n - T_n Gv_n\| = 0. \tag{95}$$

Observe that

$$\begin{aligned}
&\|v_n - T_n v_n\| \\
&\leq \|v_n - x_n\| + \|x_n - T_n Gv_n\| + \|T_n Gv_n - T_n v_n\| \\
&\leq \|v_n - x_n\| + \|x_n - T_n Gv_n\| + \|Gv_n - v_n\|.
\end{aligned} \tag{96}$$

Hence, from (78), (93), and (95) we have

$$\lim_{n \rightarrow \infty} \|v_n - T_n v_n\| = 0. \tag{97}$$

It is easy to see that

$$\begin{aligned}
&\|P_C(I - \lambda_n \nabla f)v_n - v_n\| \\
&= \|s_n v_n + (1 - s_n) T_n v_n - v_n\| \\
&= (1 - s_n) \|T_n v_n - v_n\| \\
&\leq \|T_n v_n - v_n\|,
\end{aligned} \tag{98}$$

where $s_n = ((2 - \lambda_n L)/4) \in (0, (1/2))$ for each $\lambda_n \in (0, (2/L))$. Hence we have

$$\begin{aligned}
&\|P_C(I - \frac{2}{L} \nabla f)v_n - v_n\| \\
&\leq \|P_C(I - \frac{2}{L} \nabla f)v_n - P_C(I - \lambda_n \nabla f)v_n\| \\
&\quad + \|P_C(I - \lambda_n \nabla f)v_n - v_n\| \\
&\leq \|(I - \frac{2}{L} \nabla f)v_n - (I - \lambda_n \nabla f)v_n\| \\
&\quad + \|P_C(I - \lambda_n \nabla f)v_n - v_n\| \\
&\leq \left(\frac{2}{L} - \lambda_n\right) \|\nabla f(v_n)\| + \|T_n v_n - v_n\|.
\end{aligned} \tag{99}$$

From the boundedness of $\{v_n\}$, $s_n \rightarrow 0 \Leftrightarrow \lambda_n \rightarrow (2/L)$ and $\|T_n v_n - v_n\| \rightarrow 0$ (due to (97)), it follows that

$$\lim_{n \rightarrow \infty} \|v_n - P_C(I - \frac{2}{L} \nabla f)v_n\| = 0. \tag{100}$$

Furthermore, we show that $\omega_w(x_n) \subset \Omega$. Indeed, since $\{x_n\}$ is bounded, there exists a subsequence $\{x_{n_i}\}$ of $\{x_n\}$ which converges weakly to some w . Note that $\lim_{n \rightarrow \infty} \|x_n - u_n\| = 0$ (due to (68)). Hence $u_{n_i} \rightharpoonup w$. Since C is closed and convex, C is weakly closed. So, we have $w \in C$. From (68), (76), and (78) we have that $u_{n_i} \rightharpoonup w$, $v_{n_i} \rightharpoonup w$ and $\Lambda_{n_i}^m u_{n_i} \rightharpoonup w$, where $m \in \{1, 2, \dots, N\}$. First, we prove that $w \in \cap_{m=1}^N I(B_m, R_m)$. However, the argument to show that w lies in $I(B_m, R_m)$ is quite standard by using maximality and hence is omitted. Next, we show that $w \in \text{GMEP}(\Theta, \varphi, A)$. In fact, from $u_n = S_{r_n}^{(\Theta, \varphi)}(I - r_n A)x_n$, we know that

$$\begin{aligned}
&\Theta(u_n, y) + \varphi(y) - \varphi(u_n) + \langle Ax_n, y - u_n \rangle \\
&\quad + \frac{1}{r_n} \langle K'(u_n) - K'(x_n), y - u_n \rangle \geq 0, \quad \forall y \in C.
\end{aligned} \tag{101}$$

From (H2) it follows that

$$\begin{aligned}
&\varphi(y) - \varphi(u_n) + \langle Ax_n, y - u_n \rangle + \frac{1}{r_n} \\
&\quad \times \langle K'(u_n) - K'(x_n), y - u_n \rangle \geq \Theta(y, u_n), \\
&\quad \forall y \in C.
\end{aligned} \tag{102}$$

Replacing n by n_i , we have

$$\begin{aligned}
&\varphi(y) - \varphi(u_{n_i}) + \langle Ax_{n_i}, y - u_{n_i} \rangle \\
&\quad + \left\langle \frac{K'(u_{n_i}) - K'(x_{n_i})}{r_{n_i}}, y - u_{n_i} \right\rangle \geq \Theta(y, u_{n_i}), \\
&\quad \forall y \in C.
\end{aligned} \tag{103}$$

Put $u_t = ty + (1-t)w$ for all $t \in (0, 1]$ and $y \in C$. Then, from (103) we have

$$\begin{aligned}
 & \langle u_t - u_{n_i}, Au_t \rangle \\
 & \geq \langle u_t - u_{n_i}, Au_t \rangle - \varphi(u_t) + \varphi(u_{n_i}) \\
 & \quad - \left\langle u_t - u_{n_i}, Ax_{n_i} \right\rangle - \left\langle \frac{K'(u_{n_i}) - K'(x_{n_i})}{r_{n_i}}, u_t - u_{n_i} \right\rangle \\
 & \quad + \Theta(u_t, u_{n_i}) \\
 & \geq \langle u_t - u_{n_i}, Au_t - Au_{n_i} \rangle \\
 & \quad + \langle u_t - u_{n_i}, Au_{n_i} - Ax_{n_i} \rangle - \varphi(u_t) + \varphi(u_{n_i}) \\
 & \quad - \left\langle \frac{K'(u_{n_i}) - K'(x_{n_i})}{r_{n_i}}, u_t - u_{n_i} \right\rangle + \Theta(u_t, u_{n_i}).
 \end{aligned} \tag{104}$$

Since $\|u_{n_i} - x_{n_i}\| \rightarrow 0$ as $i \rightarrow \infty$, we deduce from the Lipschitz continuity of A and K' that $\|Au_{n_i} - Ax_{n_i}\| \rightarrow 0$ and $\|K'(u_{n_i}) - K'(x_{n_i})\| \rightarrow 0$ as $i \rightarrow \infty$. Furthermore, from the monotonicity of A , we have $\langle u_t - u_{n_i}, Au_t - Au_{n_i} \rangle \geq 0$. So, from (H4), the weakly lower semicontinuity of φ , $((K'(u_{n_i}) - K'(x_{n_i}))/r_{n_i}) \rightarrow 0$, and $u_{n_i} \rightharpoonup w$, we have

$$\langle u_t - w, Au_t \rangle \geq -\varphi(u_t) + \varphi(w) + \Theta(u_t, w), \quad \text{as } i \rightarrow \infty. \tag{105}$$

