We introduce a new iterative method for finding a common element of the set of solutions of an equilibrium problem and the set of all common fixed points of a nonexpansive semigroup and prove the strong convergence theorem in Hilbert spaces. Our result extends the recent result of Zegeye and Shahzad (2013). In the last part of the paper, by the way, we point out that there is a slight flaw in the proof of the main result in Shehu's paper (2012) and perfect the proof.

1. Introduction

Let H be a real Hilbert space, and let C be a nonempty closed convex subset of H . A mapping $T : C \rightarrow C$ is called nonexpansive if $\|Tx - Ty\| \leq \|x - y\|$ for all $x, y \in C$. We denote the set of fixed points of T by $F(T)$. It is known that $F(T)$ is closed and convex. A family $\mathcal{S} = \{T(t) : 0 \leq t < \infty\}$ of mappings from C into itself is called a nonexpansive semigroup on C if it satisfies the following conditions:

- (i) $T(0)x = x$ for all $x \in C$;
- (ii) $T(s + t) = T(s)T(t)$ for all $s, t \geq 0$;
- (iii) $\|T(s)x - T(s)y\| \leq \|x - y\|$ for all $x, y \in C$ and $s \geq 0$;
- (iv) for all $x \in C, s \mapsto T(s)x$ is continuous.

We denote by $F(\mathcal{S})$ the set of all common fixed points of $\mathcal{S}$; that is, $F(\mathcal{S}) = \bigcap_{0 \leq t < \infty} F(T(t))$. It is clear that $F(\mathcal{S})$ is a closed convex subset.

The equilibrium problem for $f : C \times C \rightarrow \mathbb{R}$ is to find $\bar{x} \in C$ such that $f(\bar{x}, y) \geq 0$ for all $y \in C$. The set of such solutions is denoted by $EP(f)$. Numerous problems in physics, optimization, and economics can be reduced to find a solution of the equilibrium problem (for instance, see [1]).

For solving equilibrium problem, we assume that the bifunction f satisfies the following conditions:

- (A1) $f(x, x) = 0$ for all $x \in C$;

- (A2) f is monotone; that is, $f(x, y) + f(y, x) \leq 0$ for any $x, y \in C$;

- (A3) for each $x, y, z \in C$, $\limsup_{t \downarrow 0} f(tz + (1 - t)x, y) \leq f(x, y)$;

- (A4) $f(x, \cdot)$ is convex and lower semicontinuous for each $x \in C$.

Several methods have been proposed to solve the equilibrium problem; see [1–7]. For finding common fixed points of a nonexpansive semigroup, Nakajo and Takahashi [8] introduced a convergent sequence for nonexpansive semigroup $\mathcal{S} = \{T(t) : 0 \leq t < \infty\}$ as follows:

$$x_0 = x \in C,$$

$$y_n = \alpha_n x_n + (1 - \alpha_n) \frac{1}{t_n} \int_0^{t_n} T(s) x_n ds,$$

$$C_n = \{z \in C : \|y_n - z\| \leq \|x_n - z\|\},$$

$$Q_n = \{z \in C : \langle x_n - z, x_0 - x_n \rangle \geq 0\},$$

$$x_{n+1} = P_{C_n \cap Q_n}(x_0).$$

(1)

Some authors have paid more attention to find an element $p \in F(\mathcal{S}) \cap EP(f)$. Buong and Duong [9] constructed the following iterative sequence and proved the weak convergence

theorem for an equilibrium problem and a nonexpansive semigroup in Hilbert spaces:

$$\begin{aligned} x_0 &\in H, \\ u_k &\in C, \quad f(u_k, y) + \frac{1}{r_k} \langle y - u_k, u_k - x_k \rangle \geq 0 \quad \forall y \in C, \\ x_{k+1} &= \mu_k x_k + (1 - \mu_k) \frac{1}{t_k} \int_0^{t_k} T(s) u_k ds. \end{aligned} \quad (2)$$

In 2012, Shehu [10] studied iterative methods for fixed point problem, variational inequality, and generalized mixed equilibrium problem and introduced a new algorithm which does not involve the CQ algorithm and viscosity approximation method. However, we discover that there is a slight flaw in the proof of Theorem 3.1 in [10].

Motivated by Nakajo and Takahashi [8], Buong and Duong [9], and especially Shehu [10] and Zegeye and Shahzad [11], we present a new iterative method for finding a common element of the set of solutions of an equilibrium problem and the set of all common fixed points of a nonexpansive semigroup and prove the strong convergence theorem in Hilbert spaces. Our result extends the recent result of [11]. In the last part of the paper, we perfect and simplify the proof of Theorem 3.1 in [10].

