We consider the perturbed nonlinear elliptic system

$$
-\varepsilon^2 \Delta u + V(x)u = K(x)|u|^{2^*-2}u + H_u(u,v), x \in \mathbb{R}^N,
$$

$$
-\varepsilon^2 \Delta v + V(x)v = K(x)|v|^{2^*-2}v + H_v(u,v), x \in \mathbb{R}^N,
$$

where $2^* = \frac{2N}{N-2}$ is the Sobolev critical exponent. Under proper conditions on $V$, $H$, and $K$, the existence result and multiplicity of the system are obtained by using variational method provided $\varepsilon$ is small enough.

1. Introduction and Main Results

In this paper, we are concerned with the existence and multiplicity of nontrivial solutions for the following class of elliptic system:

$$
-\varepsilon^2 \Delta u + V(x)u = K(x)|u|^{2^*-2}u + H_u(u,v), x \in \mathbb{R}^N,
$$

$$
-\varepsilon^2 \Delta v + V(x)v = K(x)|v|^{2^*-2}v + H_v(u,v), x \in \mathbb{R}^N,
$$

$$
u(x), v(x) \to 0 \quad \text{as} \quad |x| \to \infty,
$$

(1)

where $N \geq 3$, $2^* = \frac{2N}{N-2}$ denotes the Sobolev critical exponent, $V(x)$ is a nonnegative potential, $K(x)$ is a bounded positive function, and $H_u(u,v)$ and $H_v(u,v)$ are superlinear but subcritical functions.

In the recent years, many papers have considered the scalar equation

$$
-\varepsilon^2 \Delta u + V(x)u = g(x,u), x \in \mathbb{R}^N,
$$

(2)

which arises in different models; for example, they are related to the existence of standing waves of the nonlinear Schrödinger equation

$$
i\hbar \frac{\partial \varphi}{\partial t} = -\hbar^2 \Delta \varphi + (V(x) + E) \varphi - f(\varphi) \quad \forall x \in \mathbb{R}^N.
$$

(3)

A standing wave of (3) is a solution of the form $\varphi(x,t) = u(x) \exp(-iEt/\hbar)$. We would like to cite the works of Floer and Weinstein [1], Del Pino and Felmer [2, 3], Oh [4], Wang [5], Cingolani and Nolasco [6], Cingolani and Lazzo [7], Ambrosetti et al. [8, 9], Alves and Souto [10, 11], Ding and Lin [12], Liang and Zhang [13], and references therein.

Motivated by some results found in [12], a natural question arises whether existence of nontrivial solutions continues to hold for the system (1). We study the existence and multiplicity of the nontrivial solutions for the system (1). Our work completes the results obtained in [12], in the sense that we are working with elliptic systems. To prove our main result, we follow some ideas explored in [12] and also use arguments developed in [13, 18].

In this work, we assume the following assumptions:

$$
(V_0) \quad V \in C(\mathbb{R}^N, \mathbb{R}), V(0) = \inf_{x \in \mathbb{R}^N} V(x) = 0, \text{ and there is a constant } b > 0 \text{ such that the set } \{x \in \mathbb{R}^N : V(x) < b\} \text{ has finite Lebesgue measure;}
$$

$$
(K_0) \quad K(x) \in C(\mathbb{R}^N, \mathbb{R}^+), 0 < \inf K \leq \sup K < \infty;
$$

$$
(H_1) \quad H \in C^1(\mathbb{R}^+ \times \mathbb{R}^+), H(s,t), H(s,t) = o(1) \text{ as } (s,t) \to (0,0);
$$
Abstract and Applied Analysis

(\text{H}_2) \text{ there exist } 2 < q < 2^* \text{ and } c > 0 \text{ such that }
\begin{equation}
|H_s(s,t)|, |H_t(s,t)| \leq c \left(1 + |s|^{q-1} + |t|^{q-1}\right);
\end{equation}

(\text{H}_3) \text{ there exist } a_0 > 0, \alpha, \beta > 2, \theta \in (2, 2^*) \text{ such that }
\begin{equation}
H(s, t) \geq a_0 \left(|s|^{\alpha} + |t|^{\beta}\right),
\end{equation}

\begin{equation}
0 < \theta H(s, t) \leq sH_s(s, t) + tH_t(s, t) \quad \forall s > 0, \quad t > 0.
\end{equation}

Our main results are as follows.