From (H1), (H4), and (105) we also have

$$\begin{aligned}
 0 &= \Theta(u_t, u_t) + \varphi(u_t) - \varphi(u_t) \\
 &\leq t\Theta(u_t, y) + (1-t)\Theta(u_t, w) + t\varphi(y) \\
 &\quad + (1-t)\varphi(w) - \varphi(u_t) \\
 &= t[\Theta(u_t, y) + \varphi(y) - \varphi(u_t)] \\
 &\quad + (1-t)[\Theta(u_t, w) + \varphi(w) - \varphi(w) - \varphi(u_t)] \\
 &\leq t[\Theta(u_t, y) + \varphi(y) - \varphi(u_t)] \\
 &\quad + (1-t)\langle u_t - w, Au_t \rangle \\
 &= t[\Theta(u_t, y) + \varphi(y) - \varphi(u_t)] + (1-t)t\langle y - w, Au_t \rangle,
 \end{aligned} \tag{106}$$

and hence

$$0 \leq \Theta(u_t, y) + \varphi(y) - \varphi(u_t) + (1-t)\langle y - w, Au_t \rangle. \tag{107}$$

Letting $t \rightarrow 0$, we have, for each $y \in C$,

$$0 \leq \Theta(w, y) + \varphi(y) - \varphi(w) + \langle Aw, y - w \rangle. \tag{108}$$

This implies that $w \in \text{GMEP}(\Theta, \varphi, A)$. In addition, let us show that $w \in \text{SGEP}(G) \cap \Gamma$. As a matter of fact, from (93), (100), $v_{n_i} \rightharpoonup w$, and Lemma 10, we deduce that $w \in \text{SGEP}(G)$ and

$w \in \text{Fix}(P_C(I - (2/L)\nabla f)) = \text{VI}(C, \nabla f) = \Gamma$. Hence we get $w \in \text{SGEP}(G) \cap \Gamma$. Therefore, $w \in \text{GMEP}(\Theta, \varphi, A) \cap \text{SGEP}(G) \cap \bigcap_{i=1}^N I(B_i, R_i) \cap \Gamma =: \Omega$. This shows that $\omega_w(x_n) \subset \Omega$.

Finally, we prove that $\{x_n\}$ converges strongly as $\lambda_n \rightarrow (2/L) (\Leftrightarrow s_n \rightarrow 0)$ to $q \in \Omega$, which is the unique solution in Ω to the VIP (43). In fact, we note that, for $w \in \Omega$ with $x_{n_i} \rightharpoonup w$,

$$\begin{aligned}
 x_n - w &= (I - s_n V)(T_n G v_n - w) \\
 &\quad + s_n [\alpha_n \gamma (Qx_n - Qw) + (I - \alpha_n \mu F) T_n x_n \\
 &\quad - (I - \alpha_n \mu F) T_n w] \\
 &\quad + s_n [(I - V)w + \alpha_n (\gamma Q - \mu F)w].
 \end{aligned} \tag{109}$$

By (48), (57), and Lemma 14, we obtain that

$$\begin{aligned}
 & \|x_n - w\|^2 \\
 &= \langle (I - s_n V)(T_n G v_n - w), x_n - w \rangle \\
 &\quad + s_n [\alpha_n \gamma \langle Qx_n - Qw, x_n - w \rangle \\
 &\quad + \langle (I - \alpha_n \mu F) T_n x_n - (I - \alpha_n \mu F) T_n w, x_n - w \rangle] \\
 &\quad + s_n \langle (I - V)w + \alpha_n (\gamma Q - \mu F)w, x_n - w \rangle \\
 &\leq (1 - s_n \bar{\gamma}) \|T_n G v_n - w\| \|x_n - w\| \\
 &\quad + s_n [\alpha_n \gamma \|Qx_n - Qw\| \|x_n - w\| \\
 &\quad + (1 - \alpha_n \tau) \|x_n - w\|^2] \\
 &\quad + s_n \langle (I - V)w + \alpha_n (\gamma Q - \mu F)w, x_n - w \rangle \\
 &\leq (1 - s_n \bar{\gamma}) \|v_n - w\| \|x_n - w\| \\
 &\quad + s_n [\alpha_n \gamma \|x_n - w\|^2 + (1 - \alpha_n \tau) \|x_n - w\|^2] \\
 &\quad + s_n \langle (I - V)w + \alpha_n (\gamma Q - \mu F)w, x_n - w \rangle \\
 &\leq (1 - s_n \bar{\gamma}) \|x_n - w\|^2 \\
 &\quad + s_n [\alpha_n \gamma \|x_n - w\|^2 + (1 - \alpha_n \tau) \|x_n - w\|^2] \\
 &\quad + s_n \langle (I - V)w + \alpha_n (\gamma Q - \mu F)w, x_n - w \rangle \\
 &= (1 - s_n \bar{\gamma}) \|x_n - w\|^2 + s_n (1 - \alpha_n (\tau - \gamma l)) \|x_n - w\|^2 \\
 &\quad + s_n \langle (I - V)w + \alpha_n (\gamma Q - \mu F)w, x_n - w \rangle \\
 &\leq (1 - s_n \bar{\gamma}) \|x_n - w\|^2 + s_n \|x_n - w\|^2 \\
 &\quad + s_n \langle (I - V)w + \alpha_n (\gamma Q - \mu F)w, x_n - w \rangle \\
 &= (1 - s_n (\bar{\gamma} - 1)) \|x_n - w\|^2 \\
 &\quad + s_n \langle (I - V)w + \alpha_n (\gamma Q - \mu F)w, x_n - w \rangle,
 \end{aligned} \tag{110}$$

which hence leads to

$$\|x_n - w\|^2 \leq \frac{\langle (I - V)w + \alpha_n(\gamma Q - \mu F)w, x_n - w \rangle}{\bar{\gamma} - 1}. \quad (111)$$

In particular, we have

$$\|x_{n_i} - w\|^2 \leq \frac{\langle (I - V)w + \alpha_{n_i}(\gamma Q - \mu F)w, x_{n_i} - w \rangle}{\bar{\gamma} - 1}. \quad (112)$$

Since $x_{n_i} \rightarrow w$ and $\lim_{n \rightarrow \infty} \alpha_n = 0$, it follows from (112) that $x_{n_i} \rightarrow w$ as $i \rightarrow \infty$.

