We first introduce and analyze one iterative algorithm by using the composite shrinking projection method for finding a solution of the system of generalized equilibria with constraints of several problems: a generalized mixed equilibrium problem, finitely many variational inequalities, and the common fixed point problem of an asymptotically strict pseudocontractive mapping in the intermediate sense and infinitely many nonexpansive mappings in a real Hilbert space. We prove a strong convergence theorem for the iterative algorithm under suitable conditions. On the other hand, we also propose another iterative algorithm involving no shrinking projection method and derive its weak convergence under mild assumptions. Our results improve and extend the corresponding results in the earlier and recent literature.

1. Introduction

Let $H$ be a real Hilbert space with inner product $\langle \cdot, \cdot \rangle$ and norm $\| \cdot \|$, $C$ a nonempty closed convex subset of $H$, and $P_C$ the metric projection of $H$ onto $C$. Let $S: C \to H$ be a nonlinear mapping on $C$. We denote by $\text{Fix}(S)$ the set of fixed points of $S$ and by $\mathbb{R}$ the set of all real numbers. A mapping $V$ is called strongly positive on $H$ if there exists a constant $\gamma > 0$ such that

$$\langle Vx, x \rangle \geq \gamma \|x\|^2, \quad \forall x \in H.$$ (1)

A mapping $S: C \to H$ is called $L$-Lipschitz continuous if there exists a constant $L \geq 0$ such that

$$\|Sx - Sy\| \leq L \|x - y\|, \quad \forall x, y \in C.$$ (2)

In particular, if $L = 1$ then $S$ is called a nonexpansive mapping; if $L \in [0, 1)$ then $A$ is called a contraction.

Let $A: C \to H$ be a nonlinear mapping on $C$. We consider the following variational inequality problem (VIP): find a point $x \in C$ such that

$$\langle Ax, y - x \rangle \geq 0, \quad \forall y \in C.$$ (3)

The solution set of VIP (3) is denoted by $\text{VI}(C, A)$.

The VIP (3) was first discussed by Lions [1] and now is well known; there are a lot of different approaches towards solving VIP (3) in finite-dimensional and infinite-dimensional spaces, and the research is intensively continued. The VIP (3) has many applications in computational mathematics, mathematical physics, operations research, mathematical economics, optimization theory, and other fields; see, for example, [2–5]. It is well known that if $A$ is strongly monotone
and Lipschitz-continuous mapping on $C$, then VIP (3) has a unique solution. Not only are the existence and uniqueness of solutions important topics in the study of VIP (3), but also how to actually find a solution of VIP (3) is important. Up to now, there have been many iterative algorithms in the literature, for finding approximate solutions of VIP (3) and its extended versions; see, for example, [6–11].

In 1976, Korpelevič [12] proposed an iterative algorithm for solving the VIP (3) in Euclidean space $\mathbb{R}^n$:

$$
\begin{align*}
y_n &= P_C(x_n - \tau Ax_n), \\
x_{n+1} &= P_C(x_n - \tau Ay_n),
\end{align*}
$$

with $\tau > 0$ a given number, which is known as the extrapolated method. The literature on the VIP is vast and Korpelevič’s extrapolated method has received great attention given by many authors, who improved it in various ways; see, for example, [10, 11, 13–23] and references therein, to name but a few.

Let $\varphi : C \to \mathbb{R}$ be a real-valued function, $A : H \to H$ a nonlinear mapping, and $\Theta : C \times C \to \mathbb{R}$ a bifunction. In 2008, Peng and Yao [18] introduced the following generalized mixed equilibrium problem (GMEP) of finding $x \in C$ such that

$$
\Theta(x, y) + \langle Ax, y - x \rangle \geq 0, \quad \forall y \in C.
$$

We denote the set of solutions of GMEP (5) by $\text{GMEP}(\Theta, \varphi, A)$. The GMEP (5) is very general in the sense that it includes, as special cases, optimization problems, variational inequalities, minimax problems, Nash equilibrium problems in noncooperative games, and so forth.

Throughout this paper, we assume as in [18] that $\Theta : C \times C \to \mathbb{R}$ is a bifunction satisfying conditions (H1)–(H4) and $\varphi : C \to \mathbb{R}$ is a lower semicontinuous and convex function with restriction (H5), where

(H1) $\Theta(x, x) = 0$ for all $x \in C$;
(H2) $\Theta$ is monotone; that is, $\Theta(x, y) + \Theta(y, x) \leq 0$ for any $x, y \in C$;
(H3) $\Theta$ is upper-hemicontinuous; that is, for each $x, y, z \in C$,

$$
\limsup_{t \to 0^+} \Theta(tz + (1-t)x, y) \leq \Theta(x, y);
$$

(H4) $\Theta(\cdot, \cdot)$ is convex and lower semicontinuous for each $x \in C$;
(H5) for each $x \in H$ and $r > 0$ there exists a bounded subset $D_x \subset C$ and $y_x \in C$ such that, for any $z \in C \setminus D_x$,

$$
\Theta(z, y_x) + \varphi(y_x) - \varphi(z) + \frac{1}{r} \langle y_x - z, z - x \rangle < 0.
$$

Given a positive number $r > 0$, let $S_{r(\Theta, \varphi)} : H \to C$ be the solution set of the auxiliary mixed equilibrium problem; that is, for each $x \in H$,

$$
S_{r(\Theta, \varphi)}(x) := \left\{ y \in C : \Theta(\cdot, y) + \varphi(\cdot) - \varphi(y) + \frac{1}{r} \langle K(y) - K(x), z - y \rangle \geq 0, \forall z \in C \right\}.
$$

In particular, whenever $K(x) = (1/2)\|x\|^2$, $\forall x \in H$, $S_{r(\Theta, \varphi)}$ is rewritten as $T_{r(\Theta, \varphi)}$.

Let $\Theta_1, \Theta_2 : C \times C \to \mathbb{R}$ be two bifunctions and $A_1, A_2 : C \to H$ two nonlinear mappings. Consider the following system of generalized equilibrium problems (SGEP): find $(x^*, y^*) \in C \times C$ such that

$$
\begin{align*}
\Theta_1(x^*, x) + \langle A_1 y^*, x - x^* \rangle &+ \frac{1}{\nu_1} \langle x^* - y^*, x - x^* \rangle \geq 0, \quad \forall x \in C, \\
\Theta_2(y^*, y) + \langle A_2 x^*, y - y^* \rangle &+ \frac{1}{\nu_2} \langle y^* - x^*, y - y^* \rangle \geq 0, \quad \forall y \in C,
\end{align*}
$$

where $\nu_1 > 0$ and $\nu_2 > 0$ are two constants. It is introduced and studied in [19]. Whenever $\Theta_1 \equiv \Theta_2 \equiv 0$, the SGEP reduces to a system of variational inequalities, which is considered and studied in [13]. It is worth mentioning that the system of variational inequalities is a tool to solve the Nash equilibrium problem for noncooperative games.

In 2010, Ceng and Yao [19] transformed the SGEP into a fixed point problem in the following way.
Proposition CY (see [19]). Let $\Theta_1, \Theta_2 : C \times C \to \mathbb{R}$ be two bifunctions satisfying conditions (H1)–(H4) and let $A_k : C \to H$ be $\zeta_k$-inverse strongly monotone for $k = 1, 2$. Let $\gamma_k \in (0, 2\zeta_k]$ for $k = 1, 2$. Then $(x^*, y^*) \in C \times C$ is a solution of SGEF (12) if and only if $x^*$ is a fixed point of the mapping $G : C \to C$ defined by $G = T^{\Theta_1}(I - \nu_1 A_1) T^{\Theta_2}(I - \nu_2 A_2)$, where $y^* = T^{\Theta_1}(I - \nu_2 A_2) x^*$. Here, one denotes the fixed point set of the mapping $G$ by SGEF($G$).

Let $\{T_n\}_{n=1}^\infty$ be an infinite family of nonexpansive mappings on $H$ and $\{\lambda_n\}_{n=1}^\infty$ a sequence of nonnegative numbers in $[0, 1]$. For any $n \geq 1$, define a mapping $W_n$ on $H$ as follows:

$$U_{n,n+1} = I,$$

$$U_{n,n+1} = \lambda_n T_n U_{n,n+1} + (1 - \lambda_n) I,$$

$$U_{n,n+1} = \lambda_n T_{n-1} U_{n,n} + (1 - \lambda_n) I,$$

$$U_{n,k} = \lambda_k T_k U_{n,k-1} + (1 - \lambda_k) I,$$

$$U_{n,k} = \lambda_k T_{k-1} U_{n,k-1} + (1 - \lambda_k) I,$$

$$U_{n,2} = \lambda_2 T_2 U_{n,3} + (1 - \lambda_2) I,$$

$$W_n = U_{n,1} = \lambda_1 T_1 U_{n,2} + (1 - \lambda_1) I.$$

Such a mapping $W_n$ is called the $W$-mapping generated by $T_0, T_1, \ldots, T_{n-1}$ and $\lambda_0, \lambda_1, \ldots, \lambda_{n-1}$.

In 2011, for the case where $C = H$, Yao et al. [25] proposed the following hybrid iterative algorithm:

$$\Theta (y_n, z) + \varphi (z) - \varphi (y_n) + \frac{1}{r} \langle K'(y_n) - K'(x_n), z - y_n \rangle \geq 0, \quad z \in H,$$

$$x_{n+1} = \alpha_n (u + \gamma f(x_n)) + \beta_n x_n + ((1 - \beta_n) I - \alpha_n (I + \mu V)) W_n y_n,$$

$$\forall n \geq 1,$$

where $f : H \to H$ is a contraction and $V$ a strongly positive bounded linear operator on $H$. Assume that $\varphi : H \to \mathbb{R}$ is a lower semicontinuous and convex functional, that $\Theta_1, \Theta_2 \in H \times H \to \mathbb{R}$ satisfy conditions (H1)–(H4), and that $A, A_1, A_2 : H \to H$ are inverse strongly monotone. Let the mapping $G$ be defined as in Proposition CY. Very recently, Ceng et al. [20] introduced the following hybrid extragradient-like iterative algorithm:

$$z_n = \gamma_n (\varphi, \varphi) (x_n - r_n A x_n),$$

$$x_{n+1} = \alpha_n (u + \gamma f(x_n)) + \beta_n x_n + ((1 - \beta_n) I - \alpha_n (I + \mu V)) W_n G z_n,$$

$$\forall n \geq 0,$$

(16)

for finding a common solution of GMEP (5), SGEF (12), and the fixed point problem of an infinite family of nonexpansive mappings $\{T_n\}_{n=1}^\infty$ on $H$, where $\{\gamma_n\} \subset (0, \infty)$, $\{\alpha_n\}, \{\beta_n\} \subset (0, 1)$, $\nu_k \in (0, 2\zeta_k)$, $k = 1, 2$, and $x_0, u \in H$ are given. The authors proved the strong convergence of the sequence generated by the hybrid iterative algorithm (16) to a point $x^* \in \Omega := \cap_{n=1}^\infty \text{Fix}(T_n) \cap \text{GMEP} (\Theta, \varphi, A) \cap \text{SGEP}(G)$ under some appropriate conditions. This point $x^*$ also solves the following optimization problem:

$$\min_{x \in C} \frac{\mu}{2} \langle Vx, x \rangle + \frac{1}{2} \|x - u\|^2 - h(x),$$

where $h : H \to \mathbb{R}$ is the potential function of $\gamma f$.

Recently, Kim and Xu [35] introduced the concept of asymptotically $k$-strict pseudocontractive mappings in a Hilbert space as below.

Definition 1. Let $C$ be a nonempty subset of a Hilbert space $H$. A mapping $S : C \to C$ is said to be an asymptotically $k$-strict pseudocontractive mapping with sequence $\{\gamma_n\}$ if there exist a constant $k \in [0, 1)$ and a sequence $\{\gamma_n\}$ in $[0, \infty)$ with $\lim_{n \to \infty} \gamma_n = 0$ such that

$$\|S^n x - S^n y\| \leq \|x - y\|,$$

$$\forall n \geq 1, \quad \forall x, y \in C.$$

(18)

They studied weak and strong convergence theorems for this class of mappings. It is important to note that every asymptotically $k$-strict pseudocontractive mapping with sequence $\gamma_n$ is a uniformly $\zeta$-Lipschitzian mapping with $\zeta = \sup \{k + \sqrt{1 + (1 - k) \gamma_n} / (1 + k) : n \geq 1\}$. 

Let $f : H \to H$ be a contraction and $V$ a strongly positive bounded linear operator on $H$. Assume that $\varphi : H \to \mathbb{R}$ is a lower semicontinuous and convex functional, that $\Theta_1, \Theta_2 \in H \times H \to \mathbb{R}$ satisfy conditions (H1)–(H4), and that $A, A_1, A_2 : H \to H$ are inverse strongly monotone. Let the mapping $G$ be defined as in Proposition CY. Very recently, Ceng et al. [20] introduced the following hybrid extragradient-like iterative algorithm:

$$\min_{x \in C} \frac{\mu}{2} \langle Vx, x \rangle + \frac{1}{2} \|x - u\|^2 - h(x),$$

where $h : H \to \mathbb{R}$ is the potential function of $\gamma f$. 

Recently, Kim and Xu [35] introduced the concept of asymptotically $k$-strict pseudocontractive mappings in a Hilbert space as below.