**Theorem 1.** Assume that \((V_0)(K_0)\) and \((H_1)-(H_3)\) hold. Then, for any \(\sigma > 0\), there exists \(\varepsilon_0 > 0\) such that \(\varepsilon \leq \varepsilon_0\); the perturbed elliptic system \((1)\) has one least energy solution \((u_\varepsilon, v_\varepsilon)\) which satisfies
\begin{equation}
\frac{\theta - 2}{2\theta} \int_{\mathbb{R}^N} \varepsilon^2 \left(\left|\nabla u_\varepsilon\right|^2 + \left|\nabla v_\varepsilon\right|^2\right) + V(x) \left(|u_\varepsilon|^2 + |v_\varepsilon|^2\right) \leq \sigma\varepsilon^N.
\end{equation}

**Theorem 2.** Let \((V_0)(K_0)\) and \((H_1)-(H_3)\) be satisfied. Moreover, assume that \(H(u, v)\) is even in \((u, v)\); then, for any \(m \in \mathbb{N}\) and \(\sigma > 0\), there is \(\varepsilon_m > 0\) such that \(\varepsilon \leq \varepsilon_m\); the system \((1)\) has at least \(m\) pairs of solutions \((u_\varepsilon, v_\varepsilon)\) which satisfy the estimate \((6)\).

The main difficulty in this paper is the lack of compactness of the energy functional associated to the system \((1)\). To overcome this difficulty, we carefully make estimates and prove that there is a Palais-Smale sequence that has a strongly convergent subsequence. The main results in the present paper can be seen as a complement of studies developed in [12].

This paper is organized as follows. In Section 2, we describe some notations and preliminaries. Section 3 is devoted to the behavior of (PS) sequence and the mountain pass level of \(J_\lambda\). Finally, in Section 4, we give the proofs of Theorem 1 and Theorem 2.

**2. Preliminaries**

Let \(\lambda = \varepsilon^{-2}\). The system \((1)\) reads then as
\begin{equation}
-\Delta u + \lambda V(x)u = \lambda K(x)\left|u\right|^{2^*-2}u + \lambda H_u(u, v), \quad x \in \mathbb{R}^N,
\end{equation}

\begin{equation}
-\Delta v + \lambda V(x)v = \lambda K(x)\left|v\right|^{2^*-2}v + \lambda H_v(u, v), \quad x \in \mathbb{R}^N,
\end{equation}

\begin{equation}
u(x), v(x) \to 0 \quad \text{as} \quad |x| \to \infty.
\end{equation}

We will prove the following result.

**Theorem 3.** Assume that \((V_0)(K_0)\) and \((H_1)-(H_3)\) hold. Then, for \(\sigma > 0\), there exists \(\Lambda_{\sigma} > 0\) such that if \(\lambda \geq \Lambda_\sigma\), the elliptic system \((7)\) has one positive solution of least energy \((u_\lambda, v_\lambda)\) which satisfies
\begin{equation}
\frac{\theta - 2}{2\theta} \int_{\mathbb{R}^N} \left(\left|\nabla u_\lambda\right|^2 + \left|\nabla v_\lambda\right|^2 + \lambda V(x) \left(|u_\lambda|^2 + |v_\lambda|^2\right)\right) \leq \sigma\lambda^{1-N/2}.
\end{equation}

**3. Technical Lemmas**

**Lemma 5.** If \(\{u_n, v_n\}\) is a (PS) sequence for \(J_\lambda\), then \(c \geq 0\) and \(\{(u_n, v_n)\}\) is bounded in \(E\).

**Proof.** From \((K_0)\) and \((H_3)\), we get
\begin{equation}
\begin{aligned}
J_\lambda(u_n, v_n) - \frac{1}{\theta} J_\lambda\prime(u_n, v_n)(u_n, v_n)
&= \left(\frac{1}{2} - \frac{1}{\theta}\right) \left\|u_n, v_n\right\|_E^2 \\
&\quad + \left(\frac{1}{\theta} - \frac{1}{2}\right)\lambda \int_{\mathbb{R}^N} K(x) \left(|u_n|^2 + |v_n|^2\right) \\
&\quad + \frac{\lambda}{\theta} \int_{\mathbb{R}^N} (u_n H_u(u_n, v_n) + v_n H_v(u_n, v_n) - \theta H(u_n, v_n)) \\
&\geq \left(\frac{1}{2} - \frac{1}{\theta}\right) \left\|u_n, v_n\right\|_E^2 \geq 0.
\end{aligned}
\end{equation}

**Theorem 4.** Assume that \((V_0)(K_0)\) and \((H_1)-(H_3)\) are satisfied. Moreover, assume that \(H(u, v)\) is even in \((u, v)\); then, for any \(m \in \mathbb{N}\) and \(\sigma > 0\), there exists \(\Lambda_{\sigma m} > 0\) such that if \(\lambda \geq \Lambda_{\sigma m}\), the system \((7)\) has at least \(m\) pairs of solutions \((u_\lambda, v_\lambda)\) satisfying the estimate \((8)\).