Now we show that w solves the VIP (43). As a matter of fact, from (55) and (59) we obtain that, for any $p \in \Omega$,

$$\begin{aligned} \|x_n - p\|^2 &\leq (1 - s_n \bar{\gamma}) \|u_n - p\|^2 + s_n \|x_n - p\|^2 \\ &\quad + 2s_n \langle (I - V)p + \alpha_n(\gamma Q - \mu F)p, x_n - p \rangle \\ &\leq (1 - s_n \bar{\gamma}) \|x_n - p\|^2 + s_n \|x_n - p\|^2 \\ &\quad + 2s_n \langle (I - V)p + \alpha_n(\gamma Q - \mu F)p, x_n - p \rangle \\ &= (1 - s_n(\bar{\gamma} - 1)) \|x_n - p\|^2 \\ &\quad + 2s_n \langle (I - V)p + \alpha_n(\gamma Q - \mu F)p, x_n - p \rangle \\ &\leq \|x_n - p\|^2 \\ &\quad + 2s_n \langle (I - V)p + \alpha_n(\gamma Q - \mu F)p, x_n - p \rangle, \end{aligned} \quad (113)$$

which immediately implies that

$$\langle (V - I)p + \alpha_n(\mu F - \gamma Q)p, x_n - p \rangle \leq 0. \quad (114)$$

Since $\alpha_n \rightarrow 0$ and $x_{n_i} \rightarrow w$, we get

$$\langle (V - I)p, w - p \rangle \leq 0, \quad \forall p \in \Omega. \quad (115)$$

By Minty's lemma, w is a solution in Ω to the VIP (43). In terms of the uniqueness of solutions of VIP (43), we deduce that $w = q$ and $x_{n_i} \rightarrow q$ as $n \rightarrow \infty$. So, every weak convergence subsequence of $\{x_n\}$ converges strongly to the unique solution q of VIP (43). Therefore, $\{x_n\}$ converges strongly to the unique solution q of VIP (43). This completes the proof. $\square$

Corollary 20. Let C be a nonempty closed convex subset of a real Hilbert space H . Let $f : C \rightarrow \mathbf{R}$ be a convex functional with L -Lipschitz continuous gradient ∇f . Let $\Theta, \Theta_1, \Theta_2$ be three bifunctions from $C \times C$ to $\mathbf{R}$ satisfying (H1)–(H4) and let $\varphi : C \rightarrow \mathbf{R}$ be a lower semicontinuous and convex functional. Let $R_i : C \rightarrow 2^H$ be a maximal monotone mapping and let $A : H \rightarrow H$ and $A_k, B_i : C \rightarrow H$ be ζ -inverse strongly monotone, ζ_k -inverse strongly monotone, and η_i -inverse-strongly monotone, respectively, for $k = 1, 2$ and $i = 1, 2$. Let V be a $\bar{\gamma}$ -strongly positive bounded linear operator with $\bar{\gamma} > 1$. Let $F : H \rightarrow H$ be a κ -Lipschitzian and η -strongly monotone operator with positive constants $\kappa, \eta > 0$. Let $Q : H \rightarrow H$ be an l -Lipschitzian mapping with constant

$l \geq 0$. Let $0 < \mu < (2\eta/\kappa^2)$ and $0 \leq \gamma l < \tau$, where $\tau = 1 - \sqrt{1 - \mu(2\eta - \mu\kappa^2)}$. Assume that $\Omega := \text{GMEP}(\Theta, \varphi, A) \cap \text{SGEP}(G) \cap I(B_1, R_1) \cap I(B_2, R_2) \cap \Gamma \neq \emptyset$ where G is defined as in Proposition CY. Let $\{r_n\}$ be a sequence in $(0, 2\zeta]$ and $\{\alpha_n\}$ a sequence in $(0, 1]$ such that $\lim_{n \rightarrow \infty} \alpha_n = 0$. Let $\{x_n\}$ be the sequence generated by

$$\begin{aligned} u_n &= S_{r_n}^{(\Theta, \varphi)}(I - r_n A)x_n, \\ v_n &= J_{R_2, \lambda_{2,n}}(I - \lambda_{2,n} B_2) J_{R_1, \lambda_{1,n}}(I - \lambda_{1,n} B_1) u_n, \\ x_n &= (I - s_n V) T_n G v_n \\ &\quad + s_n [T_n x_n - \alpha_n (\mu F(T_n x_n) - \gamma Q x_n)], \quad \forall n \geq 1, \end{aligned} \quad (116)$$

where $P_C(I - \lambda_n \nabla f) = s_n I + (1 - s_n) T_n$ (here T_n is nonexpansive, $s_n = ((2 - \lambda_n L)/4) \in (0, (1/2))$ for each $\lambda_n \in (0, (2/L))$). Suppose that the following conditions hold.

- (i) $K : H \rightarrow \mathbf{R}$ is strongly convex with constant $\sigma > 0$ and its derivative K' is Lipschitz continuous with constant $\nu > 0$ such that the function $x \mapsto \langle y - x, K'(x) \rangle$ is weakly upper semicontinuous for each $y \in H$.
- (ii) for each $x \in H$, there exist a bounded subset $D_x \subset C$ and $z_x \in C$ such that for any $y \notin D_x$,

$$\Theta(y, z_x) + \varphi(z_x) - \varphi(y) + \frac{1}{r} \langle K'(y) - K'(x), z_x - y \rangle < 0. \quad (117)$$

- (iii) $s_n \in (0, (1/2))$ for each $\lambda_n \in (0, (2/L))$, $\lim_{n \rightarrow \infty} s_n = 0$ ($\Leftrightarrow \lim_{n \rightarrow \infty} \lambda_n = (2/L)$).

- (iv) $v_k \in (0, 2\zeta_k)$, $k = 1, 2$ and $\{\lambda_{i,n}\} \subset [a_i, b_i] \subset (0, 2\eta_i)$, $i = 1, 2$.

- (v) $0 < \liminf_{n \rightarrow \infty} r_n \leq \limsup_{n \rightarrow \infty} r_n < 2\zeta$.

Assume that $S_r^{(\Theta, \varphi)}$ is firmly nonexpansive. Then $\{x_n\}$ converges strongly as $\lambda_n \rightarrow (2/L)$ ($\Leftrightarrow s_n \rightarrow 0$) to a point $q \in \Omega$, which is a unique solution in Ω to the VIP:

$$\langle (I - V)q, p - q \rangle \leq 0, \quad \forall p \in \Omega. \quad (118)$$

