We consider one-sided weight classes of Muckenhoupt type, but larger than the classical Muckenhoupt classes, and study the boundedness of one-sided oscillatory integral operators on weighted Lebesgue spaces using interpolation of operators with change of measures.

1. Introduction and Main Results

Oscillatory integrals in one form or another have been an essential part of harmonic analysis from the very beginnings of that subject; three chapters are devoted to them in the celebrated Stein's book [1]. Many operators in harmonic analysis or partial differential equations are related to some versions of oscillatory integrals, such as the Fourier transform, the Bochner-Riesz means, and the Radon transform which has important applications in the CT technology. Among numerous papers dealing with oscillatory singular integral operators in some function spaces, we refer to [2–7] and the references therein. More generally, let us now consider a class of oscillatory integrals defined by Ricci and Stein [8]:

$$Tf(x) = \text{p.v.} \int_{\mathbb{R}} e^{iP(x,y)} K(x-y) f(y) dy, \quad (1)$$

where $P(x, y)$ is a real-valued polynomial defined on $\mathbb{R} \times \mathbb{R}$ and the function $K \in C^1(\mathbb{R} \setminus \{0\})$ is a Calderón-Zygmund kernel. That means K satisfies

$$|K(x)| \leq \frac{C}{|x|}, \quad |\nabla K(x)| \leq \frac{C}{|x|^2}, \quad x \neq 0, \quad (2)$$

$$\int_{a < |x| < b} K(x) dx = 0 \quad \forall a, b \quad (0 < a < b). \quad (3)$$

Throughout this paper, the letter C will denote a positive constant which may vary from line to line but will remain independent of the relevant quantities.

We state a celebrated result of Ricci and Stein on oscillatory integrals as follows.

Theorem 1 (see [8]). *Let $1 < p < \infty$, K satisfy (2) and (3). Then for any real-valued polynomial $P(x, y)$, the oscillatory integral operator T is of type (L^p, L^p) and its norm depends on the total degree of P , but not on the coefficients of P in other respects.*

Weighted inequalities arise naturally in harmonic analysis, but their use is best justified by the variety of applications in which they appear. It is worth pointing out that many authors are interested in the inequalities when the weight functions belong to the Muckenhoupt classes ([9]), which are denoted by A_p ($1 < p < \infty$) classes for simplicity. This class consists of positive locally integrable functions (weight functions) w for which

$$\sup_I \left(\frac{1}{|I|} \int_I w(x) dx \right) \left(\frac{1}{|I|} \int_I w(x)^{1-p'} dx \right)^{p-1} < \infty, \quad (4)$$

where the supremum is taken over all intervals $I \subset \mathbb{R}$ and $1/p + 1/p' = 1$.

In 1992, Lu and Zhang [10] established the weighted version of Theorem 1.

Theorem 2. *Let $p, P(x, y)$ and K be as in Theorem 1. Then the oscillatory singular integral operator T is of type $(L^p(w), L^p(w))$ with $w \in A_p$. Here its operator norm is bounded by a constant depending on the total degree of P , but not on the coefficients of P in other respects.*

We point out that Theorems 1 and 2 also hold for dimension $n \geq 2$. We choose the results for $n = 1$ here in order to introduce the one-sided operators which were defined on $\mathbb{R}$. Theorems 1 and 2 are also true for more general kernels, that is, nonconvolution kernels, under the L^2 -boundedness assumption on the corresponding Calderón-Zygmund singular integral operators:

$$\tilde{T}(x) = \text{p.v.} \int_{\mathbb{R}^n} K(x-y) f(y) dy. \quad (5)$$

However, this topic exceeds the scope of this paper. For more information about this work, see [8, 10], for example.

The study of weights for one-sided operators was motivated not only by the generalization of the theory of both-sided ones, but also by their natural appearance in harmonic analysis; for example, they are required when we treat the one-sided Hardy-Littlewood maximal operator [11]:

$$\begin{aligned} M^+ f(x) &= \sup_{h>0} \frac{1}{h} \int_x^{x+h} |f(y)| dy, \\ M^- f(x) &= \sup_{h>0} \frac{1}{h} \int_{x-h}^x |f(y)| dy, \end{aligned} \quad (6)$$

arising in the ergodic maximal function. Sawyer first introduced the classical one-sided weight A_p^+ classes in [11]. The general definitions of A_p^+ and A_p^- were introduced in [12] as