2. Preliminaries

Throughout this paper, let H be a real Hilbert space with inner product $\langle \cdot, \cdot \rangle$ and norm $\| \cdot \|$, and let C be a nonempty closed convex subset of H . We write $x_n \rightarrow x$ to indicate that the sequence $\{x_n\}$ converges strongly to x . Similarly, $x_n \rightharpoonup x$ will symbolize weak convergence. It is well known that H satisfies Opial's condition; that is, for any sequence $\{x_n\} \subset H$ with $x_n \rightharpoonup x$, we have

$$\liminf_{n \rightarrow \infty} \|x_n - x\| < \liminf_{n \rightarrow \infty} \|x_n - y\|, \quad \forall y \neq x. \quad (3)$$

For any $x \in H$, there exists a unique point $P_C x \in C$ such that

$$\|x - P_C x\| \leq \|x - y\|, \quad \forall y \in C. \quad (4)$$

P_C is called the metric projection of H onto C . We know that P_C is a nonexpansive mapping of H onto C and P_C satisfies

$$\langle x - y, P_C x - P_C y \rangle \geq \|P_C x - P_C y\|^2, \quad \forall x, y \in H. \quad (5)$$

For $x \in H$ and $z \in C$, we have

$$z = P_C x \iff \langle x - z, y - z \rangle \leq 0, \quad \text{for every } y \in C. \quad (6)$$

The following lemmas will be used in the proof of our results.

Lemma 1 (see [1]). *Let C be a nonempty closed convex subset of H , and let f be a bifunction from $C \times C$ to $\mathbb{R}$ satisfying (A1)–(A4). If $r > 0$ and $x \in H$, then there exists $z \in C$ such that*

$$f(z, y) + \frac{1}{r} \langle y - z, z - x \rangle \geq 0, \quad \forall y \in C. \quad (7)$$

Lemma 2 (see [2]). *For $r > 0$, define a mapping $T_r : H \rightarrow 2^C$ as follows:*

$$T_r(x) = \left\{ z \in C : f(z, y) + \frac{1}{r} \langle y - z, z - x \rangle \geq 0, \forall y \in C \right\}. \quad (8)$$

Then the following hold:

- (i) T_r is single valued;
- (ii) T_r is firmly nonexpansive; that is, for any $x, y \in H$, $\langle x - y, T_r x - T_r y \rangle \geq \|T_r x - T_r y\|^2$;
- (iii) $F(T_r) = EP(f)$;
- (iv) $EP(f)$ is closed and convex.

Lemma 3 (see [12]). *Suppose that (A1)–(A4) hold. If $x, y \in H$ and $r_1, r_2 > 0$, then*

$$\|T_{r_2} y - T_{r_1} x\| \leq \|y - x\| + \frac{|r_2 - r_1|}{r_2} \|T_{r_2} y - y\|. \quad (9)$$

Lemma 4 (see [13]). *Let C be a nonempty bounded closed subset of H , and let $\{T(s) : 0 \leq s < \infty\}$ be a nonexpansive semigroup on C . Then, for every $h \geq 0$,*

$$\lim_{t \rightarrow +\infty} \sup_{x \in C} \left\| \frac{1}{t} \int_0^t T(s) x ds - T(h) \frac{1}{t} \int_0^t T(s) x ds \right\| = 0. \quad (10)$$

Lemma 5 (see [14]). *Let $\{x_n\}$ and $\{y_n\}$ be bounded sequences in a Banach space X , and let $\{\beta_n\}$ be a sequence in $[0, 1]$ with $0 < \liminf_{n \rightarrow \infty} \beta_n \leq \limsup_{n \rightarrow \infty} \beta_n < 1$. Suppose that $x_{n+1} = (1 - \beta_n)x_n + \beta_n y_n$ for all integers $n \geq 1$ and $\limsup_{n \rightarrow \infty} (\|y_{n+1} - y_n\| - \|x_{n+1} - x_n\|) \leq 0$. Then, $\lim_{n \rightarrow \infty} \|y_n - x_n\| = 0$.*

Lemma 6 (see [15]). *Let $\{a_n\}$ be a sequence of nonnegative real numbers satisfying $a_{n+1} \leq (1 - \alpha_n)a_n + \alpha_n \beta_n$, where*

- (i) $\{\alpha_n\} \subset (0, 1)$, $\sum_{n=1}^{\infty} \alpha_n = \infty$;
- (ii) $\limsup_{n \rightarrow \infty} \beta_n \leq 0$.

Then, $\lim_{n \rightarrow \infty} a_n = 0$.

3. Strong Convergence Theorems

In this section, we introduce a new iterative method for finding a common element of the set of solutions of an equilibrium problem and the set of all common fixed points of a nonexpansive semigroup and prove the strong convergence theorem in Hilbert spaces.

