We introduce and analyze a relaxed extragradient-like viscosity iterative algorithm for finding a solution of a generalized mixed equilibrium problem with constraints of several problems: a finite family of variational inequalities for inverse strongly monotone mappings, a finite family of variational inclusions for maximal monotone and inverse strongly monotone mappings, and a fixed point problem of infinitely many nonexpansive mappings in a real Hilbert space. Under some suitable conditions, we derive the strong convergence of the sequence generated by the proposed algorithm to a common solution of these problems which also solves a variational inequality problem.

1. Introduction

Let H be a real Hilbert space with inner product $\langle \cdot, \cdot \rangle$ and norm $\| \cdot \|$, C a nonempty closed convex subset of H , and P_C the metric projection of H onto C . Let $S : C \rightarrow H$ be a nonlinear mapping on C . We denote by $\text{Fix}(S)$ the set of fixed points of S and by $\mathbf{R}$ the set of all real numbers. A mapping V is called strongly positive on H if there exists a constant $\bar{\gamma} > 0$ such that

$$\langle Vx, x \rangle \geq \bar{\gamma} \|x\|^2, \quad \forall x \in H. \quad (1)$$

A mapping $S : C \rightarrow H$ is called L -Lipschitz continuous if there exists a constant $L \geq 0$ such that

$$\|Sx - Sy\| \leq L \|x - y\|, \quad \forall x, y \in C. \quad (2)$$

In particular, if $L = 1$, then S is called a nonexpansive mapping; if $L \in [0, 1)$, then A is called a contraction.

Let $A : C \rightarrow H$ be a nonlinear mapping on C . We consider the following variational inequality problem (VIP) [1]: find a point $x \in C$ such that

$$\langle Ax, y - x \rangle \geq 0, \quad \forall y \in C. \quad (3)$$

The solution set of VIP (3) is denoted by $\text{VI}(C, A)$.

In 1976, Korpelevič [2] proposed an iterative algorithm for solving the VIP (3) in Euclidean space $\mathbf{R}^n$:

$$\begin{aligned} y_n &= P_C(x_n - \tau Ax_n), \\ x_{n+1} &= P_C(x_n - \tau Ay_n), \quad \forall n \geq 0, \end{aligned} \quad (4)$$

with $\tau > 0$ a given number, which is known as the extragradient method. The literature on the VIP is vast and Korpelevič's extragradient method has received great attention given by many authors. See, for example, [3–10] and references therein.

Let $\varphi : C \rightarrow \mathbf{R}$ be a real-valued function, $A : H \rightarrow H$ a nonlinear mapping, and $\Theta : C \times C \rightarrow \mathbf{R}$ a bifunction. In 2008,

Peng and Yao [11] introduced the following generalized mixed equilibrium problem (GMEP): finding $x \in C$ such that

$$\Theta(x, y) + \varphi(y) - \varphi(x) + \langle Ax, y - x \rangle \geq 0, \quad \forall y \in C. \quad (5)$$

We denote the set of solutions of GMEP (5) by $\text{GMEP}(\Theta, \varphi, A)$.

Throughout this paper, it is assumed as in [11] that $\Theta : C \times C \rightarrow \mathbf{R}$ is a bifunction satisfying conditions (H1)–(H4) and $\varphi : C \rightarrow \mathbf{R}$ is a lower semicontinuous and convex function with restriction (H5), where

$$(H1) \quad \Theta(x, x) = 0 \text{ for all } x \in C,$$

$$(H2) \quad \Theta \text{ is monotone, that is, } \Theta(x, y) + \Theta(y, x) \leq 0 \text{ for any } x, y \in C,$$

$$(H3) \quad \Theta \text{ is upper hemicontinuous, that is, for each } x, y, z \in C,$$

$$\limsup_{t \rightarrow 0^+} \Theta(tz + (1-t)x, y) \leq \Theta(x, y); \quad (6)$$

$$(H4) \quad \Theta(x, \cdot) \text{ is convex and lower semicontinuous for each } x \in C,$$

$$(H5) \text{ for each } x \in H \text{ and } r > 0, \text{ there exist bounded subsets } D_x \subset C \text{ and } y_x \in C \text{ such that, for any } z \in C \setminus D_x,$$

$$\Theta(z, y_x) + \varphi(y_x) - \varphi(z) + \frac{1}{r} \langle y_x - z, z - x \rangle < 0, \quad (7)$$

given a positive number $r > 0$. Let $S_r^{(\Theta, \varphi)} : H \rightarrow C$ be the solution set of the auxiliary mixed equilibrium problem; that is, for each $x \in H$,

$$\begin{aligned} S_r^{(\Theta, \varphi)}(x) \\ := \left\{ y \in C : \Theta(y, z) + \varphi(z) - \varphi(y) \right. \\ \left. + \frac{1}{r} \langle K'(y) - K'(x), z - y \rangle \geq 0, \quad \forall z \in C \right\}. \end{aligned} \quad (8)$$

In particular, whenever $K(x) = (1/2)\|x\|^2$, for all $x \in H$, $S_r^{(\Theta, \varphi)}$ is rewritten as $T_r^{(\Theta, \varphi)}$.

Let $\{T_n\}_{n=1}^\infty$ be an infinite family of nonexpansive mappings on H and $\{\lambda_n\}_{n=1}^\infty$ a sequence of nonnegative numbers in $[0, 1]$. For any $n \geq 1$, define a mapping W_n on H as follows:

$$\begin{aligned} U_{n,n+1} &= I, \\ U_{n,n} &= \lambda_n T_n U_{n,n+1} + (1 - \lambda_n) I, \\ U_{n,n-1} &= \lambda_{n-1} T_{n-1} U_{n,n} + (1 - \lambda_{n-1}) I, \\ &\vdots \\ U_{n,k} &= \lambda_k T_k U_{n,k+1} + (1 - \lambda_k) I, \\ U_{n,k-1} &= \lambda_{k-1} T_{k-1} U_{n,k} + (1 - \lambda_{k-1}) I, \\ &\vdots \\ U_{n,2} &= \lambda_2 T_2 U_{n,3} + (1 - \lambda_2) I, \\ W_n &= U_{n,1} = \lambda_1 T_1 U_{n,2} + (1 - \lambda_1) I. \end{aligned} \quad (9)$$

Such a mapping W_n is called the W -mapping generated by $T_n, T_{n-1}, \dots, T_1$ and $\lambda_n, \lambda_{n-1}, \dots, \lambda_1$.

In 2010, for the case where $C = H$, Yao et al. [12] proposed the following hybrid iterative algorithm:

$$\begin{aligned} &\Theta(y_n, z) + \varphi(z) - \varphi(y_n) \\ &+ \frac{1}{r} \langle K'(y_n) - K'(x_n), z - y_n \rangle \geq 0, \quad z \in H, \\ x_{n+1} &= \alpha_n (u + \gamma f(x_n)) + \beta_n x_n \\ &+ ((1 - \beta_n)I - \alpha_n(I + \mu V)) W_n y_n, \quad \forall n \geq 1, \end{aligned} \quad (10)$$

where $f : H \rightarrow H$ is a contraction, $K : H \rightarrow \mathbf{R}$ is differentiable and strongly convex, $\{\alpha_n\}, \{\beta_n\} \subset (0, 1)$, and $x_1, u \in H$ are given, for finding a common element of the set $\text{MEP}(\Theta, \varphi)$ and the fixed point set $\cap_{n=1}^\infty \text{Fix}(T_n)$ of an infinite family of nonexpansive mappings $\{T_n\}_{n=1}^\infty$ on H . They proved the strong convergence of the sequence generated by the hybrid iterative algorithm (10) to a point $x^* \in \Omega := \cap_{n=1}^\infty \text{Fix}(T_n) \cap \text{MEP}(\Theta, \varphi)$ under some appropriate conditions. This point x^* also solves the following optimization problem:

$$\min_{x \in \Omega} \frac{\mu}{2} \langle Vx, x \rangle + \frac{1}{2} \|x - u\|^2 - h(x), \quad (OP)$$

where $h : H \rightarrow \mathbf{R}$ is the potential function of γf .

On the other hand, let B be a single-valued mapping of C into H and R a set-valued mapping with $D(R) = C$. Consider the following variational inclusion: find a point $x \in C$ such that

$$0 \in Bx + Rx. \quad (11)$$

We denote by $I(B, R)$ the solution set of the variational inclusion (11). In particular, if $B = R = 0$, then $I(B, R) = C$. If $B = 0$, then problem (11) becomes the inclusion problem introduced by Rockafellar [13]. Let a set-valued mapping

$R : D(R) \subset H \rightarrow 2^H$ be maximal monotone. We define the resolvent operator $J_{R,\lambda} : H \rightarrow \overline{D(R)}$ associated with R and λ as follows:

$$J_{R,\lambda} = (I + \lambda R)^{-1}, \quad \forall x \in H, \quad (12)$$

where λ is a positive number.

In 1998, Huang [14] studied problem (11) in the case where R is maximal monotone and B is strongly monotone and Lipschitz continuous with $D(R) = C = H$. Subsequently, Zeng et al. [15] further studied problem (11) in the case which is more general than Huang's one [14].

Inspired by the above facts, we introduce and analyze an iterative algorithm by relaxed extragradient-like viscosity method for finding a solution of a generalized mixed equilibrium problem with constraints of several problems: a finite family of variational inequalities for inverse strongly monotone mappings, a finite family of variational inclusions for maximal monotone and inverse strongly monotone mappings, and a fixed point problem of infinitely many nonexpansive mappings in a real Hilbert space. Under some suitable conditions, we derive the strong convergence of the sequence generated by the proposed algorithm to a common solution of these problems. Such solution also solves a variational inequality problem. Several special cases are also discussed. The results presented in this paper are the supplement, extension, improvement, and generalization of the previously known results in this area.

2. Preliminaries

Throughout this paper, we assume that H is a real Hilbert space whose inner product and norm are denoted by $\langle \cdot, \cdot \rangle$ and $\| \cdot \|$, respectively. Let C be a nonempty closed convex subset of H . We write $x_n \rightharpoonup x$ to indicate that the sequence $\{x_n\}$ converges weakly to x and $x_n \rightarrow x$ to indicate that the sequence $\{x_n\}$ converges strongly to x . Moreover, we use $\omega_w(x_n)$ to denote the weak ω -limit set of the sequence $\{x_n\}$; that is,

$$\begin{aligned} \omega_w(x_n) \\ := \{x \in H : x_{n_i} \rightarrow x \text{ for some subsequence } \{x_{n_i}\} \text{ of } \{x_n\}\}. \end{aligned} \quad (13)$$

Definition 1. A mapping $A : C \rightarrow H$ is called

(i) monotone if

$$\langle Ax - Ay, x - y \rangle \geq 0, \quad \forall x, y \in C, \quad (14)$$

(ii) η -strongly monotone if there exists a constant $\eta > 0$ such that

$$\langle Ax - Ay, x - y \rangle \geq \eta \|x - y\|^2, \quad \forall x, y \in C, \quad (15)$$

(iii) ζ -inverse strongly monotone if there exists a constant $\zeta > 0$ such that

$$\langle Ax - Ay, x - y \rangle \geq \zeta \|Ax - Ay\|^2, \quad \forall x, y \in C. \quad (16)$$

It is easy to see that the projection P_C is 1-ism. Inverse strongly monotone (also referred to as cocoercive) operators have been applied widely in solving practical problems in various fields.

Definition 2. A differentiable function $K : H \rightarrow \mathbf{R}$ is called

(i) convex, if

$$K(y) - K(x) \geq \langle K'(x), y - x \rangle, \quad \forall x, y \in H, \quad (17)$$

where $K'(x)$ is the Frechet derivative of K at x ;

(ii) strongly convex, if there exists a constant $\sigma > 0$ such that

$$\begin{aligned} K(y) - K(x) - \langle K'(x), y - x \rangle &\geq \frac{\sigma}{2} \|x - y\|^2, \\ &\forall x, y \in H. \end{aligned} \quad (18)$$

It is easy to see that if $K : H \rightarrow \mathbf{R}$ is a differentiable strongly convex function with constant $\sigma > 0$ then $K' : H \rightarrow H$ is strongly monotone with constant $\sigma > 0$.

The metric (or nearest point) projection from H onto C is the mapping $P_C : H \rightarrow C$ which assigns to each point $x \in H$ the unique point $P_C x \in C$ satisfying the property

$$\|x - P_C x\| = \inf_{y \in C} \|x - y\| =: d(x, C). \quad (19)$$

Some important properties of projections are gathered in the following proposition.

Proposition 3. For given $x \in H$ and $z \in C$,

(i) $z = P_C x \Leftrightarrow \langle x - z, y - z \rangle \leq 0$, for all $y \in C$;

(ii) $z = P_C x \Leftrightarrow \|x - z\|^2 \leq \|x - y\|^2 - \|y - z\|^2$, for all $y \in C$;

(iii) $\langle P_C x - P_C y, x - y \rangle \geq \|P_C x - P_C y\|^2$, for all $y \in H$.
(This implies that P_C is nonexpansive and monotone.)

By using the technique of [16], we can readily obtain the following elementary result.

Proposition 4 (see [17, Lemma 1 and Proposition 1]). Let C be a nonempty closed convex subset of a real Hilbert space H and let $\varphi : C \rightarrow \mathbf{R}$ be a lower semicontinuous and convex function. Let $\Theta : C \times C \rightarrow \mathbf{R}$ be a bifunction satisfying the conditions (H1)–(H4). Assume that

(i) $K : H \rightarrow \mathbf{R}$ is strongly convex with constant $\sigma > 0$ and the function $x \mapsto \langle y - x, K'(x) \rangle$ is weakly upper semicontinuous for each $y \in H$;

(ii) for each $x \in H$ and $r > 0$, there exists a bounded subset $D_x \subset C$ and $y_x \in C$ such that, for any $z \in C \setminus D_x$,

$$\Theta(z, y_x) + \varphi(y_x) - \varphi(z) + \frac{1}{r} \langle K'(z) - K'(x), y_x - z \rangle < 0. \quad (20)$$

Then the following hold:

- (a) for each $x \in H$, $S_r^{(\Theta, \varphi)}(x) \neq \emptyset$,
- (b) $S_r^{(\Theta, \varphi)}$ is single valued,
- (c) $S_r^{(\Theta, \varphi)}$ is nonexpansive if K' is Lipschitz continuous with constant $\nu > 0$ and

$$\begin{aligned} & \langle K'(x_1) - K'(x_2), u_1 - u_2 \rangle \\ & \leq \langle K'(u_1) - K'(u_2), u_1 - u_2 \rangle, \quad (21) \\ & \forall (x_1, x_2) \in H \times H, \end{aligned}$$

where $u_i = S_r^{(\Theta, \varphi)}(x_i)$ for $i = 1, 2$,

- (d) for all $s, t > 0$ and $x \in H$

$$\begin{aligned} & \langle K'(S_s^{(\Theta, \varphi)}x) - K'(S_t^{(\Theta, \varphi)}x), S_s^{(\Theta, \varphi)}x - S_t^{(\Theta, \varphi)}x \rangle \\ & \leq \frac{s-t}{s} \langle K'(S_s^{(\Theta, \varphi)}x) - K'(x), S_s^{(\Theta, \varphi)}x - S_t^{(\Theta, \varphi)}x \rangle; \quad (22) \end{aligned}$$

- (e) $\text{Fix}(S_r^{(\Theta, \varphi)}) = \text{MEP}(\Theta, \varphi)$,
- (f) $\text{MEP}(\Theta, \varphi)$ is closed and convex.

In particular, whenever $\Theta : C \times C \rightarrow \mathbf{R}$ is a bifunction satisfying the conditions (H1)–(H4) and $K(x) = (1/2)\|x\|^2$, for all $x \in H$, then that is, for any $x, y \in H$,

$$\|S_r^{(\Theta, \varphi)}x - S_r^{(\Theta, \varphi)}y\|^2 \leq \langle S_r^{(\Theta, \varphi)}x - S_r^{(\Theta, \varphi)}y, x - y \rangle \quad (23)$$

($S_r^{(\Theta, \varphi)}$ is firmly nonexpansive) and

$$\begin{aligned} & \|S_s^{(\Theta, \varphi)}x - S_t^{(\Theta, \varphi)}x\| \\ & \leq \frac{|s-t|}{s} \|S_s^{(\Theta, \varphi)}x - x\|, \quad \forall s, t > 0, x \in H. \quad (24) \end{aligned}$$

In this case, $S_r^{(\Theta, \varphi)}$ is rewritten as $T_r^{(\Theta, \varphi)}$. If, in addition, $\varphi \equiv 0$, then $T_r^{(\Theta, \varphi)}$ is rewritten as T_r^Θ .

Remark 5. Suppose $K : H \rightarrow \mathbf{R}$ is strongly convex with constant $\sigma > 0$ and $K' : H \rightarrow H$ is Lipschitz continuous with constant $\nu > 0$. Then $K' : H \rightarrow H$ is σ -strongly monotone and ν -Lipschitz continuous with positive constants $\sigma, \nu > 0$. Utilizing Proposition 4 (d) we obtain that, for all $s, t > 0$ and $x \in H$,

$$\|S_s^{(\Theta, \varphi)}x - S_t^{(\Theta, \varphi)}x\| \leq \frac{|s-t|}{s} \cdot \frac{\nu}{\sigma} \|S_s^{(\Theta, \varphi)}x - x\|. \quad (25)$$

We need some facts and tools in a real Hilbert space H which are listed as lemmas below.

Lemma 6. Let X be a real inner product space. Then there holds the following inequality:

$$\|x + y\|^2 \leq \|x\|^2 + 2 \langle y, x + y \rangle, \quad \forall x, y \in X. \quad (26)$$

Lemma 7. Let H be a real Hilbert space. Then the following hold:

- (a) $\|x - y\|^2 = \|x\|^2 - \|y\|^2 - 2 \langle x - y, y \rangle$ for all $x, y \in H$;
- (b) $\|\lambda x + \mu y + \nu z\|^2 = \lambda \|x\|^2 + \mu \|y\|^2 + \nu \|z\|^2 - \lambda \mu \|x - y\|^2 - \lambda \nu \|x - z\|^2 - \mu \nu \|y - z\|^2$ for all $x, y, z \in H$ and $\lambda, \mu, \nu \in [0, 1]$ with $\lambda + \mu + \nu = 1$;
- (c) if $\{x_n\}$ is a sequence in H such that $x_n \rightarrow x$, it follows that

$$\begin{aligned} & \limsup_{n \rightarrow \infty} \|x_n - y\|^2 \\ & = \limsup_{n \rightarrow \infty} \|x_n - x\|^2 + \|x - y\|^2, \quad \forall y \in H. \quad (27) \end{aligned}$$

We have the following crucial lemmas concerning the W -mappings defined by (9).

Lemma 8 (see [18, Lemma 3.2]). Let $\{T_n\}_{n=1}^\infty$ be a sequence of nonexpansive self-mappings on H such that $\bigcap_{n=1}^\infty \text{Fix}(T_n) \neq \emptyset$ and let $\{\lambda_n\}$ be a sequence in $(0, b]$ for some $b \in (0, 1)$. Then, for every $x \in H$ and $k \geq 1$ the limit $\lim_{n \rightarrow \infty} U_{n,k}x$ exists, where $U_{n,k}$ is defined by (9).