Definition 1. Let $C$ be a nonempty subset of a Hilbert space $H$. A mapping $S : C \to C$ is said to be an asymptotically $k$-strict pseudocontractive mapping with sequence $\{\gamma_n\}$ if there exist a constant $k \in [0, 1)$ and a sequence $\{\gamma_n\}$ in $[0, \infty)$ with $\lim_{n \to \infty} \gamma_n = 0$ such that

$$\|S^n x - S^n y\| \leq \|x - y\|,$$

$$\forall n \geq 1, \quad \forall x, y \in C.$$
Subsequently, Sahu et al. [36] considered the concept of asymptotically \( k \)-strict pseudocontractive mappings in the intermediate sense, which are not necessarily Lipschitzian.

**Definition 2.** Let \( C \) be a nonempty subset of a Hilbert space \( H \). A mapping \( S : C \rightarrow C \) is said to be an asymptotically \( k \)-strict pseudocontractive mapping in the intermediate sense if there exist a constant \( k \in [0, 1) \) and a sequence \( \{\gamma_n\} \) in \( [0, \infty) \) with \( \lim_{n \rightarrow \infty} \gamma_n = 0 \) such that

\[
\limsup_{n \rightarrow \infty} \sup_{x, y \in C} (\|S^n x - S^n y\|^2 - (1 + \gamma_n)\|x - y\|^2 - k\|x - S^n x - (y - S^n y)\|^2) \leq 0. \tag{20}
\]

Put \( c_n := \max\{0, \sup_{x, y \in C} (\|S^n x - S^n y\|^2 - (1 + \gamma_n)\|x - y\|^2 - k\|x - S^n x - (y - S^n y)\|^2)\} \). Then \( c_n \geq 0 \) for all \( n \geq 1 \), \( c_n \to 0 \) (as \( n \to \infty \)), and (13) reduces to the relation

\[
\|S^n x - S^n y\|^2 \leq (1 + \gamma_n)\|x - y\|^2 + c_n, \tag{21}
\]

\( \forall n \geq 1, \forall x, y \in C \).

Whenever \( c_n = 0 \) for all \( n \geq 1 \) in (21) then \( S \) is an asymptotically \( k \)-strict pseudocontractive mapping with sequence \( \{\gamma_n\} \). In 2009, Sahu et al. [36] derived the weak and strong convergence of the modified Mann iteration processes for an asymptotically \( k \)-strict pseudocontractive mapping in the intermediate sense with sequence \( \{\gamma_n\} \). More precisely, they first established one weak convergence theorem for the following iterative scheme:

\[
x_1 = x \in C \text{ chosen arbitrarily,} \tag{22}
\]

\[
x_{n+1} = (1 - \alpha_n) x_n + \alpha_n S^n x_n, \quad \forall n \geq 1,
\]

where \( 0 < \delta \leq \alpha_n \leq 1 - k - \delta, \sum_{n=1}^{\infty} \alpha_n c_n < \infty \), and \( \sum_{n=1}^{\infty} \gamma_n < \infty \), and then obtained another strong convergence theorem for the following iterative scheme:

\[
x_1 = x \in C \text{ chosen arbitrary,} \tag{23}
\]

\[
y_n = (1 - \alpha_n) x_n + \alpha_n S^n x_n,
\]

\[
C_n = \{z \in C : \|y_n - z\|^2 \leq \|x_n - z\|^2 + \gamma_n\},
\]

\[
Q_n = \{z \in C : \langle x_n - z, x - x_n \rangle \geq 0\},
\]

\[
x_{n+1} = P_{C_n \cap Q_n} x_n, \quad \forall n \geq 1,
\]

where \( 0 < \delta \leq \alpha_n \leq 1 - k, \theta_n = \gamma_n + \alpha_n \Delta_n, \) and \( \Delta_n = \sup \{\|S^n x - z\|^2 : z \in \text{Fix}(S)\} < \infty \). Subsequently, the above iterative schemes are extended to develop new iterative algorithms for finding a common solution of the VIP and the fixed point problem of an asymptotically strict pseudocontractive mapping in the intermediate sense; see, for example, [10, 22].

In 2009, Yao et al. [30] proposed and analyzed iterative algorithms for finding a common element of the set of fixed points of an asymptotically \( k \)-strict pseudocontractive mapping and the set of solutions of a mixed equilibrium problem in a real Hilbert space. Very recently, motivated by Yao et al. [30], Cai and Bu [26] introduced and analyzed the following iterative algorithm by the hybrid shrinking projection method:

\[
pick any x_0 \in H,
\]

\[
set C_1 = C, \quad x_1 = P_C x_0,
\]

\[
u_n = T_{\gamma_{M, n}}(I - r_{M, n} A_{M, n}) T_{\gamma_{M-1, n}}(I - r_{M-1, n} A_{M-1}) \ldots T_{\gamma_{1, n}}(I - r_{1, n} A_1) x_n, \tag{24}
\]

for finding a common element of the set \( \cap_{i=1}^{N} \text{GMEP}(\Theta_k, \varphi_k, A_k) \) of solutions of finitely many generalized mixed equilibrium problems, the set \( \cap_{i=1}^{N} \text{VIP}(C, B_i) \) of solutions of finitely many variational inequalities for inverse strong monotone mappings \( \{B_i\}_{i=1}^{N} \), and the set \( \text{Fix}(S) \) of fixed points of an asymptotically \( k \)-strict pseudocontractive mapping \( S \) in the intermediate sense (provided that \( \Omega = \cap_{i=1}^{M} \text{GMEP}(\Theta_k, \varphi_k, A_k) \cap \cap_{i=1}^{N} \text{VIP}(C, B_i) \cap \text{Fix}(S) \) is nonempty and bounded), where \( \theta_n = \gamma_n \Delta_n + \alpha_n\gamma_n\Delta_n, \) and \( \Delta_n = \sup \{\|x_n - p\| : p \in \Omega, \|\lambda_n\| < \infty, \lambda_n \in \Omega, \lambda_n \in (0, 2\eta \|x_n - z\|, \{r_k, f_k\} \subset (0, 2\eta \|x_n - z\|, i \in \{1, 2, \ldots, N\}, k \in \{1, 2, \ldots, M\}. \) It was proven in [26] that under appropriate conditions \( x_n \) converge strongly to \( P_{\Omega} x_0 \).

Motivated and inspired by the above facts, we first introduce and analyze one iterative algorithm by using a composite shrinking projection method for finding a solution of the system of generalized equilibrium with constraints of several problems: a generalized mixed equilibrium problem, finitely many variational inequalities, and the common fixed point problem of an asymptotically strict pseudocontractive mapping in the intermediate sense and infinitely many nonexpansive mappings in a real Hilbert space. We prove strong convergence theorem for the iterative algorithm under suitable conditions. On the other hand, we also propose another iterative algorithm involving no shrinking projection method and derive its weak convergence under mild assumptions. Our results improve and extend the corresponding results in the earlier and recent literature.
2. Preliminaries

Let $H$ be a real Hilbert space whose inner product and norm are denoted by $\langle \cdot, \cdot \rangle$ and $\| \cdot \|$, respectively. Let $C$ be a nonempty closed convex subset of $H$. We use the notations $x_n \to x$ and $x_n \rightharpoonup x$ to indicate the weak convergence of $\{x_n\}$ to $x$ and the strong convergence of $\{x_n\}$ to $x$, respectively. Moreover, we use $\omega_n(x_n)$ to denote the weak $\omega$-limit set of $\{x_n\}$; that is,

$$
\omega_n(x_n) := \left\{ x \in H : x_n \rightharpoonup x \text{ for some subsequence } \{x_n\} \text{ of } \{x_n\} \right\}.
$$

**Definition 3.** A mapping $A : C \to H$ is called

(i) monotone if

$$
\langle Ax - Ay, x - y \rangle \geq 0, \quad \forall x, y \in C; \tag{26}
$$

(ii) $\eta$-strongly monotone if there exists a constant $\eta > 0$ such that

$$
\langle Ax - Ay, x - y \rangle \geq \eta \|x - y\|^2, \quad \forall x, y \in C; \tag{27}
$$

(iii) $\zeta$-inverse strongly monotone if there exists a constant $\zeta > 0$ such that

$$
\langle Ax - Ay, x - y \rangle \geq \zeta \|Ax - Ay\|^2, \quad \forall x, y \in C. \tag{28}
$$

It is easy to see that the projection $P_C$ is 1-inverse strongly monotone. The inverse strongly monotone (also referred to as cocoercive) operators have been applied widely in solving practical problems in various fields.

**Definition 4.** A differentiable function $K : H \to R$ is called

(i) convex if

$$
K(y) - K(x) \geq \langle K'(x), y - x \rangle, \quad \forall x, y \in H, \tag{29}
$$

where $K'(x)$ is the Fréchet derivative of $K$ at $x$;

(ii) strongly convex if there exists a constant $\sigma > 0$ such that

$$
K(y) - K(x) - \langle K'(x), y - x \rangle \geq \frac{\sigma}{2} \|y - x\|^2, \quad \forall x, y \in H. \tag{30}
$$

It is easy to see that if $K : H \to R$ is a differentiable strongly convex function with constant $\sigma > 0$ then $K' : H \to H$ is strongly monotone with constant $\sigma > 0$.

The metric (or nearest point) projection from $H$ onto $C$ is the mapping $P_C : H \to C$ which assigns to each point $x \in H$ the unique point $P_C x \in C$ satisfying the property

$$
\|x - P_C x\| = \inf_{y \in C} \|x - y\| =: d(x, C). \tag{31}
$$

Some important properties of projections are gathered in the following proposition.

**Proposition 5.** For given $x \in H$ and $z \in C$,

(i) $z = P_C x \iff \langle x - z, y - z \rangle \leq 0, \forall y \in C$;

(ii) $z = P_C x \iff \|x - z\|^2 \leq \|x - y\|^2, \forall y \in C$;

(iii) $\langle P_C x - P_C y, x - y \rangle \geq \|P_C x - P_C y\|^2, \forall y \in H$. (This implies that $P_C$ is nonexpansive and monotone.)

By using the technique of [32], we can readily obtain the following elementary result.

**Proposition 6** (see [20, Lemma 1 and Proposition 1]). Let $C$ be a nonempty closed convex subset of a real Hilbert space $H$ and let $\varphi : C \to R$ be a lower semicontinuous and convex function. Let $\Theta : C \times C \to R$ be a bifunction satisfying the conditions (H1)–(H4). Assume that

(i) $K : H \to R$ is strongly convex with constant $\sigma > 0$ and the function $x \mapsto \langle y - x, K'(x) \rangle$ is weakly upper semicontinuous for each $y \in H$;

(ii) for each $x \in H$ and $r > 0$ there exists a bounded subset $\Delta_x \subset C$ and $y_x \in C$ such that, for any $z \in C \setminus \Delta_x$,

$$
\Theta(z, y_x) + \varphi(y_x) - \varphi(z) + \frac{1}{r} \langle K'(z) - K'(x), y_x - z \rangle < 0. \tag{32}
$$

Then the following hold:

(a) for each $x \in H$, $S^{(\Theta, \varphi)}_x(x) \neq 0$;

(b) $S^{(\Theta, \varphi)}_x$ is single valued;

(c) $S^{(\Theta, \varphi)}_x$ is nonexpansive if $K'$ is Lipschitz continuous with constant $\nu > 0$ and

$$
\langle K'(x_1) - K'(x_2), u_1 - u_2 \rangle \leq \langle K'(u_1) - K'(u_2), u_1 - u_2 \rangle, \tag{33}
$$

whenever $u_i = S^{(\Theta, \varphi)}_x(x)$ for $i = 1, 2$;

(d) for all $s, t > 0$ and $x \in H$,

$$
\langle K'(S^{(\Theta, \varphi)}_s x) - K'(S^{(\Theta, \varphi)}_t x), S^{(\Theta, \varphi)}_s x - S^{(\Theta, \varphi)}_t x \rangle \leq \frac{s - t}{s} \langle K'(S^{(\Theta, \varphi)}_s x) - K'(x), S^{(\Theta, \varphi)}_s x - S^{(\Theta, \varphi)}_t x \rangle; \tag{34}
$$

(e) $\text{Fix}(S^{(\Theta, \varphi)}_x) = \text{MEP}(\Theta, \varphi)$;

(f) $\text{MEP}(\Theta, \varphi)$ is closed and convex.

**Remark 7.** In Proposition 6, whenever $\Theta : C \times C \to R$ is a bifunction satisfying the conditions (H1)–(H4) and $K(x) = (1/2)\|x\|^2$, $\forall x \in H$, we have, for any $x, y \in H$,

$$
\|S^{(\Theta, \varphi)}_x x - S^{(\Theta, \varphi)}_y y\|^2 \leq \langle S^{(\Theta, \varphi)}_x x - S^{(\Theta, \varphi)}_y y, x - y \rangle \tag{35}
$$
Abstract and Applied Analysis

(S_ε^{(Θ,φ)} is firmly nonexpansive) and

\[ \left\| S_1^{(Θ,φ)} x - S_t^{(Θ,φ)} x \right\| \leq \frac{|s-t|}{s} \left\| S_s^{(Θ,φ)} x - x \right\|, \quad \forall s, t > 0, \ x \in H. \]  

(36)

In this case, S_ε^{(Θ,φ)} is rewritten as T_s^{(Θ,φ)}. If, in addition, φ ≡ 0, then T_ε^{(Θ,φ)} is rewritten as T_s^{r}; see [19, Lemma 2.1] for more details.