For the convenience, we quote the necessary notations. The space
\begin{equation}
E_\lambda := \left\{u \in H^1\left(\mathbb{R}^N\right) : \int_{\mathbb{R}^N} \lambda V(x) u^2 < \infty, \lambda > 0\right\}
\end{equation}
is a Hilbert space equipped with the inner product
\begin{equation}
(u, v)_\lambda := \int_{\mathbb{R}^N} (\nabla u \nabla v + \lambda V(x) uv)
\end{equation}
and the associated norm \(\|u\|_{E_\lambda} = \int_{\mathbb{R}^N} \|u\|^2 + \|v\|^2\). From the assumption \((V_\lambda)\), we conclude that \(E_\lambda\) embeds continuously in \(H^1(\mathbb{R}^N)\). Moreover, observe that the norm \(\|\cdot\|\) is equivalent to the one \(\|\cdot\|_{E_\lambda}\) for each \(\lambda > 0\). It is obvious that, for each \(\rho \in [2, 2^*]\), there exists \(c_\rho > 0\) such that if \(\lambda \geq 1\)
\begin{equation}
\|u\|_{L^\rho} \leq c_\rho \|u\|_{E_\lambda} \quad \forall u \in E_\lambda.
\end{equation}
Set \(E = E_\lambda \times E_\lambda\) and \(\|u, v\|_{E}^2 = \|u\|_{E_\lambda}^2 + \|v\|_{E_\lambda}^2\) for \((u, v) \in E\). The energy functional associated with \((7)\) is defined by
\begin{equation}
J_\lambda(u, v) = \frac{1}{2} \int_{\mathbb{R}^N} \left(\left|\nabla u^2 + \lambda V(x) |u|^2 + \left|\nabla v\right|^2 + \lambda V(x) |v|^2\right) \\
- \lambda \int_{\mathbb{R}^N} K(x) \left(|u|^2 + \left|\nabla v\right|^2\right) - \lambda \int H(u, v) \\
= \frac{1}{2} \left\|u, v\right\|_{E}^2 - \lambda \int_{\mathbb{R}^N} G(x, u, v) \quad \text{for} \quad (u, v) \in E,
\end{equation}
where \(G(x, u, v) = (K(x)/2^*)(|u|^2 + \left|\nabla v\right|^2) + H(u, v)\).

Under the assumptions of Theorem 3, standard arguments [18] show that \(J_\lambda \in C^1(E, \mathbb{R})\) and the critical points of \(J_\lambda\) are weak solutions of the elliptic system \((7)\).
Abstract and Applied Analysis

Together with \( J_\lambda(u_n, v_n) \to c \) and \( J'_{\lambda}(u_n, v_n) \to 0 \), we have that \( \{(u_n, v_n)\} \) is bounded in \( E \) and \( c \geq 0 \).

**Lemma 6.** Let \( d \in [2, 2^*) \). There exists a subsequence \( \{(u_{n_k}, v_{n_k})\} \) such that, for any \( \varepsilon > 0 \), there exists \( r_\varepsilon > 0 \) with

\[
\lim_{n_k \to \infty} \int_{B_r} \left| u_{n_k} \right|^d + \left| v_{n_k} \right|^d \leq \varepsilon \quad \forall r \geq r_\varepsilon,
\]

where \( B_r := \{ x \in \mathbb{R}^N : |x| \leq r \} \).

**Proof.** This proof is similar to the one of Lemma 3.2 [12], so we omit it.

Let \( \eta \in C^\infty c((\mathbb{R}^*)) \) satisfying \( 0 \leq \eta(t) \leq 1, t \geq 0, \eta(t) = 1 \) if \( t \leq 1 \) and \( \eta(t) = 0 \) if \( t \geq 2 \). Define \( \bar{u}_j(x) = \eta(2|x|/j)u(x), \bar{v}_j(x) = \eta(2|x|/j)v(x) \); then \( u_j \to u, v_j \to v \) in \( E_\Lambda \).

**Lemma 7.** One has

\[
\lim_{j \to \infty} \left| \int_{\mathbb{R}^N} \left( H_j(u_{n_j}, v_{n_j}) - H_j(u_{n_j} - \bar{u}_j, v_{n_j} - \bar{v}_j) \right) \phi \right| = 0,
\]

\[
\lim_{j \to \infty} \left| \int_{\mathbb{R}^N} \left( H_j(u_{n_j}, v_{n_j}) - H_j(u_{n_j} - \bar{u}_j, v_{n_j} - \bar{v}_j) \right) \psi \right| = 0,
\]

uniformly in \( (\phi, \psi) \in E \) with \( \| (\phi, \psi) \|_E \leq 1 \).