$$\begin{aligned} A_p^+ : \sup_{a<b<c} \frac{1}{(c-a)^p} \int_a^b w(x) dx \left(\int_b^c w(x)^{1-p'} dx \right)^{p-1} &\leq C, \\ A_p^- : \sup_{a<b<c} \frac{1}{(c-a)^p} \int_b^c w(x) dx \left(\int_a^b w(x)^{1-p'} dx \right)^{p-1} &\leq C, \end{aligned} \quad (7)$$

where $1 < p < \infty$, $1/p + 1/p' = 1$; also, for $p = 1$,

$$A_1^+ : M^- w \leq Cw, \quad A_1^- : M^+ w \leq Cw. \quad (8)$$

The smallest constant C for which the above inequalities are satisfied will be denoted by $A_p^+(w)$ and $A_p^-(w)$, $p \geq 1$. $A_p^+(w)$ ($A_p^-(w)$) will be called the A_p^+ (resp., A_p^-) constant of w . By Lebesgue's differentiation theorem, we can easily prove $A_1^+(w)$ (resp., $A_1^-(w)$) ≥ 1 . In [13], the class A_∞^+ was introduced as $A_\infty^+ = \bigcup_{p<\infty} A_p^+$ (see also [14]). It is easy to see that for $1 \leq p \leq \infty$, $A_p \subset A_p^+$, $A_p \subset A_p^-$, and $A_p = A_p^+ \cap A_p^-$.

Theorem 3 (see [11]). *Let $1 < p < \infty$. Then*

- (1) M^+ is bounded in $L^p(w)$ if and only if $w \in A_p^+$;
- (2) M^- is bounded in $L^p(w)$ if and only if $w \in A_p^-$.

The one-sided weight classes are of interest, not only because they control the boundedness of the one-sided Hardy-Littlewood maximal operator, but also because they are the right classes for the weighted estimates of one-sided Calderón-Zygmund singular integral operators [15], which are defined by

$$\begin{aligned} \tilde{T}^+ f(x) &= \lim_{\varepsilon \rightarrow 0^+} \int_{x+\varepsilon}^{\infty} K(x-y) f(y) dy, \\ \tilde{T}^- f(x) &= \lim_{\varepsilon \rightarrow 0^+} \int_{-\infty}^{x-\varepsilon} K(x-y) f(y) dy, \end{aligned} \quad (9)$$

where K is the one-sided Calderón-Zygmund kernel with support in $\mathbb{R}^- = (-\infty, 0)$ and $\mathbb{R}^+ = (0, +\infty)$, respectively. We say a function K is a one-sided Calderón-Zygmund kernel if K satisfies (2) and

$$\left| \int_{a<|x|<b} K(x) dx \right| \leq C, \quad 0 < a < b \quad (10)$$

with support in $\mathbb{R}^- = (-\infty, 0)$ or $\mathbb{R}^+ = (0, +\infty)$. An example of such a kernel is

$$K(x) = \frac{\sin(\log|x|)}{(x \log|x|)} \chi_{(-\infty, 0)}(x), \quad (11)$$

where χ_E denotes the characteristic function of a set E .

Theorem 4 (see [15]). *Let $1 < p < \infty$ and K be a one-sided Calderón-Zygmund kernel. Then*

- (1) $\tilde{T}^+$ is bounded in $L^p(w)$ if and only if $w \in A_p^+$;
- (2) $\tilde{T}^-$ is bounded in $L^p(w)$ if and only if $w \in A_p^-$.

Theorem 4 is the one-sided version of weighted norm inequality of singular integral due to Coifman and Fefferman [9].

Highly inspired by the above statements for oscillatory singular integral operators and one-sided operator theory, in [16], the authors had introduced the one-sided oscillatory singular integral operators and studied the weighted weak type $(1, 1)$ norm inequalities for these operators. In this paper, we will further study the one-sided Muckenhoupt weight classes and give the one-sided version of Theorem 2. It is well known that the property of the one-sided Muckenhoupt weight classes is worse than the Muckenhoupt weight classes (see also [17]). For example, both the reverse Hölder inequality and the doubling condition are not true for the one-sided case. Therefore, some new methods are needed to deal with some new difficulties.