Theorem 7. *Let C be a nonempty closed convex subset of a real Hilbert space H , and let f be a bifunction from $C \times C$ to $\mathbb{R}$ satisfying (A1)–(A4). Suppose that $\mathcal{S} = \{T(t) : 0 \leq t < \infty\}$*

is a nonexpansive semigroup on C such that $F(\mathcal{S}) \cap EP(f) \neq \emptyset$. For $u \in H$, let $\{x_n\}$, $\{y_n\}$, and $\{z_n\}$ be generated by

$x_1 \in C$ chosen arbitrarily,

$$y_n = \alpha_n u + (1 - \alpha_n) x_n,$$

$$z_n \in C, \text{ such that } f(z_n, y) + \frac{1}{r_n} \langle y - z_n, z_n - y_n \rangle \geq 0 \quad (11)$$

$$\forall y \in C,$$

$$x_{n+1} = (1 - \beta_n) x_n + \beta_n \frac{1}{t_n} \int_0^{t_n} T(s) z_n ds,$$

where the real sequences $\{\alpha_n\}$, $\{\beta_n\}$ in $(0, 1)$ and $\{r_n\} \subset (0, \infty)$ satisfy the following conditions:

- (1) $\lim_{n \rightarrow \infty} \alpha_n = 0$ and $\sum_{n=1}^{\infty} \alpha_n = \infty$;
- (2) $0 < \liminf_{n \rightarrow \infty} \beta_n \leq \limsup_{n \rightarrow \infty} \beta_n < 1$;
- (3) $0 < c \leq r_n < \infty$, $\lim_{n \rightarrow \infty} |r_{n+1} - r_n| = 0$;
- (4) $\{t_n\} \subset (0, \infty)$, $\lim_{n \rightarrow \infty} t_n = \infty$ and $\lim_{n \rightarrow \infty} (|t_{n+1} - t_n|/t_{n+1}) = 0$.

Then, the sequence $\{x_n\}$ converges strongly to $P_{F(\mathcal{S}) \cap EP(f)} u$.

Proof. Note that the set $F(\mathcal{S}) \cap EP(f)$ is closed and convex since $F(\mathcal{S})$ and $EP(f)$ are closed and convex. For simplicity, we write $\Omega := F(\mathcal{S}) \cap EP(f)$.

From Lemmas 1 and 2, we have $z_n = T_{r_n} y_n$, and, for any $p \in \Omega$,

$$\|z_n - p\| = \|T_{r_n} y_n - T_{r_n} p\| \leq \|y_n - p\|. \quad (12)$$

Observe that

$$\|y_n - p\| \leq \alpha_n \|u - p\| + (1 - \alpha_n) \|x_n - p\|. \quad (13)$$

It follows that

$$\begin{aligned} \|x_{n+1} - p\| &= \left\| (1 - \beta_n) x_n + \beta_n \frac{1}{t_n} \int_0^{t_n} T(s) z_n ds - p \right\| \\ &\leq (1 - \beta_n) \|x_n - p\| \\ &\quad + \beta_n \frac{1}{t_n} \int_0^{t_n} \|T(s) z_n - T(s) p\| ds \\ &\leq (1 - \beta_n) \|x_n - p\| + \beta_n \|z_n - p\| \\ &\leq (1 - \beta_n) \|x_n - p\| \\ &\quad + \beta_n [\alpha_n \|u - p\| + (1 - \alpha_n) \|x_n - p\|] \\ &\leq (1 - \alpha_n \beta_n) \|x_n - p\| + \alpha_n \beta_n \|u - p\| \\ &\leq \max \{ \|x_n - p\|, \|u - p\| \}. \end{aligned} \quad (14)$$

From a simple inductive process, one has

$$\|x_{n+1} - p\| \leq \max \{ \|x_1 - p\|, \|u - p\| \}, \quad (15)$$

which yields that $\{x_n\}$ is bounded. So are $\{y_n\}$ and $\{z_n\}$.

Set $\sigma_n = (1/t_n) \int_0^{t_n} T(s) z_n ds$. For any $p \in \Omega$, we have