**Proof.** The proof of Lemma 7 is similar to the one of Lemma 3.3 [12], so we omit it.

**Lemma 8.** One has along a subsequence

\[
J_\lambda(u_n - \bar{u}_n, v_n - \bar{v}_n) \to c - J_\lambda(u, v),
\]

\[
J'_{\lambda}(u_n - \bar{u}_n, v_n - \bar{v}_n) \to 0 \quad \text{in } E^*.
\]

**Proof.** Since \( u_j \to u, v_j \to v \) in \( E_\Lambda \) and \( (u_j, v_j) \to (u, v) \) in \( E \), we have

\[
J_\lambda(u_n - \bar{u}_n, v_n - \bar{v}_n) = J_\lambda(u_n, v_n) - J_\lambda(\bar{u}_n, \bar{v}_n)
+ \frac{\lambda}{2}\int_{\mathbb{R}^N} K(x) \left( |u_n|^{2^*} - |u_n - \bar{u}_n|^{2^*} - |\bar{u}_n|^{2^*} \right)
+ \frac{\lambda}{2^*}\int_{\mathbb{R}^N} K(x) \left( |v_n|^{2^*} - |v_n - \bar{v}_n|^{2^*} - |\bar{v}_n|^{2^*} \right)
+ \lambda\int_{\mathbb{R}^N} H(u_n, v_n) - H(u_n - \bar{u}_n, v_n - \bar{v}_n) - H(\bar{u}_n, \bar{v}_n) + o(1).
\]

In connection with the proof of Brezis-Lieb lemma, it is easy to check that

\[
\lim_{n \to \infty} \int_{\mathbb{R}^N} K(x) \left( |u_n|^{2^*} - |u_n - \bar{u}_n|^{2^*} - |\bar{u}_n|^{2^*} \right) = 0,
\]

\[
\lim_{n \to \infty} \int_{\mathbb{R}^N} K(x) \left( |v_n|^{2^*} - |v_n - \bar{v}_n|^{2^*} - |\bar{v}_n|^{2^*} \right) = 0,
\]

\[
\lim_{n \to \infty} \int_{\mathbb{R}^N} H(u_n, v_n) - H(u_n - \bar{u}_n, v_n - \bar{v}_n) - H(\bar{u}_n, \bar{v}_n) = 0.
\]

(18)

Note that \( J_\lambda(u_n, v_n) \to c \) and \( J_\lambda(\bar{u}_n, \bar{v}_n) \to J_\lambda(u, v) \); we get

\[
J_\lambda(u_n - \bar{u}_n, v_n - \bar{v}_n) \to c - J_\lambda(u, v).
\]

(19)

For any \( (\phi, \psi) \in E \), we have

\[
J'_\lambda(u_n - \bar{u}_n, v_n - \bar{v}_n)(\phi, \psi)
= J'_\lambda(u_n, v_n)(\phi, \psi) - J'_\lambda(\bar{u}_n, \bar{v}_n)(\phi, \psi)
+ \lambda\int_{\mathbb{R}^N} K(x) \left( |u_n|^{2^*} - |u_n - \bar{u}_n|^{2^*} - (u_n - \bar{u}_n) \right) \phi
+ \lambda\int_{\mathbb{R}^N} K(x) \left( |v_n|^{2^*} - |v_n - \bar{v}_n|^{2^*} - (v_n - \bar{v}_n) \right) \psi
+ \lambda\int_{\mathbb{R}^N} (H_u(u_n, v_n) - H_u(u_n - \bar{u}_n, v_n - \bar{v}_n) - H_u(\bar{u}_n, \bar{v}_n)) \phi
+ \lambda\int_{\mathbb{R}^N} (H_v(u_n, v_n) - H_v(u_n - \bar{u}_n, v_n - \bar{v}_n) - H_v(\bar{u}_n, \bar{v}_n)) \psi.
\]

(20)

It is standard to check that

\[
\lim_{n \to \infty} \int_{\mathbb{R}^N} K(x) \left( |u_n|^{2^*} - |u_n - \bar{u}_n|^{2^*} - (u_n - \bar{u}_n) \right) \phi = 0,
\]

\[
\lim_{n \to \infty} \int_{\mathbb{R}^N} K(x) \left( |v_n|^{2^*} - |v_n - \bar{v}_n|^{2^*} - (v_n - \bar{v}_n) \right) \psi = 0,
\]