We first recall the definition of one-sided oscillatory integral operator as

$$\begin{aligned} T^+ f(x) &= \lim_{\varepsilon \rightarrow 0^+} \int_{x+\varepsilon}^{\infty} e^{iP(x,y)} K(x-y) f(y) dy, \\ T^- f(x) &= \lim_{\varepsilon \rightarrow 0^+} \int_{-\infty}^{x-\varepsilon} e^{iP(x,y)} K(x-y) f(y) dy, \end{aligned} \quad (12)$$

where $P(x, y)$ is a real-valued polynomial defined on $\mathbb{R} \times \mathbb{R}$ and the kernel K is a one-sided Calderón-Zygmund kernel

with support in $\mathbb{R}^-$ and $\mathbb{R}^+$, respectively. Now, we formulate our results as follows.

Theorem 5. Let $1 < p < \infty$ and K be a one-sided Calderón-Zygmund kernel. Then for any real-valued polynomial $P(x, y)$,

(1) there exists constant $C > 0$ such that

$$\|T^+ f\|_{L^p(w)} \leq C \|f\|_{L^p(w)}, \quad (13)$$

where $w \in A_p^+$ and the operator norm depend on the total degree of P and $A_p^+(w)$, but not on the coefficients of P in other respects;

(2) there exists constant $C > 0$ such that

$$\|T^- f\|_{L^p(w)} \leq C \|f\|_{L^p(w)}, \quad (14)$$

where $w \in A_p^-$ and the operator norm depend on the total degree of P and $A_p^-(w)$, but not on the coefficients of P in other respects.

The rest of this paper is devoted to the argument for Theorem 5. Section 2 contains some preliminaries which are essential to our proof. In Section 3, we will give the proof of Theorem 5.

2. Preliminaries

Lemma 6 (see [11, 18]). Let $1 < p < \infty$ and $w \geq 0$ be locally integrable. Then the following statements are equivalent:

- (1) $w \in A_p^+$;
- (2) $w^{1-p'} \in A_{p'}^-$;
- (3) there exist $w_1 \in A_1^+$ and $w_2 \in A_1^-$ such that $w = w_1(w_2)^{1-p}$.

According to the definition of A_p^+ , we can easily obtain the following lemma.

Lemma 7. Let $1 < p < \infty$ and $w \in A_p^+$. Then $A_p^+(\delta^\lambda(w)) = A_p^+(w)$, where $\delta^\lambda(w)(x) = w(\lambda x)$ for all $\lambda > 0$.

Proof. For $1 < p < \infty$, if $w \in A_p^+$, then

$$\sup_{a < b < c} \frac{1}{(c-a)^p} \int_a^b w(x) dx \left(\int_b^c w(x)^{1-p'} dx \right)^{p-1} \leq C. \quad (15)$$

For $\lambda > 0$, $a' = \lambda a$, $b' = \lambda b$, $c' = \lambda c$, and $d' = \lambda d$, we have

$$\begin{aligned} & \frac{1}{(c-a)^p} \int_a^b w(\lambda x) dx \left(\int_b^c w(\lambda x)^{1-p'} dx \right)^{p-1} \\ &= \frac{1}{(c-a)^p} \int_{a\lambda}^{b\lambda} w(x) \lambda^{-1} dx \left(\int_{b\lambda}^{c\lambda} w(x)^{1-p'} \lambda^{-1} dx \right)^{p-1} \\ &= \frac{1}{(\lambda(c-a))^p} \int_{a\lambda}^{b\lambda} w(x) dx \left(\int_{b\lambda}^{c\lambda} w(x)^{1-p'} dx \right)^{p-1} \\ &= \frac{1}{(c'-a')^p} \int_{a'}^{b'} w(x) dx \left(\int_{b'}^{c'} w(x)^{1-p'} dx \right)^{p-1} \\ &\leq C. \end{aligned} \quad (16)$$

The proof is complete. $\square$

We say a weight w satisfies the one-sided reverse Hölder RH_r^+ condition [18] if there exists $C > 0$ such that for any $a < b$ and $1 < r < \infty$,

$$\int_a^b w(x)^r dx \leq C(M(w\chi_{(a,b)})(b))^{r-1} \int_a^b w(x) dx, \quad (17)$$

where M is the classical Hardy-Littlewood maximal operator. The smallest such constant will be called the RH_r^+ constant of w and will be denoted by $RH_r^+(w)$. Corresponding to the classical reverse Hölder inequality, (17) is named the weak reverse Hölder inequality. For $r = \infty$, we say a weight w satisfies the one-sided reverse Hölder RH_∞^+ condition if there exists $C > 0$ such that $w(x) \leq Cm^+w(x)$ for almost all $x \in \mathbb{R}$ where m^+ is the one-sided minimal operator defined as

$$m^+ f(x) = \inf_{h>0} \frac{1}{h} \int_x^{x+h} |f| dy. \quad (18)$$

The smallest such constant will be called the RH_∞^+ constant of w and will be denoted by $RH_\infty^+(w)$. It is clear that $RH_\infty^+(w) \geq 1$. In [18], the authors give several characterizations of RH_r^+ where the constants C are not necessary the same.