Corollary 21. Let C be a nonempty closed convex subset of a real Hilbert space H . Let $f : C \rightarrow \mathbf{R}$ be a convex functional with L -Lipschitz continuous gradient ∇f . Let $\Theta, \Theta_1, \Theta_2$ be three bifunctions from $C \times C$ to $\mathbf{R}$ satisfying (H1)–(H4) and $\varphi : C \rightarrow \mathbf{R}$ a lower semicontinuous and convex functional. Let $R : C \rightarrow 2^H$ be a maximal monotone mapping and let $A : H \rightarrow H$ and $A_k, B : C \rightarrow H$ be ζ -inverse strongly monotone, ζ_k -inverse strongly monotone, and ξ -inverse-strongly monotone, respectively, for $k = 1, 2$. Let V be a $\bar{\gamma}$ -strongly positive bounded linear operator with $\bar{\gamma} > 1$. Let $F : H \rightarrow H$ be a κ -Lipschitzian and η -strongly monotone operator with positive constants $\kappa, \eta > 0$. Let $Q : H \rightarrow H$ be an l -Lipschitzian mapping with constant $l \geq 0$. Let $0 < \mu < (2\eta/\kappa^2)$ and $0 \leq \gamma l < \tau$, where $\tau = 1 - \sqrt{1 - \mu(2\eta - \mu\kappa^2)}$. Assume that $\Omega := \text{GMEP}(\Theta, \varphi, A) \cap \text{SGEP}(G) \cap I(B, R) \cap \Gamma \neq \emptyset$ where G is

defined as in Proposition CY. Let $\{r_n\}$ be a sequence in $(0, 2\zeta]$ and $\{\alpha_n\}$ be a sequence in $(0, 1]$ such that $\lim_{n \rightarrow \infty} \alpha_n = 0$. Let $\{x_n\}$ be the sequence generated by

$$\begin{aligned} u_n &= S_{r_n}^{(\Theta, \varphi)} (I - r_n A) x_n, \\ v_n &= J_{R, \rho_n} (I - \rho_n B) u_n, \\ x_n &= (I - s_n V) T_n G v_n + s_n [T_n x_n - \alpha_n (\mu F(T_n x_n) - \gamma Q x_n)], \\ &\quad \forall n \geq 1, \end{aligned} \quad (119)$$

where $P_C(I - \lambda_n \nabla f) = s_n I + (1 - s_n) T_n$ (here T_n is nonexpansive, $s_n = ((2 - \lambda_n L)/4) \in (0, (1/2))$ for each $\lambda_n \in (0, (2/L))$). Suppose that the following conditions hold

- (i) $K : H \rightarrow \mathbf{R}$ is strongly convex with constant $\sigma > 0$ and its derivative K' is Lipschitz continuous with constant $\nu > 0$ such that the function $x \mapsto \langle y - x, K'(x) \rangle$ is weakly upper semicontinuous for each $y \in H$;
- (ii) for each $x \in H$, there exist a bounded subset $D_x \subset C$ and $z_x \in C$ such that for any $y \notin D_x$,

$$\begin{aligned} &\Theta(y, z_x) + \varphi(z_x) - \varphi(y) \\ &\quad + \frac{1}{r} \langle K'(y) - K'(x), z_x - y \rangle < 0; \end{aligned} \quad (120)$$

- (iii) $s_n \in (0, (1/2))$ for each $\lambda_n \in (0, (2/L))$, $\lim_{n \rightarrow \infty} s_n = 0$ ($\Leftrightarrow \lim_{n \rightarrow \infty} \lambda_n = (2/L)$);
- (iv) $\nu_k \in (0, 2\zeta_k)$, $k = 1, 2$ and $\{\rho_n\} \subset [a, b] \subset (0, 2\xi)$;
- (v) $0 < \liminf_{n \rightarrow \infty} r_n \leq \limsup_{n \rightarrow \infty} r_n < 2\zeta$.

Assume that $S_r^{(\Theta, \varphi)}$ is firmly nonexpansive. Then $\{x_n\}$ converges strongly as $\lambda_n \rightarrow (2/L)$ ($\Leftrightarrow s_n \rightarrow 0$) to a point $q \in \Omega$, which is a unique solution in Ω to the VIP:

$$\langle (I - V)q, p - q \rangle \leq 0, \quad \forall p \in \Omega. \quad (121)$$

We next provide one example to illustrate Corollary 21.

Example 22. Let $H = \mathbf{R}^2$ with inner product $\langle \cdot, \cdot \rangle$ and norm $\| \cdot \|$ which are defined by

$$\langle x, y \rangle = ac + bd, \quad \|x\| = \sqrt{a^2 + b^2}, \quad (122)$$

for all $x, y \in \mathbf{R}^2$ with $x = (a, b)$ and $y = (c, d)$. Let $C = \{(a, a) : a \in \mathbf{R}\}$ and $K(x) = (1/2)\|x\|^2$, for all $x \in \mathbf{R}^2$. Clearly, C is a nonempty closed convex subset of a real Hilbert space $H = \mathbf{R}^2$. Let $f : C \rightarrow \mathbf{R}$ be a convex functional with L -Lipschitz continuous gradient ∇f ; for instance, putting $S = \left\{ \begin{smallmatrix} 2/3 & 1/3 \\ 1/3 & 2/3 \end{smallmatrix} \right\}$ and $f(x) = (1/2)\langle Sx, x \rangle$, we obtain that $\|S\| = 1$ and $\nabla f = S$ with Lipschitz constant $L = 4$. Put $\Theta = \Theta_1 = \Theta_2 = 0$ and $\varphi = 0$. Then $\Theta, \Theta_1, \Theta_2$ are three bifunctions from $C \times C$ to $\mathbf{R}$ satisfying (H1)–(H4) and let $\varphi : C \rightarrow \mathbf{R}$ be a lower semicontinuous and convex functional. Let $R : C \rightarrow 2^H$ be a maximal monotone mapping, for instance, putting

$$Rv = \begin{cases} Sv + N_C v, & \text{if } v \in C, \\ \emptyset, & \text{if } v \notin C, \end{cases} \quad (123)$$

where $N_C v = \{w \in H : \langle v - u, w \rangle \geq 0, \text{ for all } u \in C\}$. It is known that R is maximal monotone and $0 \in Rv$ if and only if $v \in VI(C, S)$. Put $A = \left\{ \begin{smallmatrix} 3/5 & 2/5 \\ 2/5 & 3/5 \end{smallmatrix} \right\}$, $B = 0$, $A_1 = I - S = \left\{ \begin{smallmatrix} 1/3 & -1/3 \\ -1/3 & 1/3 \end{smallmatrix} \right\}$, $A_2 = I - A = \left\{ \begin{smallmatrix} 2/5 & -2/5 \\ -2/5 & 2/5 \end{smallmatrix} \right\}$. Then $A : H \rightarrow H$ and $A_k, B : C \rightarrow H$ are ζ -inverse strongly monotone with $\zeta = (1/2)$, ζ_k -inverse strongly monotone with $\zeta_k = (1/2)$ and ξ -inverse-strongly monotone with $\xi = (1/2)$, respectively, for $k = 1, 2$. Also, put $\mu = 2$, $Q = 0$, $V = (3/2)S$, and $F = (1/2)I$, where I is the identity mapping of $\mathbf{R}^2$. Then V is a $\bar{\gamma}$ -strongly positive bounded linear operator with $\bar{\gamma} = (3/2)$. It is easy to see that $\Omega := \text{GMEP}(\Theta, \varphi, A) \cap \text{SGEP}(G) \cap I(B, R) \cap \Gamma = \{0\}$ where G is defined as in Proposition CY. Let $\{\alpha_n\} \subset (0, 1]$, $\{r_n\} \subset (0, 2\zeta]$, and $\{\rho_n\} \subset (0, 2\xi]$ with $\zeta = \xi = (1/2)$; that is, $\{\alpha_n\}, \{\rho_n\}, \{r_n\} \subset (0, 1]$. In this case, for any given $x_1 \in C$, the iterative scheme (119) is equivalent to the following one:

$$\begin{aligned} u_n &= S_{r_n}^{(\Theta, \varphi)} (I - r_n A) x_n = P_C (I - r_n A) x_n = (1 - r_n) x_n, \\ v_n &= J_{R, \rho_n} (I - \rho_n B) u_n = J_{R, \rho_n} u_n \\ &= P_C (u_n - \rho_n S v_n) = u_n - \rho_n v_n, \\ x_n &= (I - s_n V) T_n G v_n \\ &\quad + s_n [T_n x_n - \alpha_n (\mu F(T_n x_n) - \gamma Q x_n)] \\ &= \left(I - \frac{3}{2} s_n S \right) T_n P_C (I - \nu_1 A_1) P_C (I - \nu_2 A_2) v_n \\ &\quad + s_n [T_n x_n - \alpha_n \mu F(T_n x_n)] \\ &= \left(I - \frac{3}{2} s_n S \right) T_n v_n + s_n [T_n x_n - \alpha_n T_n x_n] \\ &= \left(I - \frac{3}{2} s_n S \right) T_n v_n + s_n (1 - \alpha_n) T_n x_n, \quad \forall n \geq 1, \end{aligned} \quad (124)$$

where $P_C(I - \lambda_n \nabla f) = s_n I + (1 - s_n) T_n$ and $s_n = ((2 - \lambda_n L)/4) \in (0, (1/2))$ for each $\lambda_n \in (0, (2/L))$ with $L = 4$; that is, $s_n = ((1 - 2\lambda_n)/2) \in (0, (1/2))$ for each $\lambda_n \in (0, (1/2))$.

Next, taking into account $v_n = J_{R, \rho_n} u_n = (I + \rho_n R)^{-1} u_n$, we get $u_n \in v_n + \rho_n R v_n$, which leads to

$$\frac{u_n - v_n}{\rho_n} \in R v_n = S v_n + N_C v_n. \quad (125)$$

Hence, we have $\langle v_n - u, ((u_n - v_n)/\rho_n) - S v_n \rangle \geq 0$, for all $u \in C$; that is,

$$\langle u - v_n, u_n - \rho_n S v_n - v_n \rangle \leq 0, \quad \forall u \in C, \quad (126)$$

which immediately implies that $v_n = P_C(u_n - \rho_n S v_n) = u_n - \rho_n v_n$. Thus,

$$v_n = \frac{1}{1 + \rho_n} u_n = \frac{1 - r_n}{1 + \rho_n} x_n. \quad (127)$$

Also, note that

$$(1 - \lambda_n) x_n = P_C (I - \lambda_n \nabla f) x_n = s_n x_n + (1 - s_n) T_n x_n. \quad (128)$$

So, we obtain

$$T_n x_n = \frac{1 - s_n - \lambda_n}{1 - s_n} x_n. \quad (129)$$

On the other hand, we have

$$(1 - \lambda_n) v_n = P_C (I - \lambda_n \nabla f) v_n = s_n v_n + (1 - s_n) T_n v_n, \quad (130)$$

and hence

$$T_n v_n = \frac{1 - s_n - \lambda_n}{1 - s_n} v_n = \frac{1 - s_n - \lambda_n}{1 - s_n} \cdot \frac{1 - r_n}{1 + \rho_n} x_n, \quad (131)$$

which together with (124) implies that

$$\begin{aligned} x_n &= \left(I - \frac{3}{2} s_n S \right) T_n v_n + s_n (1 - \alpha_n) T_n x_n \\ &= \left(I - \frac{3}{2} s_n S \right) \frac{1 - s_n - \lambda_n}{1 - s_n} \frac{1 - r_n}{1 + \rho_n} x_n \\ &\quad + s_n (1 - \alpha_n) \frac{1 - s_n - \lambda_n}{1 - s_n} x_n \\ &= \left(1 - \frac{3}{2} s_n \right) \frac{1 - s_n - \lambda_n}{1 - s_n} \frac{1 - r_n}{1 + \rho_n} x_n \\ &\quad + s_n (1 - \alpha_n) \frac{1 - s_n - \lambda_n}{1 - s_n} x_n \\ &= \left[\left(1 - \frac{3}{2} s_n \right) \frac{1 - r_n}{1 + \rho_n} + s_n (1 - \alpha_n) \right] \frac{1 - s_n - \lambda_n}{1 - s_n} x_n. \end{aligned} \quad (132)$$

It is clear that if $s_n = ((1 - 2\lambda_n)/2) = ((1 - 2\lambda_n)/2) \in (0, (1/2))$ for each $\lambda_n \in (0, (1/2))$, then, for $\{r_n\}, \{\alpha_n\}, \{\rho_n\} \subset (0, 1]$, we deduce from (132) that

$$\begin{aligned} \|x_n\| &= \left[\left(1 - \frac{3}{2} s_n \right) \frac{1 - r_n}{1 + \rho_n} + s_n (1 - \alpha_n) \right] \frac{1 - s_n - \lambda_n}{1 - s_n} \|x_n\| \\ &\leq \left(1 - \frac{3}{2} s_n \right) \frac{1 - r_n}{1 + \rho_n} + s_n (1 - \alpha_n) \|x_n\| \\ &\leq \left(1 - \frac{3}{2} s_n + s_n \right) \|x_n\| \\ &= \left(1 - \frac{1}{2} s_n \right) \|x_n\|. \end{aligned} \quad (133)$$

Therefore, $x_n = 0$ for all $n \geq 1$. There is no doubt that $\{x_n\}$ converges to the unique element 0 in Ω , which solves the VIP (121).

4. Fixed Point Problems with Constraints

In this section, we will introduce and analyze another implicit iterative algorithm for solving the fixed point problem of infinitely many nonexpansive mappings with constraints of

several problems: the GMEP (4), the SGEP (8), and finitely many variational inclusions in a real Hilbert space. We prove strong convergence theorem for the iterative algorithm under mild assumptions.