Lemma 9 (see [18, Lemma 3.3]). Let $\{T_n\}_{n=1}^\infty$ be a sequence of nonexpansive self-mappings on H such that $\bigcap_{n=1}^\infty \text{Fix}(T_n) \neq \emptyset$, and let $\{\lambda_n\}$ be a sequence in $(0, b]$ for some $b \in (0, 1)$. Then, $\text{Fix}(W) = \bigcap_{n=1}^\infty \text{Fix}(T_n)$.

Lemma 10 (see [19, Demiclosedness Principle]). Let C be a nonempty closed convex subset of a real Hilbert space H . Let T be a nonexpansive self-mapping on C . Then $I - T$ is demiclosed. That is, whenever $\{x_n\}$ is a sequence in C weakly converging to some $x \in C$ and the sequence $\{(I - T)x_n\}$ strongly converges to some y , it follows that $(I - T)x = y$. Here I is the identity operator of H .

Lemma 11. Let $A : C \rightarrow H$ be a monotone mapping. In the context of the variational inequality problem the characterization of the projection (see Proposition 3 (i)) implies

$$u \in \text{VI}(C, A) \iff u = P_C(u - \lambda Au), \quad \lambda > 0. \quad (28)$$

Lemma 12 (see [20]). Let $\{x_n\}$ and $\{z_n\}$ be bounded sequences in a real Banach space X and $\{\beta_n\}$ a sequence in $[0, 1]$ with $0 < \liminf_{n \rightarrow \infty} \beta_n \leq \limsup_{n \rightarrow \infty} \beta_n < 1$. Suppose

$$\begin{aligned} & x_{n+1} = \beta_n x_n + (1 - \beta_n) z_n, \quad \forall n \geq 0, \\ & \limsup_{n \rightarrow \infty} (\|z_{n+1} - z_n\| - \|x_{n+1} - x_n\|) \leq 0. \quad (29) \end{aligned}$$

Then, $\lim_{n \rightarrow \infty} \|z_n - x_n\| = 0$.

Lemma 13 (see [21]). Assume that $\{a_n\}$ is a sequence of nonnegative real numbers such that

$$a_{n+1} \leq (1 - \delta_n) a_n + \sigma_n \delta_n, \quad \forall n \geq 1, \quad (30)$$

where $\{\delta_n\}$ is a sequence in $[0, 1]$ and $\{\sigma_n\}$ is a real sequence such that

- (i) $\sum_{n=1}^{\infty} \delta_n = \infty$;
- (ii) $\limsup_{n \rightarrow \infty} \sigma_n \leq 0$ or $\sum_{n=1}^{\infty} |\sigma_n \delta_n| < \infty$.

Then $\lim_{n \rightarrow \infty} a_n = 0$.

Recall that a set-valued mapping $T : D(T) \subset H \rightarrow 2^H$ is called monotone if, for all $x, y \in D(T)$, $f \in Tx$ and $g \in Ty$ imply

$$\langle f - g, x - y \rangle \geq 0. \quad (31)$$

A set-valued mapping T is called maximal monotone if T is monotone and $(I + \lambda T)D(T) = H$ for each $\lambda > 0$, where I is the identity mapping of H . We denote by $G(T)$ the graph of T . It is known that a monotone mapping T is maximal if and only if, for $(x, f) \in H \times H$, $\langle f - g, x - y \rangle \geq 0$ for every $(y, g) \in G(T)$ implies $f \in Tx$. Next we provide an example to illustrate the concept of maximal monotone mapping.

Let $A : C \rightarrow H$ be a monotone, k -Lipschitz-continuous mapping and let $N_C v$ be the normal cone to C at $v \in C$; that is,

$$N_C v = \{w \in H : \langle v - u, w \rangle \geq 0, \forall u \in C\}. \quad (32)$$

Define

$$Tv = \begin{cases} Av + N_C v, & \text{if } v \in C, \\ \emptyset, & \text{if } v \notin C. \end{cases} \quad (33)$$

Then, T is maximal monotone and $0 \in Tv$ if and only if $v \in VI(C, A)$; see [13].

Assume that $R : D(R) \subset H \rightarrow 2^H$ is a maximal monotone mapping. Let $\lambda > 0$. In terms of Huang [14], there holds the following property for the resolvent operator $J_{R, \lambda} : H \rightarrow \overline{D(R)}$.

Lemma 14. $J_{R, \lambda}$ is single valued and firmly nonexpansive; that is,

$$\langle J_{R, \lambda} x - J_{R, \lambda} y, x - y \rangle \geq \|J_{R, \lambda} x - J_{R, \lambda} y\|^2, \quad \forall x, y \in H. \quad (34)$$

Consequently, $J_{R, \lambda}$ is nonexpansive and monotone.

Lemma 15 (see [9]). Let R be a maximal monotone mapping with $D(R) = C$. Then, for any given $\lambda > 0$, $u \in C$ is a solution of problem (11) if and only if $u \in C$ satisfies

$$u = J_{R, \lambda}(u - \lambda Bu). \quad (35)$$

Lemma 16 (see [15]). Let R be a maximal monotone mapping with $D(R) = C$ and let $B : C \rightarrow H$ be a strongly monotone, continuous, and single-valued mapping. Then, for each $z \in H$, the equation $z \in (B + \lambda R)x$ has a unique solution x_λ for $\lambda > 0$.

Lemma 17 (see [9]). Let R be a maximal monotone mapping with $D(R) = C$ and $B : C \rightarrow H$ a monotone, continuous, and single-valued mapping. Then $(I + \lambda(R + B))C = H$ for each $\lambda > 0$. In this case, $R + B$ is maximal monotone.

Lemma 18 (see [22, Lemma 2.8]). Let $\{a_n\}_{n=1}^{\infty}$ be a bounded sequence of nonnegative real numbers and $\{b_n\}_{n=1}^{\infty}$ a sequence of real numbers such that $\limsup_{n \rightarrow \infty} b_n \leq 0$. Then, $\limsup_{n \rightarrow \infty} a_n b_n \leq 0$.

3. Main Results

We will introduce and analyze an iterative algorithm by relaxed extragradient-like viscosity method for finding a solution of a generalized equilibrium problem with constraints of several problems: a finite family of variational inclusions, a finite family of variational inequalities, and a fixed point problem in a real Hilbert space. Under appropriate conditions imposed on the parameter sequences we will prove strong convergence of the proposed algorithm.

Theorem 19. Let C be a nonempty closed convex subset of a real Hilbert space H . Let M and N be two integers. Let Θ be a bifunction from $C \times C$ to $\mathbf{R}$ satisfying (H1)–(H4) and $\varphi : C \rightarrow \mathbf{R}$ a lower semicontinuous and convex functional. Let $R_i : C \rightarrow 2^H$ be a maximal monotone mapping and let $A : H \rightarrow H$, $A_k : C \rightarrow H$, and $B_i : C \rightarrow H$ be ζ -inverse strongly monotone, ζ_k -inverse strongly monotone, and η_i -inverse strongly monotone, respectively, where $k \in \{1, 2, \dots, M\}$ and $i \in \{1, 2, \dots, N\}$. Let $\{T_n\}_{n=1}^{\infty}$ be a sequence of nonexpansive mappings on H and $\{\lambda_n\}$ a sequence in $(0, b]$ for some $b \in (0, 1)$. Let V be a $\bar{\gamma}$ -strongly positive bounded linear operator with $\bar{\gamma} \in (1, 2)$ and $f : H \rightarrow H$ a ρ -contraction with $\rho \in (0, 1)$. Let W_n be the W -mapping defined by (9). Assume that $\Omega := \cap_{n=1}^{\infty} \text{Fix}(T_n) \cap \text{GMEP}(\Theta, \varphi, A) \cap \cap_{k=1}^M VI(C, A_k) \cap \cap_{i=1}^N I(B_i, R_i) \neq \emptyset$. Define $\Delta_k = P_C(I - \nu_k A_k) \cdots P_C(I - \nu_1 A_1)$ and $\Lambda_i = J_{R_i, \mu_i}(I - \mu_i B_i) \cdots J_{R_1, \mu_1}(I - \mu_1 B_1)$ for each $k \in \{1, 2, \dots, M\}$ and $i \in \{1, 2, \dots, N\}$. Let $\{\alpha_n\}$, $\{\beta_n\}$, and $\{\gamma_n\}$ be three sequences in $[0, 1]$. Assume that

- (i) $K : H \rightarrow \mathbf{R}$ is strongly convex with constant $\sigma > 0$ and its derivative K' is Lipschitz continuous with constant $\nu > 0$ such that the function $x \mapsto \langle y - x, K'(x) \rangle$ is weakly upper semicontinuous for each $y \in H$,
- (ii) for each $x \in H$, there exist a bounded subset $D_x \subset C$ and $z_x \in C$ such that, for any $y \notin D_x$,

$$\begin{aligned} & \Theta(y, z_x) + \varphi(z_x) - \varphi(y) \\ & + \frac{1}{r} \langle K'(y) - K'(x), z_x - y \rangle < 0; \end{aligned} \quad (36)$$

- (iii) $\{\alpha_n\} \subset [0, 1 - \rho]$ and $\sum_{n=1}^{\infty} \alpha_n = \infty$,
- (iv) $\liminf_{n \rightarrow \infty} \gamma_n > 0$ and $0 < \liminf_{n \rightarrow \infty} \beta_n \leq \limsup_{n \rightarrow \infty} (\beta_n + \gamma_n \|V\|) < 1$,
- (v) $\lim_{n \rightarrow \infty} (|\alpha_{n+1}/(1 - (1 - \alpha_{n+1})\beta_{n+1}) - \alpha_n/(1 - (1 - \alpha_n)\beta_n)| + |\gamma_{n+1}/(1 - \beta_{n+1}) - \gamma_n/(1 - \beta_n)|) = 0$,
- (vi) $\{r_n\} \subset [0, 2\zeta]$, $\lim_{n \rightarrow \infty} |r_{n+1} - r_n| = 0$ and $0 < \liminf_{n \rightarrow \infty} r_n \leq \limsup_{n \rightarrow \infty} r_n < 2\zeta$.

Given $x_1 \in H$ arbitrarily, the sequence $\{x_n\}$ is generated iteratively by

$$\begin{aligned} u_n &= S_{r_n}^{(\Theta, \varphi)} (I - r_n A) x_n, \\ \gamma_n &= \beta_n x_n + \gamma_n W_n \Delta_M u_n + [(1 - \beta_n) I - \gamma_n V] W_n \Lambda_N u_n, \\ x_{n+1} &= \alpha_n f(x_n) + (1 - \alpha_n) \gamma_n, \quad \forall n \geq 1, \end{aligned} \quad (37)$$

where $\nu_k \in (0, 2\zeta_k)$ and $\mu_i \in (0, 2\eta_i)$ for each $k \in \{1, 2, \dots, M\}$ and $i \in \{1, 2, \dots, N\}$. If $\alpha_n(f(x_n) - x_n) \rightarrow 0$ and $S_r^{(\Theta, \varphi)}$ is firmly nonexpansive, then

$$x_n \rightarrow x^* \iff \limsup_{n \rightarrow \infty} \langle (I - V)x^*, x_n - x^* \rangle \leq 0, \quad (38)$$

where x^* is a unique solution in Ω to the VIP

$$\langle (I - f)x^*, x^* - x \rangle \leq 0, \quad \forall x \in \Omega. \quad (39)$$

Proof. As $\liminf_{n \rightarrow \infty} \gamma_n > 0$, $0 < \liminf_{n \rightarrow \infty} \beta_n \leq \limsup_{n \rightarrow \infty} (\beta_n + \gamma_n \|V\|) < 1$, and $0 < \liminf_{n \rightarrow \infty} r_n \leq \limsup_{n \rightarrow \infty} r_n < 2\zeta$, we may assume, without loss of generality, that $\{\beta_n\}, \{\gamma_n\} \subset [a, \hat{a}] \subset (0, 1)$, $\{r_n\} \subset [c, \hat{c}] \subset (0, 2\zeta)$ and $\beta_n + \gamma_n \|V\| \leq 1$ for all $n \geq 1$. Put

$$\begin{aligned} \Delta_k &= P_C(I - \nu_k A_k) \cdots P_C(I - \nu_1 A_1), \\ \Lambda_i &= J_{R_i, \mu_i}(I - \mu_i B_i) \cdots J_{R_i, \mu_1}(I - \mu_1 B_1), \end{aligned} \quad (40)$$

for each $k \in \{1, 2, \dots, M\}$ and $i \in \{1, 2, \dots, N\}$, and $\Delta_0 = \Lambda_0 = I$, where I is the identity mapping on H . Moreover, set $\nu_n = \Delta_M u_n$ and $w_n = \Lambda_N u_n$.

Since V is a $\bar{\gamma}$ -strongly positive bounded linear operator on H , we know that

$$\|V\| = \sup \{ \langle Vu, u \rangle : u \in H, \|u\| = 1 \} \geq \bar{\gamma} > 1. \quad (41)$$

Taking into account that $\beta_n + \gamma_n \|V\| \leq 1$ for all $n \geq 1$, we have

$$\begin{aligned} \langle ((1 - \beta_n)I - \gamma_n V)u, u \rangle &= 1 - \beta_n - \gamma_n \langle Vu, u \rangle \\ &\geq 1 - \beta_n - \gamma_n \|V\| \\ &\geq 0. \end{aligned} \quad (42)$$

That is, $(1 - \beta_n)I - \gamma_n V$ is positive. It follows that

$$\begin{aligned} &\|(1 - \beta_n)I - \gamma_n V\| \\ &= \sup \{ \langle ((1 - \beta_n)I - \gamma_n V)u, u \rangle : u \in H, \|u\| = 1 \} \\ &= \sup \{ 1 - \beta_n - \gamma_n \langle Vu, u \rangle : u \in H, \|u\| = 1 \} \\ &\leq 1 - \beta_n - \gamma_n \bar{\gamma}. \end{aligned} \quad (43)$$

In the meantime, it is not hard to find that Δ_M and Λ_N are nonexpansive. As a matter of fact, observe that, for all $x, y \in C$,

$$\begin{aligned} &\|\Delta_M x - \Delta_M y\|^2 \\ &= \|P_C(I - \nu_M A_M) \Delta_{M-1} x - P_C(I - \nu_M A_M) \Delta_{M-1} y\|^2 \\ &\leq \|(I - \nu_M A_M) \Delta_{M-1} x - (I - \nu_M A_M) \Delta_{M-1} y\|^2 \\ &= \|(\Delta_{M-1} x - \Delta_{M-1} y) - \nu_M (A_M \Delta_{M-1} x - A_M \Delta_{M-1} y)\|^2 \\ &\leq \|\Delta_{M-1} x - \Delta_{M-1} y\|^2 \\ &\quad + \nu_M (\nu_M - 2\zeta_M) \|A_M \Delta_{M-1} x - A_M \Delta_{M-1} y\|^2 \\ &\leq \|\Delta_{M-1} x - \Delta_{M-1} y\|^2 \\ &\vdots \\ &\leq \|\Delta_0 x - \Delta_0 y\|^2 \\ &= \|x - y\|^2, \\ &\|\Lambda_N x - \Lambda_N y\|^2 \\ &= \|J_{R_N, \mu_N}(I - \mu_N B_N) \Lambda_{N-1} x - J_{R_N, \mu_N}(I - \mu_N B_N) \Lambda_{N-1} y\|^2 \\ &\leq \|(I - \mu_N B_N) \Lambda_{N-1} x - (I - \mu_N B_N) \Lambda_{N-1} y\|^2 \\ &= \|(\Lambda_{N-1} x - \Lambda_{N-1} y) - \mu_N (B_N \Lambda_{N-1} x - B_N \Lambda_{N-1} y)\|^2 \\ &\leq \|\Lambda_{N-1} x - \Lambda_{N-1} y\|^2 \\ &\quad + \mu_N (\mu_N - 2\eta_N) \|B_N \Lambda_{N-1} x - B_N \Lambda_{N-1} y\|^2 \\ &\leq \|\Lambda_{N-1} x - \Lambda_{N-1} y\|^2 \\ &\vdots \\ &\leq \|\Lambda_0 x - \Lambda_0 y\|^2 \\ &= \|x - y\|^2. \end{aligned} \quad (44)$$

In addition, note that

$$\begin{aligned} &\langle (I - f)x - (I - f)y, x - y \rangle \\ &= \|x - y\|^2 - \langle f(x) - f(y), x - y \rangle \\ &\geq (1 - \rho) \|x - y\|^2, \quad \forall x, y \in H, \\ &\|(I - f)x - (I - f)y\| \\ &= \|x - y\| + \|f(x) - f(y)\| \\ &\leq (1 + \rho) \|x - y\|, \quad \forall x, y \in H. \end{aligned} \quad (45)$$

That is, $I - f$ is strongly monotone and Lipschitz continuous. So, there exists a unique solution x^* in Ω to the VIP

$$\langle (I - f)x^*, x^* - x \rangle \leq 0, \quad \forall x \in \Omega. \quad (46)$$

That is, $x^* \in \text{VI}(\Omega, I - f)$.

We divide the rest of the proof into several steps.