Lemma 8. Let $a < b < c < d$, $1 < r < \infty$, and $w \geq 0$ be locally integrable. Then the following statements are equivalent:

- (1) $\int_a^b w(x)^r dx \leq C(M(w\chi_{(a,b)})(b))^{r-1} \int_a^b w(x) dx$;
- (2) $(1/(b-a)) \int_a^b w(x)^r dx \leq C((1/(c-b)) \int_b^c w(x) dx)^r$ with $b-a = 2(c-b)$;
- (3) $(1/(b-a)) \int_a^b w(x)^r dx \leq C((1/(d-c)) \int_c^d w(x) dx)^r$ with $b-a = d-b = 2(d-c)$;
- (4) $(1/(b-a)) \int_a^b w(x)^r dx \leq C((1/(c-b)) \int_b^c w(x) dx)^r$ with $b-a = c-b$;
- (5) $(1/(b-a)) \int_a^b w(x)^r dx \leq C((1/(d-c)) \int_c^d w(x) dx)^r$ with $b-a = d-c = \gamma(d-a)$, $0 < \gamma \leq 1/2$.

Lemma 9 (see [18]). A weight $w \in A_p^+$ for $p > 1$ if and only if there exist $0 < \gamma < 1/2$ and a constant C_γ such that for $b - a = d - c = \gamma(d - a)$ with $a < b < c < d$, the following inequality holds:

$$\int_a^b w(x) dx \left(\int_c^d w(x)^{1-p'} dx \right)^{p-1} \leq C_\gamma (b - a)^p. \quad (19)$$

Combining the results in [12, 15, 18, 19], we can deduce Lemma 10. In what follows, we will include its proof with slight modifications for the sake of completeness.

Lemma 10. Let $w \in A_p^+$. Then there exists $\varepsilon > 0$ such that $w^{1+\varepsilon} \in A_p^+$.

Proof. By Lemma 6, we have $w = w_1 w_2^{1-p}$ with $w_1 \in A_1^+$ and $w_2 \in A_1^-$. For fixed interval $I = (a, b)$, we next claim that $w_1 \in RH_r^+$ for all $1 < r < C/(C - 1)$ with $C = \max\{A_1^+(w_1), A_1^-(w_1)\} > 1$. In fact, we consider the truncation of w at height H defined by $w_H = \min\{w_1, H\}$ which also satisfies A_1^+ condition (with a constant $C_H \leq C$). Therefore, if $\lambda_I = M(w_H \chi_I)(b)$ and $S_\lambda = \{x \in I : w_H(x) > \lambda\}$, then we have

$$\int_{S_\lambda} w_H(x) dx \leq C_H \lambda |S_\lambda|, \quad \lambda \geq \lambda_I. \quad (20)$$

Indeed, it is straightforward if $S_\lambda = I$ since

$$w_H(S_\lambda) = \int_a^b w_H(x) dx \leq \lambda_I (b - a) \leq C_H \lambda |S_\lambda|. \quad (21)$$

We now assume $S_\lambda \neq I$ and fix $\varepsilon > 0$ and an open set O such that $S_\lambda \subset O \subset I$ with $|O| \leq \varepsilon + |S_\lambda|$. Let $O_i = (c, d)$, which is connected. There are two cases; that is, $a \leq c < d < b$ and $a \leq c < d = b$. In the first case, it is easy to check that d is not contained in S_λ . By the definition of S_λ , w_1^+ , we have $\int_c^d w_H(x) dx \leq C_H \lambda (d - c)$, while the second case is handled as the case $S_\lambda = I$ since $\int_c^d w_H(x) dx \leq C(b - c)$. Thus $w_H(O_i) \leq C_H \lambda |O_i|$. Adding up with i , we get

$$w_H(S_\lambda) \leq w_H(O) \leq C_H \lambda |O_i| \leq C_H \lambda (\varepsilon + |S_\lambda|). \quad (22)$$