$$\begin{aligned} \|\sigma_{n+1} - \sigma_n\| &= \left\| \frac{1}{t_{n+1}} \int_0^{t_{n+1}} T(s) z_{n+1} ds - \frac{1}{t_n} \int_0^{t_n} T(s) z_n ds \right\| \\ &= \left\| \frac{1}{t_{n+1}} \int_0^{t_{n+1}} T(s) z_{n+1} ds - \frac{1}{t_{n+1}} \int_0^{t_{n+1}} T(s) z_n ds \right. \\ &\quad \left. + \frac{1}{t_{n+1}} \int_0^{t_{n+1}} T(s) z_n ds - \frac{1}{t_n} \int_0^{t_n} T(s) z_n ds \right\| \\ &= \left\| \frac{1}{t_{n+1}} \int_0^{t_{n+1}} (T(s) z_{n+1} - T(s) z_n) ds \right. \\ &\quad \left. + \left(\frac{1}{t_{n+1}} - \frac{1}{t_n} \right) \int_0^{t_n} T(s) z_n ds + \frac{1}{t_{n+1}} \int_{t_n}^{t_{n+1}} T(s) z_n ds \right\| \\ &= \left\| \frac{1}{t_{n+1}} \int_0^{t_{n+1}} (T(s) z_{n+1} - T(s) z_n) ds \right. \\ &\quad \left. + \left(\frac{1}{t_{n+1}} - \frac{1}{t_n} \right) \int_0^{t_n} (T(s) z_n - T(s) p) ds \right. \\ &\quad \left. + \left(\frac{1}{t_{n+1}} - \frac{1}{t_n} \right) \int_0^{t_n} T(s) p ds + \frac{1}{t_{n+1}} \int_{t_n}^{t_{n+1}} T(s) z_n ds \right\| \\ &= \left\| \frac{1}{t_{n+1}} \int_0^{t_{n+1}} (T(s) z_{n+1} - T(s) z_n) ds \right. \\ &\quad \left. + \left(\frac{1}{t_{n+1}} - \frac{1}{t_n} \right) \int_0^{t_n} (T(s) z_n - T(s) p) ds \right. \\ &\quad \left. + \frac{1}{t_{n+1}} \int_{t_n}^{t_{n+1}} (T(s) z_n - T(s) p) ds \right\| \\ &\leq \|z_{n+1} - z_n\| + \frac{2|t_{n+1} - t_n|}{t_{n+1}} \|z_n - p\|. \end{aligned} \quad (16)$$

It follows from Lemma 3 that

$$\|z_{n+1} - z_n\| \leq \|y_{n+1} - y_n\| + \frac{|r_{n+1} - r_n|}{r_{n+1}} \|z_{n+1} - y_{n+1}\|. \quad (17)$$

Hence,

$$\begin{aligned} \|\sigma_{n+1} - \sigma_n\| &\leq \|y_{n+1} - y_n\| + \frac{|r_{n+1} - r_n|}{r_{n+1}} \|z_{n+1} - y_{n+1}\| \\ &\quad + \frac{2|t_{n+1} - t_n|}{t_{n+1}} \|z_n - p\| \\ &\leq \|\alpha_{n+1} u + (1 - \alpha_{n+1}) x_{n+1} - \alpha_n u - (1 - \alpha_n) x_n\| \end{aligned}$$

$$\begin{aligned}
& + \frac{|r_{n+1} - r_n|}{r_{n+1}} \|z_{n+1} - y_{n+1}\| + \frac{2|t_{n+1} - t_n|}{t_{n+1}} \|z_n - p\| \\
& \leq \|x_{n+1} - x_n\| + \alpha_{n+1} (\|u\| + \|x_{n+1}\|) + \alpha_n (\|u\| + \|x_n\|) \\
& + \frac{|r_{n+1} - r_n|}{c} \|z_{n+1} - y_{n+1}\| + \frac{2|t_{n+1} - t_n|}{t_{n+1}} \|z_n - p\|.
\end{aligned} \tag{18}$$

This implies that

$$\limsup_{n \rightarrow \infty} (\|\sigma_{n+1} - \sigma_n\| - \|x_{n+1} - x_n\|) \leq 0. \tag{19}$$

It follows from Lemma 5 that $\lim_{n \rightarrow \infty} \|\sigma_n - x_n\| = 0$. Thus,

$$\lim_{n \rightarrow \infty} \|x_{n+1} - x_n\| = \lim_{n \rightarrow \infty} \beta_n \|\sigma_n - x_n\| = 0. \tag{20}$$

For any $p \in \Omega$, we have

$$\begin{aligned}
\|z_n - p\|^2 &= \|T_{r_n} y_n - T_{r_n} p\|^2 \\
&\leq \langle y_n - p, z_n - p \rangle \\
&= \frac{1}{2} [\|y_n - p\|^2 + \|z_n - p\|^2 - \|z_n - y_n\|^2].
\end{aligned} \tag{21}$$

Thus

$$\|z_n - p\|^2 \leq \|y_n - p\|^2 - \|z_n - y_n\|^2. \tag{22}$$

From the convexity of $\|\cdot\|^2$, it follows that

$$\begin{aligned}
& \|x_{n+1} - p\|^2 \\
&= \left\| (1 - \beta_n)(x_n - p) + \beta_n \left(\frac{1}{t_n} \int_0^{t_n} T(s) z_n ds - p \right) \right\|^2 \\
&\leq (1 - \beta_n) \|x_n - p\|^2 \\
&+ \beta_n \left\| \frac{1}{t_n} \int_0^{t_n} (T(s) z_n - T(s) p) ds \right\|^2 \\
&\leq (1 - \beta_n) \|x_n - p\|^2 + \beta_n \|z_n - p\|^2 \\
&\leq (1 - \beta_n) \|x_n - p\|^2 + \beta_n [\|y_n - p\|^2 - \|z_n - y_n\|^2] \\
&\leq (1 - \beta_n) \|x_n - p\|^2 + \beta_n [\|\alpha_n u + (1 - \alpha_n) x_n - p\|^2 \\
&\quad - \|z_n - y_n\|^2] \\
&\leq (1 - \beta_n) \|x_n - p\|^2 + \beta_n [(1 - \alpha_n) \|x_n - p\|^2 \\
&\quad + \alpha_n \|u - p\|^2 - \|z_n - y_n\|^2].
\end{aligned} \tag{23}$$