Step 1. We show that $\{x_n\}$ is bounded. Indeed, take $p \in \Omega$ arbitrarily. Since $p = S_{r_n}^{(\Theta, \varphi)}(p - r_n A p)$, A is ζ -inverse strongly monotone, and $0 \leq r_n \leq 2\zeta$, we have, for any $n \geq 1$,

$$\begin{aligned} \|u_n - p\|^2 &= \|S_{r_n}^{(\Theta, \varphi)}(I - r_n A)x_n - S_{r_n}^{(\Theta, \varphi)}(I - r_n A)p\|^2 \\ &\leq \|(I - r_n A)x_n - (I - r_n A)p\|^2 \\ &= \|(x_n - p) - r_n(Ax_n - Ap)\|^2 \\ &= \|x_n - p\|^2 - 2r_n \langle x_n - p, Ax_n - Ap \rangle \\ &\quad + r_n^2 \|Ax_n - Ap\|^2 \\ &\leq \|x_n - p\|^2 - 2r_n \zeta \|Ax_n - Ap\|^2 \\ &\quad + r_n^2 \|Ax_n - Ap\|^2 \\ &= \|x_n - p\|^2 + r_n(r_n - 2\zeta) \|Ax_n - Ap\|^2 \\ &\leq \|x_n - p\|^2. \end{aligned} \quad (47)$$

Since $p = P_C(I - \nu_k A_k)p$, $\Delta_k p = p$, and A_k is ζ_k -inverse strongly monotone, where $\nu_k \in (0, 2\zeta_k)$, $k \in \{1, 2, \dots, M\}$, by Proposition 3 we obtain that for each $n \geq 1$

$$\begin{aligned} \|\nu_n - p\|^2 &\leq \|(I - \nu_M A_M)\Delta_{M-1}u_n - (I - \nu_M A_M)\Delta_{M-1}p\|^2 \\ &\leq \|\Delta_{M-1}u_n - \Delta_{M-1}p\|^2 \\ &\quad + \nu_M(\nu_M - 2\zeta_M) \|A_M \Delta_{M-1}u_n - A_M \Delta_{M-1}p\|^2 \\ &\leq \|\Delta_{M-1}u_n - \Delta_{M-1}p\|^2 \\ &\vdots \\ &\leq \|\Delta_0 u_n - \Delta_0 p\|^2 \\ &= \|u_n - p\|^2. \end{aligned} \quad (48)$$

Since $p = J_{R_i, \mu_i}(I - \mu_i B_i)p$, $\Lambda_i p = p$, and B_i is η_i -inverse strongly monotone, where $\mu_i \in (0, 2\eta_i)$, $i \in \{1, 2, \dots, N\}$, by Lemma 14 we deduce that for each $n \geq 1$

$$\begin{aligned} \|w_n - p\|^2 &\leq \|(I - \mu_N B_N)\Lambda_{N-1}u_n - (I - \mu_N B_N)\Lambda_{N-1}p\|^2 \\ &\leq \|\Lambda_{N-1}u_n - \Lambda_{N-1}p\|^2 \\ &\quad + \mu_N(\mu_N - 2\eta_N) \|B_N \Lambda_{N-1}u_n - B_N \Lambda_{N-1}p\|^2 \\ &\leq \|\Lambda_{N-1}u_n - \Lambda_{N-1}p\|^2 \\ &\vdots \\ &\leq \|\Lambda_0 u_n - \Lambda_0 p\|^2 \\ &= \|u_n - p\|^2. \end{aligned} \quad (49)$$

Hence from (37)–(49), we have

$$\begin{aligned} \|y_n - p\| &= \|\beta_n(x_n - p) + \gamma_n(W_n \Delta_M u_n - p)\| \\ &\quad + [(1 - \beta_n)I - \gamma_n V](W_n \Lambda_N u_n - p) + \gamma_n(I - V)p\| \\ &\leq \beta_n \|x_n - p\| + \gamma_n \|W_n \Delta_M u_n - p\| \\ &\quad + \|(1 - \beta_n)I - \gamma_n V\| \|W_n \Lambda_N u_n - p\| + \gamma_n \|(I - V)p\| \\ &\leq \beta_n \|x_n - p\| + \gamma_n \|W_n v_n - p\| \\ &\quad + (1 - \beta_n - \gamma_n \bar{\gamma}) \|W_n w_n - p\| + \gamma_n \|(I - V)p\| \\ &\leq \beta_n \|x_n - p\| + \gamma_n \|v_n - p\| \\ &\quad + (1 - \beta_n - \gamma_n \bar{\gamma}) \|w_n - p\| + \gamma_n \|(I - V)p\| \\ &\leq \beta_n \|x_n - p\| + \gamma_n \|u_n - p\| \\ &\quad + (1 - \beta_n - \gamma_n \bar{\gamma}) \|u_n - p\| + \gamma_n \|(I - V)p\| \\ &\leq \beta_n \|x_n - p\| + \gamma_n \|x_n - p\| \\ &\quad + (1 - \beta_n - \gamma_n \bar{\gamma}) \|x_n - p\| + \gamma_n \|(I - V)p\| \\ &= (1 - \gamma_n(\bar{\gamma} - 1)) \|x_n - p\| + \gamma_n \|(I - V)p\| \\ &= (1 - \gamma_n(\bar{\gamma} - 1)) \|x_n - p\| + \gamma_n(\bar{\gamma} - 1) \frac{\|(I - V)p\|}{\bar{\gamma} - 1} \\ &\leq \max \left\{ \|x_n - p\|, \frac{\|(I - V)p\|}{\bar{\gamma} - 1} \right\}. \end{aligned} \quad (50)$$

Since $f : H \rightarrow H$ is a ρ -contraction with $\rho \in (0, 1)$, from (37) and (50) we get

$$\begin{aligned}
& \|x_{n+1} - p\| \\
& \leq \alpha_n \|f(x_n) - p\| + (1 - \alpha_n) \|y_n - p\| \\
& \leq \alpha_n (\|f(x_n) - f(p)\| + \|f(p) - p\|) \\
& \quad + (1 - \alpha_n) \max \left\{ \|x_n - p\|, \frac{\|(I - V)p\|}{\bar{\gamma} - 1} \right\} \\
& \leq \alpha_n (\rho \|x_n - p\| + \|f(p) - p\|) \\
& \quad + (1 - \alpha_n) \max \left\{ \|x_n - p\|, \frac{\|(I - V)p\|}{\bar{\gamma} - 1} \right\} \\
& \leq \alpha_n \rho \max \left\{ \|x_n - p\|, \frac{\|(I - V)p\|}{\bar{\gamma} - 1} \right\} \\
& \quad + (1 - \alpha_n) \max \left\{ \|x_n - p\|, \frac{\|(I - V)p\|}{\bar{\gamma} - 1} \right\} \quad (51) \\
& \quad + \alpha_n \|f(p) - p\| \\
& = (1 - \alpha_n (1 - \rho)) \max \left\{ \|x_n - p\|, \frac{\|(I - V)p\|}{\bar{\gamma} - 1} \right\} \\
& \quad + \alpha_n \|(I - f)p\| \\
& = (1 - \alpha_n (1 - \rho)) \max \left\{ \|x_n - p\|, \frac{\|(I - V)p\|}{\bar{\gamma} - 1} \right\} \\
& \quad + \alpha_n (1 - \rho) \frac{\|(I - f)p\|}{1 - \rho} \\
& \leq \max \left\{ \|x_n - p\|, \frac{\|(I - V)p\|}{\bar{\gamma} - 1}, \frac{\|(I - f)p\|}{1 - \rho} \right\}.
\end{aligned}$$

By induction, we get

$$\|x_n - p\| \leq \max \left\{ \|x_1 - p\|, \frac{\|(I - V)p\|}{\bar{\gamma} - 1}, \frac{\|(I - f)p\|}{1 - \rho} \right\}. \quad (52)$$

Therefore, $\{x_n\}$ is bounded and so are the sequences $\{u_n\}$, $\{v_n\}$, $\{w_n\}$, $\{f(x_n)\}$, and $\{W_n w_n\}$.

Step 2. We show that $\lim_{n \rightarrow \infty} \|x_n - x_{n+1}\| = 0$ and $\lim_{n \rightarrow \infty} \|x_n - y_n\| = 0$. Indeed, put $\sigma_n = (1 - \alpha_n)\beta_n$, for all $n \geq 1$. Then it follows from conditions (iii) and (iv) that

$$\begin{aligned}
\beta_n & \geq \sigma_n = (1 - \alpha_n) \beta_n \\
& \geq (1 - (1 - \rho)) \beta_n = \rho \beta_n, \quad \forall n \geq 1,
\end{aligned} \quad (53)$$

and hence

$$0 < \liminf_{n \rightarrow \infty} \sigma_n \leq \limsup_{n \rightarrow \infty} \sigma_n < 1. \quad (54)$$

Define

$$x_{n+1} = \sigma_n x_n + (1 - \sigma_n) z_n, \quad \forall n \geq 1. \quad (55)$$

Observe that

$$\begin{aligned}
& z_{n+1} - z_n \\
& = \frac{x_{n+2} - \sigma_{n+1} x_{n+1}}{1 - \sigma_{n+1}} - \frac{x_{n+1} - \sigma_n x_n}{1 - \sigma_n} \\
& = \frac{\alpha_{n+1} f(x_{n+1}) + (1 - \alpha_{n+1}) y_{n+1} - \sigma_{n+1} x_{n+1}}{1 - \sigma_{n+1}} \\
& \quad - \frac{\alpha_n f(x_n) + (1 - \alpha_n) y_n - \sigma_n x_n}{1 - \sigma_n} \\
& = \left(\frac{\alpha_{n+1} f(x_{n+1})}{1 - \sigma_{n+1}} - \frac{\alpha_n f(x_n)}{1 - \sigma_n} \right) \\
& \quad - ((1 - \alpha_n) [\beta_n x_n + \gamma_n W_n v_n \\
& \quad + [(1 - \beta_n) I - \gamma_n V] W_n w_n] - \sigma_n x_n) \\
& \quad \times (1 - \sigma_n)^{-1} \\
& \quad + ((1 - \alpha_{n+1}) [\beta_{n+1} x_{n+1} + \gamma_{n+1} W_{n+1} v_{n+1} \\
& \quad + [(1 - \beta_{n+1}) I - \gamma_{n+1} V] W_{n+1} w_{n+1}] \\
& \quad - \sigma_{n+1} x_{n+1}) \times (1 - \sigma_{n+1})^{-1} \\
& = \left(\frac{\alpha_{n+1} f(x_{n+1})}{1 - \sigma_{n+1}} - \frac{\alpha_n f(x_n)}{1 - \sigma_n} \right) + \frac{1 - \alpha_{n+1}}{1 - \sigma_{n+1}} \\
& \quad \times (\gamma_{n+1} W_{n+1} v_{n+1} + ((1 - \beta_{n+1}) I - \gamma_{n+1} V) W_{n+1} w_{n+1}) \\
& \quad - \frac{1 - \alpha_n}{1 - \sigma_n} (\gamma_n W_n v_n + ((1 - \beta_n) I - \gamma_n V) W_n w_n) \\
& = \left(\frac{\alpha_{n+1} f(x_{n+1})}{1 - \sigma_{n+1}} - \frac{\alpha_n f(x_n)}{1 - \sigma_n} \right) \\
& \quad + \frac{(1 - \alpha_{n+1})(1 - \beta_{n+1})}{1 - \sigma_{n+1}} \\
& \quad \times \left[\frac{\gamma_{n+1} W_{n+1} v_{n+1} + ((1 - \beta_{n+1}) I - \gamma_{n+1} V) W_{n+1} w_{n+1}}{1 - \beta_{n+1}} \right. \\
& \quad \left. - \frac{\gamma_n W_n v_n + ((1 - \beta_n) I - \gamma_n V) W_n w_n}{1 - \beta_n} \right] \\
& \quad + \left[\frac{(1 - \alpha_{n+1})(1 - \beta_{n+1})}{1 - \sigma_{n+1}} - \frac{(1 - \alpha_n)(1 - \beta_n)}{1 - \sigma_n} \right] \\
& \quad \times \frac{\gamma_n W_n v_n + ((1 - \beta_n) I - \gamma_n V) W_n w_n}{1 - \beta_n} \\
& = \frac{\alpha_{n+1}}{1 - \sigma_{n+1}} (f(x_{n+1}) - f(x_n)) \\
& \quad + \left(\frac{\alpha_{n+1}}{1 - \sigma_{n+1}} - \frac{\alpha_n}{1 - \sigma_n} \right) f(x_n) + \frac{(1 - \alpha_{n+1})(1 - \beta_{n+1})}{1 - \sigma_{n+1}}
\end{aligned}$$

$$\begin{aligned}
& \times \left[\frac{\gamma_{n+1}}{1-\beta_{n+1}} W_{n+1} v_{n+1} - \frac{\gamma_n}{1-\beta_n} W_n v_n + W_{n+1} w_{n+1} \right. \\
& \quad \left. - W_n w_n + \frac{\gamma_n}{1-\beta_n} V W_n w_n - \frac{\gamma_{n+1}}{1-\beta_{n+1}} V W_{n+1} w_{n+1} \right] \\
& - \left(\frac{\alpha_{n+1}}{1-\sigma_{n+1}} - \frac{\alpha_n}{1-\sigma_n} \right) \\
& \times \frac{\gamma_n W_n v_n + ((1-\beta_n)I - \gamma_n V) W_n w_n}{1-\beta_n} \\
& = \frac{\alpha_{n+1}}{1-\sigma_{n+1}} (f(x_{n+1}) - f(x_n)) \\
& + \left(\frac{\alpha_{n+1}}{1-\sigma_{n+1}} - \frac{\alpha_n}{1-\sigma_n} \right) f(x_n) + \frac{(1-\alpha_{n+1})(1-\beta_{n+1})}{1-\sigma_{n+1}} \\
& \times \left[\left(\frac{\gamma_{n+1}}{1-\beta_{n+1}} - \frac{\gamma_n}{1-\beta_n} \right) (W_{n+1} v_{n+1} - V W_{n+1} w_{n+1}) \right. \\
& \quad + (W_{n+1} v_{n+1} - W_n v_n) \frac{\gamma_n}{1-\beta_n} \\
& \quad \left. + \frac{((1-\beta_n)I - \gamma_n V) (W_{n+1} w_{n+1} - W_n w_n)}{1-\beta_n} \right] \\
& - \left(\frac{\alpha_{n+1}}{1-\sigma_{n+1}} - \frac{\alpha_n}{1-\sigma_n} \right) \\
& \times \frac{\gamma_n W_n v_n + ((1-\beta_n)I - \gamma_n V) W_n w_n}{1-\beta_n}, \\
\end{aligned} \tag{56}$$

and hence

$$\begin{aligned}
& \|z_{n+1} - z_n\| \\
& \leq \frac{\alpha_{n+1}}{1-\sigma_{n+1}} \|f(x_{n+1}) - f(x_n)\| \\
& + \left| \frac{\alpha_{n+1}}{1-\sigma_{n+1}} - \frac{\alpha_n}{1-\sigma_n} \right| \|f(x_n)\| \\
& + \frac{(1-\alpha_{n+1})(1-\beta_{n+1})}{1-\sigma_{n+1}} \\
& \times \left[\left| \frac{\gamma_{n+1}}{1-\beta_{n+1}} - \frac{\gamma_n}{1-\beta_n} \right| \|W_{n+1} v_{n+1} - V W_{n+1} w_{n+1}\| \right. \\
& \quad + \|W_{n+1} v_{n+1} - W_n v_n\| \frac{\gamma_n}{1-\beta_n} \\
& \quad \left. + \frac{\|((1-\beta_n)I - \gamma_n V) (W_{n+1} w_{n+1} - W_n w_n)\|}{1-\beta_n} \right] \\
& + \left| \frac{\alpha_{n+1}}{1-\sigma_{n+1}} - \frac{\alpha_n}{1-\sigma_n} \right| \frac{\|\gamma_n v_n + ((1-\beta_n)I - \gamma_n V) W_n w_n\|}{1-\beta_n} \\
& \leq \frac{\alpha_{n+1}}{1-\sigma_{n+1}} \rho \|x_{n+1} - x_n\| + \left| \frac{\alpha_{n+1}}{1-\sigma_{n+1}} - \frac{\alpha_n}{1-\sigma_n} \right| \|f(x_n)\|
\end{aligned}$$

$$\begin{aligned}
& + \frac{1-\alpha_{n+1}-\sigma_{n+1}}{1-\sigma_{n+1}} \\
& \times \left[\left| \frac{\gamma_{n+1}}{1-\beta_{n+1}} - \frac{\gamma_n}{1-\beta_n} \right| \|W_{n+1} v_{n+1} - V W_{n+1} w_{n+1}\| \right. \\
& \quad + \|W_{n+1} v_{n+1} - W_n v_n\| \frac{\gamma_n}{1-\beta_n} \\
& \quad \left. + \frac{(1-\beta_n - \gamma_n \bar{\gamma}) \|W_{n+1} w_{n+1} - W_n w_n\|}{1-\beta_n} \right] \\
& + \left| \frac{\alpha_{n+1}}{1-\sigma_{n+1}} - \frac{\alpha_n}{1-\sigma_n} \right| \\
& \times \frac{\gamma_n \|W_n v_n\| + (1-\beta_n - \gamma_n \bar{\gamma}) \|W_n w_n\|}{1-\beta_n} \\
& \leq \frac{\alpha_{n+1}}{1-\sigma_{n+1}} \|x_{n+1} - x_n\| \\
& + \left| \frac{\alpha_{n+1}}{1-\sigma_{n+1}} - \frac{\alpha_n}{1-\sigma_n} \right| \|f(x_n)\| \\
& + \frac{1-\alpha_{n+1}-\sigma_{n+1}}{1-\sigma_{n+1}} \\
& \times \left[\left| \frac{\gamma_{n+1}}{1-\beta_{n+1}} - \frac{\gamma_n}{1-\beta_n} \right| \|W_{n+1} v_{n+1} - V W_{n+1} w_{n+1}\| \right. \\
& \quad + \|W_{n+1} v_{n+1} - W_n v_n\| \frac{\gamma_n}{1-\beta_n} \\
& \quad \left. + \frac{(1-\beta_n - \gamma_n \bar{\gamma}) \|W_{n+1} w_{n+1} - W_n w_n\|}{1-\beta_n} \right] \\
& + \left| \frac{\alpha_{n+1}}{1-\sigma_{n+1}} - \frac{\alpha_n}{1-\sigma_n} \right| \frac{\|W_n v_n\| + \|W_n w_n\|}{1-\beta_n}. \\
\end{aligned} \tag{57}$$

From (9), since W_n , T_n , and $U_{n,i}$ are all nonexpansive, we have

$$\begin{aligned}
& \|W_{n+1} v_{n+1} - W_n v_n\| \\
& \leq \|W_{n+1} v_{n+1} - W_{n+1} v_n\| + \|W_{n+1} w_n - W_n v_n\| \\
& = \|W_{n+1} v_{n+1} - W_{n+1} v_n\| + \|\lambda_1 T_1 U_{n+1,2} v_n - \lambda_1 T_1 U_{n,2} v_n\| \\
& \leq \|v_{n+1} - v_n\| + \lambda_1 \|U_{n+1,2} v_n - U_{n,2} v_n\| \\
& = \|v_{n+1} - v_n\| + \lambda_1 \|\lambda_2 T_2 U_{n+1,3} v_n - \lambda_2 T_2 U_{n,3} v_n\| \\
& \leq \|v_{n+1} - v_n\| + \lambda_1 \lambda_2 \|U_{n+1,3} v_n - U_{n,3} v_n\| \\
& \vdots \\
& \leq \|v_{n+1} - v_n\| + \lambda_1 \lambda_2 \cdots \lambda_n \|U_{n+1,n+1} v_n - U_{n,n+1} v_n\| \\
& \leq \|v_{n+1} - v_n\| + \widetilde{M} \prod_{i=1}^n \lambda_i,
\end{aligned}$$

$$\begin{aligned}
& \|W_{n+1}w_{n+1} - W_n w_n\| \\
& \leq \|W_{n+1}w_{n+1} - W_{n+1}w_n\| + \|W_{n+1}w_n - W_n w_n\| \\
& = \|W_{n+1}w_{n+1} - W_{n+1}w_n\| \\
& \quad + \|\lambda_1 T_1 U_{n+1,2} w_n - \lambda_1 T_1 U_{n,2} w_n\| \\
& \leq \|w_{n+1} - w_n\| + \lambda_1 \|U_{n+1,2} w_n - U_{n,2} w_n\| \\
& = \|w_{n+1} - w_n\| + \lambda_1 \|\lambda_2 T_2 U_{n+1,3} w_n - \lambda_2 T_2 U_{n,3} w_n\| \\
& \leq \|w_{n+1} - w_n\| + \lambda_1 \lambda_2 \|U_{n+1,3} w_n - U_{n,3} w_n\| \\
& \vdots \\
& \leq \|w_{n+1} - w_n\| + \lambda_1 \lambda_2 \cdots \lambda_n \|U_{n+1,n+1} w_n - U_{n,n+1} w_n\| \\
& \leq \|w_{n+1} - w_n\| + \widetilde{M} \prod_{i=1}^n \lambda_i,
\end{aligned} \tag{58}$$

where $\sup_{n \geq 1} \{\|U_{n+1,n+1} v_n\| + \|U_{n,n+1} v_n\|\} \leq \widetilde{M}$ and $\sup_{n \geq 1} \{\|U_{n+1,n+1} w_n\| + \|U_{n,n+1} w_n\|\} \leq \widetilde{M}$ for some $\widetilde{M} > 0$.