Therefore, we obtain (20). For fixed $\theta > -1$, multiply both sides of (20) by λ^θ and integrate from λ_I to infinity; we can obtain

$$\frac{1}{\theta + 1} \int_I (w_H^{\theta+2} - \lambda_I^{\theta+1})(x) dx \leq \frac{C_H}{\theta + 2} \int_I w_H^{\theta+2}(x) dx. \quad (23)$$

Now if $r = \theta + 2 < C_H/(C_H - 1)$, then $1/(\theta + 1) - C_H/(\theta + 2) > 0$, which implies

$$\begin{aligned} \int_I w_H^r(x) dx &\leq C_H \lambda_I^{r-1} \int_I w_H(x) dx \\ &= C_H (M(w_H \chi_I)(b))^{r-1} \int_I w_H(x) dx. \end{aligned} \quad (24)$$

The inequality $C_H \leq C$ implies $C_H/(C_H - 1) \geq C/(C - 1)$. Therefore, if $r \leq C/(C - 1)$, then we have

$$\begin{aligned} \int_I w_H^r(x) dx &= C_H (M(w_H \chi_I)(b))^{r-1} \int_a^b w_H(x) dx \\ &= C (M(w_1 \chi_{(a,b)})(b))^{r-1} \int_a^b w_H(x) dx. \end{aligned} \quad (25)$$

Hence $w_1 \in RH_r^+$ by the monotone convergence theorem. Since $w_2 \in A_1^-$, we next claim that $w_2^{1-p} \in RH_\infty^+$. In fact, for any interval $I = (a, b)$, we have

$$\left(\frac{1}{|I|} \int_I w_2(x) dx \right)^{1-p} \leq \frac{1}{|I|} \int_I w_2(x)^{1-p} dx \quad (26)$$

by Hölder's inequality and the A_1^- condition. For almost every $x \in I^- = (2a - b, a)$, we have

$$C w_2 \geq \frac{1}{|I|} \int_I w_2(x) dx. \quad (27)$$

Thus,

$$\begin{aligned} w_2(x)^{1-p} &\leq C \left(\frac{1}{|I|} \int_I w_2(x) dx \right)^{1-p} \\ &\leq C \frac{1}{|I|} \int_I w_2(x)^{1-p} dx \\ &\leq C \frac{1}{b - x} \int_x^b w_2(x)^{1-p} dx, \end{aligned} \quad (28)$$

which implies our claim. Hence,

$$\begin{aligned} \frac{1}{|I|} \int_I w^r &\leq \frac{1}{|I|} \int_I w_1^r \sup_I (w_2^{-r(p-1)}) \\ &\leq C \left(\frac{1}{|I_1|} \int_{I_1} w_1 \right)^r \left(\frac{1}{|I_1|} \int_{I_1} w_2^{1-p} \right)^r \\ &\leq C \left(\inf_{I_1} w_1 \right)^r \left(\sup_{I_1} w_2^{1-p} \right)^r \\ &\leq C (\inf w_1)^r \left(\frac{1}{|I_2|} \int_{I_2} w_2^{1-p} \right)^r \\ &\leq C \left(\frac{1}{|I_2|} \int_{I_2} w \right)^r, \end{aligned} \quad (29)$$

where $I_1 = (b, 2b - a)$ and $I_2 = (2b - a, 3b - 2a)$. By Lemma 8, we obtain $w \in RH_r^+$. Hence, $w^{1-p'} \in RH_r^-$ for all $1 < r < C/(C - 1)$ by Lemma 6.

Let us fix $a < d$ and choose b, c such that $b - a = d - c = (d - a)/4$ (e.g., we choose $b = (d + 3a)/4$, $c = (3d + a)/4$). Following from the five points $a, b, (b + c)/2, c, d$, we have four intervals, namely,

$$\begin{aligned} I_1 &= (a, b), & I_2 &= \left(b, \frac{(b+c)}{2} \right), \\ I_3 &= \left(\frac{(b+c)}{2}, c \right), & I_4 &= (c, d). \end{aligned} \quad (30)$$

By Lemma 8, we have

$$\begin{aligned} & \frac{1}{|I_1|} \int_I w^r \left(\frac{1}{|I_4|} \int_{I_4} w^{r(1-p')} \right)^{p-1} \\ & \leq \left(\frac{1}{|I_2|} \int_{I_2} w \right)^r \left(\frac{1}{|I_3|} \int_{I_3} w^{(1-p')} \right)^{r(p-1)} \leq C^r. \end{aligned} \quad (31)$$

Thus, $w^r \in A_p^+$ by Lemma 9. Choosing $0 < \varepsilon = r - 1 < 1/(C - 1)$, then we complete the proof of the lemma. $\square$

To prove Theorem 5, we still need a celebrated interpolation theorem of operators with change of measures.