We need some facts and tools in a real Hilbert space H which are listed as lemmas below.

**Lemma 8.** Let X be a real inner product space. Then the following inequality holds:

\[ \left\| x + y \right\|^2 \leq \left\| x \right\|^2 + 2 \left\langle y, x + y \right\rangle, \quad \forall x, y \in X. \]  

(37)

**Lemma 9.** Let H be a real Hilbert space. Then the following hold:

(a) \[ \left\| x - y \right\|^2 = \left\| x \right\|^2 - \left\| y \right\|^2 - 2 \left\langle y, x - y \right\rangle \] for all x, y ∈ H;

(b) \[ \left\| \lambda x + \mu y \right\|^2 = \lambda \left\| x \right\|^2 + \mu \left\| y \right\|^2 - \lambda \mu \left\langle x - y \right\rangle \] for all x, y ∈ H and \( \lambda, \mu \in [0, 1] \) with \( \lambda + \mu = 1 \); and

(c) if \{x_n\} is a sequence in H such that x_n → x, it follows that

\[ \limsup_{n \to \infty} \left\| x_n - y \right\|^2 \leq \limsup_{n \to \infty} \left\| x_n - x \right\|^2 + \left\| x - y \right\|^2, \quad \forall y \in H. \]  

(38)

We have the following crucial lemmas concerning the W-mappings defined by (13).

**Lemma 10** (see [37, Lemma 3.2]). Let \{T_n\}_{n=0}^{\infty} be a sequence of nonexpansive self-mappings on H such that \( \cap_{n=1}^{\infty} \text{Fix}(T_n) \neq \emptyset \) and let \{λ_n\} be a sequence in (0,b) for some b ∈ (0,1). Then, for every x ∈ H and k ≥ 1 the limit \( \lim_{n \to \infty} U_{n,k} x \) exists, where U_{n,k} is defined by (13).

**Lemma 11** (see [37, Lemma 3.3]). Let \{T_n\}_{n=0}^{\infty} be a sequence of nonexpansive self-mappings on H such that \( \cap_{n=1}^{\infty} \text{Fix}(T_n) \neq \emptyset \), and let \{λ_n\} be a sequence in (0,b) for some b ∈ (0,1). Then \( \text{Fix}(W) = \cap_{n=1}^{\infty} \text{Fix}(T_n) \).

**Lemma 12** (see [38, Demiclosedness principle]). Let C be a nonempty closed convex subset of a real Hilbert space H. Let T be a nonexpansive self-mapping on C. Then I – T is demiclosed. That is, whenever \{x_n\} is a sequence in C weakly converging to some x ∈ C and the sequence [(I – T)x_n] strongly converges to some y, it follows that (I – T)x = y. Here I is the identity operator of H.

**Lemma 13.** Let A : C → H be a monotone mapping. In the context of the variational inequality problem the characterization of the projection (see Proposition 5(i)) implies

\[ u \in \text{VI} (C, A) \iff u = P_C (u - \lambda Au), \quad \lambda > 0. \]  

(39)

**Lemma 14** (see [36, Lemma 2.5]). Let H be a real Hilbert space. Given a nonempty closed convex subset of H and points x, y, z ∈ H and given also a real number \( a \in \mathbb{R} \), the set

\[ \{ v \in C : \left\| y - v \right\|^2 \leq \left\| x - v \right\|^2 + \langle z, v \rangle + a \} \]  

is convex (and closed).

Recall that a set-valued mapping \( T : D(T) \subset H \to 2^H \) is called monotone if, for all \( x, y \in D(T) \), \( f \in Tx \) and \( g \in Ty \) imply

\[ \langle f - g, x - y \rangle \geq 0. \]  

(41)

A set-valued mapping T is called maximal monotone if T is monotone and \( (I + \lambda T)D(T) = H \) for each \( \lambda > 0 \), where I is the identity mapping of H. We denote by G(T) the graph of T. It is known that a monotone mapping T is maximal if and only if, for \( (x, f) \in H \times H \), \( \langle f - g, x - y \rangle \geq 0 \) for every \( (y, g) \in G(T) \) implies \( f \in Tx \). Let \( A : C \to H \) be a monotone, k-Lipschitz-continuous mapping, and let \( N_{C,v} \) be the normal cone to C at \( v \in C \); that is,

\[ N_{C,v} = \{ w \in H : \langle v - u, w \rangle \geq 0, \forall u \in C \}. \]  

(42)

Define

\[ T_v = \begin{cases} Av + N_{C,v}, & \text{if } v \in C, \\ 0, & \text{if } v \notin C. \end{cases} \]  

(43)

Then, T is maximal monotone and 0 ∈ Tv if and only if \( v \in VI(C, A) \); see [39].

**Lemma 15** (see [36, Lemma 2.6]). Let C be a nonempty subset of a Hilbert space H and \( S : C \to C \) an asymptotically k-strict pseudocontractive mapping in the intermediate sense with sequence \( \{ γ_n \} \). Then

\[ \| S^nx - S^ny \|^2 \leq \frac{1}{1 - k} \times \left( k \| x - y \| + \sqrt{(1 + (1 - k) γ_n) \| x - y \|^2 + (1 - k)c_n} \right) \]  

(44)

for all \( x, y \in C \) and \( n \geq 1 \).

**Lemma 16** (see [36, Lemma 2.7]). Let C be a nonempty subset of a Hilbert space H and \( S : C \to C \) a continuously asymptotically k-strict pseudocontractive mapping in the intermediate sense with sequence \( \{ γ_n \} \). Let \{x_n\} be a sequence in C such that \( \| x_n - x_{n+1} \| \to 0 \) and \( \| x_n - S^nx_n \| \to 0 \) as \( n \to \infty \). Then \( \| x_n - S^nx_n \| \to 0 \) as \( n \to \infty \).

**Lemma 17** (see Demiclosedness principle [36, Proposition 3.1]). Let C be a nonempty closed convex subset of a Hilbert space H and \( S : C \to C \) a continuous asymptotically k-strict pseudocontractive mapping in the intermediate sense with sequence \( \{ γ_n \} \). Then I – S is demiclosed at zero in the sense that if \{x_n\} is a sequence in C such that \( x_n \rightharpoonup x \in C \) and \( \limsup_{m \to \infty} \limsup_{n \to \infty} \| x_n - S^nx_n \| = 0 \), then \( (I - S)x = 0 \).
Lemma 18 (see [36, Proposition 3.2]). Let $C$ be a nonempty closed convex subset of a Hilbert space $H$ and $S : C \to C$ a continuous asymptotically $k$-strict pseudocontractive mapping in the intermediate sense with sequence $\{\gamma_n\}$ such that $\text{Fix}(S) \neq \emptyset$. Then $\text{Fix}(S)$ is closed and convex.

Remark 19. Lemmas 17 and 18 give some basic properties of an asymptotically $k$-strict pseudocontractive mapping in the intermediate sense with sequence $\{\gamma_n\}$. Moreover, Lemma 17 extends the Demiclosedness principles studied for certain classes of nonlinear mappings in Kim and Xu [35], Górnicki [40], Xu [41], and Marino and Xu [42].

Lemma 20 (see [43, page 80]). Let $\{a_n\}_{n=1}^{\infty}$, $\{b_n\}_{n=1}^{\infty}$, and $\{\delta_n\}_{n=1}^{\infty}$ be sequences of nonnegative real numbers satisfying the inequality

$$a_{n+1} \leq (1 + \delta_n) a_n + b_n, \quad \forall n \geq 1.$$  

(45)

If $\sum_{n=1}^{\infty} \delta_n < \infty$ and $\sum_{n=1}^{\infty} b_n < \infty$, then $\lim_{n \to \infty} a_n$ exists. If, in addition, $\{a_n\}_{n=1}^{\infty}$ has a subsequence which converges to zero, then $\lim_{n \to \infty} a_n = 0$.

Recall that a Banach space $X$ is said to satisfy the Opial condition [38] if, for any given sequence $\{x_n\} \subset X$ which converges weakly to an element $x \in X$, there holds the inequality

$$\limsup_{n \to \infty} \|x_n - x\| < \limsup_{n \to \infty} \|x_n - y\|, \quad \forall y \in X, \quad y \neq x.$$  

(46)

It is well known in [38] that every Hilbert space $H$ satisfies the Opial condition.

Lemma 21 (see [22, Proposition 3.1]). Let $C$ be a nonempty closed convex subset of a real Hilbert space $H$ and let $\{x_n\}$ be a sequence in $H$. Suppose that

$$\|x_{n+1} - p\|^2 \leq (1 + \lambda_n) \|x_n - p\|^2 + \delta_n, \quad \forall p \in C, \quad n \geq 1,$$  

(47)

where $\{\lambda_n\}$ and $\{\delta_n\}$ are sequences of nonnegative real numbers such that $\sum_{n=1}^{\infty} \lambda_n < \infty$ and $\sum_{n=1}^{\infty} \delta_n < \infty$. Then $\{\text{Proj}_C x_n\}$ converges strongly in $C$.

Lemma 22 (see [44]). Let $C$ be a closed convex subset of a real Hilbert space $H$. Let $\{x_n\}$ be a sequence in $H$ and $u \in H$. Let $q = \text{Proj}_C u$. If $\{x_n\}$ is such that $\omega_n(x_n) \subset C$ and satisfies the condition

$$\|x_n - u\| \leq \|u - q\|, \quad \forall n,$$  

(48)

then $x_n \to q$ as $n \to \infty$.

3. Strong Convergence Theorem

In this section, we will introduce and analyze one iterative algorithm by using a composite shrinking projection method for finding a solution of the system of generalized equilibria with constraints of several problems: a generalized mixed equilibrium problem, finitely many variational inequalities, and the common fixed point problem of an asymptotically strict pseudocontractive mapping in the intermediate sense and infinitely many nonexpansive mappings in a real Hilbert space. Under appropriate conditions we will prove strong convergence of the proposed algorithm.

Theorem 23. Let $C$ be a nonempty closed convex subset of a real Hilbert space $H$. Let $N$ be an integer. Let $\Theta$, $\Theta_1$, $\Theta_2$ be three bifunctions from $C \times C$ to $\mathbb{R}$ satisfying (H1)–(H4) and let $\varphi : C \to \mathbb{R}$ be a lower semicontinuous and convex functional. Let $A, A_k : H \to H$ and $B_1 : C \to C$ be $\xi$-inverse strongly monotone, $\zeta_k$-inverse strongly monotone, and $\eta$-inverse strongly monotone, respectively, where $k \in \{1, 2\}$ and $i \in \{1, 2, \ldots, N\}$. Let $S : C \to C$ be a uniformly continuous asymptotically $k$-strict pseudocontractive mapping in the intermediate sense for some $0 \leq k < 1$ with sequence $\{\gamma_n\} \subset (0, \infty)$ such that $\lim_{n \to \infty} \gamma_n = 0$ and $\{c_n\} \subset (0, \infty)$ such that $\lim_{n \to \infty} c_n = 0$. Let $\{\tau_{n, i}\}$ be a sequence of nonexpansive mappings on $H$ and $\{\lambda_n\}$ a sequence in $(0, b)$ for some $b \in (0, 1)$. Let $V$ be a $\varphi$-strongly positive bounded linear operator with $\varphi \in (1, 2)$. Let $W_n$ be the $W$-mapping defined by (13). Assume that $\Omega := \bigcap_{n=1}^{\infty} \text{Fix}(T_n) \cap \text{GMEP}(\Theta, \varphi, A) \cap \text{SGEP}(G) \cap (\bigcap_{i=1}^{N} V(C, B_i)) \cap \text{Fix}(S)$ is nonempty and bounded where $G$ is defined as in Proposition CY. Let $\{\alpha_n\}$ be a sequence in $[0, 2\xi]$ and $\{\beta_n\}$, $\{\sigma_n\}$, $\{\gamma_n\}$ sequences in $[0, 1]$ such that $\lim_{n \to \infty} \alpha_n = 0, 0 < \alpha \leq \alpha_n \leq 1$, and $k \leq \delta_n \leq d < 1$. Pick any $x_0 \in H$ and set $C_1 = C, x_1 = P_C x_0$. Let $\{x_n\}$ be a sequence generated by the following algorithm:

$$u_n = S_n^{(\Theta, \varphi)}(I - r_n A)x_n,$$

$$v_n = P_C(I - \lambda N A B_n)u_n,$$

$$z_n = \beta_n x_n + \sigma_n G v_n + \left(1 - \beta_n\right) I - \sigma_n V W_n G v_n,$$

$$k_n = \delta_n z_n + (1 - \delta_n) S_n^\alpha z_n,$$

$$y_n = (1 - \alpha_n) x_n + \alpha_n k_n,$$

$$C_{n+1} = \{z \in C_n : \|y_n - z\|^2 \leq \|x_n - z\|^2 + \theta_n\},$$

$$x_{n+1} = P_{C_{n+1}} x_n, \quad \forall n \geq 1,$$  

(49)

where $\theta_n = (\sigma_n + \gamma_n)(1 + \gamma_n) \Delta_n + c_n, \Delta_n = \sup\{\|x_n - p\|^2 + \| (I - V) p \|^2 / (\varphi - 1) : p \in \Omega < \infty, \forall k \in (0, 2\xi_k), k \in \{1, 2\},$ and $\{\lambda_{i, n}\} \subset [a_i, b_i] \subset (0, 2\eta_i), \forall i \in \{1, 2, \ldots, N\}$. Assume that the following conditions are satisfied:

(i) $K : H \to \mathbb{R}$ is strongly convex with constant $\sigma > 0$ and its derivative $K’$ is Lipschitz continuous with constant $\nu > 0$ such that the function $x \mapsto \langle y - x, K’(x) \rangle$ is weakly upper semicontinuous for each $y \in H$;
(ii) For each \( x \in H \), there exists a bounded subset \( D_x \subset C \) and \( z_x \in C \) such that, for any \( y \notin D_x \),
\[
\Theta(y, z_x) + \varphi(z_x) - \varphi(y) + \frac{1}{r} \left( K'(y) - K'(x), x - y \right) < 0; \tag{50}
\]
(3i) \( 0 < \liminf_{n \to \infty} \beta_n \leq \limsup_{n \to \infty} \beta_n < 1 \) and \( 0 < \liminf_{n \to \infty} \gamma_n \leq \limsup_{n \to \infty} \gamma_n < 2 \zeta \).