Theorem 23. Let C be a nonempty closed convex subset of a real Hilbert space H . Let N be an integer. Let $\Theta, \Theta_1, \Theta_2$ be three bifunctions from $C \times C$ to $\mathbf{R}$ satisfying (H1)–(H4) and $\varphi : C \rightarrow \mathbf{R}$ a lower semicontinuous and convex functional. Let $R_i : C \rightarrow 2^H$ be a maximal monotone mapping and let $A : H \rightarrow H$ and $A_k, B_i : C \rightarrow H$ be ζ -inverse strongly monotone, ζ_k -inverse strongly monotone, and η_i -inverse-strongly monotone, respectively, for $k = 1, 2$ and $i = 1, 2, \dots, N$. Let $\{T_n\}_{n=1}^\infty$ be a sequence of nonexpansive mappings on H and $\{\lambda_n\}$ a sequence in $(0, b]$ for some $b \in (0, 1)$. Let V be a $\bar{\gamma}$ -strongly positive bounded linear operator with $\bar{\gamma} > 1$. Let $F : H \rightarrow H$ be a κ -Lipschitzian and η -strongly monotone operator with positive constants $\kappa, \eta > 0$. Let $Q : H \rightarrow H$ be an l -Lipschitzian mapping with constant $l \geq 0$. Let $0 < \mu < (2\eta/\kappa^2)$ and $0 \leq \gamma l < \tau$, where $\tau = 1 - \sqrt{1 - \mu(2\eta - \mu\kappa^2)}$. Assume that $\Omega := \cap_{n=1}^\infty \text{Fix}(T_n) \cap \text{GMEP}(\Theta, \varphi, A) \cap \text{SGEP}(G) \cap \cap_{i=1}^N I(B_i, R_i) \neq \emptyset$ where G is defined as in Proposition CY. Let $\{r_n\}$ be a sequence in $(0, 2\zeta]$ and let $\{\alpha_n\}$ and $\{\sigma_n\}$ be sequences in $(0, 1]$. Let $\{x_n\}$ be the sequence generated by

$$\begin{aligned} u_n &= S_{r_n}^{(\Theta, \varphi)} (I - r_n A) x_n, \\ v_n &= J_{R_N, \lambda_{N,n}} (I - \lambda_{N,n} B_N) J_{R_{N-1}, \lambda_{N-1,n}} \\ &\quad \times (I - \lambda_{N-1,n} B_{N-1}) \cdots J_{R_1, \lambda_{1,n}} (I - \lambda_{1,n} B_1) u_n, \\ x_n &= (I - \sigma_n V) W_n G v_n \\ &\quad + \sigma_n [W_n x_n - \alpha_n (\mu F(W_n x_n) - \gamma Q x_n)], \quad \forall n \geq 1, \end{aligned} \quad (134)$$

where W_n is the W -mapping defined by (9). Suppose that the following conditions hold:

- (i) $K : H \rightarrow \mathbf{R}$ is strongly convex with constant $\sigma > 0$ and its derivative K' is Lipschitz continuous with constant $\nu > 0$ such that the function $x \mapsto \langle y - x, K'(x) \rangle$ is weakly upper semicontinuous for each $y \in H$;
- (ii) for each $x \in H$, there exist a bounded subset $D_x \subset C$ and $z_x \in C$ such that for any $y \notin D_x$,

$$\Theta(y, z_x) + \varphi(z_x) - \varphi(y) + \frac{1}{r} \langle K'(y) - K'(x), z_x - y \rangle < 0; \quad (135)$$

(iii) $\lim_{n \rightarrow \infty} \alpha_n = 0$ and $\lim_{n \rightarrow \infty} \sigma_n = 0$;

(iv) $\nu_k \in (0, 2\zeta_k)$, $k = 1, 2$ and $\{\lambda_{i,n}\} \subset [a_i, b_i] \subset (0, 2\eta_i)$, $i = 1, 2, \dots, N$;

(v) $0 < \liminf_{n \rightarrow \infty} r_n \leq \limsup_{n \rightarrow \infty} r_n < 2\zeta$.

Assume that $S_r^{(\Theta, \varphi)}$ is firmly nonexpansive. Then $\{x_n\}$ converges strongly to a point $q \in \Omega$, which is a unique solution in Ω to the VIP:

$$\langle (I - V)q, p - q \rangle \leq 0, \quad \forall p \in \Omega. \quad (136)$$

Proof. First of all, let us show that the sequence $\{x_n\}$ is well defined. As $\lim_{n \rightarrow \infty} \sigma_n = 0$ and $0 < \liminf_{n \rightarrow \infty} r_n \leq \limsup_{n \rightarrow \infty} r_n < 2\zeta$, we may assume, without loss of generality, that $\{r_n\} \subset [a, \hat{a}] \subset (0, 2\zeta)$ and $\sigma_n \|V\| \leq 1$ for all $n \geq 1$. Utilizing the arguments similar to those in the proof of Theorem 19, we get

$$\|I - \sigma_n V\| \leq 1 - \sigma_n \bar{\gamma}. \quad (137)$$

Put

$$\begin{aligned} \Lambda_n^i &= J_{R_i, \lambda_{i,n}} (I - \lambda_{i,n} B_i) J_{R_{i-1}, \lambda_{i-1,n}} \\ &\quad \times (I - \lambda_{i-1,n} B_{i-1}) \cdots J_{R_1, \lambda_{1,n}} (I - \lambda_{1,n} B_1) \end{aligned} \quad (138)$$

for all $i \in \{1, 2, \dots, N\}$, and $\Lambda_n^0 = I$, where I is the identity mapping on H . Then we have $v_n = \Lambda_n^N u_n$.

Consider the following mapping G_n on H defined by

$$\begin{aligned} G_n x &= (I - \sigma_n V) T_n G \Lambda_n^{N, \phi} (I - r_n A) x \\ &\quad + \sigma_n [T_n x - \alpha_n (\mu F(T_n x) - \gamma Q x)], \quad \forall x \in H, \quad n \geq 1. \end{aligned} \quad (139)$$

Since A_k is ζ_k -inverse-strongly monotone with $0 \leq \nu_k \leq 2\zeta_k$ for $k = 1, 2$, repeating the same arguments as in the proof of Theorem 19 we deduce that G is a nonexpansive mapping on H . Utilizing the arguments similar to those in the proof of Theorem 19, we deduce that, for any $x, y \in H$,

$$\|G_n x - G_n y\|^2 \leq (1 - \sigma_n \alpha_n (\tau - \gamma l)) \|x - y\|. \quad (140)$$

Since $0 < 1 - \sigma_n \alpha_n (\tau - \gamma l) < 1$, $G_n : H \rightarrow H$ is a contraction. Therefore, by the Banach contraction principle, G_n has a unique fixed point $x_n \in H$, which uniquely solves the fixed point equation

$$\begin{aligned} x_n &= (I - \sigma_n V) W_n G v_n \\ &\quad + \sigma_n [W_n x_n - \alpha_n (\mu F(W_n x_n) - \gamma Q x_n)]. \end{aligned} \quad (141)$$

This shows that the sequence $\{x_n\}$ is defined well.

It is easy to see the VIP (43) has only one solution in Ω . Below we use $q \in \Omega$ to denote the unique solution of the VIP (43).