Lemma 11 (see [20]). *Suppose that u_0, v_0, u_1, v_1 are positive weight functions and $1 < p_0, p_1 < \infty$. Assume sublinear operator S satisfies*

$$\begin{aligned} \|Sf\|_{L^{p_0}(u_0)} &\leq C_0 \|f\|_{L^{p_0}(v_0)}, \\ \|Sf\|_{L^{p_1}(u_1)} &\leq C_1 \|f\|_{L^{p_1}(v_1)}. \end{aligned} \quad (32)$$

Then,

$$\|Sf\|_{L^p(u)} \leq C \|f\|_{L^p(v)} \quad (33)$$

holds for any $0 < \theta < 1$ and $1/p = \theta/p_0 + (1 - \theta)/p_1$, where $u = u_0^{p\theta/p_0} u_1^{p(1-\theta)/p_1}$, $v = v_0^{p\theta/p_0} v_1^{p(1-\theta)/p_1}$, and $C \leq C_0^\theta C_1^{1-\theta}$.

Lemmas 10 and 11 are the main tools in proving Theorem 5.

3. Proof of Theorem 5

In this section, we will prove Theorem 5 by induction, which is partly motivated by [8, 10]. We begin with the proof of (1). For any nonzero real polynomial $P(x, y)$ in x and y , there are $k, l, m \geq 0$ such that

$$P(x, y) = a_{kl} x^k y^l + R(x, y) \quad (34)$$

with $a_{kl} \neq 0$ and

$$R(x, y) = \sum_{0 \leq \alpha < k, 0 \leq \beta \leq m} a_{\alpha\beta} x^\alpha y^\beta + \sum_{0 \leq \beta < l} a_{k\beta} x^k y^\beta. \quad (35)$$

We will write $d_x(P) = k$ and $d_y(P) = l$. Below we will carry out the argument by using a double induction on k and l .

If $d_x(P) = 0$ and $d_y(P)$ is arbitrary, then $P(x, y) = P(y)$ and $T^+ f$ can be written as

$$T^+ f(x) = \lim_{\varepsilon \rightarrow 0^+} \int_{x+\varepsilon}^{\infty} K(x-y) g(y) dy, \quad (36)$$

where $g(y) = e^{iP(y)} f(y)$. Therefore, the conclusion of Theorem 5 follows from Theorem 4.

Let $k \geq 1$ and assume that the conclusion of Theorem 5 holds for all $P(x, y)$ with $d_x(P) \leq k - 1$ and $d_y(P)$ arbitrary.

We will now prove that the conclusion of Theorem 5 holds for all $P(x, y)$ with $d_x(P) = k$ and $d_y(P)$ arbitrary.

If $d_x(P) = k$ and $d_y(P) = 0$, then

$$P(x, y) = a_{k0} x^k + Q(x, y) \quad (37)$$

with $d_x(Q) \leq k - 1$. By taking the factor $e^{ia_{k0}x^k}$ out of the integral sign, we see that this case follows from the above inductive hypothesis.

Suppose $l \geq 1$ and the desired bound holds when $d_x(P) = k$ and $d_y(P) \leq l - 1$.

Now, let $P(x, y)$ be a polynomial with $d_x(P) = k$ and $d_y(P) = l$, as given in (34).

Case 1 ($|a_{kl}| = 1$). Write

$$\begin{aligned} T^+ f(x) &= \int_x^{1+x} e^{iP(x,y)} K(x-y) f(y) dy \\ &\quad + \sum_{j=1}^{\infty} \int_{2^{j-1}+x}^{2^j+x} e^{iP(x,y)} K(x-y) f(y) dy \\ &=: T_0^+ f(x) + \sum_{j=1}^{\infty} T_j^+ f(x). \end{aligned} \quad (38)$$

Take any $h \in \mathbb{R}$, and write

$$P(x, y) = a_{kl}(x-h)^k(y-h)^l + R(x, y, h), \quad (39)$$

where the polynomial $R(x, y, h)$ satisfies the induction assumption and the coefficients of $R(x, y, h)$ depend on h .