Hence

$$\begin{aligned}
\beta_n \|z_n - y_n\|^2 &\leq \|x_n - p\|^2 - \|x_{n+1} - p\|^2 + \alpha_n \beta_n \|u - p\|^2 \\
&\leq \|x_n - x_{n+1}\| (\|x_n - p\| + \|x_{n+1} - p\|) \\
&\quad + \alpha_n \beta_n \|u - p\|^2.
\end{aligned} \tag{24}$$

Since $\lim_{n \rightarrow \infty} \|x_{n+1} - x_n\| = 0$ and $\lim_{n \rightarrow \infty} \alpha_n = 0$, one has

$$\lim_{n \rightarrow \infty} \|z_n - y_n\| = 0. \tag{25}$$

Observe that

$$\lim_{n \rightarrow \infty} \|y_n - x_n\| = \lim_{n \rightarrow \infty} \alpha_n \|u - x_n\| = 0. \tag{26}$$

As $\|z_n - x_n\| \leq \|z_n - y_n\| + \|y_n - x_n\|$, the following equality holds:

$$\lim_{n \rightarrow \infty} \|z_n - x_n\| = 0. \tag{27}$$

Now we show that

$$\lim_{n \rightarrow \infty} \|T(s) z_n - z_n\| = 0, \quad \forall 0 \leq s < \infty. \tag{28}$$

In fact, we have

$$\begin{aligned}
& \|T(s) z_n - z_n\| \\
&= \left\| T(s) z_n - T(s) \frac{1}{t_n} \int_0^{t_n} T(s) z_n ds \right. \\
&\quad + T(s) \frac{1}{t_n} \int_0^{t_n} T(s) z_n ds - \frac{1}{t_n} \int_0^{t_n} T(s) z_n ds \\
&\quad \left. + \frac{1}{t_n} \int_0^{t_n} T(s) z_n ds - z_n \right\| \\
&\leq \left\| T(s) z_n - T(s) \frac{1}{t_n} \int_0^{t_n} T(s) z_n ds \right\| \\
&\quad + \left\| T(s) \frac{1}{t_n} \int_0^{t_n} T(s) z_n ds - \frac{1}{t_n} \int_0^{t_n} T(s) z_n ds \right\| \\
&\quad + \left\| \frac{1}{t_n} \int_0^{t_n} T(s) z_n ds - z_n \right\| \\
&\leq 2 \left\| \frac{1}{t_n} \int_0^{t_n} T(s) z_n ds - z_n \right\| \\
&\quad + \left\| T(s) \frac{1}{t_n} \int_0^{t_n} T(s) z_n ds - \frac{1}{t_n} \int_0^{t_n} T(s) z_n ds \right\|.
\end{aligned} \tag{29}$$

Notice that

$$\begin{aligned}
& \left\| \frac{1}{t_n} \int_0^{t_n} T(s) z_n ds - z_n \right\| \\
&\leq \left\| \frac{1}{t_n} \int_0^{t_n} T(s) z_n ds - x_n \right\| + \|x_n - z_n\| \\
&= \frac{1}{\beta_n} \|x_{n+1} - x_n\| + \|x_n - z_n\| \longrightarrow 0, \text{ as } n \longrightarrow \infty.
\end{aligned} \tag{30}$$

For any $p \in \Omega$, let $G = \{x \in C : \|x - p\| \leq \max\{\|x_1 - p\|, \|u - p\|\}\}$. It is easy to see that G is a bounded closed convex subset and $T(s)G$ is a subset of G . Since

$$\begin{aligned}
\|z_n - p\| &= \|T_{r_n} y_n - p\| \\
&\leq (1 - \alpha_n) \|x_n - p\| + \alpha_n \|u - p\| \\
&\leq \max\{\|x_1 - p\|, \|u - p\|\},
\end{aligned} \tag{31}$$

the sequence $\{z_n\}$ is contained in G . It follows from Lemma 4 that

$$\lim_{n \rightarrow \infty} \left\| \frac{1}{t_n} \int_0^{t_n} T(s) z_n ds - T(s) \frac{1}{t_n} \int_0^{t_n} T(s) z_n ds \right\| = 0. \quad (32)$$

From (29), (30), and (32), the expression (28) is obtained.