Now, let us show that $\{x_n\}$ is bounded. In fact, take $p \in \Omega$ arbitrarily. Repeating the same arguments as in the proof of Theorem 19 we obtain

$$\begin{aligned} \|u_n - p\|^2 &\leq \|x_n - p\|^2 + r_n (r_n - 2\zeta) \|A x_n - A p\|^2, \quad (142) \\ \|v_n - p\|^2 &\leq \|\Lambda_n^i u_n - p\|^2 \\ &\leq \|u_n - p\|^2 + \lambda_{i,n} (\lambda_{i,n} - 2\eta_i) \|B_i \Lambda_n^{i-1} u_n - B_i p\|^2, \end{aligned} \quad (143)$$

$$\begin{aligned} &\|G v_n - p\|^2 \\ &\leq \|T_{\nu_2}^{\Theta_2} (I - \nu_2 A_2) v_n - T_{\nu_2}^{\Theta_2} (I - \nu_2 A_2) p\|^2 \\ &\quad + \nu_1 (\nu_1 - 2\zeta_1) \\ &\quad \times \|A_1 T_{\nu_2}^{\Theta_2} (I - \nu_2 A_2) v_n - A_1 T_{\nu_2}^{\Theta_2} (I - \nu_2 A_2) p\|^2 \\ &\leq \|v_n - p\|^2 + \nu_2 (\nu_2 - 2\zeta_2) \|A_2 v_n - A_2 p\|^2, \\ \|x_n - p\|^2 &\leq (1 - \sigma_n \bar{\gamma}) \|G v_n - p\|^2 + \sigma_n \|x_n - p\|^2 \\ &\quad + 2s_n \langle (I - V) p + \alpha_n (\gamma Q - \mu F) p, x_n - p \rangle \\ &\leq (1 - \sigma_n \bar{\gamma}) \|v_n - p\|^2 + \sigma_n \|x_n - p\|^2 \\ &\quad + 2s_n \langle (I - V) p + \alpha_n (\gamma Q - \mu F) p, x_n - p \rangle \\ &= (1 - \sigma_n (\bar{\gamma} - 1)) \|x_n - p\|^2 \\ &\quad + 2\sigma_n (\|(I - V) p\| + \|(\gamma Q - \mu F) p\|) \\ &\quad \times \|x_n - p\|. \end{aligned} \quad (144)$$

From (145) we conclude that

$$\|x_n - p\| \leq \frac{2}{\bar{\gamma} - 1} (\|(I - V) p\| + \|(\gamma Q - \mu F) p\|). \quad (146)$$

Hence $\{x_n\}$ is bounded. So, according to (142) and (143) we know that $\{u_n\}$, $\{v_n\}$, $\{G v_n\}$, $\{W_n G v_n\}$, $\{W_n x_n\}$, $\{Q x_n\}$, and $\{F W_n x_n\}$ are bounded.

Repeating the arguments similar to those of (68), (76), (78), (93), and (97) in the proof of Theorem 19 we obtain that $\|x_n - u_n\| \rightarrow 0$, $\|\Lambda_n^{i-1} u_n - \Lambda_n^i u_n\| \rightarrow 0$, $\|x_n - v_n\| \rightarrow 0$, $\|v_n - G v_n\| \rightarrow 0$ and $\|v_n - W_n v_n\| \rightarrow 0$ as $n \rightarrow \infty$. In addition, note that

$$\|v_n - W v_n\| \leq \|v_n - W_n v_n\| + \|W_n v_n - W v_n\|. \quad (147)$$

So, from $\|v_n - W_n v_n\| \rightarrow 0$ and [15, Remark 3.2] it follows that

$$\lim_{n \rightarrow \infty} \|v_n - W v_n\| = 0. \quad (148)$$

Further, we show that $\omega_w(x_n) \subset \Omega$. Indeed, since $\{x_n\}$ is bounded, there exists a subsequence $\{x_{n_i}\}$ of $\{x_n\}$ which converges weakly to some w . Note that $\lim_{n \rightarrow \infty} \|x_n - u_n\| = 0$. Hence $u_{n_i} \rightharpoonup w$. Since C is closed and convex, C is weakly closed. So, we have $w \in C$. On the other hand, it is easy to see that $u_{n_i} \rightharpoonup w$, $v_{n_i} \rightharpoonup w$, and $\Lambda_{n_i}^m u_{n_i} \rightharpoonup w$, where $m \in \{1, 2, \dots, N\}$. Repeating the same arguments as in the proof of Theorem 19, we obtain that $w \in \cap_{i=1}^N I(B_i, R_i) \cap \text{GMPEP}(\Theta, \varphi, A)$. Next let us show that $w \in \text{SGEP}(G) \cap \cap_{n=1}^\infty \text{Fix}(T_n)$. As a matter of fact, from $\|v_n - G v_n\| \rightarrow 0$, $\|v_n - W v_n\| \rightarrow 0$, $v_{n_i} \rightharpoonup w$ and Lemma 10, we deduce that $w \in \text{SGEP}(G)$ and $w \in \text{Fix}(W) = \cap_{n=1}^\infty \text{Fix}(T_n)$ (due to Lemma 12). Hence we get $w \in \text{SGEP}(G) \cap \cap_{n=1}^\infty \text{Fix}(T_n)$. Therefore, $w \in \cap_{n=1}^\infty \text{Fix}(T_n) \cap \text{GMPEP}(\Theta, \varphi, A) \cap \text{SGEP}(G) \cap \cap_{i=1}^N I(B_i, R_i) =: \Omega$. This shows that $\omega_w(x_n) \subset \Omega$.

Finally, we prove that $\{x_n\}$ converges strongly to $q \in \Omega$, which is the unique solution in Ω to the VIP (136). In fact, we note that, for $w \in \Omega$ with $x_{n_i} \rightarrow w$,

$$\begin{aligned} x_n - w &= (I - \sigma_n V) (W_n G v_n - w) \\ &\quad + \sigma_n [\alpha_n \gamma (Q x_n - Q w) \\ &\quad + (I - \alpha_n \mu F) W_n x_n - (I - \alpha_n \mu F) W_n w] \\ &\quad + \sigma_n [(I - V) w + \alpha_n (\gamma Q - \mu F) w]. \end{aligned} \quad (149)$$

Utilizing the arguments similar to those in the proof of Theorem 19, we obtain that

$$\begin{aligned} \|x_n - w\|^2 &\leq (1 - \sigma_n (\bar{\gamma} - 1)) \|x_n - w\|^2 \\ &\quad + \sigma_n \langle (I - V) w + \alpha_n (\gamma Q - \mu F) w, x_n - w \rangle, \end{aligned} \quad (150)$$

which hence leads to

$$\|x_n - w\|^2 \leq \frac{\langle (I - V) w + \alpha_n (\gamma Q - \mu F) w, x_n - w \rangle}{\bar{\gamma} - 1}. \quad (151)$$

In particular, we have

$$\|x_{n_i} - w\|^2 \leq \frac{\langle (I - V) w + \alpha_{n_i} (\gamma Q - \mu F) w, x_{n_i} - w \rangle}{\bar{\gamma} - 1}. \quad (152)$$

Since $x_{n_i} \rightarrow w$ and $\lim_{n \rightarrow \infty} \alpha_n = 0$, it follows from (152) that $x_{n_i} \rightarrow w$ as $i \rightarrow \infty$.