We consider first the estimates for T_0^+ . It is easy to check that

$$\begin{aligned} T_0^+ f(x) &= \int_x^{1+x} e^{i(R(x,y,h)+a_{kl}(y-h)^{k+l})} K(x-y) f(y) dy \\ &\quad + \int_x^{1+x} \left\{ e^{iP(x,y)} - e^{i(R(x,y,h)+a_{kl}(y-h)^{k+l})} \right\} \\ &\quad \times K(x-y) f(y) dy \\ &=: T_{01}^+ f(x) + T_{02}^+ f(x). \end{aligned} \quad (40)$$

Now we split f into three parts as

$$\begin{aligned} f(y) &= f(y) \chi_{\{|y-h| < 1/2\}}(y) \\ &\quad + f(y) \chi_{\{1/2 \leq |y-h| < 5/4\}}(y) \\ &\quad + f(y) \chi_{\{|y-h| \geq 5/4\}}(y) \\ &=: f_1(y) + f_2(y) + f_3(y). \end{aligned} \quad (41)$$

Observe that if $|x-h| < 1/4$, then

$$\begin{aligned} T_{01}^+ f_1(x) &= \int_x^{1+x} e^{i(R(x,y,h)+a_{kl}(y-h)^{k+l})} K(x-y) f_1(y) dy. \end{aligned} \quad (42)$$

Thus, it follows from the induction assumption that

$$\begin{aligned} & \int_{|x-h|<1/4} |T_{01}^+ f_1(x)|^p w(x) dx \\ & \leq C \int_{|y-h|<1/2} |f(y)|^p w(y) dy, \end{aligned} \quad (43)$$

where C is independent of h and the coefficients of $P(x, y)$.

Notice that if $|x - h| < 1/4$, $1/2 \leq |y - h| < 5/4$, then $y - x > 1/4$. Thus,

$$\begin{aligned} |T_{01}^+ f_2(x)| & \leq C \int_{x+1/4}^{x+1} |K(x-y) f_2(y)| dy \\ & \leq CM^+(f_2)(x). \end{aligned} \quad (44)$$

So we have

$$\begin{aligned} & \int_{|x-h|<1/4} |T_{01}^+ f_2(x)|^p w(x) dx \\ & \leq C \int_{|y-h|<5/4} |f(y)|^p w(y) dy, \end{aligned} \quad (45)$$

where C is independent of h and the coefficients of $P(x, y)$.

Again observe that if $|x - h| < 1/4$ and $|y - h| \geq 5/4$, then $y - x > 1$. Thus,

$$T_{01}^+ f_3(x) = 0. \quad (46)$$

Combining (43), (45), and (46), we get

$$\begin{aligned} & \int_{|x-h|<1/4} |T_{01}^+ f(x)|^p w(x) dx \\ & \leq C \int_{|y-h|<5/4} |f(y)|^p w(y) dy, \end{aligned} \quad (47)$$

where C is independent of h and the coefficients of $P(x, y)$.

Evidently, if $|x - h| < 1/4$ and $0 < y - x < 1$, then

$$\begin{aligned} & \left| e^{iP(x,y)} - e^{i(R(x,y,h)+a_{kl}(y-h)^{k+l})} \right| \\ & \leq C |a_{kl}| |x - y| = C(y - x). \end{aligned} \quad (48)$$

Therefore, when $|x - h| < 1/4$, we have

$$\begin{aligned} |T_{02}^+ f(x)| & \leq C \int_x^{x+1} |f(y)| dx \\ & \leq CM^+(f(\cdot) \chi_{B(h,5/4)}(\cdot))(x). \end{aligned} \quad (49)$$

It follows from Theorem 3 that

$$\begin{aligned} & \int_{|x-h|<1/4} |T_{02}^+ f(x)|^p w(x) dx \\ & \leq C \int_{|y-h|<5/4} |f(y)|^p w(y) dy, \end{aligned} \quad (50)$$

where C is independent of h and the coefficients of $P(x, y)$.

From (47) and (50), it follows that the inequality

$$\begin{aligned} & \int_{|x-h|<1/4} |T_0^+ f(x)|^p w(x) dx \\ & \leq C \int_{|y-h|<5/4} |f(y)|^p w(y) dy \end{aligned} \quad (51)$$

holds uniformly in $h \in \mathbb{R}^+$, which implies

$$\|T_0^+ f\|_{L^p(w)} \leq C \|f\|_{L^p(w)}, \quad (52)$$

where C is independent of the coefficients of $P(x, y)$ and $w \in A_p^+$.