Next we prove that

$$\limsup_{n \rightarrow \infty} \langle u - \bar{x}, x_n - \bar{x} \rangle \leq 0, \quad (33)$$

where $\bar{x} = P_\Omega u$. In order to show this inequality, we can choose a subsequence $\{x_{n_j}\}$ of $\{x_n\}$ such that

$$\limsup_{n \rightarrow \infty} \langle u - \bar{x}, x_n - \bar{x} \rangle = \lim_{j \rightarrow \infty} \langle u - \bar{x}, x_{n_j} - \bar{x} \rangle. \quad (34)$$

Due to the boundedness of $\{x_{n_j}\}$, there exists a subsequence $\{x_{n_{j_i}}\}$ of $\{x_{n_j}\}$ such that $x_{n_{j_i}} \rightharpoonup \omega$. Without loss of generality, we assume that $x_{n_j} \rightharpoonup \omega$. From (27), we see that $z_{n_j} \rightharpoonup \omega$. Since $\{z_{n_j}\} \subset C$ and C is closed and convex, we get $\omega \in C$.

We first show that $\omega \in \text{EP}(f)$. By $z_n = T_{r_n} y_n$, we have

$$f(z_n, y) + \frac{1}{r_n} \langle y - z_n, z_n - y_n \rangle \geq 0, \quad \forall y \in C. \quad (35)$$

It follows from the monotonicity of f that

$$\frac{1}{r_n} \langle y - z_n, z_n - y_n \rangle \geq f(y, z_n), \quad \forall y \in C. \quad (36)$$

Replacing n by n_j , we obtain

$$\left\langle y - z_{n_j}, \frac{z_{n_j} - y_{n_j}}{r_{n_j}} \right\rangle \geq f(y, z_{n_j}), \quad \forall y \in C. \quad (37)$$

From (25), (27), and (A4), we have

$$f(y, \omega) \leq 0, \quad \forall y \in C. \quad (38)$$

For $0 < t \leq 1$, $y \in C$, set $y_t = ty + (1-t)\omega$. We have $y_t \in C$ and $f(y_t, \omega) \leq 0$. Hence

$$0 = f(y_t, y_t) \leq tf(y_t, y) + (1-t)f(y_t, \omega) \leq tf(y_t, y). \quad (39)$$

Dividing by t , we see that

$$f(y_t, y) \geq 0. \quad (40)$$

Letting $t \downarrow 0$ and from (A3), we get

$$f(\omega, y) \geq 0, \quad \forall y \in C. \quad (41)$$

That is, $\omega \in \text{EP}(f)$.

Second, we prove that $\omega \in F(\mathcal{S})$. Note that the equality (27) implies that $z_{n_j} \rightharpoonup \omega$. Suppose for contradiction that $\omega \notin F(\mathcal{S})$; that is,

$$\text{there exists } s_0 > 0 \text{ such that } T(s_0)\omega \neq \omega. \quad (42)$$

Then from Opial's condition and (28), we obtain

$$\begin{aligned} & \liminf_{j \rightarrow \infty} \|z_{n_j} - T(s_0)\omega\| \\ &= \liminf_{j \rightarrow \infty} \|z_{n_j} - T(s_0)z_{n_j} + T(s_0)z_{n_j} - T(s_0)\omega\| \\ &= \liminf_{j \rightarrow \infty} \|T(s_0)z_{n_j} - T(s_0)\omega\| \\ &\leq \liminf_{j \rightarrow \infty} \|z_{n_j} - \omega\|, \end{aligned} \quad (43)$$

which is a contradiction. Therefore, $\omega \in F(\mathcal{S})$. Consequently, one gets $\omega \in \Omega$.

From (34) and the property of metric projection, we have

$$\begin{aligned} \limsup_{n \rightarrow \infty} \langle u - \bar{x}, x_n - \bar{x} \rangle &= \lim_{j \rightarrow \infty} \langle u - \bar{x}, x_{n_j} - \bar{x} \rangle \\ &= \langle u - \bar{x}, \omega - \bar{x} \rangle \leq 0. \end{aligned} \quad (44)$$

The inequality (33) arrives.

Finally we show that $x_n \rightarrow \bar{x}$. From (11), we have

$$\begin{aligned} & \|x_{n+1} - \bar{x}\|^2 \\ &= \left\| (1 - \beta_n)x_n + \beta_n \frac{1}{t_n} \int_0^{t_n} T(s) z_n ds - \bar{x} \right\|^2 \\ &\leq (1 - \beta_n) \|x_n - \bar{x}\|^2 + \beta_n \|z_n - \bar{x}\|^2 \\ &\leq (1 - \beta_n) \|x_n - \bar{x}\|^2 + \beta_n \|y_n - \bar{x}\|^2 \\ &\leq (1 - \alpha_n \beta_n) \|x_n - \bar{x}\|^2 \\ &\quad + \alpha_n \beta_n [2(1 - \alpha_n) \langle u - \bar{x}, x_n - \bar{x} \rangle + \alpha_n \|u - \bar{x}\|^2]. \end{aligned} \quad (45)$$

It follows from (33) and Lemma 6 that $\{x_n\}$ converges strongly to $\bar{x}$. $\square$