Then \( \{ x_n \} \) converges strongly to \( x^* = P_I x_0 \) provided that \( S_n^{\Theta, \varphi} \) is firmly nonexpansive.

Proof. As \( \lim_{n \to \infty} \sigma_n = 0 \), \( 0 < \liminf_{n \to \infty} \beta_n \leq \limsup_{n \to \infty} \beta_n < 1 \) and \( 0 < \liminf_{n \to \infty} \gamma_n \leq \limsup_{n \to \infty} \gamma_n < 2 \zeta \), we may assume, without loss of generality, that \( \{ \beta_n \} \subset [\alpha, 1] \subset [0, 1] \), \( \{ \gamma_n \} \subset [\zeta, 2 \zeta] \subset (0, 2 \zeta) \) and \( \beta_n + \sigma_n \| V \| \leq 1 \) for all \( n \geq 1 \). Since \( V \) is a \( \overline{F} \)-strongly positive bounded linear operator on \( H \), we know that
\[
\| V \| = \sup \{ \langle Vu, u \rangle : u \in H, \| u \| = 1 \} \geq \overline{F} > 1. \tag{51}
\]
Taking into account that \( \beta_n + \sigma_n \| V \| \leq 1 \) for all \( n \geq 1 \), we have
\[
\langle ((1 - \beta_n)I - \sigma_n V)u, u \rangle = 1 - \beta_n - \sigma_n \langle Vu, u \rangle \geq 1 - \beta_n - \sigma_n \| V \| \tag{52}
\]
\[
\geq 0;
\]
that is, \( (1 - \beta_n)I - \sigma_n V \) is positive. It follows that
\[
\| (1 - \beta_n)I - \sigma_n V \| = \sup \{ \langle ((1 - \beta_n)I - \sigma_n V)u, u \rangle : u \in H, \| u \| = 1 \} \tag{53}
\]
\[
= \sup \{ (1 - \beta_n - \sigma_n \langle Vu, u \rangle) : u \in H, \| u \| = 1 \}
\]
\[
\leq 1 - \beta_n - \sigma_n \| V \|.
\]
Putting
\[
\Lambda_n^i = P_C(I - \lambda_{i,n} B_i) P_C(I - \lambda_{i-1,n} B_{i-1}) \cdots P_C(I - \lambda_{1,n} B_1) \tag{54}
\]
for all \( i \in \{1, 2, \ldots, N\} \), and \( \Lambda_0^i = I \), where \( I \) is the identity mapping on \( H \). Then we have \( v_n = \Lambda_n^N u_n \).

We divide the rest of the proof into several steps.

Step 1. We show that \( \{ x_n \} \) is well defined. It is obvious that \( \Omega \subset C_n \) is closed and convex. As the defining inequality in \( C_n \) is equivalent to the inequality
\[
\langle 2(x_n - y_n), z \rangle \leq \| x_n \|^2 - \| y_n \|^2 + \theta_n, \tag{55}
\]
by Lemma 14 we know that \( C_n \) is convex for every \( n \geq 1 \).

First of all, let us show that \( \Omega \subset C_n \) for all \( n \geq 1 \). Suppose that \( \Omega \subset C_n \) for some \( n \geq 1 \). Take \( p \in \Omega \) arbitrarily. Since
\[
p = S_{t_n}^{(\Theta, \varphi)}(p - r_n A p), \]
\( A \) is \( \zeta \)-inverse strongly monotone, and \( 0 \leq r_n \leq 2 \zeta \), we have, for any \( n \geq 1 \),
\[
\| u_n - p \|^2 = \| S_n^{(\Theta, \varphi)}(I - r_n A) x_n - S_n^{(\Theta, \varphi)}(I - r_n A) p \|^2 \tag{56}
\]
\[
\leq \| (I - r_n A) x_n - (I - r_n A) p \|^2 = \| (x_n - p) - r_n (A x_n - A p) \|^2 \tag{57}
\]
\[
= \| x_n - p \|^2 - 2 r_n \langle x_n - p, A x_n - A p \rangle + r_n^2 \| A x_n - A p \|^2 \tag{58}
\]
\[
= \| x_n - p \|^2 + r_n (r_n - 2 \zeta) \| A x_n - A p \|^2 \leq \| x_n - p \|^2.
\]

Since \( p = P_C(I - \lambda_{i,n} B_i) p \), \( \Lambda_n^i p = p \), and \( B_i \) is \( \eta_i \)-inverse strongly monotone, where \( \lambda_{i,n} \in (0, 2 \eta_i), i \in \{1, 2, \ldots, N\} \), by Proposition 5(iii) we deduce that for each \( n \geq 1 \)
\[
\| v_n - p \| = \| P_C(I - \lambda_{N,n} B_N) \Lambda_{N-1} u_n - P_C(I - \lambda_{N,n} B_N) \Lambda_{N-1} p \| \leq \| (I - \lambda_{N,n} B_N) \Lambda_{N-1} u_n - (I - \lambda_{N,n} B_N) \Lambda_{N-1} p \| \leq \Lambda_{N-1}^N u_n - \Lambda_{N-1}^N p \|
\]
\[
\leq \| \Lambda_{N-1}^N u_n - \Lambda_{N-1}^N p \| = \| u_n - p \|. \tag{57}
\]
Combining (56) and (57), we have
\[
\| v_n - p \| \leq \| x_n - p \|. \tag{58}
\]
Since \( p = G p = T_{t_k}^{(\Theta)}(I - \nu_k A_k) T_{t_{k-1}}^{(\Theta)}(I - \nu_{k-1} A_{k-1}) \cdots T_{t_1}^{(\Theta)}(I - \nu_1 A_1) p \), \( A_k \) is \( \zeta_k \)-inverse strongly monotone, for \( k = 1, 2 \), and \( 0 \leq \nu_k \leq 2 \zeta_k \) for \( k = 1, 2, \ldots, N \), by Proposition 5(iii) we deduce that for each \( n \geq 1 \),
\[
\| v_n - p \| \leq \| x_n - p \|. \tag{58}
\]
we deduce that, for any $n \geq 1$,
\[
\|G\nu_n - p\|^2 \\
= \|T_{\nu_n}^\theta (I - \nu A_1) T_{\nu_2}^\theta (I - \nu A_2) v_n \\
- T_{\nu_n}^\theta (I - \nu A_1) T_{\nu_2}^\theta (I - \nu A_2) p\|^2 \\
\leq \|(I - \nu A_1) T_{\nu_n}^\theta (I - \nu A_2) v_n \\
- (I - \nu A_1) T_{\nu_2}^\theta (I - \nu A_2) p\|^2 \\
= \|T_{\nu_n}^\theta (I - \nu A_2) v_n - T_{\nu_2}^\theta (I - \nu A_2) p\|^2 \\
- \nu_1 \|A_1 T_{\nu_n}^\theta (I - \nu A_2) v_n - A_1 T_{\nu_2}^\theta (I - \nu A_2) p\|^2 \\
\leq \|T_{\nu_n}^\theta (I - \nu A_2) v_n - T_{\nu_2}^\theta (I - \nu A_2) p\|^2 \\
+ \nu_1 \|v_1 (v_2 - 2\nu_2) + \nu_2 (v_2 - 2\nu_2) A_2 v_n - A_2 p\|^2 \\
\leq \|v_1 - p\|^2 \\
(59)
\]
(This shows that $G$ is nonexpansive.) Also, from (49), (53), (58), and (59) it follows that
\[
\|z_n - p\|^2 \\
= \|\beta_n (x_n - p) + \sigma_n (G\nu_n - p) + [(1 - \beta_n) I - \sigma_n V] \\
\times (W_n G\nu_n - p) + \sigma_n (I - V) p\| \\
\leq \beta_n \|x_n - p\|^2 + \sigma_n \|G\nu_n - p\|^2 \\
+ \|[(1 - \beta_n) I - \sigma_n V] (W_n G\nu_n - p)\| \\
+ \sigma_n \|(I - V) p\| \\
\leq \beta_n \|x_n - p\|^2 + \sigma_n \|G\nu_n - p\|^2 \\
+ (1 - \beta_n - \sigma_n \gamma) \|W_n G\nu_n - p\| \\
+ \sigma_n \|(I - V) p\| \\
\leq \beta_n \|x_n - p\|^2 + \gamma_n \|G\nu_n - p\|^2 \\
+ (1 - \beta_n - \gamma_n \gamma) \|G\nu_n - p\| \\
+ \gamma_n \|(I - V) p\| \\
= \beta_n \|x_n - p\|^2 + (1 - \beta_n - \sigma_n \gamma) \|x_n - p\|^2 \\
\times \|G\nu_n - p\| + \sigma_n \|(I - V) p\|^2 \\
\leq \beta_n \|x_n - p\|^2 + (1 - \beta_n - \sigma_n \gamma) \|x_n - p\|^2 \\
\times \|G\nu_n - p\| + \sigma_n \|(I - V) p\|^2 \\
\leq \beta_n \|x_n - p\|^2 + (1 - \beta_n - \sigma_n \gamma) \|x_n - p\|^2 \\
\times \|G\nu_n - p\| + \sigma_n \|(I - V) p\|^2 \\
\leq \beta_n \|x_n - p\|^2 + (1 - \beta_n - \sigma_n \gamma) \|x_n - p\|^2 \\
\times \|G\nu_n - p\| + \sigma_n \|(I - V) p\|^2 \\
(60)
\]
which hence yields
\[
\|z_n - p\|^2 \leq \beta_n \|x_n - p\|^2 + (1 - \beta_n - \sigma_n \gamma) \|x_n - p\|^2 \\
\times \|G\nu_n - p\| + \sigma_n \|(I - V) p\|^2 \\
\leq \beta_n \|x_n - p\|^2 + (1 - \beta_n - \sigma_n \gamma) \|x_n - p\|^2 \\
\times \|G\nu_n - p\| + \sigma_n \|(I - V) p\|^2 \\
(61)
\]
By Lemma 9(b), we deduce from (49) and (61) that
\[
\|k_n - p\|^2 \\
= \|\delta_n (z_n - p) + (1 - \delta_n) (S^n z_n - p)\|^2 \\
= \delta_n \|z_n - p\|^2 + (1 - \delta_n) \|S^n z_n - p\|^2 \\
\leq \delta_n \|z_n - p\|^2 + (1 - \delta_n) \|z_n - S^n z_n\|^2 \\
\leq \delta_n \|z_n - p\|^2 + (1 - \delta_n) \|z_n - S^n z_n\|^2 \\
\times \left[ (1 + \gamma_n) \|z_n - p\|^2 + k \|z_n - S^n z_n\|^2 + c_n \right] \\
\leq \delta_n \|z_n - p\|^2 + (1 - \delta_n) \|z_n - S^n z_n\|^2 \\
\times \left[ (1 + \gamma_n) \|z_n - p\|^2 + (1 - \delta_n) \|z_n - S^n z_n\|^2 + c_n \right] \\
\leq (1 + \gamma_n) \|z_n - p\|^2 + (1 - \delta_n) \|z_n - S^n z_n\|^2 + c_n \\
(62)
\]
So, from (49) and (62) we get

\[ \|y_n - p\|^2 \]
\[ = \| (1 - \alpha_n) (x_n - p) + \alpha_n (k_n - p) \|^2 \]
\[ \leq (1 - \alpha_n) \| x_n - p \|^2 + \alpha_n \| k_n - p \|^2 \]
\[ \leq (1 - \alpha_n) \| x_n - p \|^2 + \alpha_n \left[ (1 + \gamma_n) \left( \| x_n - p \|^2 + \sigma_n \| (I - V) p \|^2 \frac{1}{(1 - \beta_n)} \right) + c_n \right] \]
\[ \leq (1 + \gamma_n) \left( \| x_n - p \|^2 + \sigma_n \| (I - V) p \|^2 \frac{1}{(1 - \beta_n)} \right) + c_n \]
\[ \leq \| x_n - p \|^2 + \gamma_n \| x_n - p \|^2 + \sigma_n \| (I - V) p \|^2 \frac{1}{(1 - \beta_n)} + c_n \]
\[ = \| x_n - p \|^2 + \gamma_n \| x_n - p \|^2 + \sigma_n \| (I - V) p \|^2 \frac{1}{(1 - \beta_n)} + c_n \]