On the other hand, we estimate $\|v_{n+1} - v_n\|$ and $\|w_{n+1} - w_n\|$. First observe that

$$\begin{aligned}
& \|v_{n+1} - v_n\|^2 \\
& = \|P_C(I - \nu_M A_M) \Delta_{M-1} u_{n+1} - P_C(I - \nu_M A_M) \Delta_{M-1} u_n\|^2 \\
& \leq \|(I - \nu_M A_M) \Delta_{M-1} u_{n+1} - (I - \nu_M A_M) \Delta_{M-1} u_n\|^2 \\
& = \|(\Delta_{M-1} u_{n+1} - \Delta_{M-1} u_n) \\
& \quad - \nu_M (A_M \Delta_{M-1} u_{n+1} - A_M \Delta_{M-1} u_n)\|^2 \\
& \leq \|\Delta_{M-1} u_{n+1} - \Delta_{M-1} u_n\|^2 \\
& \quad + \nu_M (\nu_M - 2\zeta_M) \|A_M \Delta_{M-1} u_{n+1} - A_M \Delta_{M-1} u_n\|^2 \\
& \leq \|\Delta_{M-1} u_{n+1} - \Delta_{M-1} u_n\|^2 \\
& \vdots \\
& \leq \|\Delta_0 u_{n+1} - \Delta_0 u_n\|^2 \\
& = \|u_{n+1} - u_n\|^2.
\end{aligned} \tag{59}$$

Utilizing Remark 5 and Lemma 14, we have

$$\begin{aligned}
& \|w_{n+1} - w_n\|^2 \\
& = \|J_{R_N, \mu_N} (I - \mu_N B_N) \Lambda_{N-1} u_{n+1} \\
& \quad - J_{R_N, \mu_N} (I - \mu_N B_N) \Lambda_{N-1} u_n\|^2 \\
& \leq \|(I - \mu_N B_N) \Lambda_{N-1} u_{n+1} - (I - \mu_N B_N) \Lambda_{N-1} u_n\|^2
\end{aligned}$$

$$\begin{aligned}
& = \|(\Lambda_{N-1} u_{n+1} - \Lambda_{N-1} u_n) \\
& \quad - \mu_N (B_N \Lambda_{N-1} u_{n+1} - B_N \Lambda_{N-1} u_n)\|^2 \\
& \leq \|\Lambda_{N-1} u_{n+1} - \Lambda_{N-1} u_n\|^2 \\
& \quad + \mu_N (\mu_N - 2\eta_N) \|B_N \Lambda_{N-1} u_{n+1} - B_N \Lambda_{N-1} u_n\|^2 \\
& \leq \|\Lambda_{N-1} u_{n+1} - \Lambda_{N-1} u_n\|^2 \\
& \vdots \\
& \leq \|\Lambda_0 u_{n+1} - \Lambda_0 u_n\|^2 \\
& = \|u_{n+1} - u_n\|^2, \\
& \|(I - r_{n+1} A) x_{n+1} - (I - r_n A) x_n\| \\
& = \|x_{n+1} - x_n - r_{n+1} (Ax_{n+1} - Ax_n) + (r_n - r_{n+1}) Ax_n\| \\
& \leq \|x_{n+1} - x_n - r_{n+1} (Ax_{n+1} - Ax_n)\| + |r_{n+1} - r_n| \|Ax_n\| \\
& \leq \|x_{n+1} - x_n\| + |r_{n+1} - r_n| \|Ax_n\|, \\
& \|u_{n+1} - u_n\| \\
& = \|S_{r_{n+1}}^{(\Theta, \varphi)} (I - r_{n+1} A) x_{n+1} - S_{r_n}^{(\Theta, \varphi)} (I - r_n A) x_n\| \\
& = \|S_{r_{n+1}}^{(\Theta, \varphi)} (I - r_{n+1} A) x_{n+1} - S_{r_{n+1}}^{(\Theta, \varphi)} (I - r_n A) x_n \\
& \quad + S_{r_{n+1}}^{(\Theta, \varphi)} (I - r_n A) x_n - S_{r_n}^{(\Theta, \varphi)} (I - r_n A) x_n\| \\
& \leq \|S_{r_{n+1}}^{(\Theta, \varphi)} (I - r_{n+1} A) x_{n+1} - S_{r_{n+1}}^{(\Theta, \varphi)} (I - r_n A) x_n\| \\
& \quad + \|S_{r_{n+1}}^{(\Theta, \varphi)} (I - r_n A) x_n - S_{r_n}^{(\Theta, \varphi)} (I - r_n A) x_n\| \\
& \leq \|(I - r_{n+1} A) x_{n+1} - (I - r_n A) x_n\| \\
& \quad + \|S_{r_{n+1}}^{(\Theta, \varphi)} (I - r_n A) x_n - S_{r_n}^{(\Theta, \varphi)} (I - r_n A) x_n\| \\
& \leq \|x_{n+1} - x_n\| + |r_{n+1} - r_n| \|Ax_n\| \\
& \quad + \|S_{r_{n+1}}^{(\Theta, \varphi)} (I - r_n A) x_n - S_{r_n}^{(\Theta, \varphi)} (I - r_n A) x_n\| \\
& \leq \|x_{n+1} - x_n\| + |r_{n+1} - r_n| \|Ax_n\| \\
& \quad + \frac{|r_{n+1} - r_n|}{r_{n+1}} \cdot \frac{\gamma}{\sigma} \|S_{r_{n+1}}^{(\Theta, \varphi)} (I - r_n A) x_n - (I - r_n A) x_n\| \\
& \leq \|x_{n+1} - x_n\| + |r_{n+1} - r_n| \\
& \quad \times \left(\|Ax_n\| + \frac{\gamma}{c\sigma} \|S_{r_{n+1}}^{(\Theta, \varphi)} (I - r_n A) x_n - (I - r_n A) x_n\| \right) \\
& \leq \|x_{n+1} - x_n\| + |r_{n+1} - r_n| \widetilde{M}_1,
\end{aligned} \tag{60}$$

where $\sup_{n \geq 1} \{\|Ax_n\| + (\nu/c\sigma)\|S_{r_{n+1}}^{(\Theta, \varphi)}(I - r_n A)x_n - (I - r_n A)x_n\|\} \leq \widetilde{M}_1$ for some $\widetilde{M}_1 > 0$. So, combining (57)–(60) we get

$$\begin{aligned}
& \|z_{n+1} - z_n\| \\
& \leq \frac{\alpha_{n+1}}{1 - \sigma_{n+1}} \|x_{n+1} - x_n\| + \left| \frac{\alpha_{n+1}}{1 - \sigma_{n+1}} - \frac{\alpha_n}{1 - \sigma_n} \right| \|f(x_n)\| \\
& \quad + \frac{1 - \alpha_{n+1} - \sigma_{n+1}}{1 - \sigma_{n+1}} \\
& \quad \times \left[\left| \frac{\gamma_{n+1}}{1 - \beta_{n+1}} - \frac{\gamma_n}{1 - \beta_n} \right| \|W_{n+1}v_{n+1} - VW_{n+1}w_{n+1}\| \right. \\
& \quad \quad + \|W_{n+1}v_{n+1} - W_nv_n\| \frac{\gamma_n}{1 - \beta_n} \\
& \quad \quad \left. + \frac{1 - \beta_n - \gamma_n \bar{\gamma}}{1 - \beta_n} \|W_{n+1}w_{n+1} - W_nw_n\| \right] \\
& \quad + \left| \frac{\alpha_{n+1}}{1 - \sigma_{n+1}} - \frac{\alpha_n}{1 - \sigma_n} \right| \frac{\|W_nv_n\| + \|W_nw_n\|}{1 - \beta_n} \\
& \leq \frac{\alpha_{n+1}}{1 - \sigma_{n+1}} \|x_{n+1} - x_n\| + \left| \frac{\alpha_{n+1}}{1 - \sigma_{n+1}} - \frac{\alpha_n}{1 - \sigma_n} \right| \|f(x_n)\| \\
& \quad + \frac{1 - \alpha_{n+1} - \sigma_{n+1}}{1 - \sigma_{n+1}} \\
& \quad \times \left[\left| \frac{\gamma_{n+1}}{1 - \beta_{n+1}} - \frac{\gamma_n}{1 - \beta_n} \right| \|W_{n+1}v_{n+1} - VW_{n+1}w_{n+1}\| \right. \\
& \quad \quad + \left(\|v_{n+1} - v_n\| + \widetilde{M} \prod_{i=1}^n \lambda_i \right) \frac{\gamma_n}{1 - \beta_n} \\
& \quad \quad \left. + \frac{1 - \beta_n - \gamma_n \bar{\gamma}}{1 - \beta_n} \left(\|w_{n+1} - w_n\| + \widetilde{M} \prod_{i=1}^n \lambda_i \right) \right] \\
& \quad + \left| \frac{\alpha_{n+1}}{1 - \sigma_{n+1}} - \frac{\alpha_n}{1 - \sigma_n} \right| \frac{\|W_nv_n\| + \|W_nw_n\|}{1 - \beta_n} \\
& \leq \frac{\alpha_{n+1}}{1 - \sigma_{n+1}} \|x_{n+1} - x_n\| + \left| \frac{\alpha_{n+1}}{1 - \sigma_{n+1}} - \frac{\alpha_n}{1 - \sigma_n} \right| \|f(x_n)\| \\
& \quad + \frac{1 - \alpha_{n+1} - \sigma_{n+1}}{1 - \sigma_{n+1}} \\
& \quad \times \left[\left| \frac{\gamma_{n+1}}{1 - \beta_{n+1}} - \frac{\gamma_n}{1 - \beta_n} \right| \|W_{n+1}v_{n+1} - VW_{n+1}w_{n+1}\| \right. \\
& \quad \quad + \left(\|u_{n+1} - u_n\| + \widetilde{M} \prod_{i=1}^n \lambda_i \right) \frac{\gamma_n}{1 - \beta_n} \\
& \quad \quad \left. + \frac{1 - \beta_n - \gamma_n \bar{\gamma}}{1 - \beta_n} \left(\|u_{n+1} - u_n\| + \widetilde{M} \prod_{i=1}^n \lambda_i \right) \right] \\
& \quad + \left| \frac{\alpha_{n+1}}{1 - \sigma_{n+1}} - \frac{\alpha_n}{1 - \sigma_n} \right| \frac{\|W_nv_n\| + \|W_nw_n\|}{1 - \beta_n}
\end{aligned}$$

$$\begin{aligned}
& = \frac{\alpha_{n+1}}{1 - \sigma_{n+1}} \|x_{n+1} - x_n\| + \left| \frac{\alpha_{n+1}}{1 - \sigma_{n+1}} - \frac{\alpha_n}{1 - \sigma_n} \right| \|f(x_n)\| \\
& \quad + \frac{1 - \alpha_{n+1} - \sigma_{n+1}}{1 - \sigma_{n+1}} \\
& \quad \times \left[\left| \frac{\gamma_{n+1}}{1 - \beta_{n+1}} - \frac{\gamma_n}{1 - \beta_n} \right| \|W_{n+1}v_{n+1} - VW_{n+1}w_{n+1}\| \right. \\
& \quad \quad + \frac{1 - \beta_n - \gamma_n (\bar{\gamma} - 1)}{1 - \beta_n} \|u_{n+1} - u_n\| \\
& \quad \quad \left. + \frac{1 - \beta_n - \gamma_n (\bar{\gamma} - 1)}{1 - \beta_n} \widetilde{M} \prod_{i=1}^n \lambda_i \right] \\
& \quad + \left| \frac{\alpha_{n+1}}{1 - \sigma_{n+1}} - \frac{\alpha_n}{1 - \sigma_n} \right| \frac{\|W_nv_n\| + \|W_nw_n\|}{1 - \beta_n} \\
& \leq \frac{\alpha_{n+1}}{1 - \sigma_{n+1}} \|x_{n+1} - x_n\| + \left| \frac{\alpha_{n+1}}{1 - \sigma_{n+1}} - \frac{\alpha_n}{1 - \sigma_n} \right| \|f(x_n)\| \\
& \quad + \left| \frac{\gamma_{n+1}}{1 - \beta_{n+1}} - \frac{\gamma_n}{1 - \beta_n} \right| \|W_{n+1}v_{n+1} - VW_{n+1}w_{n+1}\| \\
& \quad + \frac{1 - \alpha_{n+1} - \sigma_{n+1}}{1 - \sigma_{n+1}} \|u_{n+1} - u_n\| + \widetilde{M} \prod_{i=1}^n \lambda_i \\
& \quad + \left| \frac{\alpha_{n+1}}{1 - \sigma_{n+1}} - \frac{\alpha_n}{1 - \sigma_n} \right| \frac{\|W_nv_n\| + \|W_nw_n\|}{1 - \beta_n} \\
& \leq \frac{\alpha_{n+1}}{1 - \sigma_{n+1}} \|x_{n+1} - x_n\| + \left| \frac{\alpha_{n+1}}{1 - \sigma_{n+1}} - \frac{\alpha_n}{1 - \sigma_n} \right| \|f(x_n)\| \\
& \quad + \left| \frac{\gamma_{n+1}}{1 - \beta_{n+1}} - \frac{\gamma_n}{1 - \beta_n} \right| \|W_{n+1}v_{n+1} - VW_{n+1}w_{n+1}\| \\
& \quad + \frac{1 - \alpha_{n+1} - \sigma_{n+1}}{1 - \sigma_{n+1}} (\|x_{n+1} - x_n\| + |r_{n+1} - r_n| \widetilde{M}_1) \\
& \quad + \widetilde{M} \prod_{i=1}^n \lambda_i + \left| \frac{\alpha_{n+1}}{1 - \sigma_{n+1}} - \frac{\alpha_n}{1 - \sigma_n} \right| \frac{\|W_nv_n\| + \|W_nw_n\|}{1 - \beta_n} \\
& \leq \|x_{n+1} - x_n\| + \left| \frac{\alpha_{n+1}}{1 - \sigma_{n+1}} - \frac{\alpha_n}{1 - \sigma_n} \right| \|f(x_n)\| \\
& \quad + \left| \frac{\gamma_{n+1}}{1 - \beta_{n+1}} - \frac{\gamma_n}{1 - \beta_n} \right| \|W_{n+1}v_{n+1} - VW_{n+1}w_{n+1}\| \\
& \quad + |r_{n+1} - r_n| \widetilde{M}_1 + \widetilde{M} \prod_{i=1}^n \lambda_i \\
& \quad + \left| \frac{\alpha_{n+1}}{1 - \sigma_{n+1}} - \frac{\alpha_n}{1 - \sigma_n} \right| \frac{\|W_nv_n\| + \|W_nw_n\|}{1 - \widehat{a}} \\
& \leq \|x_{n+1} - x_n\|
\end{aligned}$$

$$+ \widetilde{M}_2 \left(\left| \frac{\alpha_{n+1}}{1 - \sigma_{n+1}} - \frac{\alpha_n}{1 - \sigma_n} \right| + \left| \frac{\gamma_{n+1}}{1 - \beta_{n+1}} - \frac{\gamma_n}{1 - \beta_n} \right| + |r_{n+1} - r_n| + b^n \right), \quad (61)$$

where $\sup_{n \geq 1} \{ \|f(x_n)\| + ((\|W_n v_n\| + \|W_n w_n\|)/(1 - \widehat{a})) + \|W_n v_n - V W_n w_n\| + \widetilde{M}_1 + \widetilde{M} \} \leq \widetilde{M}_2$ for some $\widetilde{M}_2 > 0$. Thus, from (61), $b \in (0, 1)$, and conditions (v)-(vi) it follows that

$$\lim_{n \rightarrow \infty} \sup (\|z_{n+1} - z_n\| - \|x_{n+1} - x_n\|) \leq 0. \quad (62)$$

Since $x_{n+1} = \sigma_n x_n + (1 - \sigma_n) z_n$ for all $n \geq 1$, by Lemma 12 we obtain from $0 < \liminf_{n \rightarrow \infty} \sigma_n \leq \limsup_{n \rightarrow \infty} \sigma_n < 1$ that

$$\lim_{n \rightarrow \infty} \|z_n - x_n\| = 0, \quad (63)$$

which immediately yields

$$\lim_{n \rightarrow \infty} \|x_{n+1} - x_n\| = \lim_{n \rightarrow \infty} (1 - \sigma_n) \|z_n - x_n\| = 0. \quad (64)$$

Note that

$$\begin{aligned} \rho \|y_n - x_n\| &= (1 - (1 - \rho)) \|y_n - x_n\| \\ &\leq (1 - \alpha_n) \|y_n - x_n\| \\ &= \|x_{n+1} - x_n - \alpha_n (f(x_n) - x_n)\| \\ &\leq \|x_{n+1} - x_n\| + \|\alpha_n (f(x_n) - x_n)\|. \end{aligned} \quad (65)$$

Consequently, it follows from (64) and $\alpha_n (f(x_n) - x_n) \rightarrow 0$ that

$$\lim_{n \rightarrow \infty} \|y_n - x_n\| = 0. \quad (66)$$

Step 3. We prove $\lim_{n \rightarrow \infty} \|x_n - u_n\| = 0$.