uniformly in \( \| (\phi, \psi) \|_E \leq 1 \). Together with Lemma 7, we complete the proof of Lemma 8. □
Let \( u_n' = u_n - \bar{u}_n, v_n' = v_n - \bar{v}_n; \) then \((u_n, v_n) \to (u, v) \) in \( E \) if and only if \((u_n', v_n') \to (0, 0) \) in \( E \). Observe that
\[
J_\lambda (u_n', v_n') - \frac{1}{2} J_\lambda (u_n', v_n') (u_n', v_n') = \left( 1 - \frac{1}{2^*} \right) \lambda \int_{\mathbb{R}^N} K(x) \left( |u_n'|^{2^*} + |v_n'|^{2^*} \right)
\]
\[
+ \lambda \int_{\mathbb{R}^N} \left( \frac{1}{2} (u_n' H_u (u_n', v_n') + v_n' H_v (u_n', v_n')) - H (u_n', v_n') \right)
\]
\[
\geq \frac{\lambda}{N} k_{\min} \int_{\mathbb{R}^N} \left( |u_n'|^{2^*} + |v_n'|^{2^*} \right),
\]
where \( k_{\min} = \inf_{x \in \mathbb{R}^N} K(x) > 0 \). By Lemma 8, we get
\[
\| u_n' \|_{L_2^{2^*}}^{2^*} + \| v_n' \|_{L_2^{2^*}}^{2^*} \leq \frac{N (c - J_\lambda (u, v))}{\lambda k_{\min}} + o (1).
\]

Meanwhile, by \((H_2)\) and \((H_3)\), there exists \( C_b > 0 \) such that
\[
\int_{\mathbb{R}^N} K(x) \left( |u_n'|^{2^*} + |v_n'|^{2^*} \right) + u H_u (u_n', v_n') + v H_v (u_n', v_n') \leq b \left( \| u_n' \|_{L_2^{2^*}}^{2^*} + \| v_n' \|_{L_2^{2^*}}^{2^*} \right) + C_b \left( \| u_n' \|_{L_2^{2^*}}^{2^*} + \| v_n' \|_{L_2^{2^*}}^{2^*} \right)
\]
\[
\leq b \left( \| u_n' \|_{L_2^{2^*}}^{2^*} + \| v_n' \|_{L_2^{2^*}}^{2^*} \right) + C_b \left( \| u_n' \|_{L_2^{2^*}}^{2^*} + \| v_n' \|_{L_2^{2^*}}^{2^*} \right).
\]

**Lemma 9.** There is a constant \( \alpha_0 > 0 \) (independent of \( \lambda \)) such that, for any \((PS)_\epsilon\) sequence \((u_n, v_n) \subset E \) for \( J_\lambda \) with \((u_n, v_n) \to (u, v) \), either \((u_n, v_n) \to (u, v) \) or \( c - J_\lambda (u, v) \geq \alpha_0 \lambda^{1-1/N^2} \).

**Proof.** On the contrary, if \((u_n, v_n) \to (u, v) \), we have
\[
\liminf_{n \to \infty} \| (u_n', v_n') \|_E > 0, \quad c - J_\lambda (u, v) > 0.
\]

Let \( V_b(x) = \max \{ V(x), b \} \), where \( b \) is the positive constant in the assumption \((V_b)\). In connection with the set \( b \) which has finite measure and \( u_n', \ v_n' \to 0 \) in \( L_2^{2^*} (\mathbb{R}^N) \), we have
\[
\int_{\mathbb{R}^N} V_b(x) \left( |u_n'|^{2^*} + |v_n'|^{2^*} \right) = \int_{\mathbb{R}^N} V_b(x) \left( |u_n'|^{2^*} + |v_n'|^{2^*} \right) + o (1).
\]

Therefore, we obtain
\[
S \left( \| u_n' \|_{L_2^{2^*}}^{2^*} + \| v_n' \|_{L_2^{2^*}}^{2^*} \right)
\]
\[
\leq \int_{\mathbb{R}^N} \left( \| u_n' \|_{L_2^{2^*}}^{2^*} + \| v_n' \|_{L_2^{2^*}}^{2^*} + \lambda V(x) \left( |u_n'|^{2^*} + |v_n'|^{2^*} \right) \right)
\]
\[
- \int_{\mathbb{R}^N} \lambda V(x) \left( |u_n'|^{2^*} + |v_n'|^{2^*} \right)
\]
\[
\leq \lambda \int_{\mathbb{R}^N} K(x) \left( |u_n'|^{2^*} + |v_n'|^{2^*} \right)
\]
\[
+ u_n' H_u (u_n', v_n') + v_n' H_v (u_n', v_n') - \int_{\mathbb{R}^N} \lambda V_b (x) \left( |u_n'|^{2^*} + |v_n'|^{2^*} \right) + o (1)
\]
\[
\leq \lambda C_b \left( \| u_n' \|_{L_2^{2^*}}^{2^*} + \| v_n' \|_{L_2^{2^*}}^{2^*} \right) + o (1),
\]
where \( S \) is the best Sobolev constant which satisfies
\[
S \| u \|_{L_2^{2^*}}^{2^*} \leq \int_{\mathbb{R}^N} |\nabla u|^2 \quad \forall u \in H^1 (\mathbb{R}^N).
\]

By \((23)\), we get
\[
S \leq \lambda C_b \left( \| u_n' \|_{L_2^{2^*}}^{2^*} + \| v_n' \|_{L_2^{2^*}}^{2^*} \right)^{2/2^*} + o (1)
\]
\[
\leq \lambda C_b \left( \frac{N (c - J_\lambda (u, v))}{\lambda k_{\min}} \right)^{2/N} + o (1)
\]
\[
= \lambda^{1-2/2^*} C_b \left( \frac{N}{k_{\min}} \right)^{2/N} (c - J_\lambda (u, v))^{2/N} + o (1).
\]

Therefore, \( \alpha_0 \lambda^{1-2/N^2} \leq c - J_\lambda (u, v) + o(1) \), where \( \alpha_0 = S^{N/2} C_b^{-N} \lambda^{-1} k_{\min} \). The proof is completed.