Therefore \( \lim_{n \to \infty} \| y_n - x_0 \| \) exists. From \( x_n = P_{C_n} x_0 \), \( x_{n+1} \in C_{n+1} \subseteq C_n \), by Proposition 5(ii) we obtain

\[ \| x_{n+1} - x_n \|^2 \leq \| x_0 - x_{n+1} \|^2 - \| x_0 - x_n \|^2, \] (66)

which implies

\[ \lim_{n \to \infty} \| x_{n+1} - x_n \| = 0. \] (67)

It follows from \( x_{n+1} \in C_{n+1} \) that \( \| y_n - x_{n+1} \|^2 \leq \| x_n - x_{n+1} \|^2 + \theta_n \) and hence

\[ \| x_n - y_n \|^2 \]
\[ \leq 2 \left( \| x_n - x_{n+1} \|^2 + \| x_{n+1} - y_n \|^2 \right) \]
\[ \leq 2 \left( \| x_n - x_{n+1} \|^2 + \| x_n - x_{n+1} \|^2 + \theta_n \right) \]
\[ = 2 \left( 2 \| x_n - x_{n+1} \|^2 + \theta_n \right). \] (68)

From (67) and \( \lim_{n \to \infty} \theta_n = 0 \), we have

\[ \lim_{n \to \infty} \| x_n - y_n \| = 0. \] (69)

Since \( y_n - x_n = \alpha_n (k_n - x_n) \) and \( 0 < \alpha \leq \alpha_n \leq 1 \), we have

\[ \alpha \| k_n - x_n \| \leq \alpha_n \| k_n - x_n \| = \| y_n - x_n \|, \] (70)

which immediately leads to

\[ \lim_{n \to \infty} \| k_n - x_n \| = 0. \] (71)

Also, utilizing Lemmas 8 and 9(b) we obtain from (49), (58), (59), and (62) that

\[ \| z_n - p \|^2 \]
\[ = \| p_n x_p + \sigma_n G \gamma_n + [(1 - \beta_n) I - \sigma_n V] W_n G \gamma_n - p \|^2 \]
\[ = \| p_n (x_n - p) + (1 - \beta_n) (W_n G \gamma_n - p) + \sigma_n (G \gamma_n - W_n G \gamma_n) \|^2 \]
\[ \leq \| p_n (x_n - p) + (1 - \beta_n) (W_n G \gamma_n - p) + 2 \sigma_n ([G \gamma_n - W_n G \gamma_n], z_n - p) \]
\[ = \beta_n \| x_n - p \|^2 + (1 - \beta_n) \| W_n G \gamma_n - p \|^2 \]
\[ - \beta_n (1 - \beta_n) \| x_n - W_n G \gamma_n \|^2 \]
\[ + 2 \sigma_n ([G \gamma_n - W_n G \gamma_n], z_n - p) \]
\[ \leq \beta_n \| x_n - p \|^2 + (1 - \beta_n) \| W_n G \gamma_n - p \|^2 \]
\[ - \beta_n (1 - \beta_n) \| x_n - W_n G \gamma_n \|^2 \]
\[ + 2 \sigma_n \| G \gamma_n - W_n G \gamma_n \| \| z_n - p \| \]

where \( \theta_n = \| \sigma_n + \gamma_n \| (1 + \gamma_n) \Delta_n + c_n \) and \( \Delta_n = \sup \{ \| x_n - p \|^2 + \| (I - V) p \|^2 (\gamma - 1) : p \in \Omega \} < \infty \). Hence \( p \in C_{n+1} \). This implies that \( \Omega \subset C_n \) for all \( n \geq 1 \). Therefore, \( \{ x_n \} \) is well defined.

**Step 2.** We prove that \( \| x_n - k_n \| \to 0 \), \( \| x_n - z_n \| \to 0 \), and \( \| x^* - z_n \| \to 0 \) as \( n \to \infty \).

Indeed, let \( x^* = P_{C_n} x_0 \). From \( x_n = P_{C_n} x_0 \) and \( x^* \in \Omega \subset C_n \), we obtain

\[ \| x_n - x_0 \| \leq \| x^* - x_0 \|. \] (64)

This implies that \( \{ x_n \} \) is bounded and hence \( \{ u_n \}, \{ v_n \}, \{ z_n \}, \{ k_n \}, \) and \( \{ y_n \} \) are also bounded. Since \( x_{n+1} \in C_{n+1} \subseteq C_n \) and \( x_n = P_{C_n} x_0 \), we have

\[ \| x_n - x_0 \| \leq \| x_{n+1} - x_0 \|, \quad \forall n \geq 1. \] (65)
\[
\|y_n - p\|^2 \\
\leq (1 - \alpha_n) \|x_n - p\|^2 + \alpha_n \|k_n - p\|^2 \\
\leq (1 - \alpha_n) \|x_n - p\|^2 \\
+ \alpha_n \left[ (1 + \gamma_n) \|z_n - p\|^2 + c_n \right] \\
\leq (1 - \alpha_n) \|x_n - p\|^2 \\
+ \alpha_n \left[ (1 + \gamma_n) \|x_n - W_n G v_n\|^2 \\
+ 2\sigma_n \|G v_n - W_n G v_n\| \|z_n - p\| + c_n \right] \\
\leq (1 - \alpha_n) \|x_n - p\|^2 + \alpha_n (1 + \gamma_n) \|x_n - W_n G v_n\|^2 \\
+ 2\sigma_n \|G v_n - W_n G v_n\| \|z_n - p\| + c_n \\
\leq (1 - \alpha_n) \|x_n - W_n G v_n\|^2 \\
- \alpha_n (1 + \gamma_n) \beta_n (1 - \beta_n) \|x_n - W_n G v_n\|^2 \\
+ (1 + \gamma_n) 2\sigma_n \|G v_n - W_n G v_n\| \|z_n - p\| + c_n \\
\leq (1 + \gamma_n) \|x_n - p\|^2 - \alpha_n (1 + \gamma_n) \beta_n (1 - \beta_n) \|x_n - W_n G v_n\|^2 \\
+ 2\sigma_n (1 + \gamma_n) \|G v_n - W_n G v_n\| \|z_n - p\| + c_n.
\]

So, it follows that
\[
\alpha (1 + \gamma_n) \alpha (1 - \alpha) \|x_n - W_n G v_n\|^2 \\
\leq \alpha_n (1 + \gamma_n) \beta_n (1 - \beta_n) \|x_n - W_n G v_n\|^2 \\
\leq \|x_n - p\|^2 - \|y_n - p\|^2 + \gamma_n \|x_n - p\|^2 \\
+ 2\sigma_n (1 + \gamma_n) \|G v_n - W_n G v_n\| \|z_n - p\| + c_n.
\]

and hence
\[
\|y_n - p\|^2 \\
\leq (1 - \alpha_n) \|x_n - p\|^2 + \alpha_n (1 + \gamma_n) \|x_n - W_n G v_n\|^2 \\
+ 2\sigma_n (1 + \gamma_n) \|G v_n - W_n G v_n\| \|z_n - p\| + c_n.
\]

(72)

Since \( \lim_{n \to \infty} \sigma_n = 0 \), \( \lim_{n \to \infty} y_n = 0 \), and \( \lim_{n \to \infty} z_n = 0 \), it follows from (69) and the boundedness of \( \{x_n\}, \{y_n\}, \{z_n\} \), and \( \{v_n\} \) that
\[
\lim_{n \to \infty} \|x_n - W_n G v_n\| = 0.
\]

(75)

Note that
\[
\|z_n - x_n\| \\
= \|(1 - \beta_n) (W_n G v_n - x_n) + \sigma_n (G v_n - W_n G v_n)\| \\
\leq (1 - \beta_n) \|W_n G v_n - x_n\| + \sigma_n \|G v_n - W_n G v_n\| \\
\leq \|W_n G v_n - x_n\| + \sigma_n \|G v_n - W_n G v_n\|.
\]

(76)

Hence, it follows from (75) and \( \lim_{n \to \infty} \sigma_n = 0 \) that
\[
\lim_{n \to \infty} \|x_n - z_n\| = 0.
\]

(77)

Note that
\[
\|k_n - z_n\| \leq \|k_n - x_n\| + \|x_n - z_n\|.
\]

(78)

Thus, we deduce from (71) and (77) that
\[
\lim_{n \to \infty} \|k_n - z_n\| = 0.
\]

(79)

Since \( k_n - z_n = (1 - \delta_n) (S^2 z_n - z_n) \) and \( k \leq \delta_n \leq d < 1 \), we have
\[
(1 - d) \|S^2 z_n - z_n\| \leq (1 - \delta_n) \|S^2 z_n - z_n\| - \|k_n - z_n\|,
\]

(80)

which, together with (79), yields
\[
\lim_{n \to \infty} \|S^2 z_n - z_n\| = 0.
\]

(81)

Step 3. We prove that \( \|x_n - u_n\| \to 0 \), \( \|x_n - v_n\| \to 0 \), \( \|v_n - G v_n\| \to 0 \), \( \|x_n - W x_n\| \to 0 \), and \( \|z_n - S z_n\| \to 0 \) as \( n \to \infty \).

Indeed, from (57), (59), and \( \forall \in (1, 2] \) it follows that
\[
\|z_n - p\|^2 \\
= \beta_n (x_n - p) + \sigma_n (G v_n - p) \\
+ [(1 - \beta_n) I - \sigma_n V] (W_n G v_n - p) \\
+ \sigma_n (I - V) p^2.
\]

(74)
\[
\beta_n \|x_n - p\|^2 + (1 - \beta_n) \|x_n - u_n\|^2 \\
\leq \beta_n \|x_n - p\|^2 + (1 - \beta_n) \|u_n - p\|^2 \\
+ 2\sigma_n \|(I - V) p\| \|z_n - p\| \\
\leq \beta_n \|x_n - p\|^2 + (1 - \beta_n) \|u_n - p\|^2 \\
+ 2\sigma_n \|(I - V) p\| \|z_n - p\|. 
\]

which immediately implies that
\[
(1 - \tilde{\alpha}) c (2\zeta - \tilde{\zeta}) \|Ax_n - Ap\|^2 \\
\leq (1 - \beta_n) r_n (2\zeta - r_n) \|Ax_n - Ap\|^2 \\
\leq \|x_n - p\|^2 - \|z_n - p\|^2 \\
+ 2\sigma_n \|(I - V) p\| \|z_n - p\| \\
\leq \|x_n - z_n\| (\|x_n - p\| + \|z_n - p\|) \\
+ 2\sigma_n \|(I - V) p\| \|z_n - p\|. 
\]

Since \(\lim_{n \to \infty} \sigma_n = 0\) and \(\{x_n\}\) and \(\{z_n\}\) are bounded sequences, it follows from (77) that
\[
\lim_{n \to \infty} \|Ax_n - Ap\| = 0. 
\]

Furthermore, from the firm nonexpansivity of \(S_{n}^{(\Theta, \varphi)}\), we have
\[
\|u_n - p\|^2 \\
= \|S_{n}^{(\Theta, \varphi)} (I - r_n A) x_n - S_{n}^{(\Theta, \varphi)} (I - r_n A) p\|^2 \\
\leq \|(I - r_n A) x_n - (I - r_n A) p\|^2 \\
\leq \frac{1}{2} \left[ \|(I - r_n A) x_n - (I - r_n A) p\|^2 + \|u_n - p\|^2 \\
- \|(I - r_n A) x_n - (I - r_n A) p - (u_n - p)\|^2 \right] \\
\leq \frac{1}{2} \left[ \|x_n - p\|^2 + \|u_n - p\|^2 \\
- \|x_n - u_n - r_n (Ax_n - Ap)\|^2 \right] \\
= \frac{1}{2} \left[ \|x_n - p\|^2 + \|u_n - p\|^2 - \|x_n - u_n\|^2 \\
+ 2r_n \langle Ax_n - Ap, x_n - u_n \rangle - r_n^2 \|Ax_n - Ap\|^2 \right], 
\]

which leads to
\[
\|u_n - p\|^2 \leq \|x_n - p\|^2 - \|x_n - u_n\|^2 \\
+ 2r_n \langle Ax_n - Ap, x_n - u_n \rangle. 
\]
From (82) and (89), we have
\[
\|z_n - p\|^2 \leq \beta_n \|x_n - p\|^2 + (1 - \beta_n) \|u_n - p\|^2 + 2\sigma_n \|(I - V) p\| \|z_n - p\|
\]
which hence implies that
\[
\|x_n - u_n\|^2 \\
\leq \|x_n - p\|^2 - \|z_n - p\|^2 + 2r_n \|Ax_n - Ap\| \|x_n - u_n\|
\times \left( \|x_n - u_n\| + 2\sigma_n \|(I - V) p\| \|z_n - p\| \right)
\leq \|x_n - z_n\| (\|x_n - p\| + \|z_n - p\|)
+ 2r_n \|Ax_n - Ap\| \|x_n - u_n\|
+ 2\sigma_n \|(I - V) p\| \|z_n - p\|.
\]
(91)

Since \(\lim_{n \to \infty} \sigma_n = 0\) and \(\{x_n\}, \{u_n\},\) and \(\{z_n\}\) are bounded sequences, it follows from (77) and (87) that (83) holds.