Remark 8. Let $H = \mathbb{R}$ and $C = [0, 1]$. Setting $f(x, y) = y^2 - x^2$, we see that $f(x, y)$ satisfies (A1)–(A4). For $0 \leq t < +\infty$, let

$$T(t)x = \frac{x}{1+tx}, \quad \forall x \in [0, 1]. \quad (46)$$

Thus, it follows that $\mathcal{S} = \{T(t) : 0 \leq t < \infty\}$ is a nonexpansive semigroup such that $F(\mathcal{S}) \cap \text{EP}(f) = \{0\}$. If we take

$$\begin{aligned} \alpha_n &= \frac{1}{n+1}, \quad \beta_1 = \beta_2 = \frac{1}{2}, \quad \beta_n = \frac{1}{2} - \frac{1}{n}, \quad \forall n \geq 3, \\ r_n &\equiv c > 0, \quad t_n = n, \end{aligned} \quad (47)$$

then all assumptions and conditions in Theorem 7 are satisfied.

Remark 9. Taking $u = 0$ in Theorem 7, we obtain the iterative method for minimum-norm solution of an equilibrium problem and a nonexpansive semigroup.

As a direct consequence of Theorem 7, we obtain the following corollary.

Corollary 10. *Let C be a nonempty closed convex subset of a real Hilbert space H , and assume that $\mathcal{S} = \{T(t) : 0 \leq t < \infty\}$ is a nonexpansive semigroup on C such that $F(\mathcal{S}) \neq \emptyset$. Let $\{\alpha_n\}$ and $\{\beta_n\}$ be real sequences in $(0, 1)$, and let $\{x_n\}$ and $\{z_n\}$ be generated by*

$$\begin{aligned} x_1 &\in C \text{ chosen arbitrarily,} \\ z_n &= P_C [(1 - \alpha_n) x_n], \\ x_{n+1} &= (1 - \beta_n) x_n + \beta_n \frac{1}{t_n} \int_0^{t_n} T(s) z_n ds. \end{aligned} \quad (48)$$

Suppose that the following conditions are satisfied:

- (1) $\lim_{n \rightarrow \infty} \alpha_n = 0$ and $\sum_{n=1}^{\infty} \alpha_n = \infty$;
- (2) $0 < \liminf_{n \rightarrow \infty} \beta_n \leq \limsup_{n \rightarrow \infty} \beta_n < 1$;
- (3) $\{t_n\} \subset (0, \infty)$, $\lim_{n \rightarrow \infty} t_n = \infty$, and $\lim_{n \rightarrow \infty} (|t_{n+1} - t_n|/t_{n+1}) = 0$.

Then the sequence $\{x_n\}$ converges strongly to $P_{F(\mathcal{S})}0$.

Proof. Letting $f(x, y) = 0$ for all $x, y \in C$, $r_n = 1$, and $u = 0$ in Theorem 7, we get the result. $\square$

Remark 11. Corollary 10 extends the recent results of Zegeye and Shahzad [11, Corollaries 3.2 and 3.3] from finite family of nonexpansive mappings to a nonexpansive semigroup.

4. A Note on Shehu's Paper "Iterative Method for Fixed Point Problem, Variational Inequality and Generalized Mixed Equilibrium Problems with Applications"

In 2012, Shehu [10] studied iterative methods for fixed point problem, variational inequality, and generalized mixed equilibrium problem and gave an interesting convergence theorem. However, there is a slight flaw in the proof of the main result (Theorem 3.1 in [10]).

Shehu obtained the following result (for more details, see [10]).

Theorem 12 (see [10]). *Let K be a closed convex subset of a real Hilbert space H , let F be a bifunction from $K \times K$ satisfying (A1)–(A4), let $\varphi : K \rightarrow \mathbb{R} \cup \{+\infty\}$ be a proper lower semicontinuous and convex function with assumption (B1) or (B2), let A be a μ -Lipschitzian, relaxed (λ, γ) -cocoercive mapping of K into H , and let ψ be an α -inverse, strongly monotone mapping of K into H . Suppose that $T : K \rightarrow K$ is a nonexpansive mapping of K into itself such that $\Omega := F(T) \cap VI(K, A) \cap GMEP \neq \emptyset$. Let $\{\alpha_n\}$ and $\{\beta_n\}$ be two real*

sequences in $(0, 1)$ and $\{r_n\}, \{s_n\} \subset (0, \infty)$. Let $\{x_n\}$, $\{y_n\}$, and $\{u_n\}$ be generated by $x_1 \in K$,

$$\begin{aligned} y_n &= P_K [(1 - \alpha_n) x_n], \\ u_n &= T_{r_n}^{(F, \varphi)} (y_n - r_n \psi y_n), \\ x_{n+1} &= (1 - \beta_n) x_n + \beta_n TP_K (u_n - s_n A u_n). \end{aligned} \quad (49)$$

Suppose that the following conditions are satisfied:

- (a) $\lim_{n \rightarrow \infty} \alpha_n = 0$ and $\sum_{n=1}^{\infty} \alpha_n = \infty$;
- (b) $0 < \liminf_{n \rightarrow \infty} \beta_n \leq \limsup_{n \rightarrow \infty} \beta_n < 1$;
- (c) $0 < a \leq s_n \leq b < 2(\gamma - \lambda \mu^2)/\mu^2$, $\lim_{n \rightarrow \infty} |s_{n+1} - s_n| = 0$;
- (d) $0 < c \leq r_n \leq d < 2\alpha$, $\lim_{n \rightarrow \infty} |r_{n+1} - r_n| = 0$.