**Lemma 10.** There is a constant \( \alpha_0 > 0 \) (independent of \( \lambda \)) such that if a sequence \((u_n, v_n) \subset E \) satisfies
\[
J_\lambda (u_n, v_n) \to c < \alpha_0 \lambda^{1-2/N^2},
\]
then \((u_n, v_n) \) is relatively compact in \( E \).

**Proof.** Lemma 9 implies that \( J_\lambda \) satisfies the following local \((PS)_\epsilon\) condition. The proof is completed.

Next, we consider \( \lambda \geq 1 \) and see that \( J_\lambda \) has the mountain pass structure.

**Lemma 11.** Assume that \((V_0), (K_0), \) and \((H_1)-(H_3)\) hold. There exist \( \alpha_1, \rho_0 > 0 \) such that
\[
J_\lambda (u, v) > 0, \quad 0 < \| (u, v) \|_E < \rho_0;
\]
\[
J_\lambda (u, v) > \alpha_1, \quad \text{if} \quad \| (u, v) \|_E = \rho_0.
\]

**Proof.** Observe that \( \| u \|_{L_2^{2^*}}^{2^*} + \| v \|_{L_2^{2^*}}^{2^*} \leq C_b \| (u, v) \|_{E}^{2^*} \). For \( \delta \leq (4\lambda C_1)^{-1} \), there is a constant \( C_\delta \) such that
\[
J_\lambda (u, v) \geq \frac{1}{4} \| (u, v) \|_{E}^{2^*} - \lambda C_b \left( \| u \|_{L_2^{2^*}}^{2^*} + \| v \|_{L_2^{2^*}}^{2^*} \right),
\]
which implies that the required conclusions hold.

**Lemma 12.** Under the assumptions of Theorem 3, for any finite dimensional subspace \( F \subset E \), we get
\[
J_\lambda (u, v) \to -\infty \quad \text{as} \quad (u, v) \in F, \quad \| (u, v) \|_E \to \infty.
\]

**Proof.** By \((K_0)\) and \((H_3)\), we get
\[
J_\lambda (u, v) \leq \frac{1}{2} \| (u, v) \|_{E}^{2^*} - \lambda \alpha_0 \left( \| u \|_{E}^{2^*} + \| v \|_{E}^{2^*} \right) \quad \forall (u, v) \in E.
\]

Since all norms in a finite dimensional space are equivalent and \( \alpha, \beta > 2 \), we easily obtain the desired conclusion.
Define the functional
\[
\Phi_\lambda(u, v) = \frac{1}{2} \int_{\mathbb{R}^N} \left( |\nabla u|^2 + |\nabla v|^2 + \lambda V(x) \left( |u|^2 + |v|^2 \right) \right) - a_\lambda \int_{\mathbb{R}^N} (|u|^\alpha + |v|^\beta),
\]
\[
I_\lambda(u, v) = \frac{1}{2} \int_{\mathbb{R}^N} \left( |\nabla u|^2 + |\nabla v|^2 + V(\lambda^{-1/2} x) \left( |u|^2 + |v|^2 \right) \right) - a_0 \int_{\mathbb{R}^N} (|u|^\alpha + |v|^\beta).
\]

The standard arguments show that \( \Phi_\lambda \in C^3(E) \) and \( I_\lambda(u, v) \leq \Phi_\lambda(u, v), (u, v) \in E. \) Observe that
\[
\inf \left\{ \int_{\mathbb{R}^N} |\nabla \phi|^2 : \phi \in C_0^\infty(\mathbb{R}^N, \mathbb{R}), \| \phi \|_{L^2} = 1 \right\} = 0,
\]
\[
\inf \left\{ \int_{\mathbb{R}^N} |\nabla \psi|^2 : \psi \in C_0^\infty(\mathbb{R}^N, \mathbb{R}), \| \psi \|_{L^2} = 1 \right\} = 0.
\]