Next we show that \(\lim_{n \to \infty} \|B_i \Lambda_n^{-1} u_n - B_i p\| = 0, i = 1, 2, \ldots, N\). As a matter of fact, observe that
\[
\|\Lambda_n u_n - p\|^2
= \|P_C (I - \lambda_i B_i) \Lambda_n^{-1} u_n - P_C (I - \lambda_i B_i) p\|^2
\leq \|(I - \lambda_i B_i) \Lambda_n^{-1} u_n - (I - \lambda_i B_i) p\|^2
\leq \|\lambda_i^{-1} u_n - p\|^2 + (\lambda_i - 2\eta_i) \|B_i \Lambda_n^{-1} u_n - B_i p\|^2
\leq \|u_n - p\|^2 + (\lambda_i - 2\eta_i) \|B_i \Lambda_n^{-1} u_n - B_i p\|^2
\leq \|x_n - p\|^2 + (\lambda_i - 2\eta_i) \|B_i \Lambda_n^{-1} u_n - B_i p\|^2.
\]
(92)

Combining (59), (82), and (92), we have
\[
\|z_n - p\|^2 \\
\leq \beta_n \|x_n - p\|^2 + (1 - \beta_n) \|u_n - p\|^2 + 2\sigma_n \|(I - V) p\| \|z_n - p\|
\leq \beta_n \|x_n - p\|^2 + (1 - \beta_n) \|u_n - p\|^2 + 2\sigma_n \|(I - V) p\| \|z_n - p\|
\leq \beta_n \|x_n - p\|^2 + (1 - \beta_n) \left( \|x_n - p\|^2 + 2\sigma_n \|(I - V) p\| \|z_n - p\| \right)
\leq \beta_n \|x_n - p\|^2 + (1 - \beta_n) \left( \|x_n - p\|^2 + 2\sigma_n \|(I - V) p\| \|z_n - p\| \right)
\]
which together with \(\{\lambda_i\} \subset [a, b] \subset (0, 2\eta_i), \forall i \in \{1, 2, \ldots, N\}\), implies that
\[
(1 - \tilde{a}) a (2\eta_i - b_i) \|B_i \Lambda_n^{-1} u_n - B_i p\|^2
\leq (1 - \beta_n) \lambda_i^{-1} (2\eta_i - \lambda_i) \|B_i \Lambda_n^{-1} u_n - B_i p\|^2
\leq \|x_n - p\|^2 - \|z_n - p\|^2 + 2\sigma_n \|(I - V) p\| \|z_n - p\|
\leq \|x_n - p\|^2 - \|z_n - p\|^2 + 2\sigma_n \|(I - V) p\| \|z_n - p\|
\]
(94)

By Proposition 5(iii) and Lemma 9(a), we obtain
\[
\|\Lambda_n u_n - p\|^2
= \|P_C (I - \lambda_i B_i) \Lambda_n^{-1} u_n - P_C (I - \lambda_i B_i) p\|^2
\leq \left( (I - \lambda_i B_i) \Lambda_n^{-1} u_n - (I - \lambda_i B_i) p, \Lambda_n u_n - p \right)
\]
(95)
\[
\begin{align*}
&= \frac{1}{2} \left( \| (I - \lambda_n B) \Lambda_n^{-1} u_n - (I - \lambda_n B) p \|^2 \\
&\quad + \| \Lambda_n^{-1} u_n - p \|^2 - \| (I - \lambda_n B) \Lambda_n^{-1} u_n - (I - \lambda_n B) p \|^2 \right) \\
&\quad - \left( I - \lambda_n B \right) p - (\Lambda_n^{-1} u_n - p) \right) \|^2 \\
&\leq \frac{1}{2} \left( \| \Lambda_n^{-1} u_n - p \|^2 + \| \Lambda_n^{-1} u_n - p \|^2 \\
&\quad - \Lambda_n^{-1} u_n - \Lambda_n^{-1} u_n - \lambda_n (B_i \Lambda_i^{-1} u_i - B_i p) \right) \right) \|^2 \\
&\leq \frac{1}{2} \left( \| x_n - p \|^2 + \| \Lambda_i u_n - p \|^2 \\
&\quad - \Lambda_i^{-1} u_i - \Lambda_i^{-1} u_i - \lambda_n (B_i \Lambda_i^{-1} u_i - B_i p) \right) \right) \|^2 ,
\end{align*}
\]

which implies
\[
\begin{align*}
\| \Lambda_n^{-1} u_n - p \|^2 \\
&\leq \| x_n - p \|^2 - \| \Lambda_n^{-1} u_n - \Lambda_n^{-1} u_n \|^2 \\
&\quad - \lambda_n (B_i \Lambda_i^{-1} u_i - B_i p) \|^2 \\
&\quad + 2 \lambda_n \left( \Lambda_i^{-1} u_i - \Lambda_i^{-1} u_i, B_i \Lambda_i^{-1} u_i - B_i p \right) \\
&\leq \| x_n - p \|^2 - \| \Lambda_n^{-1} u_n - \Lambda_n^{-1} u_n \|^2 \\
&\quad + 2 \lambda_n \left( \Lambda_i^{-1} u_i - \Lambda_i^{-1} u_i, B_i \Lambda_i^{-1} u_i - B_i p \right) .
\end{align*}
\]

Combining (59), (82), and (97), we have
\[
\begin{align*}
\| x_n - p \|^2 \\
&\leq \beta_n \| x_n - p \|^2 + (1 - \beta_n) \| u_n - p \|^2 \\
&\quad + 2 \sigma_n \| (I - V) p \| \| z_n - p \| \\
&\leq \beta_n \| x_n - p \|^2 + (1 - \beta_n) \| \Lambda_n^{-1} u_n - \Lambda_n^{-1} u_n \|^2 \\
&\quad + 2 \sigma_n \| (I - V) p \| \| z_n - p \| \\
&\leq \beta_n \| x_n - p \|^2 + (1 - \beta_n) \\
&\quad \times \left( \| x_n - p \|^2 - \| \Lambda_n^{-1} u_n - \Lambda_n^{-1} u_n \|^2 \right) \\
&\quad + 2 \sigma_n \| (I - V) p \| \| z_n - p \| \\
&\quad + 2 \lambda_n \left( \Lambda_n^{-1} u_n - \Lambda_n^{-1} u_n \| B_i \Lambda_i^{-1} u_i - B_i p \| \\
&\quad + 2 \sigma_n \| (I - V) p \| \| z_n - p \| .
\end{align*}
\]

So, we conclude that
\[
(1 - \alpha) \| \Lambda_n^{-1} u_n - \Lambda_n^{-1} u_n \|^2 \\
\leq (1 - \beta_n) \| \Lambda_n^{-1} u_n - \Lambda_n^{-1} u_n \|^2 \\
\leq \| x_n - p \|^2 - \| z_n - p \| \\
&\quad + 2 \lambda_n \left( \Lambda_n^{-1} u_n - \Lambda_n^{-1} u_n \| B_i \Lambda_i^{-1} u_i - B_i p \| \\
&\quad + 2 \sigma_n \| (I - V) p \| \| z_n - p \| .
\]

Since \( \lim_{n \to \infty} \| x_n - p \| = \| x_n - p \| \), and \( \{z_n\} \), \( \{u_n\} \), \( \{v_n\} \) are bounded, from (77) and (95) we get
\[
\lim_{n \to \infty} \| \Lambda_n^{-1} u_n - \Lambda_n^{-1} u_n \| = 0 .
\]

From (100) we get
\[
\begin{align*}
\| u_n - v_n \| &\leq \| \Lambda_n^{-1} u_n - \Lambda_n^{-1} u_n \| \\
&\leq \| \Lambda_n^{-1} u_n - \Lambda_n^{-1} u_n \| + \| \Lambda_i u_i - \Lambda_i u_i \| \\
&\quad + \cdots + \| \Lambda_i u_i - \Lambda_i u_i \| \to 0 \\
&\quad \quad \quad \text{as } n \to \infty .
\end{align*}
\]

Taking into account that \( \| x_n - v_n \| \leq \| x_n - u_n \| + \| u_n - v_n \| \), we conclude from (83) and (101) that
\[
\lim_{n \to \infty} \| x_n - v_n \| = 0 .
\]

On the other hand, for simplicity, we write \( p = T_{y_1}^\theta (I - v_1 A_2) \), \( v_n = T_{y_1}^\theta (I - v_1 A_2) v_n \), and \( u_n = G v_n = T_{y_1}^\theta (I - v_1 A_1) \) for all \( n \geq 1 \). Then
\[
\begin{align*}
p &= G p = T_{y_1}^\theta (I - v_1 A_1) p \\
&= T_{y_1}^\theta (I - v_1 A_1) T_{y_2}^\theta (I - v_2 A_2) p .
\end{align*}
\]
We now show that \( \lim_{n \to \infty} \| Gv_n - V_n \| = 0 \); that is, \( \lim_{n \to \infty} \| w_n - V_n \| = 0 \). As a matter of fact, for \( \rho \in \Omega \), it follows from \((58)\), \((59)\), and \((82)\) that

\[
\| z_n - p \|^2 \\
\leq \beta_n \| x_n - p \|^2 + (1 - \beta_n) \| Gv_n - p \|^2 \\
+ 2\sigma_n \| (I - V) p \| \| z_n - p \|
\]

\[
= \beta_n \| x_n - p \|^2 + (1 - \beta_n) \| w_n - p \|^2 \\
+ 2\sigma_n \| (I - V) p \| \| z_n - p \|
\]

\[
\leq \beta_n \| x_n - p \|^2 + (1 - \beta_n) \\
\times \left[ \| y_1 - 2\zeta_1 \| \| A_1 V_n - A_1 p \|^2 \right] \\
+ 2\sigma_n \| (I - V) p \| \| z_n - p \|
\]

\[
\leq \beta_n \| x_n - p \|^2 + (1 - \beta_n) \\
\times \left[ \| y_2 - 2\zeta_2 \| \| A_2 V_n - A_2 p \|^2 \right] \\
+ 2\sigma_n \| (I - V) p \| \| z_n - p \|
\]

which immediately yields

\[
(1 - \alpha) \left[ y_2 - 2\zeta_2 - y_2 \right] \| A_2 V_n - A_2 p \|^2 \\
+ y_1 \left[ 2\zeta_1 - y_1 \right] \| A_1 V_n - A_1 p \|^2 \\
\leq (1 - \beta_n) \left[ y_2 - 2\zeta_2 - y_2 \right] \| A_2 V_n - A_2 p \|^2 \\
+ y_1 \left[ 2\zeta_1 - y_1 \right] \| A_1 V_n - A_1 p \|^2 \\
\leq \| x_n - p \|^2 - \| z_n - p \|^2 + 2\sigma_n \| (I - V) p \| \| z_n - p \|
\]

\[
\leq \| x_n - z_n \| \left( \| x_n - p \| + \| z_n - p \| \right) \\
+ 2\sigma_n \| (I - V) p \| \| z_n - p \|
\]

Since \( \lim_{n \to \infty} \sigma_n = 0 \) and \( \{x_n\} \) and \( \{z_n\} \) are bounded, from \((77)\) we get

\[
\lim_{n \to \infty} \| A_2 v_n - A_2 p \| = 0, \quad \lim_{n \to \infty} \| A_1 v_n - A_1 \tilde{p} \| = 0.
\]

Also, in terms of the firm nonexpansivity of \( T_{\rho_k}^{\tilde{p}} \) and the \( \zeta_k \)-inverse strong monotonicity of \( A_k \) for \( k = 1, 2 \), we obtain from \( \nu_k \in (0, 2\zeta_k), k \in \{1, 2\}, \) and \((59)\) that

\[
\| \nu_n - \tilde{p} \|^2 \\
= \| T_{\rho_k}^{\tilde{p}} (I - y_2 A_2) v_n - T_{\rho_k}^{\tilde{p}} (I - y_2 A_2) p \|^2 \\
\leq \langle (I - y_2 A_2) v_n - (I - y_2 A_2) p, \nu_n - \tilde{p} \rangle \\
= \frac{1}{2} \left( \| (I - y_2 A_2) v_n - (I - y_2 A_2) p \|^2 + \| \nu_n - \tilde{p} \|^2 \\
- \| (I - y_2 A_2) v_n - (I - y_2 A_2) p - (\nu_n - \tilde{p}) \|^2 \right) \\
\leq \frac{1}{2} \left( \| \nu_n - \tilde{p} \|^2 + \| \nu_n - \tilde{p} \|^2 \\
- \| (\nu_n - \nu_n) - y_2 (A_2 v_n - A_2 p) - (p - \tilde{p}) \|^2 \right) \\
= \frac{1}{2} \left( \| \nu_n - \tilde{p} \|^2 + \| \nu_n - \tilde{p} \|^2 \\
- \| \nu_n - \nu_n - y_2 (A_2 v_n - A_2 p) - (p - \tilde{p}) \|^2 \right) \\
+ v_2 \left( \| \nu_n - \nu_n - (p - \tilde{p}) \| A_2 v_n - A_2 p \right) \\
- v_2 \| A_2 v_n - A_2 p \|^2 \right). 
\]

\[
\| w_n - p \|^2 \\
= \| T_{\rho_k}^{\tilde{p}} (I - y_1 A_1) v_n - T_{\rho_k}^{\tilde{p}} (I - y_1 A_1) \tilde{p} \|^2 \\
\leq \langle (I - y_1 A_1) v_n - (I - y_1 A_1) \tilde{p}, w_n - p \rangle \\
= \frac{1}{2} \left( \| (I - y_1 A_1) v_n - (I - y_1 A_1) \tilde{p} \|^2 + \| w_n - p \|^2 \\
- \| (I - y_1 A_1) v_n - (I - y_1 A_1) \tilde{p} - (w_n - p) \|^2 \right) \\
\leq \frac{1}{2} \left( \| \nu_n - \tilde{p} \|^2 + \| w_n - p \|^2 - \| (\nu_n - w_n) + (p - \tilde{p}) \|^2 \\
+ 2v_1 \left( \| A_1 v_n - A_1 \tilde{p}, (\nu_n - w_n) + (p - \tilde{p}) \right) \\
- v_2 \| A_1 v_n - A_1 \tilde{p} \|^2 \right). 
\]
Thus, we have
\[
\| \tilde{v}_n - \bar{p} \|^2 \leq \| v_n - \bar{p} \|^2 - \| (v_n - \tilde{v}_n) - (p - \bar{p}) \|^2 \\
+ 2v_2 \langle (v_n - \tilde{v}_n) - (p - \bar{p}) , A_2v_n - A_2\bar{p} \rangle \\
+ \bar{\beta}_n \| A_2v_n - A_2\bar{p} \|^2 ,
\]
\[ \tag{108} \]
\[
\| w_n - p \|^2 \leq \| v_n - p \|^2 - \| (\tilde{v}_n - w_n) + (p - \bar{p}) \|^2 \\
+ 2v_1 \| A_1\tilde{v}_n - A_1\bar{p} \| \| (\tilde{v}_n - w_n) + (p - \bar{p}) \|.
\]
\[ \tag{109} \]