We proceed with the proof of Theorem 5 with the estimates for $T_j^+ f$. Because of the size condition (2), we observe that for $j \geq 1$

$$|T_j^+ f(x)| \leq \int_{2^{j-1}+x}^{2^j+x} \frac{|f(y)|}{|x-y|} dy \leq CM^+(f)(x), \quad (53)$$

where C is independent of j . By Lemma 10, we know that there exists $\varepsilon > 0$ such that $w^{1+\varepsilon} \in A_p^+$. Thus we have

$$\|T_j^+ f\|_{L^p(w^{1+\varepsilon})} \leq C \|f\|_{L^p(w^{1+\varepsilon})}, \quad (54)$$

where C is independent of j . We now only need to recall Lemma 3.7 in [16] to see that

$$\|T_j^+ f\|_{L^p} \leq C 2^{-j\delta} \|f\|_{L^p}, \quad (55)$$

where C depends only on the total degree of $P(x, y)$ and $\delta > 0$. It follows from (54), (55), and Lemma 11 that

$$\|T_j^+ f\|_{L^p(w)} \leq C 2^{-j\theta\delta} \|f\|_{L^p(w)}, \quad (56)$$

where $0 < \theta < 1$, θ is independent of j , and C depends only on the total degree of $P(x, y)$.

From (52) and (56), it is clear that when $w \in A_p^+$,

$$\|T^+ f\|_{L^p(w)} \leq C \|f\|_{L^p(w)}, \quad (57)$$

where C depends only on the total degree of $P(x, y)$.

Case 2 ($|a_{kl}| \neq 1$). In this case, we write $\lambda = |a_{kl}|^{1/(k+l)}$ and

$$\begin{aligned} P(x, y) & = \lambda^{-(k+l)} a_{kl} (\lambda x)^k (\lambda y)^l + R\left(\frac{\lambda x}{\lambda}, \frac{\lambda y}{\lambda}\right) \\ & = Q(\lambda x, \lambda y). \end{aligned} \quad (58)$$

Therefore,

$$\begin{aligned} T^+ f(x) & = \text{p.v.} \int e^{iQ(\lambda x, \lambda y)} K(x-y) f(y) dy \\ & = \text{p.v.} \int e^{iQ(\lambda x, y)} K\left(\frac{\lambda x}{\lambda} - \frac{y}{\lambda}\right) f\left(\frac{y}{\lambda}\right) \lambda^{-1} dy \\ & = T_\lambda^+ \left(f\left(\frac{\cdot}{\lambda}\right)\right)(\lambda x), \end{aligned} \quad (59)$$

where $K_\lambda(x - y) = \lambda^{-1}K(x/\lambda - y/\lambda)$ and

$$T_\lambda^+ f(x) = \text{p.v.} \int e^{iQ(x,y)} K_\lambda(x - y) f(y) dy. \quad (60)$$

It is easy to check that K_λ satisfies (2) and (10). We have thus established that

$$\|T_\lambda^+ f\|_{L^p(w)} \leq C \|f\|_{L^p(w)} \quad (61)$$

with similar statements as in Case 1. By Lemma 7, we have

$$\begin{aligned} & \int |T^+ f(x)|^p w(x) dx \\ &= \int \left| T_\lambda^+ f\left(\frac{\cdot}{\lambda}\right)(\lambda x) \right|^p w(x) dx \\ &= \lambda^{-1} \int \left| T_\lambda^+ f\left(\frac{\cdot}{\lambda}\right)(x) \right|^p w\left(\frac{x}{\lambda}\right) dx \\ &\leq C \int \left| f\left(\frac{x}{\lambda}\right) \right|^p w\left(\frac{x}{\lambda}\right) dx \\ &= C \int |f(x)|^p w(x) dx; \end{aligned} \quad (62)$$

that is,

$$\|T^+ f\|_{L^p(w)} \leq C \|f\|_{L^p(w)}, \quad (63)$$

where C depends on the total degree of $P(x, y)$ but not on the coefficients of $P(x, y)$.

(2) We omit the details, since they are very similar to that of the proof of (1) with $w \in A_p^-$ instead of $w \in A_p^+$.

Conflict of Interests

The authors declare that there is no conflict of interests regarding the publication of this paper.