Then, the sequence $\{x_n\}$ converges strongly to an element of $F(T) \cap VI(K, A) \cap GMEP$.

This theorem is proved in [10] by the following steps.

Step 1. The sequence $\{x_n\}$ is bounded.

Step 2. The following equalities hold:

$$\begin{aligned} \lim_{n \rightarrow \infty} \|A u_n - A x^*\| &= 0, \quad \lim_{n \rightarrow \infty} \|\psi y_n - \psi x^*\| = 0, \\ \forall x^* &\in \Omega. \end{aligned} \quad (50)$$

Step 3. If ω is a weak limit of $\{x_{n_j}\}$ which is a subsequence of $\{x_n\}$, then $\omega \in \Omega$.

Step 4. The sequence $\{x_n\}$ converges strongly to ω .

In Step 4, in order to show that the sequence $\{x_n\}$ converges strongly to ω , the author shows the inequality $\limsup_{n \rightarrow \infty} \langle -\omega, x_n - \omega \rangle \leq 0$ by defining a mapping $\phi : H \rightarrow \mathbb{R}$ as follows: $\phi(x) = \mu_n \|x_n - x\|^2$, where μ is a Banach limit. It is proved that the set $K^* = \{x \in H : \phi(x) = \min_{u \in H} \phi(u)\} \neq \emptyset$ and $K^* \cap F(T) \neq \emptyset$. An element of $K^* \cap F(T)$ is taken arbitrarily and is denoted by ω . Of course, the element ω is not necessarily the weak sequential cluster point of $\{x_n\}$. However, in Step 3, the symbol ω stands for the weak limit of $\{x_{n_j}\}$ which is a subsequence of $\{x_n\}$. In the sequel, the author obtains

$$\|x_{n+1} - \omega\|^2 \leq (1 - \beta_n) \|x_n - \omega\|^2 + \beta_n \|y_n - \omega\|^2. \quad (51)$$

The meaning of the element ω in (51) is ambiguous. It is difficult to ensure consistency.

Now, we perfect and simplify the proof of Step 4. According to the equality in Step 2, $\lim_{n \rightarrow \infty} \|A u_n - A x^*\| = 0$, for all $x^* \in \Omega$, we see that the set $\{A x^* : x^* \in \Omega\}$ contains only one element. Since A is a relaxed (λ, γ) -cocoercive mapping of K into H , that is, there exist $\lambda, \gamma > 0$ such that

$$\begin{aligned} \langle A x - A y, x - y \rangle &\geq -\lambda \|A x - A y\|^2 + \gamma \|x - y\|^2, \\ \forall x, y &\in K, \end{aligned} \quad (52)$$

it follows that the mapping A is one-to-one. Therefore, the set Ω is a singleton. By Step 3, the sequence $\{x_n\}$ possesses only one weak sequential cluster point. It follows from Lemma 2.38 in [16] that $\{x_n\}$ converges weakly to ω and so

$$\begin{aligned}
 & \|x_{n+1} - \omega\|^2 \\
 & \leq (1 - \beta_n) \|x_n - \omega\|^2 + \beta_n \|y_n - \omega\|^2 \\
 & \leq (1 - \beta_n) \|x_n - \omega\|^2 + \beta_n \|(1 - \alpha_n)x_n - \omega\|^2 \\
 & \leq (1 - \beta_n) \|x_n - \omega\|^2 \\
 & \quad + \beta_n \left[(1 - \alpha_n) \|x_n - \omega\|^2 \right. \\
 & \quad \left. + 2\alpha_n (1 - \alpha_n) \langle -\omega, x_n - \omega \rangle + \alpha_n^2 \|\omega\|^2 \right] \\
 & \leq (1 - \alpha_n \beta_n) \|x_n - \omega\|^2 \\
 & \quad + \alpha_n \beta_n \left[2(1 - \alpha_n) \langle -\omega, x_n - \omega \rangle + \alpha_n \|\omega\|^2 \right].
 \end{aligned} \tag{53}$$

Since $\{x_n\}$ converges weakly to ω , it follows from Lemma 2.2 in [10] or Lemma 6 in this paper that $\{x_n\}$ converges strongly to $\omega \in \Omega$.

Conflict of Interests

The authors declare that there is no conflict of interests.

Acknowledgment

The authors would like to thank referees and editors for their valuable comments and suggestions.