Consequently, from (58), (104), and (108) it follows that
\[
\| z_n - \bar{p} \|^2 \\
\leq \beta_n \| x_n - \bar{p} \|^2 + (1 - \beta_n) \\
\times \left[ \| \tilde{v}_n - \bar{p} \|^2 + v_1 (v_n - 2\bar{v}_n) \| A_1\tilde{v}_n - A_1\bar{p} \|^2 \right] \\
+ 2\sigma_n \| (I - V) \bar{p} \| \| z_n - \bar{p} \| \\
\leq \beta_n \| x_n - \bar{p} \|^2 + (1 - \beta_n) \| \tilde{v}_n - \bar{p} \|^2 \\
+ 2\sigma_n \| (I - V) \bar{p} \| \| z_n - \bar{p} \| \\
\leq \beta_n \| x_n - \bar{p} \|^2 + (1 - \beta_n) \\
\times \left[ \| v_n - \bar{p} \|^2 - \| (v_n - \tilde{v}_n) - (p - \bar{p}) \|^2 \\
+ 2v_2 \langle (v_n - \tilde{v}_n) - (p - \bar{p}) , A_2v_n - A_2\bar{p} \rangle \\
- \bar{\beta}_n \| A_2v_n - A_2\bar{p} \|^2 \right] \\
+ 2\sigma_n \| (I - V) \bar{p} \| \| z_n - \bar{p} \| \\
\leq \beta_n \| x_n - \bar{p} \|^2 + (1 - \beta_n) \\
\times \left[ \| x_n - \bar{p} \|^2 - \| (v_n - \tilde{v}_n) - (p - \bar{p}) \|^2 \\
+ 2v_2 \langle (v_n - \tilde{v}_n) - (p - \bar{p}) , A_2v_n - A_2\bar{p} \rangle \\
+ 2\sigma_n \| (I - V) \bar{p} \| \| z_n - \bar{p} \| \\
\leq \| x_n - \bar{p} \|^2 - (1 - \beta_n) \| (v_n - \tilde{v}_n) - (p - \bar{p}) \|^2 \\
+ 2v_2 \langle (v_n - \tilde{v}_n) - (p - \bar{p}) , A_2v_n - A_2\bar{p} \rangle \\
+ 2\sigma_n \| (I - V) \bar{p} \| \| z_n - \bar{p} \| ,
\]
\[ \tag{110} \]

which hence leads to
\[
(1 - \bar{a}) \| (v_n - \bar{v}_n) - (p - \bar{p}) \|^2 \\
\leq (1 - \beta_n) \| (v_n - \bar{v}_n) - (p - \bar{p}) \|^2 \\
\leq \| x_n - \bar{p} \|^2 - \| z_n - \bar{p} \|^2 .
\]

Since \( \lim_{n \to \infty} \sigma_n = 0 \) and \( \{x_n\}, \{z_n\}, \{v_n\}, \) and \( \{\tilde{v}_n\} \) are bounded sequences, we conclude from (77) and (106) that
\[
\lim_{n \to \infty} \| (v_n - \bar{v}_n) - (p - \bar{p}) \| = 0.
\]
\[ \tag{112} \]
Furthermore, from (58), (104), and (109) it follows that
\[
\| z_n - \bar{p} \|^2 \\
\leq \beta_n \| x_n - \bar{p} \|^2 + (1 - \beta_n) \| w_n - p \|^2 \\
+ 2\sigma_n \| (I - V) \bar{p} \| \| z_n - \bar{p} \| \\
\leq \beta_n \| x_n - \bar{p} \|^2 + (1 - \beta_n) \\
\times \left[ \| x_n - \bar{p} \|^2 - \| (v_n - \tilde{v}_n) - (p - \bar{p}) \|^2 \\
+ 2v_2 \langle (v_n - \tilde{v}_n) - (p - \bar{p}) , A_2v_n - A_2\bar{p} \rangle \\
+ 2\sigma_n \| (I - V) \bar{p} \| \| z_n - \bar{p} \| \\
\leq \beta_n \| x_n - \bar{p} \|^2 + (1 - \beta_n) \\
\times \left[ \| x_n - \bar{p} \|^2 - \| (v_n - \tilde{v}_n) - (p - \bar{p}) \|^2 \\
+ 2v_2 \langle (v_n - \tilde{v}_n) - (p - \bar{p}) , A_2v_n - A_2\bar{p} \rangle \\
+ 2\sigma_n \| (I - V) \bar{p} \| \| z_n - \bar{p} \| \\
\leq \| x_n - \bar{p} \|^2 - (1 - \beta_n) \| (v_n - \tilde{v}_n) - (p - \bar{p}) \|^2 \\
+ 2v_2 \langle (v_n - \tilde{v}_n) - (p - \bar{p}) , A_2v_n - A_2\bar{p} \rangle \\
+ 2\sigma_n \| (I - V) \bar{p} \| \| z_n - \bar{p} \| ,
\]
\[ \tag{113} \]

which hence yields
\[
(1 - \bar{a}) \| (v_n - \bar{v}_n) + (p - \bar{p}) \|^2 \\
\leq (1 - \beta_n) \| (v_n - \bar{v}_n) + (p - \bar{p}) \|^2 \\
\leq \| x_n - \bar{p} \|^2 - \| z_n - \bar{p} \|^2 + 2v_1 \| A_1\tilde{v}_n - A_1\bar{p} \| \\
\times \| (\tilde{v}_n - w_n) + (p - \bar{p}) \| \\
+ 2\sigma_n \| (I - V) \bar{p} \| \| z_n - \bar{p} \| ,
\]
\[ \tag{114} \]
Since \( \lim_{n \to \infty} \sigma_n = 0 \) and \( \{x_n\}, \{z_n\}, \{w_n\}, \) and \( \{\tilde{V}_n\} \) are bounded sequences, we conclude from (77) and (106) that

\[
\lim_{n \to \infty} \|(\tilde{v}_n - w_n) + (p - \tilde{p})\| = 0.
\]  

(115)

Note that

\[
\|v_n - w_n\| \leq \|(v_n - \tilde{v}_n) - (p - \tilde{p})\| + \|(\tilde{v}_n - w_n) + (p - \tilde{p})\|.
\]  

(116)

Hence from (112) and (115) we get

\[
\lim_{n \to \infty} \|v_n - Gv_n\| = \lim_{n \to \infty} \|v_n - w_n\| = 0,
\]  

(117)

then by (75), (102), and (117), we have

\[
\|x_n - W_n x_n\| \leq \|x_n - W_n Gv_n\| + \|W_n Gv_n - W_n x_n\|
\]

\[
\leq \|x_n - W_n Gv_n\| + \|Gv_n - x_n\|
\]

(118)

\[
\leq \|x_n - W_n Gv_n\| + \|Gv_n - v_n\| + \|v_n - x_n\| \to 0
\]

as \( n \to \infty \).

Also, observe that

\[
\|x_n - W_n x_n\| \leq \|x_n - W_n x_n\| + \|W_n x_n - W x_n\|.
\]  

(119)

From (118), [45, Remark 3.2], and the boundedness of \( \{x_n\} \) we immediately obtain

\[
\lim_{n \to \infty} \|x_n - W x_n\| = 0.
\]  

(120)

In addition, from (67) and (77), we have

\[
\|z_{n+1} - z_n\| \leq \|z_{n+1} - x_{n+1}\| + \|x_{n+1} - x_n\| + \|x_n - z_n\| \to 0
\]

(121)

as \( n \to \infty \).

We note that

\[
\|S^n z_n - S^{n+1} z_n\| \leq \|S^n z_n - z_n\| + \|z_n - z_{n+1}\|
\]

\[
+ \|z_{n+1} - S^{n+1} z_{n+1}\|
\]

(122)

\[
+ \|S^{n+1} z_{n+1} - S^{n+1} z_n\|.
\]

From (81), (121), and Lemma 15, we obtain

\[
\lim_{n \to \infty} \|S^n z_n - S^{n+1} z_n\| = 0.
\]  

(123)

In the meantime, we note that

\[
\|z_n - Sz_n\| \leq \|z_n - S^n z_n\| + \|S^n z_n - S^{n+1} z_n\|
\]

\[
+ \|S^{n+1} z_n - Sz_n\|.
\]  

(124)

From (81), (123), and the uniform continuity of \( S \), we have

\[
\lim_{n \to \infty} \|z_n - Sz_n\| = 0.
\]  

(125)

Step 4. We prove that \( x_n \to x^* = P_{\Omega} x_0 \) as \( n \to \infty \).

Indeed, since \( \{x_n\} \) is bounded, there exists a subsequence \( \{x_{n_k}\} \) which converges weakly to some \( w \). From (102), (83), (100), and (77), we have that \( v_{n_k} \to w \), \( u_{n_k} \to w \), \( A_{m_k}^{m} u_{n_k} \to w \), and \( z_{n_k} \to w \), where \( m \in \{1, 2, \ldots, N\} \). Since \( S \) is uniformly continuous, by (125) we get \( \lim_{n \to \infty} \|z_n - S^{m} z_n\| = 0 \) for any \( m \geq 1 \). Hence from Lemma 17, we obtain \( w \in \text{Fix}(S) \). In the meantime, utilizing Lemma 12, we deduce from \( v_{n_k} \to w \), \( x_{n_k} \to w \), (117), and (120) that \( w \in \text{SGBP}(G) \) and \( w \in \text{Fix}(W) = \cap_{n=1}^{\infty} \text{Fix}(T_n) \) (due to Lemma 11). Next, we prove that \( w \in \cap_{n=1}^{\infty} \text{VI}(C, B_n) \). As a matter of fact, let

\[
\tilde{T}_m v = \begin{cases} \frac{B_m v + N_C v}{\theta}, & v \in C, \\ \theta, & v \notin C, \end{cases}
\]  

(126)

where \( m \in \{1, 2, \ldots, N\} \). Let \( (v, u) \in G(T_m) \). Since \( u - B_m v \in N_C v \) and \( \Lambda_n u_n \in C \), we have

\[
\langle v - \Lambda_n u_n, u - B_m v \rangle \geq 0.
\]  

(127)

On the other hand, from \( \Lambda_n u_n = P_C(I - \lambda_n B_m) \Lambda_n^{-1} u_n \) and \( v \in C \), we have

\[
\langle v - \Lambda_n u_n, \Lambda_n u_n - \Lambda_n^{-1} u_n \rangle \geq 0,
\]  

(128)

and hence

\[
\langle v - \Lambda_n u_n, \Lambda_n u_n - \Lambda_n^{-1} u_n \rangle \geq 0.
\]  

(129)

Therefore we have

\[
\langle v - \Lambda_n u_n, u \rangle \geq \langle v - \Lambda_n u_n, B_m v \rangle
\]

\[
\geq \langle v - \Lambda_n u_n, B_m v \rangle
\]

\[
- \left( \langle v - \Lambda_n u_n, \frac{\Lambda_n u_n - \Lambda_n^{-1} u_n}{\lambda_n} + B_m \Lambda_n^{-1} u_n \rangle \right)
\]

\[
= \langle v - \Lambda_n u_n, B_m v + B_m \Lambda_n^{-1} u_n \rangle
\]

\[
- \left( \langle v - \Lambda_n u_n, \frac{\Lambda_n u_n - \Lambda_n^{-1} u_n}{\lambda_n} \rangle \right)
\]

\[
- \left( \langle v - \Lambda_n u_n, \frac{\Lambda_n u_n - \Lambda_n^{-1} u_n}{\lambda_n} \rangle \right)
\]

\[
\geq \langle v - \Lambda_n u_n, B_m \Lambda_n^{-1} u_n - B_n \Lambda_n^{-1} u_n \rangle
\]

\[
- \left( \langle v - \Lambda_n u_n, \frac{\Lambda_n u_n - \Lambda_n^{-1} u_n}{\lambda_n} \rangle \right)
\]

\[
(130)
\]