Now we show that w solves the VIP (136). As a matter of fact, from (142) and (145) we obtain that, for any $p \in \Omega$,

$$\begin{aligned} \|x_n - p\|^2 &\leq (1 - \sigma_n \bar{\gamma}) \|u_n - p\|^2 + \sigma_n \|x_n - p\|^2 \\ &\quad + 2\sigma_n \langle (I - V) p + \alpha_n (\gamma Q - \mu F) p, x_n - p \rangle \\ &\leq (1 - \sigma_n \bar{\gamma}) \|x_n - p\|^2 + \sigma_n \|x_n - p\|^2 \\ &\quad + 2\sigma_n \langle (I - V) p + \alpha_n (\gamma Q - \mu F) p, x_n - p \rangle \\ &= (1 - \sigma_n (\bar{\gamma} - 1)) \|x_n - p\|^2 \\ &\quad + 2\sigma_n \langle (I - V) p + \alpha_n (\gamma Q - \mu F) p, x_n - p \rangle \\ &\leq \|x_n - p\|^2 \\ &\quad + 2\sigma_n \langle (I - V) p + \alpha_n (\gamma Q - \mu F) p, x_n - p \rangle, \end{aligned} \quad (153)$$

which immediately implies that

$$\langle (V - I) p + \alpha_n (\mu F - \gamma Q) p, x_n - p \rangle \leq 0. \quad (154)$$

Since $\alpha_n \rightarrow 0$ and $x_{n_i} \rightarrow w$, we get

$$\langle (V - I) p, w - p \rangle \leq 0, \quad \forall p \in \Omega. \quad (155)$$

By Minty's lemma, w is a solution in Ω to the VIP (136). In terms of the uniqueness of solutions of VIP (136), we deduce that $w = q$ and $x_{n_i} \rightarrow q$ as $n \rightarrow \infty$. So, every weak convergence subsequence of $\{x_n\}$ converges strongly to the unique solution q of VIP (136). Therefore, $\{x_n\}$ converges strongly to the unique solution q of VIP (136). This completes the proof. $\square$

Corollary 24. Let C be a nonempty closed convex subset of a real Hilbert space H . Let $\Theta, \Theta_1, \Theta_2$ be three bifunctions from $C \times C$ to $\mathbf{R}$ satisfying (H1)–(H4) and let $\varphi : C \rightarrow \mathbf{R}$ be a lower semicontinuous and convex functional. Let $R_i : C \rightarrow 2^H$ be a maximal monotone mapping and let $A, A_k : H \rightarrow H$ and $B_i : C \rightarrow H$ be ζ -inverse strongly monotone, ζ_k -inverse strongly monotone, and η_i -inverse strongly monotone, respectively, for $k = 1, 2$ and $i = 1, 2$. Let $\{T_n\}_{n=1}^\infty$ be a sequence of nonexpansive mappings on H and let $\{\lambda_n\}$ be a sequence in $(0, b]$ for some $b \in (0, 1)$. Let V be a $\bar{\gamma}$ -strongly positive bounded linear operator with $\bar{\gamma} > 1$. Let $F : H \rightarrow H$ be a κ -Lipschitzian and η -strongly monotone operator with positive constants $\kappa, \eta > 0$. Let $Q : H \rightarrow H$ be an l -Lipschitzian mapping with constant $l \geq 0$. Let $0 < \mu < (2\eta/\kappa^2)$ and $0 \leq \gamma l < \tau$, where $\tau = 1 - \sqrt{1 - \mu(2\eta - \mu\kappa^2)}$. Assume that $\Omega := \cap_{n=1}^\infty \text{Fix}(T_n) \cap \text{GMEP}(\Theta, \varphi, A) \cap \text{SGEP}(G) \cap I(B_1, R_1) \cap I(B_2, R_2) \neq \emptyset$ where G is defined as in Proposition CY. Let $\{r_n\}$ be a sequence in $(0, 2\zeta]$ and $\{\alpha_n\}$ and $\{\sigma_n\}$ sequences in $(0, 1]$. Let $\{x_n\}$ be the sequence generated by

$$\begin{aligned} u_n &= S_{r_n}^{(\Theta, \varphi)} (I - r_n A) x_n, \\ v_n &= J_{R_2, \lambda_{2,n}} (I - \lambda_{2,n} B_2) J_{R_1, \lambda_{1,n}} (I - \lambda_{1,n} B_1) u_n, \\ x_n &= (I - \sigma_n V) W_n G v_n \\ &\quad + \sigma_n [W_n x_n - \alpha_n (\mu F (W_n x_n) - \gamma Q x_n)], \quad \forall n \geq 1, \end{aligned} \quad (156)$$

where W_n is the W -mapping defined by (9). Suppose that the following conditions hold:

- (i) $K : H \rightarrow \mathbf{R}$ is strongly convex with constant $\sigma > 0$ and its derivative K' is Lipschitz continuous with constant $\nu > 0$ such that the function $x \mapsto \langle y - x, K'(x) \rangle$ is weakly upper semicontinuous for each $y \in H$;
- (ii) for each $x \in H$, there exist a bounded subset $D_x \subset C$ and $z_x \in C$ such that, for any $y \notin D_x$,

$$\Theta(y, z_x) + \varphi(z_x) - \varphi(y) + \frac{1}{r} \langle K'(y) - K'(x), z_x - y \rangle < 0; \quad (157)$$

- (iii) $\lim_{n \rightarrow \infty} \alpha_n = 0$ and $\lim_{n \rightarrow \infty} \sigma_n = 0$;
- (iv) $\nu_k \in (0, 2\zeta_k)$, $k = 1, 2$ and $\{\lambda_{i,n}\} \subset [a_i, b_i] \subset (0, 2\eta_i)$, $i = 1, 2$;
- (v) $0 < \liminf_{n \rightarrow \infty} r_n \leq \limsup_{n \rightarrow \infty} r_n < 2\zeta$.

Assume that $S_r^{(\Theta, \varphi)}$ is firmly nonexpansive. Then $\{x_n\}$ converges strongly to a point $q \in \Omega$, which is a unique solution in Ω to the VIP:

$$\langle (I - V) q, p - q \rangle \leq 0, \quad \forall p \in \Omega. \quad (158)$$

Corollary 25. Let C be a nonempty closed convex subset of a real Hilbert space H .