For any \( \delta > 0 \), there are \( \phi_\delta, \psi_\delta \in C_0^\infty(\mathbb{R}^N, \mathbb{R}) \) with \( \| \phi_\delta \|_{L^2} = \| \psi_\delta \|_{L^2} = 1 \) and \( \supp \phi_\delta, \psi_\delta \subset B_\delta(0) \) such that \( \| \nabla \phi_\delta \|_{L^2} \geq \delta \), \( \| \nabla \psi_\delta \|_{L^2} \geq \delta \). Set \( e_\lambda(x) = (\phi_\lambda(\sqrt{\lambda} x), \psi_\lambda(\sqrt{\lambda} x)) \); then, \( \supp e_\lambda \subset B_{\lambda^{-1/2} \delta}(0) \). For \( t \geq 0 \), we get
\[
\Phi_\lambda(t e_\lambda) = \lambda^{1/2} I_\lambda(t \phi_\lambda, t \psi_\lambda).
\]

It is obvious that
\[
\max_{t \geq 0} I_\lambda(t \phi_\delta, t \psi_\delta) \leq \frac{\alpha - 2}{2a(a a_0)^{2/(\alpha - 2)}} \left\{ \int_{\mathbb{R}^N} |\nabla \phi_\delta|^2 + V(\lambda^{-1/2} x)|\phi_\delta|^2 \right\}^{\alpha/(\alpha - 2)} + \frac{\beta - 2}{2\beta(\beta a_0)^{2/(\beta - 2)}} \times \left\{ \int_{\mathbb{R}^N} |\nabla \psi_\delta|^2 + V(\lambda^{-1/2} x)|\psi_\delta|^2 \right\}^{\beta/(\beta - 2)}.
\]

In connection with \( V(0) = 0 \) and \( \supp \phi_\delta, \supp \psi_\delta \subset B_\delta(0) \), there is \( \Lambda_\delta > 0 \) such that
\[
\max_{t \geq 0} I_\lambda(t \phi_\delta, t \psi_\delta) \leq \lambda^{1/2} \left( \frac{\alpha - 2}{2a(a a_0)^{2/(\alpha - 2)}}(2\delta)^{\alpha/(\alpha - 2)} + \frac{\beta - 2}{2\beta(\beta a_0)^{2/(\beta - 2)}}(2\delta)^{\beta/(\beta - 2)} \right),
\]
for all \( \lambda \geq \Lambda_\sigma \).

From (39), we easily obtain the following result.

**Lemma 13.** For any \( \sigma > 0 \), there exists \( \Lambda_\sigma > 0 \) such that, for each \( \lambda \geq \Lambda_\sigma \), there exists \( e_\lambda \in E \) with \( \| e_\lambda \|_E > \rho_\sigma \); we get
\[
J_\lambda(e_\lambda) \leq 0, \quad \max_{t \geq 0} J_\lambda(t e_\lambda) \leq \sigma \lambda^{1/2} \lambda^{-1/2},
\]
where \( \rho_\sigma \) is defined form Lemma II.

**Proof.** This proof is similar to Lemma 4.3 in [12]; it can be easily obtained.

For any \( m \in \mathbb{N} \), we choose \( m \) functions \( \phi_\delta^i \in C_0^\infty(\mathbb{R}^N, \mathbb{R}) \) such that \( \supp \phi_\delta^i \cap \supp \phi_\delta^j = 0 \), \( i \neq j \), \( \| \phi_\delta^i \|_L^2 = 1 \), and \( \| \nabla \phi_\delta^i \|_{L^2} < \delta \). Similarly, one can also get \( m \) functions \( \psi_\delta^i \in C_0^\infty(\mathbb{R}^N, \mathbb{R}) \) with \( \supp \phi_\delta^i \cap \supp \psi_\delta^j = 0 \), \( i \neq j \), \( \| \phi_\delta^i \|_L^2 = 1 \), and \( \| \nabla \psi_\delta^i \|_{L^2} < \delta \). Let \( r_\delta^m > 0 \) such that \( \supp(\phi_\delta^i, \psi_\delta^i) \subset B_{r_\delta^m}(0) \) for \( i = 1, 2, \ldots, m \). Set \( e_\lambda(x) = (\phi_\lambda(\sqrt{\lambda} x), \psi_\lambda(\sqrt{\lambda} x)) \); then, \( \supp e_\lambda \subset B_{\lambda^{-1/2} \delta}(0) \).