Indeed, for any $p \in \Omega$, we find that

$$\begin{aligned} \|u_n - p\|^2 &= \|S_{r_n}^{(\Theta, \varphi)}(I - r_n A)x_n - S_{r_n}^{(\Theta, \varphi)}(I - r_n A)p\|^2 \\ &\leq \|(I - r_n A)x_n - (I - r_n A)p\|^2 \\ &= \|x_n - p - r_n(Ax_n - Ap)\|^2 \\ &\leq \|x_n - p\|^2 + r_n(r_n - 2\zeta) \|Ax_n - Ap\|^2 \\ &\leq \|x_n - p\|^2. \end{aligned} \quad (67)$$

From (37), (48), (49), and (67), we obtain

$$\begin{aligned} \|y_n - p\|^2 &= \|\beta_n(x_n - p) + \gamma_n(W_n v_n - p) \\ &\quad + [(1 - \beta_n)I - \gamma_n V](W_n w_n - p) + \gamma_n(I - V)p\|^2 \\ &\leq \|\beta_n(x_n - p) + \gamma_n(W_n v_n - p) \\ &\quad + [(1 - \beta_n)I - \gamma_n V](W_n w_n - p)\|^2 \\ &\quad + 2\gamma_n \langle (I - V)p, y_n - p \rangle \end{aligned}$$

$$\begin{aligned} &\leq \beta_n \|x_n - p\|^2 + \gamma_n \|W_n v_n - p\|^2 \\ &\quad + (1 - \beta_n - \gamma_n) \\ &\quad \times \left\| \frac{1}{1 - \beta_n - \gamma_n} [(1 - \beta_n)I - \gamma_n V](W_n w_n - p) \right\|^2 \\ &\quad + 2\gamma_n \langle (I - V)p, y_n - p \rangle \\ &\leq \beta_n \|x_n - p\|^2 + \gamma_n \|v_n - p\|^2 \\ &\quad + (1 - \beta_n - \gamma_n) \frac{(1 - \beta_n - \gamma_n \bar{\gamma})^2}{(1 - \beta_n - \gamma_n)^2} \|W_n w_n - p\|^2 \\ &\quad + 2\gamma_n \langle (I - V)p, y_n - p \rangle \\ &\leq \beta_n \|x_n - p\|^2 + \gamma_n \|u_n - p\|^2 \\ &\quad + \frac{(1 - \beta_n - \gamma_n \bar{\gamma})^2}{1 - \beta_n - \gamma_n} \|w_n - p\|^2 \\ &\quad + 2\gamma_n \langle (I - V)p, y_n - p \rangle \\ &\leq \beta_n \|x_n - p\|^2 + \gamma_n \|u_n - p\|^2 \\ &\quad + (1 - \beta_n - \gamma_n \bar{\gamma}) \|u_n - p\|^2 + 2\gamma_n \langle (I - V)p, y_n - p \rangle \\ &= \beta_n \|x_n - p\|^2 + (1 - \beta_n - \gamma_n(\bar{\gamma} - 1)) \\ &\quad \times \|u_n - p\|^2 + 2\gamma_n \langle (I - V)p, y_n - p \rangle \\ &\leq \beta_n \|x_n - p\|^2 + (1 - \beta_n - \gamma_n(\bar{\gamma} - 1)) \\ &\quad \times [\|x_n - p\|^2 + r_n(r_n - 2\zeta) \|Ax_n - Ap\|^2] \\ &\quad + 2\gamma_n \langle (I - V)p, y_n - p \rangle \\ &= (1 - \gamma_n(\bar{\gamma} - 1)) \|x_n - p\|^2 \\ &\quad + (1 - \beta_n - \gamma_n(\bar{\gamma} - 1)) r_n(r_n - 2\zeta) \|Ax_n - Ap\|^2 \\ &\quad + 2\gamma_n \langle (I - V)p, y_n - p \rangle \\ &\leq \|x_n - p\|^2 + (1 - \beta_n - \gamma_n(\bar{\gamma} - 1)) r_n \\ &\quad \times (r_n - 2\zeta) \|Ax_n - Ap\|^2 + 2\gamma_n \langle (I - V)p, y_n - p \rangle, \end{aligned} \quad (68)$$

which immediately yields

$$\begin{aligned} &(1 - \beta_n - \gamma_n \|V\|) r_n(r_n - 2\zeta) \|Ax_n - Ap\|^2 \\ &\leq (1 - \beta_n - \gamma_n(\bar{\gamma} - 1)) r_n(r_n - 2\zeta) \|Ax_n - Ap\|^2 \\ &\leq \|x_n - p\|^2 - \|y_n - p\|^2 + 2\gamma_n \langle (I - V)p, y_n - p \rangle \\ &\leq \|x_n - y_n\| (\|x_n - p\| + \|y_n - p\|) + 2\gamma_n \langle (I - V)p, y_n - p \rangle. \end{aligned} \quad (69)$$

In particular, putting $p = x^*$ we have

$$\begin{aligned}
 & (1 - \beta_n - \gamma_n \|V\|) r_n (r_n - 2\zeta) \|Ax_n - Ax^*\|^2 \\
 & \leq \|x_n - y_n\| (\|x_n - x^*\| + \|y_n - x^*\|) \\
 & \quad + 2\gamma_n \langle (I - V)x^*, y_n - x^* \rangle \\
 & \leq \|x_n - y_n\| (\|x_n - x^*\| + \|y_n - x^*\|) \\
 & \quad + 2\gamma_n \|(I - V)x^*\| \|y_n - x_n\| \\
 & \quad + 2\gamma_n \langle (I - V)x^*, x_n - x^* \rangle \\
 & = \|x_n - y_n\| \\
 & \quad \times (\|x_n - x^*\| + \|y_n - x^*\| + 2\|(I - V)x^*\|) \\
 & \quad + 2\gamma_n \langle (I - V)x^*, x_n - x^* \rangle.
 \end{aligned} \tag{70}$$

Since $\limsup_{n \rightarrow \infty} (\beta_n + \gamma_n \|V\|) < 1$, $0 < \liminf_{n \rightarrow \infty} r_n \leq \limsup_{n \rightarrow \infty} r_n < 2\zeta$, and $\limsup_{n \rightarrow \infty} \langle (I - V)x^*, x_n - x^* \rangle \leq 0$, we obtain from (66) and the boundedness of $\{x_n\}$ and $\{y_n\}$ that

$$\lim_{n \rightarrow \infty} \|Ax_n - Ax^*\| = 0. \tag{71}$$

Furthermore, from the firm nonexpansivity of $S_{r_n}^{(\Theta, \varphi)}$, we have

$$\begin{aligned}
 & \|u_n - p\|^2 \\
 & = \|S_{r_n}^{(\Theta, \varphi)}(I - r_n A)x_n - S_{r_n}^{(\Theta, \varphi)}(I - r_n A)p\|^2 \\
 & \leq \langle (I - r_n A)x_n - (I - r_n A)p, u_n - p \rangle \\
 & = \frac{1}{2} [\|(I - r_n A)x_n - (I - r_n A)p\|^2 \\
 & \quad + \|u_n - p\|^2 \\
 & \quad - \|(I - r_n A)x_n - (I - r_n A)p - (u_n - p)\|^2] \\
 & \leq \frac{1}{2} [\|x_n - p\|^2 + \|u_n - p\|^2 - \|x_n - u_n - r_n(Ax_n - Ap)\|^2] \\
 & = \frac{1}{2} [\|x_n - p\|^2 + \|u_n - p\|^2 - \|x_n - u_n\|^2 \\
 & \quad + 2r_n \langle Ax_n - Ap, x_n - u_n \rangle - r_n^2 \|Ax_n - Ap\|^2],
 \end{aligned} \tag{72}$$

which implies that

$$\begin{aligned}
 \|u_n - p\|^2 & \leq \|x_n - p\|^2 - \|x_n - u_n\|^2 \\
 & \quad + 2r_n \|Ax_n - Ap\| \|x_n - u_n\|.
 \end{aligned} \tag{73}$$

From (68) and (73), we have

$$\begin{aligned}
 & \|y_n - p\|^2 \\
 & \leq \beta_n \|x_n - p\|^2 + (1 - \beta_n - \gamma_n (\bar{\gamma} - 1)) \|u_n - p\|^2 \\
 & \quad + 2\gamma_n \langle (I - V)p, y_n - p \rangle \\
 & \leq \beta_n \|x_n - p\|^2 + (1 - \beta_n - \gamma_n (\bar{\gamma} - 1)) \\
 & \quad \times [\|x_n - p\|^2 - \|x_n - u_n\|^2 \\
 & \quad + 2r_n \|Ax_n - Ap\| \|x_n - u_n\|] \\
 & \quad + 2\gamma_n \langle (I - V)p, y_n - p \rangle \\
 & \leq (1 - \gamma_n (\bar{\gamma} - 1)) \|x_n - p\|^2 \\
 & \quad - (1 - \beta_n - \gamma_n (\bar{\gamma} - 1)) \|x_n - u_n\|^2 \\
 & \quad + 2r_n \|Ax_n - Ap\| \|x_n - u_n\| \\
 & \quad + 2\gamma_n \langle (I - V)p, y_n - p \rangle \\
 & \leq \|x_n - p\|^2 - (1 - \beta_n - \gamma_n (\bar{\gamma} - 1)) \|x_n - u_n\|^2 \\
 & \quad + 2r_n \|Ax_n - Ap\| \|x_n - u_n\| \\
 & \quad + 2\gamma_n \langle (I - V)p, y_n - p \rangle,
 \end{aligned} \tag{74}$$

which immediately yields

$$\begin{aligned}
 & (1 - \beta_n - \gamma_n (\bar{\gamma} - 1)) \|x_n - u_n\|^2 \\
 & \leq \|x_n - p\|^2 - \|y_n - p\|^2 \\
 & \quad + 2r_n \|Ax_n - Ap\| \|x_n - u_n\| \\
 & \quad + 2\gamma_n \langle (I - V)p, y_n - p \rangle.
 \end{aligned} \tag{75}$$

In particular, putting $p = x^*$ we have

$$\begin{aligned}
 & (1 - \beta_n - \gamma_n \|V\|) \|x_n - u_n\|^2 \\
 & \leq (1 - \beta_n - \gamma_n (\bar{\gamma} - 1)) \|x_n - u_n\|^2 \\
 & \leq \|x_n - x^*\|^2 - \|y_n - x^*\|^2 \\
 & \quad + 2r_n \|Ax_n - Ax^*\| \|x_n - u_n\| \\
 & \quad + 2\gamma_n \langle (I - V)x^*, y_n - x^* \rangle \\
 & \leq \|x_n - y_n\| (\|x_n - x^*\| + \|y_n - x^*\|) \\
 & \quad + 2\gamma_n \|(I - V)x^*\| \|y_n - x_n\|
 \end{aligned}$$

$$\begin{aligned}
& + 2\gamma_n \langle (I - V)x^*, x_n - x^* \rangle \\
& + 2r_n \|Ax_n - Ax^*\| \|x_n - u_n\| \\
& = \|x_n - y_n\| \\
& \quad \times (\|x_n - x^*\| + \|y_n - x^*\| + 2\|(I - V)x^*\|) \\
& + 2\gamma_n \langle (I - V)x^*, x_n - x^* \rangle \\
& + 2r_n \|Ax_n - Ax^*\| \|x_n - u_n\|.
\end{aligned} \tag{76}$$

Since $\limsup_{n \rightarrow \infty} (\beta_n + \gamma_n \|V\|) < 1$ and $\limsup_{n \rightarrow \infty} \langle (I - V)x^*, x_n - x^* \rangle \leq 0$, we deduce from (66) and (71) and the boundedness of $\{u_n\}$, $\{x_n\}$, and $\{y_n\}$ that

$$\lim_{n \rightarrow \infty} \|x_n - u_n\| = 0. \tag{77}$$

Step 4. We prove that $\lim_{n \rightarrow \infty} \|\Delta_{k-1}u_n - \Delta_k u_n\| = 0$ and $\lim_{n \rightarrow \infty} \|\Lambda_{i-1}u_n - \Lambda_i u_n\| = 0$ for each $k \in \{1, 2, \dots, M\}$ and $i \in \{1, 2, \dots, N\}$.

Indeed, let us show that $\lim_{n \rightarrow \infty} \|A_k \Delta_k u_n - A_k x^*\| = 0$ and $\lim_{n \rightarrow \infty} \|B_i \Lambda_i u_n - B_i x^*\| = 0$ for each $k \in \{1, 2, \dots, M\}$ and $i \in \{1, 2, \dots, N\}$. Observe that, for any $p \in \Omega$,

$$\begin{aligned}
& \|\Delta_k u_n - p\|^2 \\
& = \|P_C(I - \nu_k A_k) \Delta_{k-1} u_n - P_C(I - \nu_k A_k) p\|^2 \\
& \leq \|(I - \nu_k A_k) \Delta_{k-1} u_n - (I - \nu_k A_k) p\|^2 \\
& \leq \|\Delta_{k-1} u_n - p\|^2 + \nu_k (\nu_k - 2\zeta_k) \|A_k \Delta_{k-1} u_n - A_k p\|^2 \\
& \leq \|u_n - p\|^2 + \nu_k (\nu_k - 2\zeta_k) \|A_k \Delta_{k-1} u_n - A_k p\|^2 \\
& \leq \|x_n - p\|^2 + \nu_k (\nu_k - 2\zeta_k) \|A_k \Delta_{k-1} u_n - A_k p\|^2, \\
& \|\Lambda_i u_n - p\|^2 \\
& = \|J_{R_i, \mu_i}(I - \mu_i B_i) \Lambda_{i-1} u_n - J_{R_i, \mu_i}(I - \mu_i B_i) p\|^2 \\
& \leq \|(I - \mu_i B_i) \Lambda_{i-1} u_n - (I - \mu_i B_i) p\|^2 \\
& \leq \|\Lambda_{i-1} u_n - p\|^2 + \mu_i (\mu_i - 2\eta_i) \|B_i \Lambda_{i-1} u_n - B_i p\|^2 \\
& \leq \|u_n - p\|^2 + \mu_i (\mu_i - 2\eta_i) \|B_i \Lambda_{i-1} u_n - B_i p\|^2 \\
& \leq \|x_n - p\|^2 + \mu_i (\mu_i - 2\eta_i) \|B_i \Lambda_{i-1} u_n - B_i p\|^2.
\end{aligned} \tag{78}$$

From (68) and (78) we have

$$\begin{aligned}
& \|y_n - p\|^2 \\
& \leq \beta_n \|x_n - p\|^2 + \gamma_n \|y_n - p\|^2
\end{aligned}$$

$$\begin{aligned}
& + (1 - \beta_n - \gamma_n) \frac{(1 - \beta_n - \gamma_n \bar{\gamma})^2}{(1 - \beta_n - \gamma_n)^2} \|W_n w_n - p\|^2 \\
& + 2\gamma_n \langle (I - V)p, y_n - p \rangle \\
& \leq \beta_n \|x_n - p\|^2 + \gamma_n \|\Delta_k u_n - p\|^2 \\
& + \frac{(1 - \beta_n - \gamma_n \bar{\gamma})^2}{1 - \beta_n - \gamma_n} \|\Lambda_i u_n - p\|^2 + 2\gamma_n \langle (I - V)p, y_n - p \rangle \\
& \leq \beta_n \|x_n - p\|^2 \\
& + \gamma_n [\|x_n - p\|^2 + \nu_k (\nu_k - 2\zeta_k) \|A_k \Delta_{k-1} u_n - A_k p\|^2] \\
& + (1 - \beta_n - \gamma_n \bar{\gamma}) \\
& \times [\|x_n - p\|^2 + \mu_i (\mu_i - 2\eta_i) \|B_i \Lambda_{i-1} u_n - B_i p\|^2] \\
& + 2\gamma_n \langle (I - V)p, y_n - p \rangle \\
& = (1 - \gamma_n (\bar{\gamma} - 1)) \|x_n - p\|^2 \\
& + \gamma_n \nu_k (\nu_k - 2\zeta_k) \|A_k \Delta_{k-1} u_n - A_k p\|^2 \\
& + (1 - \beta_n - \gamma_n \bar{\gamma}) \mu_i (\mu_i - 2\eta_i) \|B_i \Lambda_{i-1} u_n - B_i p\|^2 \\
& + 2\gamma_n \langle (I - V)p, y_n - p \rangle \\
& \leq \|x_n - p\|^2 + \gamma_n \nu_k (\nu_k - 2\zeta_k) \|A_k \Delta_{k-1} u_n - A_k p\|^2 \\
& + (1 - \beta_n - \gamma_n \bar{\gamma}) \mu_i (\mu_i - 2\eta_i) \|B_i \Lambda_{i-1} u_n - B_i p\|^2 \\
& + 2\gamma_n \langle (I - V)p, y_n - p \rangle,
\end{aligned} \tag{79}$$

which leads to

$$\begin{aligned}
& \gamma_n \nu_k (2\zeta_k - \nu_k) \|A_k \Delta_{k-1} u_n - A_k p\|^2 \\
& + (1 - \beta_n - \gamma_n \bar{\gamma}) \mu_i (2\eta_i - \mu_i) \|B_i \Lambda_{i-1} u_n - B_i p\|^2 \\
& \leq \|x_n - p\|^2 - \|y_n - p\|^2 + 2\gamma_n \langle (I - V)p, y_n - p \rangle \\
& \leq \|x_n - y_n\| (\|x_n - p\| + \|y_n - p\|) \\
& + 2\gamma_n \langle (I - V)p, y_n - p \rangle.
\end{aligned} \tag{80}$$

In particular, putting $p = x^*$ we have

$$\begin{aligned}
& \gamma_n \nu_k (2\zeta_k - \nu_k) \|A_k \Delta_{k-1} u_n - A_k x^*\|^2 \\
& + (1 - \beta_n - \gamma_n \|V\|) \mu_i (2\eta_i - \mu_i) \|B_i \Lambda_{i-1} u_n - B_i x^*\|^2 \\
& \leq \gamma_n \nu_k (2\zeta_k - \nu_k) \|A_k \Delta_{k-1} u_n - A_k x^*\|^2
\end{aligned}$$

$$\begin{aligned}
& + (1 - \beta_n - \gamma_n \bar{\gamma}) \mu_i (2\eta_i - \mu_i) \|B_i \Lambda_{i-1} u_n - B_i x^*\|^2 \\
& \leq \|x_n - y_n\| (\|x_n - x^*\| + \|y_n - x^*\|) \\
& \quad + 2\gamma_n \langle (I - V) x^*, y_n - x^* \rangle \\
& \leq \|x_n - y_n\| (\|x_n - x^*\| + \|y_n - x^*\|) \\
& \quad + 2\gamma_n \|(I - V) x^*\| \|y_n - x_n\| + 2\gamma_n \langle (I - V) x^*, x_n - x^* \rangle \\
& = \|x_n - y_n\| (\|x_n - x^*\| + \|y_n - x^*\| + 2\|(I - V) x^*\|) \\
& \quad + 2\gamma_n \langle (I - V) x^*, x_n - x^* \rangle.
\end{aligned} \tag{81}$$

Since $0 < \liminf_{n \rightarrow \infty} \gamma_n \leq \limsup_{n \rightarrow \infty} (\beta_n + \gamma_n \|V\|) < 1$ and $\limsup_{n \rightarrow \infty} \langle (I - V) x^*, x_n - x^* \rangle \leq 0$, we obtain from (66), $\nu_k \in (0, 2\zeta_k)$, $\mu_i \in (0, 2\eta_i)$, $k \in \{1, 2, \dots, M\}$, $i \in \{1, 2, \dots, N\}$, and the boundedness of $\{x_n\}$ and $\{y_n\}$ that

$$\begin{aligned}
\lim_{n \rightarrow \infty} \|A_k \Delta_{k-1} u_n - A_k x^*\| &= 0, \\
\lim_{n \rightarrow \infty} \|B_i \Lambda_{i-1} u_n - B_i x^*\| &= 0,
\end{aligned} \tag{82}$$

for each $k \in \{1, 2, \dots, M\}$ and $i \in \{1, 2, \dots, N\}$.