Define \( F_\delta^m = \text{span}(e_\lambda^1, e_\lambda^2, \ldots, e_\lambda^m) \). For each \( (u, v) = \sum_{i=1}^m k_i e_\lambda^i \) in \( F_\delta^m \), we easily get
\[
I_\lambda(u, v) = \sum_{i=1}^m I_\lambda(k_i e_\lambda^i),
\]
\[
J_\lambda(k_i e_\lambda^i) \leq \lambda \lambda^{1/2} \lambda^{-1/2}.
\]

Set \( \beta_\delta := \max\{\| \phi_\delta^i \|_L^2^2 + \| \psi_\delta^i \|_L^2^2 : i = 1, 2, \ldots, m\} \) and choose some \( \lambda_{m\delta} > 0 \) such that
\[
V(\lambda^{-1/2} x) \leq \frac{\delta}{\beta_\delta} \quad \forall \lambda \leq \Lambda_{m\delta}.
\]

Furthermore, we have the following inequality:
\[
\max_{(u,v) \in F_\delta^m} (u,v) \leq \lambda^{1/2} \lambda^{-1/2} \lambda^{-1/2}.
\]

**Lemma 14.** Under the assumptions of Theorem 4, for any \( m \in \mathbb{N} \) and \( \sigma > 0 \), there is \( \Lambda_{m\delta} > 0 \) such that, for each \( \lambda \geq \Lambda_{m\delta} \), we can get an \( m \)-dimensional subspace \( F \) which satisfies
\[
\max_{(u,v) \in F} (u,v) \leq \lambda^{1/2} \lambda^{-1/2} \lambda^{-1/2}.
\]

**Proof.** For any \( \sigma > 0 \), we choose \( \delta > 0 \) so small that
\[
\left( \frac{m (\alpha - 2)}{2a(a a_0)^{2/(\alpha - 2)}} (2\delta)^{\alpha/(\alpha - 2)} \right) + \frac{m (\beta - 2)}{2\beta(\beta a_0)^{2/(\beta - 2)}} (2\delta)^{\beta/(\beta - 2)} \right) \leq \sigma.
\]

Meanwhile, we take \( F = F_\delta^m \). By (43), we prove the required conclusion.
4. Proof of the Main Results

Proof of Theorem 3. Define \( c_\lambda = \inf_{\gamma \in \Gamma_{\lambda}} \max_{t \in [0,1]} J_\lambda(\gamma(t)) \), where \( \Gamma_{\lambda} = \{ \gamma \in C([0,1], E) : \gamma(0) = 0, \gamma(1) = e_\lambda \} \). For any \( 0 < \sigma < \alpha_0 \), there exists \( \Lambda_\sigma > 0 \) such that, for each \( \lambda \geq \Lambda_\sigma \), we can choose \( c_\lambda \) satisfying \( c_\lambda \leq \sigma \lambda^{1-\sigma} \).

By Lemma 9, \( J_\lambda \) satisfies the (PS)\(_{c_\lambda}\) condition. Hence, by the mountain pass theorem, there exists \( (u_1, \nu_1) \in E \) satisfying \( J'_\lambda(u_1, \nu_1) = 0 \) and \( J_\lambda(u_1, \nu_1) = c_\lambda \). So \( (u_1, \nu_1) \) is a weak solution of (7).

Furthermore, we have
\[
J_\lambda(u_1, \nu_1) = J_\lambda(u_1, \nu_1) - \frac{1}{\theta} J'_\lambda(u_1, \nu_1)(u_1, \nu_1) \geq \left( \frac{1}{2} - \frac{1}{\theta} \right) \| (u_1, \nu_1) \|_E^2.
\]
(46)

This shows that
\[
\frac{\theta - 2}{2\theta} \int_{\mathbb{R}^N} \left( |\nabla u_1|^2 + |\nabla \nu_1|^2 + \lambda V(x) \left( |u_1|^2 + |\nu_1|^2 \right) \right) \leq \sigma \lambda^{1-\sigma/2}.
\]
(47)

\( \square \)

Proof of Theorem 4. By Lemma 14, for any \( m \in \mathbb{N} \) and \( \sigma \leq \alpha_0 \), there exists \( \Lambda_{m \sigma} \) such that, for \( \lambda \geq \Lambda_{m \sigma} \), we choose an \( m \)-dimensional subspace \( F \) with max \( J_\lambda(F) \leq \sigma \lambda^{1-\sigma/2} \).

By Lemma 12, there is \( R > 0 \) such that \( J_\lambda(u) \leq 0 \) for all \( u \in F \cap B_R \). Define \( e_{\lambda j} = \inf_{i \in \Omega} \sup_{u \in F \cap B_R} J_\lambda(u, v), 1 \leq j \leq m \), where \( \Omega \) is a version of Benci’s pseudoindex [19].

Since \( J_\lambda(u, v) \geq \alpha_1 \) for all \( (u, v) \in \partial \mathcal{B}_{\rho_\lambda} \) (see Lemma 11) and \( i(F) = \dim F = m \), one has
\[
\alpha_1 \leq c_1 \leq c_2 \leq \cdots \leq c_m \leq \sup_{(u, v) \in \mathcal{P}_{\rho_\lambda}^0} J_\lambda(u, v) \leq \sigma \lambda^{1-\sigma/2}.
\]
(48)

We easily get that \( c_\lambda \) are critical levels and \( J_\lambda \) has at least \( m \) pairs of nontrivial critical points. This proof is completed. \( \square \)