Furthermore, by Proposition 3(iii) and Lemma 7(a), we obtain

$$\begin{aligned}
& \|\Delta_k u_n - p\|^2 \\
& = \|P_C(I - \nu_k A_k) \Delta_{k-1} u_n - P_C(I - \nu_k A_k) p\|^2 \\
& \leq \langle (I - \nu_k A_k) \Delta_{k-1} u_n - (I - \nu_k A_k) p, \Delta_k u_n - p \rangle \\
& = \frac{1}{2} (\|(I - \nu_k A_k) \Delta_{k-1} u_n - (I - \nu_k A_k) p\|^2 \\
& \quad + \|\Delta_k u_n - p\|^2 \\
& \quad - \|(I - \nu_k A_k) \Delta_{k-1} u_n \\
& \quad - (I - \nu_k A_k) p - (\Delta_k u_n - p)\|^2) \\
& \leq \frac{1}{2} (\|\Delta_{k-1} u_n - p\|^2 + \|\Delta_k u_n - p\|^2 \\
& \quad - \|\Delta_{k-1} u_n - \Delta_k u_n - \nu_k (A_k \Delta_{k-1} u_n - A_k p)\|^2) \\
& \leq \frac{1}{2} (\|u_n - p\|^2 + \|\Delta_k u_n - p\|^2 \\
& \quad - \|\Delta_{k-1} u_n - \Delta_k u_n - \nu_k (A_k \Delta_{k-1} u_n - A_k p)\|^2) \\
& \leq \frac{1}{2} (\|x_n - p\|^2 + \|\Delta_k u_n - p\|^2 \\
& \quad - \|\Delta_{k-1} u_n - \Delta_k u_n - \nu_k (A_k \Delta_{k-1} u_n - A_k p)\|^2),
\end{aligned} \tag{83}$$

which implies that

$$\begin{aligned}
& \|\Delta_k u_n - p\|^2 \\
& \leq \|x_n - p\|^2 - \|\Delta_{k-1} u_n - \Delta_k u_n - \nu_k (A_k \Delta_{k-1} u_n - A_k p)\|^2 \\
& = \|x_n - p\|^2 - \|\Delta_{k-1} u_n - \Delta_k u_n\|^2 - \nu_k^2 \|A_k \Delta_{k-1} u_n - A_k p\|^2 \\
& \quad + 2\nu_k \langle \Delta_{k-1} u_n - \Delta_k u_n, A_k \Delta_{k-1} u_n - A_k p \rangle \\
& \leq \|x_n - p\|^2 - \|\Delta_{k-1} u_n - \Delta_k u_n\|^2 \\
& \quad + 2\nu_k \|\Delta_{k-1} u_n - \Delta_k u_n\| \|A_k \Delta_{k-1} u_n - A_k p\|.
\end{aligned} \tag{84}$$

By Lemmas 7(a) and 14, we get

$$\begin{aligned}
& \|\Lambda_i u_n - p\|^2 \\
& = \|J_{R_i, \mu_i} (I - \mu_i B_i) \Lambda_{i-1} u_n - J_{R_i, \mu_i} (I - \mu_i B_i) p\|^2 \\
& \leq \langle (I - \mu_i B_i) \Lambda_{i-1} u_n - (I - \mu_i B_i) p, \Lambda_i u_n - p \rangle \\
& = \frac{1}{2} (\|(I - \mu_i B_i) \Lambda_{i-1} u_n - (I - \mu_i B_i) p\|^2 + \|\Lambda_i u_n - p\|^2 \\
& \quad - \|(I - \mu_i B_i) \Lambda_{i-1} u_n - (I - \mu_i B_i) p - (\Lambda_i u_n - p)\|^2) \\
& \leq \frac{1}{2} (\|\Lambda_{i-1} u_n - p\|^2 + \|\Lambda_i u_n - p\|^2 \\
& \quad - \|\Lambda_{i-1} u_n - \Lambda_i u_n - \mu_i (B_i \Lambda_{i-1} u_n - B_i p)\|^2) \\
& \leq \frac{1}{2} (\|u_n - p\|^2 + \|\Lambda_i u_n - p\|^2 \\
& \quad - \|\Lambda_{i-1} u_n - \Lambda_i u_n - \mu_i (B_i \Lambda_{i-1} u_n - B_i p)\|^2) \\
& \leq \frac{1}{2} (\|x_n - p\|^2 + \|\Lambda_i u_n - p\|^2 \\
& \quad - \|\Lambda_{i-1} u_n - \Lambda_i u_n - \mu_i (B_i \Lambda_{i-1} u_n - B_i p)\|^2),
\end{aligned} \tag{85}$$

which implies that

$$\begin{aligned}
& \|\Lambda_i u_n - p\|^2 \\
& \leq \|x_n - p\|^2 - \|\Lambda_{i-1} u_n - \Lambda_i u_n - \mu_i (B_i \Lambda_{i-1} u_n - B_i p)\|^2 \\
& = \|x_n - p\|^2 - \|\Lambda_{i-1} u_n - \Lambda_i u_n\|^2 - \mu_i^2 \|B_i \Lambda_{i-1} u_n - B_i p\|^2 \\
& \quad + 2\mu_i \langle \Lambda_{i-1} u_n - \Lambda_i u_n, B_i \Lambda_{i-1} u_n - B_i p \rangle \\
& \leq \|x_n - p\|^2 - \|\Lambda_{i-1} u_n - \Lambda_i u_n\|^2 \\
& \quad + 2\mu_i \|\Lambda_{i-1} u_n - \Lambda_i u_n\| \|B_i \Lambda_{i-1} u_n - B_i p\|.
\end{aligned} \tag{86}$$

From (68), (84), and (86) we have

$$\begin{aligned}
& \|y_n - p\|^2 \\
& \leq \beta_n \|x_n - p\|^2 + \gamma_n \|v_n - p\|^2 \\
& \quad + (1 - \beta_n - \gamma_n) \frac{(1 - \beta_n - \gamma_n \bar{\gamma})^2}{(1 - \beta_n - \gamma_n)^2} \|W_n w_n - p\|^2 \\
& \quad + 2\gamma_n \langle (I - V)p, y_n - p \rangle \\
& \leq \beta_n \|x_n - p\|^2 \\
& \quad + \gamma_n [\|x_n - p\|^2 - \|\Delta_{k-1}u_n - \Delta_k u_n\|^2 \\
& \quad \quad + 2\gamma_k \|\Delta_{k-1}u_n - \Delta_k u_n\| \|A_k \Delta_{k-1}u_n - A_k p\|] \\
& \quad + (1 - \beta_n - \gamma_n \bar{\gamma}) \\
& \quad \times [\|x_n - p\|^2 - \|\Lambda_{i-1}u_n - \Lambda_i u_n\|^2 \\
& \quad \quad + 2\mu_i \|\Lambda_{i-1}u_n - \Lambda_i u_n\| \|B_i \Lambda_{i-1}u_n - B_i p\|] \\
& \quad + 2\gamma_n \langle (I - V)p, y_n - p \rangle \\
& \leq (1 - \gamma_n (\bar{\gamma} - 1)) \|x_n - p\|^2 - \gamma_n \|\Delta_{k-1}u_n - \Delta_k u_n\|^2 \\
& \quad - (1 - \beta_n - \gamma_n \bar{\gamma}) \|\Lambda_{i-1}u_n - \Lambda_i u_n\|^2 \\
& \quad + 2\gamma_k \|\Delta_{k-1}u_n - \Delta_k u_n\| \|A_k \Delta_{k-1}u_n - A_k p\| \\
& \quad + 2\mu_i \|\Lambda_{i-1}u_n - \Lambda_i u_n\| \|B_i \Lambda_{i-1}u_n - B_i p\| \\
& \quad + 2\gamma_n \langle (I - V)p, y_n - p \rangle \\
& \leq \|x_n - p\|^2 - \gamma_n \|\Delta_{k-1}u_n - \Delta_k u_n\|^2 \\
& \quad - (1 - \beta_n - \gamma_n \bar{\gamma}) \|\Lambda_{i-1}u_n - \Lambda_i u_n\|^2 \\
& \quad + 2\gamma_k \|\Delta_{k-1}u_n - \Delta_k u_n\| \|A_k \Delta_{k-1}u_n - A_k p\| \\
& \quad + 2\mu_i \|\Lambda_{i-1}u_n - \Lambda_i u_n\| \|B_i \Lambda_{i-1}u_n - B_i p\| \\
& \quad + 2\gamma_n \langle (I - V)p, y_n - p \rangle,
\end{aligned} \tag{87}$$

which hence implies that

$$\begin{aligned}
& \gamma_n \|\Delta_{k-1}u_n - \Delta_k u_n\|^2 + (1 - \beta_n - \gamma_n \|V\|) \|\Lambda_{i-1}u_n - \Lambda_i u_n\|^2 \\
& \leq \gamma_n \|\Delta_{k-1}u_n - \Delta_k u_n\|^2 + (1 - \beta_n - \gamma_n \bar{\gamma}) \|\Lambda_{i-1}u_n - \Lambda_i u_n\|^2 \\
& \leq \|x_n - p\|^2 - \|y_n - p\|^2 \\
& \quad + 2\gamma_k \|\Delta_{k-1}u_n - \Delta_k u_n\| \|A_k \Delta_{k-1}u_n - A_k p\| \\
& \quad + 2\mu_i \|\Lambda_{i-1}u_n - \Lambda_i u_n\| \|B_i \Lambda_{i-1}u_n - B_i p\| \\
& \quad + 2\gamma_n \langle (I - V)p, y_n - p \rangle \\
& \leq \|x_n - y_n\| (\|x_n - p\| + \|y_n - p\|)
\end{aligned}$$

$$\begin{aligned}
& + 2\gamma_k \|\Delta_{k-1}u_n - \Delta_k u_n\| \|A_k \Delta_{k-1}u_n - A_k p\| \\
& + 2\mu_i \|\Lambda_{i-1}u_n - \Lambda_i u_n\| \|B_i \Lambda_{i-1}u_n - B_i p\| \\
& + 2\gamma_n \langle (I - V)p, y_n - p \rangle.
\end{aligned} \tag{88}$$

In particular, putting $p = x^*$ we have

$$\begin{aligned}
& \gamma_n \|\Delta_{k-1}u_n - \Delta_k u_n\|^2 + (1 - \beta_n - \gamma_n \|V\|) \|\Lambda_{i-1}u_n - \Lambda_i u_n\|^2 \\
& \leq \|x_n - y_n\| (\|x_n - x^*\| + \|y_n - x^*\|) \\
& \quad + 2\gamma_k \|\Delta_{k-1}u_n - \Delta_k u_n\| \|A_k \Delta_{k-1}u_n - A_k x^*\| \\
& \quad + 2\mu_i \|\Lambda_{i-1}u_n - \Lambda_i u_n\| \|B_i \Lambda_{i-1}u_n - B_i x^*\| \\
& \quad + 2\gamma_n \langle (I - V)x^*, y_n - x^* \rangle \\
& \leq \|x_n - y_n\| \\
& \quad \times (\|x_n - x^*\| + \|y_n - x^*\| + 2\|(I - V)x^*\|) \\
& \quad + 2\gamma_k \|\Delta_{k-1}u_n - \Delta_k u_n\| \|A_k \Delta_{k-1}u_n - A_k x^*\| \\
& \quad + 2\mu_i \|\Lambda_{i-1}u_n - \Lambda_i u_n\| \|B_i \Lambda_{i-1}u_n - B_i x^*\| \\
& \quad + 2\gamma_n \langle (I - V)x^*, x_n - x^* \rangle.
\end{aligned} \tag{89}$$

Since $0 < \liminf_{n \rightarrow \infty} \gamma_n \leq \limsup_{n \rightarrow \infty} (\beta_n + \gamma_n \|V\|) < 1$ and $\limsup_{n \rightarrow \infty} \langle (I - V)x^*, x_n - x^* \rangle \leq 0$, we obtain from (66) and (82) and the boundedness of $\{u_n\}$, $\{x_n\}$, and $\{y_n\}$ that

$$\lim_{n \rightarrow \infty} \|\Delta_{k-1}u_n - \Delta_k u_n\| = 0, \tag{90}$$

$$\lim_{n \rightarrow \infty} \|\Lambda_{i-1}u_n - \Lambda_i u_n\| = 0,$$

for each $k \in \{1, 2, \dots, M\}$ and $i \in \{1, 2, \dots, N\}$. Consequently, from (90) it follows that

$$\begin{aligned}
& \|u_n - v_n\| \\
& = \|\Delta_0 u_n - \Delta_M u_n\| \\
& \leq \|\Delta_0 u_n - \Delta_1 u_n\| + \|\Delta_1 u_n - \Delta_2 u_n\| \\
& \quad + \dots + \|\Delta_{M-1} u_n - \Delta_M u_n\| \\
& \longrightarrow 0 \quad \text{as } n \longrightarrow \infty,
\end{aligned} \tag{91}$$

$$\begin{aligned}
& \|u_n - w_n\| \\
& = \|\Lambda_0 u_n - \Lambda_N u_n\| \\
& \leq \|\Lambda_0 u_n - \Lambda_1 u_n\| + \|\Lambda_1 u_n - \Lambda_2 u_n\| \\
& \quad + \dots + \|\Lambda_{N-1} u_n - \Lambda_N u_n\| \\
& \longrightarrow 0 \quad \text{as } n \longrightarrow \infty.
\end{aligned} \tag{92}$$

By (77), (91), and (92), we have

$$\lim_{n \rightarrow \infty} \|x_n - v_n\| = 0, \quad \lim_{n \rightarrow \infty} \|x_n - w_n\| = 0. \tag{93}$$

Step 5. We show that $\lim_{n \rightarrow \infty} \|v_n - Wv_n\| = 0$. Indeed, utilizing Lemma 7(b), from (37), (48), (49), and (67) we obtain that, for any $p \in \Omega$,

$$\begin{aligned}
& \|y_n - p\|^2 \\
&= \|\beta_n(x_n - p) + \gamma_n(W_nv_n - p) \\
&\quad + [(1 - \beta_n)I - \gamma_n V](W_n w_n - p) + \gamma_n(I - V)p\|^2 \\
&\leq \|\beta_n(x_n - p) + \gamma_n(W_nv_n - p) \\
&\quad + [(1 - \beta_n)I - \gamma_n V](W_n w_n - p)\|^2 \\
&\quad + 2\gamma_n \langle (I - V)p, y_n - p \rangle \\
&\leq \beta_n \|x_n - p\|^2 + \gamma_n \|W_nv_n - p\|^2 \\
&\quad + (1 - \beta_n - \gamma_n) \\
&\quad \times \left\| \frac{1}{1 - \beta_n - \gamma_n} [(1 - \beta_n)I - \gamma_n V](W_n w_n - p) \right\|^2 \\
&\quad - \beta_n \gamma_n \|x_n - W_nv_n\|^2 + 2\gamma_n \langle (I - V)p, y_n - p \rangle \\
&\leq \beta_n \|x_n - p\|^2 + \gamma_n \|v_n - p\|^2 \\
&\quad + (1 - \beta_n - \gamma_n) \frac{(1 - \beta_n - \gamma_n \bar{\gamma})^2}{(1 - \beta_n - \gamma_n)^2} \|W_n w_n - p\|^2 \\
&\quad - \beta_n \gamma_n \|x_n - W_nv_n\|^2 + 2\gamma_n \langle (I - V)p, y_n - p \rangle \\
&\leq \beta_n \|x_n - p\|^2 + \gamma_n \|u_n - p\|^2 + \frac{(1 - \beta_n - \gamma_n \bar{\gamma})^2}{1 - \beta_n - \gamma_n} \|w_n - p\|^2 \\
&\quad + 2\gamma_n \langle (I - V)p, y_n - p \rangle - \beta_n \gamma_n \|x_n - W_nv_n\|^2 \\
&\leq \beta_n \|x_n - p\|^2 + \gamma_n \|u_n - p\|^2 + (1 - \beta_n - \gamma_n \bar{\gamma}) \|u_n - p\|^2 \\
&\quad - \beta_n \gamma_n \|x_n - W_nv_n\|^2 + 2\gamma_n \langle (I - V)p, y_n - p \rangle \\
&= \beta_n \|x_n - p\|^2 + (1 - \beta_n - \gamma_n(\bar{\gamma} - 1)) \|u_n - p\|^2 \\
&\quad - \beta_n \gamma_n \|x_n - W_nv_n\|^2 + 2\gamma_n \langle (I - V)p, y_n - p \rangle \\
&\leq \beta_n \|x_n - p\|^2 + (1 - \beta_n - \gamma_n(\bar{\gamma} - 1)) \|x_n - p\|^2 \\
&\quad - \beta_n \gamma_n \|x_n - W_nv_n\|^2 + 2\gamma_n \langle (I - V)p, y_n - p \rangle \\
&= (1 - \gamma_n(\bar{\gamma} - 1)) \|x_n - p\|^2 - \beta_n \gamma_n \|x_n - W_nv_n\|^2 \\
&\quad + 2\gamma_n \langle (I - V)p, y_n - p \rangle \\
&\leq \|x_n - p\|^2 - \beta_n \gamma_n \|x_n - W_nv_n\|^2 + 2\gamma_n \langle (I - V)p, y_n - p \rangle,
\end{aligned} \tag{94}$$

which implies that

$$\begin{aligned}
& \beta_n \gamma_n \|x_n - W_nv_n\|^2 \\
&\leq \|x_n - p\|^2 - \|y_n - p\|^2 + 2\gamma_n \langle (I - V)p, y_n - p \rangle
\end{aligned}$$

$$\begin{aligned}
& \leq \|x_n - y_n\| (\|x_n - p\| + \|y_n - p\|) \\
& \quad + 2\gamma_n \langle (I - V)p, y_n - p \rangle.
\end{aligned} \tag{95}$$

In particular, putting $p = x^*$ we have

$$\begin{aligned}
& \beta_n \gamma_n \|x_n - W_nv_n\|^2 \\
&\leq \|x_n - y_n\| (\|x_n - x^*\| + \|y_n - x^*\|) \\
&\quad + 2\gamma_n \langle (I - V)x^*, y_n - x^* \rangle \\
&\leq \|x_n - y_n\| (\|x_n - x^*\| + \|y_n - x^*\|) \\
&\quad + 2\gamma_n \|(I - V)x^*\| \|y_n - x_n\| + 2\gamma_n \langle (I - V)x^*, x_n - x^* \rangle \\
&= \|x_n - y_n\| (\|x_n - x^*\| + \|y_n - x^*\| + 2\|(I - V)x^*\|) \\
&\quad + 2\gamma_n \langle (I - V)x^*, x_n - x^* \rangle.
\end{aligned} \tag{96}$$

Since $\liminf_{n \rightarrow \infty} \beta_n > 0$, $\liminf_{n \rightarrow \infty} \gamma_n > 0$, and $\limsup_{n \rightarrow \infty} \langle (I - V)x^*, x_n - x^* \rangle \leq 0$, we deduce from (66) and the boundedness of $\{x_n\}$ and $\{y_n\}$ that

$$\lim_{n \rightarrow \infty} \|x_n - W_nv_n\| = 0. \tag{97}$$

Also, observe that

$$\|v_n - W_nv_n\| \leq \|v_n - u_n\| + \|u_n - x_n\| + \|x_n - W_nv_n\|. \tag{98}$$

Thus, from (77), (91), and (97) it follows that

$$\lim_{n \rightarrow \infty} \|v_n - W_nv_n\| = 0. \tag{99}$$

Moreover, note that

$$\|v_n - Wv_n\| \leq \|v_n - W_nv_n\| + \|W_nv_n - Wv_n\|. \tag{100}$$

From (99), [23, Remark 3.2], and the boundedness of $\{v_n\}$ we immediately obtain

$$\lim_{n \rightarrow \infty} \|v_n - Wv_n\| = 0. \tag{101}$$

Step 6. We show that $\limsup_{n \rightarrow \infty} \langle (f - I)x^*, x_n - x^* \rangle \leq 0$.

Indeed, we observe that there exists a subsequence $\{x_{n_i}\}$ of $\{x_n\}$ such that

$$\begin{aligned}
& \limsup_{n \rightarrow \infty} \langle (f - I)x^*, x_n - x^* \rangle \\
&= \lim_{i \rightarrow \infty} \langle (f - I)x^*, x_{n_i} - x^* \rangle.
\end{aligned} \tag{102}$$

Since $\{x_{n_i}\}$ is bounded, there exists a subsequence $\{x_{n_{i_j}}\}$ of $\{x_{n_i}\}$ which converges weakly to some w . Without loss of generality, we may assume that $x_{n_{i_j}} \rightharpoonup w$. From (77), (90), and (93), we have that $u_{n_{i_j}} \rightharpoonup w$, $v_{n_{i_j}} \rightharpoonup w$, $\Delta_k u_{n_{i_j}} \rightharpoonup w$, and $\Lambda_m u_{n_{i_j}} \rightharpoonup w$, where $k \in \{1, 2, \dots, M\}$ and $m \in \{1, 2, \dots, N\}$. By (101) we have that $\|v_n - Wv_n\| \rightarrow 0$ as $n \rightarrow \infty$. Then,

by Lemma 10 we obtain $w \in \text{Fix}(W) = \cap_{n=1}^{\infty} \text{Fix}(T_n)$ (due to Lemma 9). Next we prove that $w \in \cap_{k=1}^M \text{VI}(C, A_k)$. Let

$$\tilde{T}_k v = \begin{cases} A_k v + N_C v, & v \in C, \\ \emptyset, & v \notin C, \end{cases} \quad (103)$$

where $k \in \{1, 2, \dots, M\}$. Let $(v, u) \in G(\tilde{T}_k)$. Since $u - A_k v \in N_C v$ and $\Delta_k u_n \in C$, we have

$$\langle v - \Delta_k u_n, u - A_k v \rangle \geq 0. \quad (104)$$

Also, from $\Delta_k u_n = P_C(I - \nu_k A_k) \Delta_{k-1} u_n$ and $v \in C$, we have

$$\langle v - \Delta_k u_n, \Delta_k u_n - (\Delta_{k-1} u_n - \nu_k A_k \Delta_{k-1} u_n) \rangle \geq 0, \quad (105)$$

and hence

$$\left\langle v - \Delta_k u_n, \frac{\Delta_k u_n - \Delta_{k-1} u_n}{\nu_k} + A_k \Delta_{k-1} u_n \right\rangle \geq 0. \quad (106)$$

Therefore we have

$$\begin{aligned} & \langle v - \Delta_k u_{n_i}, u \rangle \\ & \geq \langle v - \Delta_k u_{n_i}, A_k v \rangle \\ & \geq \langle v - \Delta_k u_{n_i}, A_k v \rangle \\ & \quad - \left\langle v - \Delta_k u_{n_i}, \frac{\Delta_k u_{n_i} - \Delta_{k-1} u_{n_i}}{\nu_k} + A_k \Delta_{k-1} u_{n_i} \right\rangle \\ & = \langle v - \Delta_k u_{n_i}, A_k v - A_k \Delta_{k-1} u_{n_i} \rangle \\ & \quad + \langle v - \Delta_k u_{n_i}, A_k \Delta_k u_{n_i} - A_k \Delta_{k-1} u_{n_i} \rangle \\ & \quad - \left\langle v - \Delta_k u_{n_i}, \frac{\Delta_k u_{n_i} - \Delta_{k-1} u_{n_i}}{\nu_k} \right\rangle \\ & \geq \langle v - \Delta_k u_{n_i}, A_k \Delta_k u_{n_i} - A_k \Delta_{k-1} u_{n_i} \rangle \\ & \quad - \left\langle v - \Delta_k u_{n_i}, \frac{\Delta_k u_{n_i} - \Delta_{k-1} u_{n_i}}{\nu_k} \right\rangle. \end{aligned} \quad (107)$$

From (90) and since A_k is uniformly continuous, we obtain that $\lim_{n \rightarrow \infty} \|A_k \Delta_k u_n - A_k \Delta_{k-1} u_n\| = 0$. From $\Delta_k u_{n_i} \rightharpoonup w$, $\nu_k \in (0, 2\zeta_k)$, for all $k \in \{1, 2, \dots, M\}$ and (90), we have

$$\langle v - w, u \rangle \geq 0. \quad (108)$$

Since $\tilde{T}_k$ is maximal monotone, we have $w \in \tilde{T}_k^{-1}0$ and hence $w \in \text{VI}(C, A_k)$, $k = 1, 2, \dots, M$, which implies $w \in \cap_{k=1}^M \text{VI}(C, A_k)$. Next, we prove that $w \in \cap_{m=1}^N I(B_m, R_m)$. As a matter of fact, since B_m is η_m -inverse strongly monotone, B_m is a monotone and Lipschitz continuous mapping. It follows from Lemma 17 that $R_m + B_m$ is maximal monotone. Let $(v, g) \in G(R_m + B_m)$; that is, $g - B_m v \in R_m v$. Again, since $\Lambda_m u_n = J_{R_m, \mu_m}(I - \mu_m B_m) \Lambda_{m-1} u_n$, $n \geq 1$, $m \in \{1, 2, \dots, N\}$, we have

$$\Lambda_{m-1} u_n - \mu_m B_m \Lambda_{m-1} u_n \in (I + \mu_m R_m) \Lambda_m u_n. \quad (109)$$

That is,

$$\frac{1}{\mu_m} (\Lambda_{m-1} u_n - \Lambda_m u_n - \mu_m B_m \Lambda_{m-1} u_n) \in R_m \Lambda_m u_n. \quad (110)$$

In terms of the monotonicity of R_m , we get

$$\begin{aligned} & \left\langle v - \Lambda_m u_n, g - B_m v \right. \\ & \quad \left. - \frac{1}{\mu_m} (\Lambda_{m-1} u_n - \Lambda_m u_n - \mu_m B_m \Lambda_{m-1} u_n) \right\rangle \geq 0 \end{aligned} \quad (111)$$

and hence

$$\begin{aligned} & \langle v - \Lambda_m u_n, g \rangle \\ & \geq \left\langle v - \Lambda_m u_n, \right. \\ & \quad \left. B_m v + \frac{1}{\mu_m} (\Lambda_{m-1} u_n - \Lambda_m u_n - \mu_m B_m \Lambda_{m-1} u_n) \right\rangle \\ & = \left\langle v - \Lambda_m u_n, B_m v - B_m \Lambda_m u_n + B_m \Lambda_m u_n \right. \\ & \quad \left. - B_m \Lambda_{m-1} u_n + \frac{1}{\mu_m} (\Lambda_{m-1} u_n - \Lambda_m u_n) \right\rangle \\ & \geq \langle v - \Lambda_m u_n, B_m \Lambda_m u_n - B_m \Lambda_{m-1} u_n \rangle \\ & \quad + \left\langle v - \Lambda_m u_n, \frac{1}{\mu_m} (\Lambda_{m-1} u_n - \Lambda_m u_n) \right\rangle. \end{aligned} \quad (112)$$

In particular,

$$\begin{aligned} & \langle v - \Lambda_m u_{n_i}, g \rangle \\ & \geq \langle v - \Lambda_m u_{n_i}, B_m \Lambda_m u_{n_i} - B_m \Lambda_{m-1} u_{n_i} \rangle \\ & \quad + \left\langle v - \Lambda_m u_{n_i}, \frac{1}{\mu_m} (\Lambda_{m-1} u_{n_i} - \Lambda_m u_{n_i}) \right\rangle. \end{aligned} \quad (113)$$

Since $\|\Lambda_m u_n - \Lambda_{m-1} u_n\| \rightarrow 0$ (due to (90)) and $\|B_m \Lambda_m u_n - B_m \Lambda_{m-1} u_n\| \rightarrow 0$ (due to the Lipschitz continuity of B_m), we conclude from $\Lambda_m u_{n_i} \rightharpoonup w$ and $\mu_m \in (0, 2\eta_m)$, $m \in \{1, 2, \dots, N\}$, that

$$\lim_{i \rightarrow \infty} \langle v - \Lambda_m u_{n_i}, g \rangle = \langle v - w, g \rangle \geq 0. \quad (114)$$

It follows from the maximal monotonicity of $B_m + R_m$ that $0 \in (R_m + B_m)w$; that is, $w \in I(B_m, R_m)$. Therefore, $w \in \cap_{m=1}^N I(B_m, R_m)$.

Next, we show that $w \in \text{GMEP}(\Theta, \varphi, A)$. In fact, from $u_n = S_{r_n}^{(\Theta, \varphi)}(I - r_n A)x_n$, we know that

$$\begin{aligned} & \Theta(u_n, y) + \varphi(y) - \varphi(u_n) + \langle Ax_n, y - u_n \rangle \\ & \quad + \frac{1}{r_n} \langle K'(u_n) - K'(x_n), y - u_n \rangle \geq 0, \quad \forall y \in C. \end{aligned} \quad (115)$$

From (H2) it follows that

$$\begin{aligned} & \varphi(y) - \varphi(u_n) + \langle Ax_n, y - u_n \rangle \\ & + \frac{1}{r_n} \langle K'(u_n) - K'(x_n), y - u_n \rangle \geq \Theta(y, u_n), \quad \forall y \in C. \end{aligned} \quad (116)$$

Replacing n by n_i , we have

$$\begin{aligned} & \varphi(y) - \varphi(u_{n_i}) + \langle Ax_{n_i}, y - u_{n_i} \rangle \\ & + \left\langle \frac{K'(u_{n_i}) - K'(x_{n_i})}{r_{n_i}}, y - u_{n_i} \right\rangle \geq \Theta(y, u_{n_i}), \\ & \forall y \in C. \end{aligned} \quad (117)$$

Put $u_t = ty + (1-t)w$ for all $t \in (0, 1]$ and $y \in C$. Then, from (117) we have

$$\begin{aligned} & \langle u_t - u_{n_i}, Au_t \rangle \\ & \geq \langle u_t - u_{n_i}, Au_t \rangle - \varphi(u_t) + \varphi(u_{n_i}) \\ & - \langle u_t - u_{n_i}, Ax_{n_i} \rangle - \left\langle \frac{K'(u_{n_i}) - K'(x_{n_i})}{r_{n_i}}, u_t - u_{n_i} \right\rangle \\ & + \Theta(u_t, u_{n_i}) \\ & \geq \langle u_t - u_{n_i}, Au_t - Au_{n_i} \rangle + \langle u_t - u_{n_i}, Au_{n_i} - Ax_{n_i} \rangle \\ & - \varphi(u_t) + \varphi(u_{n_i}) \\ & - \left\langle \frac{K'(u_{n_i}) - K'(x_{n_i})}{r_{n_i}}, u_t - u_{n_i} \right\rangle + \Theta(u_t, u_{n_i}). \end{aligned} \quad (118)$$

Since $\|u_{n_i} - x_{n_i}\| \rightarrow 0$ as $i \rightarrow \infty$, we deduce from the Lipschitz continuity of A and K' that $\|Au_{n_i} - Ax_{n_i}\| \rightarrow 0$ and $\|K'(u_{n_i}) - K'(x_{n_i})\| \rightarrow 0$ as $i \rightarrow \infty$. Further, from the monotonicity of A , we have $\langle u_t - u_{n_i}, Au_t - Au_{n_i} \rangle \geq 0$. So, from (H4), the weakly lower semicontinuity of φ , $(K'(u_{n_i}) - K'(x_{n_i}))/r_{n_i} \rightarrow 0$, and $u_{n_i} \rightarrow w$, we have

$$\langle u_t - w, Au_t \rangle \geq -\varphi(u_t) + \varphi(w) + \Theta(u_t, w), \quad \text{as } i \rightarrow \infty. \quad (119)$$

From (H1), (H4), and (119) we also have

$$\begin{aligned} 0 & = \Theta(u_t, u_t) + \varphi(u_t) - \varphi(u_t) \\ & \leq t\Theta(u_t, y) + (1-t)\Theta(u_t, w) \\ & \quad + t\varphi(y) + (1-t)\varphi(w) - \varphi(u_t) \\ & = t[\Theta(u_t, y) + \varphi(y) - \varphi(u_t)] \\ & \quad + (1-t)[\Theta(u_t, w) + \varphi(w) - \varphi(u_t)] \end{aligned}$$

$$\begin{aligned} & \leq t[\Theta(u_t, y) + \varphi(y) - \varphi(u_t)] \\ & \quad + (1-t)\langle u_t - w, Au_t \rangle \\ & = t[\Theta(u_t, y) + \varphi(y) - \varphi(u_t)] \\ & \quad + (1-t)t\langle y - w, Au_t \rangle, \end{aligned} \quad (120)$$

and hence

$$0 \leq \Theta(u_t, y) + \varphi(y) - \varphi(u_t) + (1-t)\langle y - w, Au_t \rangle. \quad (121)$$

Letting $t \rightarrow 0$, we have, for each $y \in C$,

$$0 \leq \Theta(w, y) + \varphi(y) - \varphi(w) + \langle Aw, y - w \rangle. \quad (122)$$

This implies that $w \in \text{GMEP}(\Theta, \varphi, A)$. Therefore, $w \in \bigcap_{n=1}^{\infty} \text{Fix}(T_n) \cap \text{GMEP}(\Theta, \varphi, A) \cap \bigcap_{k=1}^M \text{VI}(A_k, C) \cap \bigcap_{i=1}^N I(B_i, R_i) = \Omega$. This shows that $\omega_w(x_n) \subset \Omega$. Consequently, from (102) and $x^* \in \text{VI}(\Omega, I - f)$, we have

$$\limsup_{n \rightarrow \infty} \langle (f - I)x^*, x_n - x^* \rangle = \langle (f - I)x^*, w - x^* \rangle \leq 0. \quad (123)$$

Step 7. Finally, we show that $x_n \rightarrow x^* \in \Omega$ as $n \rightarrow \infty$.

Indeed, in terms of (68) we get

$$\begin{aligned} & \|y_n - x^*\|^2 \\ & \leq (1 - \gamma_n(\bar{\gamma} - 1))\|x_n - x^*\|^2 \\ & \quad + (1 - \beta_n - \gamma_n(\bar{\gamma} - 1))r_n(r_n - 2\zeta)\|Ax_n - Ax^*\|^2 \\ & \quad + 2\gamma_n\langle (I - V)x^*, y_n - x^* \rangle \\ & \leq (1 - \gamma_n(\bar{\gamma} - 1))\|x_n - x^*\|^2 \\ & \quad + 2\gamma_n\langle (I - V)x^*, y_n - x^* \rangle, \end{aligned} \quad (124)$$

which, together with (37), implies that

$$\begin{aligned} & \|x_{n+1} - x^*\|^2 \\ & = \|\alpha_n(f(x_n) - f(x^*)) + (1 - \alpha_n)(y_n - x^*) \\ & \quad + \alpha_n(f(x^*) - x^*)\|^2 \\ & \leq \|\alpha_n(f(x_n) - f(x^*)) + (1 - \alpha_n)(y_n - x^*)\|^2 \\ & \quad + 2\alpha_n\langle (f - I)x^*, x_{n+1} - x^* \rangle \end{aligned}$$

$$\begin{aligned}
&\leq \alpha_n \|f(x_n) - f(x^*)\|^2 + (1 - \alpha_n) \|y_n - x^*\|^2 \\
&\quad + 2\alpha_n \langle (f - I)x^*, x_{n+1} - x^* \rangle \\
&\leq \alpha_n \|x_n - x^*\|^2 + (1 - \alpha_n) \\
&\quad \times [(1 - \gamma_n(\bar{\gamma} - 1)) \|x_n - x^*\|^2 \\
&\quad + 2\gamma_n \langle (I - V)x^*, y_n - x^* \rangle] \\
&\quad + 2\alpha_n \langle (f - I)x^*, x_{n+1} - x^* \rangle \\
&= (1 - (1 - \alpha_n)\gamma_n(\bar{\gamma} - 1)) \|x_n - x^*\|^2 \\
&\quad + 2(1 - \alpha_n)\gamma_n \langle (I - V)x^*, y_n - x^* \rangle \\
&\quad + 2\alpha_n \langle (f - I)x^*, x_{n+1} - x^* \rangle \\
&= (1 - (1 - \alpha_n)\gamma_n(\bar{\gamma} - 1)) \|x_n - x^*\|^2 + (1 - \alpha_n)\gamma_n(\bar{\gamma} - 1) \\
&\quad \times \left[\frac{2 \langle (I - V)x^*, y_n - x^* \rangle}{(\bar{\gamma} - 1)} \right. \\
&\quad \left. + \frac{2\alpha_n}{(1 - \alpha_n)\gamma_n(\bar{\gamma} - 1)} \langle (f - I)x^*, x_{n+1} - x^* \rangle \right] \\
&= (1 - \delta_n) \|x_n - x^*\|^2 + \sigma_n \delta_n,
\end{aligned} \tag{125}$$

where $\delta_n = (1 - \alpha_n)\gamma_n(\bar{\gamma} - 1)$ and

$$\begin{aligned}
\sigma_n &= \frac{2 \langle (I - V)x^*, y_n - x^* \rangle}{\bar{\gamma} - 1} \\
&\quad + \frac{2\alpha_n}{(1 - \alpha_n)\gamma_n(\bar{\gamma} - 1)} \langle (f - I)x^*, x_{n+1} - x^* \rangle.
\end{aligned} \tag{126}$$

Since $\{\rho_n\} \subset [0, 1 - \rho]$, $\{\gamma_n\} \subset [a, \bar{a}] \subset (0, 1)$, and $\sum_{n=1}^{\infty} \alpha_n = \infty$, we deduce that $\sum_{n=1}^{\infty} \delta_n = \sum_{n=1}^{\infty} (1 - \alpha_n)\gamma_n(\bar{\gamma} - 1) = \infty$ and $2\alpha_n/((1 - \alpha_n)\gamma_n(\bar{\gamma} - 1)) \leq 2/\rho a(\bar{\gamma} - 1)$. Note that

$$\begin{aligned}
&\limsup_{n \rightarrow \infty} \langle (I - V)x^*, y_n - x^* \rangle \\
&= \limsup_{n \rightarrow \infty} [\langle (I - V)x^*, y_n - x_n \rangle + \langle (I - V)x^*, x_n - x^* \rangle] \\
&\leq 0.
\end{aligned} \tag{127}$$

Hence from (123) and Lemma 18 it follows that

$$\begin{aligned}
&\limsup_{n \rightarrow \infty} \sigma_n \\
&= \limsup_{n \rightarrow \infty} \left[\frac{2 \langle (I - V)x^*, y_n - x^* \rangle}{(\bar{\gamma} - 1)} + \frac{2\alpha_n}{(1 - \alpha_n)\gamma_n(\bar{\gamma} - 1)} \right. \\
&\quad \left. \times \langle (f - I)x^*, x_{n+1} - x^* \rangle \right]
\end{aligned}$$

$$\begin{aligned}
&\leq \limsup_{n \rightarrow \infty} \frac{2 \langle (I - V)x^*, y_n - x^* \rangle}{\bar{\gamma} - 1} \\
&\quad + \limsup_{n \rightarrow \infty} \frac{2\alpha_n}{(1 - \alpha_n)\gamma_n(\bar{\gamma} - 1)} \langle (f - I)x^*, x_{n+1} - x^* \rangle \\
&\leq 0.
\end{aligned} \tag{128}$$

Applying Lemma 13 to (125), we infer that the sequence $\{x_n\}$ converges strongly to x^* . This completes the proof. $\square$

Corollary 20. Let C be a nonempty closed convex subset of a real Hilbert space H . Let N be an integer. Let Θ be a bifunction from $C \times C$ to $\mathbf{R}$ satisfying (H1)–(H4) and $\varphi : C \rightarrow \mathbf{R}$ a lower semicontinuous and convex functional. Let $R_i : C \rightarrow 2^H$ be a maximal monotone mapping and let $A : H \rightarrow H$, $A_1 : C \rightarrow H$, and $B_i : C \rightarrow H$ be ξ -inverse strongly monotone, ξ_1 -inverse strongly monotone, and η_i -inverse strongly monotone, respectively, where $i \in \{1, 2, \dots, N\}$. Let $\{T_n\}_{n=1}^{\infty}$ be a sequence of nonexpansive mappings on H and $\{\lambda_n\}$ a sequence in $(0, b]$ for some $b \in (0, 1)$. Define $\Delta_k = P_C(I - \nu_k A_k) \cdots P_C(I - \nu_1 A_1)$ and $\Lambda_i = J_{R_i, \mu_i}(I - \mu_i B_i) \cdots J_{R_i, \mu_1}(I - \mu_1 B_i)$ for each $k \in \{1, 2, \dots, M\}$ and $i \in \{1, 2, \dots, N\}$. Let $\{\alpha_n\}$, $\{\beta_n\}$, and $\{\gamma_n\}$ be three sequences in $[0, 1]$. Assume that

(i) $K : H \rightarrow \mathbf{R}$ is strongly convex with constant $\sigma > 0$ and its derivative K' is Lipschitz continuous with constant $\nu > 0$ such that the function $x \mapsto \langle y - x, K'(x) \rangle$ is weakly upper semicontinuous for each $y \in H$,

(ii) for each $x \in H$, there exist a bounded subset $D_x \subset C$ and $z_x \in C$ such that, for any $y \notin D_x$,

$$\begin{aligned} \Theta(y, z_x) + \varphi(z_x) - \varphi(y) \\ + \frac{1}{r} \langle K'(y) - K'(x), z_x - y \rangle < 0; \end{aligned} \quad (141)$$

(iii) $\{\alpha_n\} \subset [0, 1 - \rho]$ and $\sum_{n=1}^\infty \alpha_n = \infty$,

(iv) $\liminf_{n \rightarrow \infty} \gamma_n > 0$ and $0 < \liminf_{n \rightarrow \infty} \beta_n \leq \limsup_{n \rightarrow \infty} (\beta_n + \gamma_n \|V\|) < 1$,

(v) $\lim_{n \rightarrow \infty} (|\alpha_{n+1}/(1 - (1 - \alpha_{n+1})\beta_{n+1}) - \alpha_n/(1 - (1 - \alpha_n)\beta_n)| + |\gamma_{n+1}/(1 - \beta_{n+1}) - \gamma_n/(1 - \beta_n)|) = 0$,

(vi) $\{r_n\}$ is a bounded sequence in $(0, \infty)$ such that

$$\liminf_{n \rightarrow \infty} r_n > 0, \quad \lim_{n \rightarrow \infty} |r_{n+1} - r_n| = 0. \quad (142)$$

Given $x_1 \in H$ arbitrarily, the sequence $\{x_n\}$ is generated iteratively by

$$\begin{aligned} \Theta(u_n, y) + \varphi(y) - \varphi(u_n) \\ + \frac{1}{r_n} \langle K'(u_n) - K'(x_n), y - u_n \rangle \geq 0, \\ \forall y \in C, \\ y_n = \beta_n x_n + \gamma_n W_n \Delta_M u_n + [(1 - \beta_n)I - \gamma_n V] W_n \Lambda_N u_n, \\ x_{n+1} = \alpha_n f(x_n) + (1 - \alpha_n) y_n, \quad \forall n \geq 1, \end{aligned} \quad (143)$$

where $\nu_k \in (0, 2\zeta_k)$ and $\mu_i \in (0, 2\eta_i)$ for each $k \in \{1, 2, \dots, M\}$ and $i \in \{1, 2, \dots, N\}$. If $\alpha_n(f(x_n) - x_n) \rightarrow 0$ and $S_r^{(\Theta, \varphi)}$ is firmly nonexpansive, then

$$x_n \rightarrow x^* \iff \limsup_{n \rightarrow \infty} \langle (I - V)x^*, x_n - x^* \rangle \leq 0, \quad (144)$$

where x^* is a unique solution in Ω to the VIP

$$\langle (I - f)x^*, x^* - x \rangle \leq 0, \quad \forall x \in \Omega. \quad (145)$$

Proof. In Theorem 19, for all $n \geq 1$, $u_n = S_{r_n}^{(\Theta, \varphi)}(I - r_n A)x_n$ is equivalent to

$$\begin{aligned} \Theta(u_n, y) + \varphi(y) - \varphi(u_n) + \langle Ax_n, y - u_n \rangle \\ + \frac{1}{r_n} \langle K'(u_n) - K'(x_n), y - u_n \rangle \geq 0, \quad \forall y \in C. \end{aligned} \quad (146)$$

Put $A \equiv 0$. Then it follows that

$$\begin{aligned} \Theta(u_n, y) + \varphi(y) - \varphi(u_n) \\ + \frac{1}{r_n} \langle K'(u_n) - K'(x_n), y - u_n \rangle \geq 0, \quad \forall y \in C. \end{aligned} \quad (147)$$

Observe that for all $\zeta \in (0, \infty)$

$$\langle Ax - Ay, x - y \rangle \geq \zeta \|Ax - Ay\|^2, \quad \forall x, y \in H. \quad (148)$$

So, whenever $0 < \liminf_{n \rightarrow \infty} r_n \leq \limsup_{n \rightarrow \infty} r_n < 2\zeta$ for some $\zeta \in (0, \infty)$, we obtain the desired result by using Theorem 19. $\square$

Let $T : H \rightarrow H$ be a κ -strictly pseudocontractive mapping. For recent convergence result for strictly pseudocontractive mappings, we refer to [24]. Putting $A = I - T$, we know that for all $x, y \in H$

$$\|(I - A)x - (I - A)y\|^2 \leq \|x - y\|^2 + \kappa \|Ax - Ay\|^2. \quad (149)$$

Note that

$$\begin{aligned} \|(I - A)x - (I - A)y\|^2 &= \|x - y\|^2 + \|Ax - Ay\|^2 \\ &\quad - 2 \langle Ax - Ay, x - y \rangle. \end{aligned} \quad (150)$$

Hence we have for all $x, y \in H$

$$\langle Ax - Ay, x - y \rangle \geq \frac{1 - \kappa}{2} \|Ax - Ay\|^2. \quad (151)$$

Consequently, if $T : H \rightarrow H$ is a κ -strictly pseudocontractive mapping, then the mapping $A = I - T$ is $(1 - \kappa)/2$ -inverse strongly monotone.

Corollary 24. Let C be a nonempty closed convex subset of a real Hilbert space H . Let M and N be two integers. Let Θ be a bifunction from $C \times C$ to $\mathbf{R}$ satisfying (H1)–(H4) and $\varphi : C \rightarrow \mathbf{R}$ a lower semicontinuous and convex functional. Let $R_i : C \rightarrow 2^H$ be a maximal monotone mapping and let $T : H \rightarrow H$, $A_k :$

$C \rightarrow H$, and $B_i : C \rightarrow H$ be κ -strictly pseudocontractive, ζ_k -inverse strongly monotone, and η_i -inverse strongly monotone, respectively, where $k \in \{1, 2, \dots, M\}$ and $i \in \{1, 2, \dots, N\}$. Let $\{T_n\}_{n=1}^\infty$ be a sequence of nonexpansive mappings on H and $\{\lambda_n\}$ a sequence in $(0, b]$ for some $b \in (0, 1)$. Let V be a $\bar{\gamma}$ -strongly positive bounded linear operator with $\bar{\gamma} \in (1, 2)$ and $f : H \rightarrow H$ a ρ -contraction with $\rho \in (0, 1)$. Let W_n be the W -mapping defined by (9). Assume that $\Omega := \bigcap_{n=1}^\infty \text{Fix}(T_n) \cap \text{GMEP}(\Theta, \varphi, A) \cap \bigcap_{k=1}^M \text{VI}(C, A_k) \cap \bigcap_{i=1}^N I(B_i, R_i) \neq \emptyset$ where $A = I - T$. Define $\Delta_k = P_C(I - \nu_k A_k) \cdots P_C(I - \nu_1 A_1)$ and $\Lambda_i = J_{R_i, \mu_i}(I - \mu_i B_i) \cdots J_{R_i, \mu_1}(I - \mu_1 B_1)$ for each $k \in \{1, 2, \dots, M\}$ and $i \in \{1, 2, \dots, N\}$. Let $\{\alpha_n\}$, $\{\beta_n\}$, and $\{\gamma_n\}$ be three sequences in $[0, 1]$. Assume that

- (i) $K : H \rightarrow \mathbf{R}$ is strongly convex with constant $\sigma > 0$ and its derivative K' is Lipschitz continuous with constant $\nu > 0$ such that the function $x \mapsto \langle y - x, K'(x) \rangle$ is weakly upper semicontinuous for each $y \in H$,
- (ii) for each $x \in H$, there exist a bounded subset $D_x \subset C$ and $z_x \in C$ such that, for any $y \notin D_x$,

$$\Theta(y, z_x) + \varphi(z_x) - \varphi(y) + \frac{1}{r} \langle K'(y) - K'(x), z_x - y \rangle < 0; \quad (152)$$

- (iii) $\{\alpha_n\} \subset [0, 1 - \rho]$ and $\sum_{n=1}^\infty \alpha_n = \infty$,
- (iv) $\liminf_{n \rightarrow \infty} \gamma_n > 0$ and $0 < \liminf_{n \rightarrow \infty} \beta_n \leq \limsup_{n \rightarrow \infty} (\beta_n + \gamma_n \|V\|) < 1$,
- (v) $\lim_{n \rightarrow \infty} (|\alpha_{n+1}/(1 - (1 - \alpha_{n+1})\beta_{n+1}) - \alpha_n/(1 - (1 - \alpha_n)\beta_n)| + |\gamma_{n+1}/(1 - \beta_{n+1}) - \gamma_n/(1 - \beta_n)|) = 0$,
- (vi) $\{r_n\} \subset [0, 1 - \kappa]$, $\lim_{n \rightarrow \infty} |r_{n+1} - r_n| = 0$, and $0 < \liminf_{n \rightarrow \infty} r_n \leq \limsup_{n \rightarrow \infty} r_n < 1 - \kappa$. Given $x_1 \in H$ arbitrarily, the sequence $\{x_n\}$ is generated iteratively by

$$\begin{aligned} u_n &= S_{r_n}^{(\Theta, \varphi)}((1 - r_n)x_n + r_n T x_n), \\ y_n &= \beta_n x_n + \gamma_n W_n \Delta_M u_n + [(1 - \beta_n)I - \gamma_n V] W_n \Lambda_N u_n, \\ x_{n+1} &= \alpha_n f(x_n) + (1 - \alpha_n) y_n, \quad \forall n \geq 1, \end{aligned} \quad (153)$$

where $\nu_k \in (0, 2\zeta_k)$ and $\mu_i \in (0, 2\eta_i)$ for each $k \in \{1, 2, \dots, M\}$ and $i \in \{1, 2, \dots, N\}$. If $\alpha_n(f(x_n) - x_n) \rightarrow 0$ and $S_r^{(\Theta, \varphi)}$ is firmly nonexpansive, then

$$x_n \rightarrow x^* \iff \limsup_{n \rightarrow \infty} \langle (I - V)x^*, x_n - x^* \rangle \leq 0, \quad (154)$$

where x^* is a unique solution in Ω to the VIP

$$\langle (I - f)x^*, x^* - x \rangle \leq 0, \quad \forall x \in \Omega. \quad (155)$$

Proof. Since T is a κ -strictly pseudocontractive mapping, the mapping $A = I - T$ is $(1 - \kappa)/2$ -inverse strongly monotone. In this case, put $\zeta = (1 - \kappa)/2$. Moreover, we obtain that

$$\begin{aligned} u_n &= S_{r_n}^{(\Theta, \varphi)}(I - r_n A)x_n \\ &= S_{r_n}^{(\Theta, \varphi)}(x_n - r_n(I - T)x_n) \\ &= S_{r_n}^{(\Theta, \varphi)}((1 - r_n)x_n + r_n T x_n). \end{aligned} \quad (156)$$

So, from Theorem 19, we obtain the desired result. $\square$

Corollary 25. Let C be a nonempty closed convex subset of a real Hilbert space H . Let M and N be two integers. Let Θ be a bifunction from $C \times C$ to $\mathbf{R}$ satisfying (H1)–(H4) and $\varphi : C \rightarrow \mathbf{R}$ a lower semicontinuous and convex functional. Let $R_i : C \rightarrow 2^H$ be a maximal monotone mapping and let $A : H \rightarrow H$, $A_k : C \rightarrow H$, and $B_i : C \rightarrow H$ be ζ -inverse strongly monotone, ζ_k -inverse strongly monotone, and η_i -inverse strongly monotone, respectively, where $k \in \{1, 2, \dots, M\}$ and $i \in \{1, 2, \dots, N\}$. Let V be a $\bar{\gamma}$ -strongly positive bounded linear operator with $\bar{\gamma} \in (1, 2)$ and $f : H \rightarrow H$ a ρ -contraction with $\rho \in (0, 1)$. Assume that $\Omega := \text{GMEP}(\Theta, \varphi, A) \cap \bigcap_{k=1}^M \text{VI}(C, A_k) \cap \bigcap_{i=1}^N I(B_i, R_i) \neq \emptyset$. Define $\Delta_k = P_C(I - \nu_k A_k) \cdots P_C(I - \nu_1 A_1)$ and $\Lambda_i = J_{R_i, \mu_i}(I - \mu_i B_i) \cdots J_{R_i, \mu_1}(I - \mu_1 B_1)$ for each $k \in \{1, 2, \dots, M\}$ and $i \in \{1, 2, \dots, N\}$. Let $\{\alpha_n\}$, $\{\beta_n\}$, and $\{\gamma_n\}$ be three sequences in $[0, 1]$. Assume that

- (i) $K : H \rightarrow \mathbf{R}$ is strongly convex with constant $\sigma > 0$ and its derivative K' is Lipschitz continuous with constant $\nu > 0$ such that the function $x \mapsto \langle y - x, K'(x) \rangle$ is weakly upper semicontinuous for each $y \in H$,
- (ii) for each $x \in H$, there exist a bounded subset $D_x \subset C$ and $z_x \in C$ such that, for any $y \notin D_x$,

$$\Theta(y, z_x) + \varphi(z_x) - \varphi(y) + \frac{1}{r} \langle K'(y) - K'(x), z_x - y \rangle < 0; \quad (157)$$

- (iii) $\{\alpha_n\} \subset [0, 1 - \rho]$ and $\sum_{n=1}^\infty \alpha_n = \infty$,
- (iv) $\liminf_{n \rightarrow \infty} \gamma_n > 0$ and $0 < \liminf_{n \rightarrow \infty} \beta_n \leq \limsup_{n \rightarrow \infty} (\beta_n + \gamma_n \|V\|) < 1$;
- (v) $\lim_{n \rightarrow \infty} (|\alpha_{n+1}/(1 - (1 - \alpha_{n+1})\beta_{n+1}) - \alpha_n/(1 - (1 - \alpha_n)\beta_n)| + |\gamma_{n+1}/(1 - \beta_{n+1}) - \gamma_n/(1 - \beta_n)|) = 0$,
- (vi) $\{r_n\} \subset [0, 2\zeta]$, $\lim_{n \rightarrow \infty} |r_{n+1} - r_n| = 0$, and $0 < \liminf_{n \rightarrow \infty} r_n \leq \limsup_{n \rightarrow \infty} r_n < 2\zeta$.

Given $x_1 \in H$ arbitrarily, the sequence $\{x_n\}$ is generated iteratively by

$$\begin{aligned} u_n &= S_{r_n}^{(\Theta, \varphi)}(I - r_n A)x_n, \\ y_n &= \beta_n x_n + \gamma_n \Delta_M u_n + [(1 - \beta_n)I - \gamma_n V] \Lambda_N u_n, \\ x_{n+1} &= \alpha_n f(x_n) + (1 - \alpha_n) y_n, \quad \forall n \geq 1, \end{aligned} \quad (158)$$

where $\nu_k \in (0, 2\zeta_k)$ and $\mu_i \in (0, 2\eta_i)$ for each $k \in \{1, 2, \dots, M\}$ and $i \in \{1, 2, \dots, N\}$. If $\alpha_n(f(x_n) - x_n) \rightarrow 0$ and $S_r^{(\Theta, \varphi)}$ is firmly nonexpansive, then

$$x_n \rightarrow x^* \iff \limsup_{n \rightarrow \infty} \langle (I - V)x^*, x_n - x^* \rangle \leq 0, \quad (159)$$

where x^* is a unique solution in Ω to the VIP

$$\langle (I - f)x^*, x^* - x \rangle \leq 0, \quad \forall x \in \Omega. \quad (160)$$

Proof. Put $T_n x = x$ for all integers $n \geq 1$ and all $x \in H$. Then, the desired result follows from Theorem 19. $\square$

Corollary 26. Let C be a nonempty closed convex subset of a real Hilbert space H . Let M and N be two integers. Let $R_i : C \rightarrow 2^H$ be a maximal monotone mapping and let $A_k : C \rightarrow H$ and $B_i : C \rightarrow H$ be ζ_k -inverse strongly monotone and η_i -inverse strongly monotone, respectively, where $k \in \{1, 2, \dots, M\}$ and $i \in \{1, 2, \dots, N\}$. Let $\{T_n\}_{n=1}^\infty$ be a sequence of nonexpansive mappings on H and $\{\lambda_n\}$ a sequence in $(0, b]$ for some $b \in (0, 1)$. Let V be a $\bar{\gamma}$ -strongly positive bounded linear operator with $\bar{\gamma} \in (1, 2)$ and $f : H \rightarrow H$ a ρ -contraction with $\rho \in (0, 1)$. Let W_n be the W -mapping defined by (9). Assume that $\Omega := \bigcap_{n=1}^\infty \text{Fix}(T_n) \cap \bigcap_{k=1}^M \text{VI}(C, A_k) \cap \bigcap_{i=1}^N I(B_i, R_i) \neq \emptyset$. Define $\Delta_k = P_C(I - \nu_k A_k) \cdots P_C(I - \nu_1 A_1)$ and $\Lambda_i = J_{R_i, \mu_i}(I - \mu_i B_i) \cdots J_{R_1, \mu_1}(I - \mu_1 B_1)$ for each $k \in \{1, 2, \dots, M\}$ and $i \in \{1, 2, \dots, N\}$. Let $\{\alpha_n\}$, $\{\beta_n\}$, and $\{\gamma_n\}$ be three sequences in $[0, 1]$. Assume that

- (i) $\{\alpha_n\} \subset [0, 1 - \rho]$ and $\sum_{n=1}^\infty \alpha_n = \infty$,
- (ii) $\liminf_{n \rightarrow \infty} \gamma_n > 0$ and $0 < \liminf_{n \rightarrow \infty} \beta_n \leq \limsup_{n \rightarrow \infty} (\beta_n + \gamma_n \|V\|) < 1$,
- (iii) $\lim_{n \rightarrow \infty} (|\alpha_{n+1}/(1 - (1 - \alpha_{n+1})\beta_{n+1}) - \alpha_n/(1 - (1 - \alpha_n)\beta_n)| + |\gamma_{n+1}/(1 - \beta_{n+1}) - \gamma_n/(1 - \beta_n)|) = 0$.

Given $x_1 \in H$ arbitrarily, the sequence $\{x_n\}$ is generated iteratively by

$$\begin{aligned} y_n &= \beta_n x_n + \gamma_n W_n \Delta_M x_n + [(1 - \beta_n)I - \gamma_n V] W_n \Lambda_N x_n, \\ x_{n+1} &= \alpha_n f(x_n) + (1 - \alpha_n) y_n, \quad \forall n \geq 1, \end{aligned} \quad (161)$$

where $\nu_k \in (0, 2\zeta_k)$ and $\mu_i \in (0, 2\eta_i)$ for each $k \in \{1, 2, \dots, M\}$ and $i \in \{1, 2, \dots, N\}$. If $\alpha_n(f(x_n) - x_n) \rightarrow 0$ and $S_r^{(\Theta, \varphi)}$ is firmly nonexpansive, then

$$x_n \longrightarrow x^* \iff \limsup_{n \rightarrow \infty} \langle (I - V)x^*, x_n - x^* \rangle \leq 0, \quad (162)$$

where x^* is a unique solution in Ω to the VIP

$$\langle (I - f)x^*, x^* - x \rangle \leq 0, \quad \forall x \in \Omega. \quad (163)$$

Proof. Put $\Theta(x, y) = 0$, $\varphi(x) = 0$, for all $x, y \in C$, $Ax = 0$ for all $x \in H$, and $r_n = 1$. Take $K(x) = (1/2)\|x\|^2$ for all $x \in H$. Then we get $u_n = x_n$ in Theorem 19 and the conclusion follows. $\square$

Conflict of Interests

The authors declare that there is no conflict of interests regarding the publication of this paper.