From (100) and since \( B_m \) is uniformly continuous, we obtain that \( \lim_{n \to \infty} \|B_m \Lambda_n u_n - B_m \Lambda_n^{-1} u_n \| = 0 \). From \( \Lambda_n u_n \to w \),
\{\lambda_{m,n}\} \subset [a_m, b_m] \subset (0, 2\eta_m), \forall m \in \{1, 2, \ldots, N\}, and (100), we have
\langle v - w, u \rangle \geq 0 \quad (131)

Since \( \tilde{T}_m \) is maximal monotone, we have \( w \in \tilde{T}_m^{-1}0 \) and hence \( w \in V(I(C, B_m), m = 1, 2, \ldots, N, \) which implies \( w \in \cap_{m=1}^{N} VI(C, B_m). \)

Next, we show that \( w \in GMEP(\Theta, \varphi, A). \) In fact, from \( u_n = S_n^{\Theta, \varphi}(I - r_n A)x_0, \) we know that
\[
\Theta(u_n, y) + \varphi(y) - \varphi(u_n) + \langle Ax_n, y - u_n \rangle
+ \frac{1}{r_n} \langle K'(u_n) - K'(x_n), y - u_n \rangle \geq 0, \quad \forall y \in C.
\quad (132)
\]

From (H2) it follows that
\[
\varphi(y) - \varphi(u_n) + \langle Ax_n, y - u_n \rangle
+ \frac{1}{r_n} \langle K'(u_n) - K'(x_n), y - u_n \rangle \geq 0, \quad \forall y \in C.
\quad (133)
\]

Replacing \( n \) by \( n_i, \) we have
\[
\varphi(y) - \varphi(u_{n_i}) + \langle Ax_{n_i}, y - u_{n_i} \rangle
+ \frac{1}{r_{n_i}} \langle K'(u_{n_i}) - K'(x_{n_i}), y - u_{n_i} \rangle \geq \Theta(y, u_{n_i}), \quad \forall y \in C.
\quad (134)
\]

Put \( u_t = ty + (1 - t)w \) for all \( t \in (0, 1] \) and \( y \in C. \) Then from (134) we have
\[
\langle u_t - u_{n_i}, Au_{n_i} \rangle
\geq \langle u_t - u_{n_i}, Au_{n_i} \rangle - \varphi(u_{n_i}) + \varphi(u_{n_i}) - \langle u_t - u_{n_i}, Ax_{n_i} \rangle
- \frac{1}{r_{n_i}} \langle K'(u_{n_i}) - K'(x_{n_i}), u_t - u_{n_i} \rangle + \Theta(u_t, u_{n_i})
\geq \langle u_t - u_{n_i}, Au_t - Au_{n_i} \rangle + \langle u_t - u_{n_i}, Au_{n_i} - Ax_{n_i} \rangle
- \varphi(u_t) + \varphi(u_{n_i})
- \frac{1}{r_{n_i}} \langle K'(u_{n_i}) - K'(x_{n_i}), u_t - u_{n_i} \rangle + \Theta(u_t, u_{n_i}).
\quad (135)
\]

Since \( \|u_t - x_n\| \to 0 \) as \( i \to \infty, \) we deduce from the Lipschitz continuity of \( A \) and \( K' \) that \( \|Au_{n_i} - Ax_{n_i}\| \to 0 \) and \( \|K'(u_{n_i}) - K'(x_{n_i})\| \to 0 \) as \( i \to \infty. \) Further, from the monotonicity of \( A, \) we have \( \langle u_t - u_{n_i}, Au_t - Au_{n_i} \rangle \geq 0. \) So, from (H4), the weakly lower semicontinuity of \( \varphi, (K'(u_{n_i}) - K'(x_{n_i}))/r_{n_i} \to 0 \) and \( u_{n_i} \to w, \) we have
\[
\langle u_t - w, Au_{n_i} \rangle \geq -\varphi(u_t) + \varphi(w) + \Theta(u_t, w), \quad \text{as } i \to \infty.
\quad (136)
\]

From (H1), (H4), and (136) we also have
\[
0 = \Theta(u_t, u_t) + \varphi(u_t) - \varphi(u_t)
\leq t \Theta(u_t, y) + (1 - t) \Theta(u_t, w)
+ t \varphi(y) + (1 - t) \varphi(w) - \varphi(u_t)
= t \left( \Theta(u_t, y) + \varphi(y) - \varphi(u_t) \right)
+ (1 - t) \left( \Theta(u_t, w) + \varphi(w) - \varphi(w) - \varphi(u_t) \right)
\leq t \left( \Theta(u_t, y) + \varphi(y) - \varphi(u_t) \right)
+ (1 - t) \langle y - w, Au_t \rangle
= t \left( \Theta(u_t, y) + \varphi(y) - \varphi(u_t) \right)
+ (1 - t) t \langle y - w, Au_t \rangle.
\quad (137)
\]

and hence
\[
0 \leq \Theta(u_t, y) + \varphi(y) - \varphi(u_t) + (1 - t) \langle y - w, Au_t \rangle.
\quad (138)
\]

Letting \( t \to 0^+, \) we have, for each \( y \in C, \)
\[
0 \leq \Theta(w, y) + \varphi(y) - \varphi(w) + \langle Aw, y - w \rangle.
\quad (139)
\]

This implies that \( w \in GMEP(\Theta, \varphi, A). \) Consequently, \( w \in \Omega = \cap_{m=1}^{N} Fix(T_m) \cap GMEP(\Theta, \varphi, A) \cap SGEP(G) \cap \cap_{m=1}^{N} VI(C, B_m) \cap Fix(S). \) This shows that \( \omega_n(x_n) \subset \Omega. \) From (64) and Lemma 22 we infer that \( x_n \to x^* = P_{\Omega}\{x_0 \} \) as \( n \to \infty. \) This completes the proof.

**Corollary 24.** Choose \( N = 2 \) in Theorem 23. For any \( x_0 \in H, \) \( C_1 = C, \) and \( x_1 = P_{C_1}x_0, \) the iterative scheme (49) reduces to the following iterative one:
\[
u_n = P_{C_1} (I - \lambda_{1,n} B_1) u_n, \quad z_n = \beta_n x_n + \sigma_n G \nu_n + \left( [1 - \beta_n] (I - \sigma_n V) W_n G \nu_n \right), \quad k_n = \delta_n z_n + (1 - \delta_n) S_n^\delta z_n, \quad y_n = (1 - \alpha_n) x_n + \alpha_n k_n, \quad (140)
\]
\[
0 \leq \Theta(w, y) + \varphi(y) - \varphi(w) + \langle Aw, y - w \rangle.
\quad (139)
\]

Since \( u_t \to x^* = P_{\Omega}\{x_0 \} \) as \( n \to \infty, \) we deduce from the Lipschitz continuity of \( A \) and \( K' \) that \( \|Au_{n_i} - Ax_{n_i}\| \to 0 \) and \( \|K'(u_{n_i}) - K'(x_{n_i})\| \to 0 \) as \( i \to \infty. \) Further, from the monotonicity of \( A, \) we have \( \langle u_t - u_{n_i}, Au_t - Au_{n_i} \rangle \geq 0. \) So, from (H4), the weakly lower semicontinuity of \( \varphi, (K'(u_{n_i}) - K'(x_{n_i}))/r_{n_i} \to 0 \) and \( u_{n_i} \to w, \) we have
\[
\langle u_t - w, Au_{n_i} \rangle \geq -\varphi(u_t) + \varphi(w) + \Theta(u_t, w), \quad \text{as } i \to \infty.
\quad (136)
\]
**Corollary 25.** Choose $N = 1$ and $T_n \equiv I$ the identity operator of $H$ in Theorem 23. For any $x_0 \in H$, $C_1 = C$, and $x_1 = P_{C_1}x_0$, the iterative scheme (49) reduces to the following iterative one:

$$u_n = S_{\gamma_n}^\psi(I - r_n A)x_n,$$

$$y_n = P_{C_1}(I - \lambda_n B_n),$$

$$z_n = \beta_n x_n + (1 - \beta_n) G V_n + \sigma_n (I - V) G V_n,$$

$$k_n = \delta_n z_n + (1 - \delta_n) S^\psi z_n,$$  \hspace{1cm} (141)

$$y_n = (1 - \alpha_n) x_n + \alpha_n k_n,$$

$$C_{n+1} = \{ z \in C_n : \| y_n - z \| ^2 \leq \| x_n - z \| ^2 + \theta_n \},$$

$$x_{n+1} = P_{C_{n+1}}x_0, \quad \forall n \geq 1,$$

where $\theta_n = (\sigma_n + \gamma_n)(1 + \gamma_n) \lambda_n + c_n \Delta_n = \sup \{\| x_n - p \| ^2 + \| (I - V) p \| ^2 / (\psi - 1) \} : p \in \Omega < \infty, \gamma_n \in (0, 2\gamma], k = 1, 2, \text{ and } \lambda_n \in [a_1, b_1] \subset (0, 2\gamma].$ Then $\{x_n\}$ converges strongly to $x^* = P_{C_1}x_0$ provided that $S^\psi_\gamma$ is firmly nonexpansive.

**Proof.** In Theorem 23, putting $N = 1$ and $T_n \equiv I$ the identity operator of $H$, we have $W_n \equiv I$. In this case, we get

$$z_n = \beta_n x_n + \sigma_n G V_n + [(1 - \beta_n) I - \sigma_n V] W_n G V_n,$$

$$= \beta_n x_n + \sigma_n G V_n + [(1 - \beta_n) I - \sigma_n V] G V_n,$$  \hspace{1cm} (142)

$$= \beta_n x_n + (1 - \beta_n) G V_n + \sigma_n (I - V) G V_n.$$

So, the iterative scheme (49) reduces to the iterative one (141). Utilizing Theorem 23, we derive the desired result. \qed

**Remark 26.** Theorem 23 extends, improves, supplements, and develops Ceng et al.'s [20, Theorem 1] in the following aspects.

(i) The problem of finding a point

$$x^* \in \bigcap_{i=1}^N \text{Fix}(T_n) \cap \text{GMEP}(\Theta, \varphi, A) \cap$$

$$\text{SGEP}(G) \cap \bigcap_{i=1}^N \text{VI}(C, B_i) \cap \text{Fix}(S)$$

in Theorem 23 is very different from the problem of finding a point

$$x^* \in \bigcap_{m=1}^\infty \text{Fix}(T_n) \cap \text{GMEP}(\Theta, \varphi, A) \cap \text{SGEP}(G)$$

in Ceng et al.'s [20, Theorem 1]. There is no doubt that our problem of finding a point $x^* \in \bigcap_{m=1}^\infty \text{Fix}(T_n) \cap \text{GMEP}(\Theta, \varphi, A) \cap \text{SGEP}(G) \cap \bigcap_{m=1}^\infty \text{VI}(C, B_i) \cap \text{Fix}(S)$ is more general and more subtle than the problem of finding a point $x^* \in \bigcap_{m=1}^\infty \text{Fix}(T_n) \cap \text{GMEP}(\Theta, \varphi, A) \cap \text{SGEP}(G)$ in [20, Theorem 1].

(ii) The iterative scheme in [20, Theorem 1] is extended to develop the iterative scheme in Theorem 23 by the virtue of Mann-type iterative method and the shrinking projection method. The iterative scheme in Theorem 23 is more advantageous and more flexible than the iterative scheme in [20, Theorem 1] because it involves solving four problems: the GMEP (5), the SGEP (12), finitely many variational inequalities, and the common fixed point problem of an asymptotically strict pseudocontractive mapping in the intermediate sense and infinitely many nonexpansive mappings.

(iii) The iterative scheme in Theorem 23 is very different from the iterative scheme in [20, Theorem 1] because the iterative scheme in Theorem 23 involves Mann-type iterative method and the shrinking projection method. The proof of [20, Theorem 1] makes use of Lemma 12 (i.e., Demiclosedness principle for a nonexpansive mapping) but no use of Lemma 17 (i.e., Demiclosedness principle for an asymptotically strict pseudocontractive mapping in the intermediate sense). However, the proof of Theorem 23 depends not only on Lemma 12 but also Lemma 17 because there is an asymptotically strict pseudocontractive mapping in the intermediate sense and infinitely many nonexpansive mappings appearing in the problem of Theorem 23.

(iv) The proof of Theorem 23 combines Caï and Bu convergence analysis for Mann-type iterative method and the shrinking projection method to solve finitely many GMEPs, finitely many VIPs, and the fixed point problem of an asymptotically strict pseudocontractive mapping in the intermediate sense (see [26, Theorem 3.1]) and Ceng et al.'s convergence analysis for hybrid extragradient-like iterative algorithm (see [20, Theorem 3.1]), where $V \in (0, 1]$ for a $V$-strongly positive bounded linear operator $V$. Because in iterative scheme (49) the composite shrinking projection method involves a $V$-strongly positive bounded linear operator $V$ with $V \in (1, 2]$ and infinitely many nonexpansive mappings, the properties of the $W$-mappings $W_n$ and $W$ and the operator $V$ play a key role in the proof of Theorem 23.

(v) Theorem 23 extends Ceng et al.'s [20, Theorem 1] from the fixed point problem of infinitely many nonexpansive mappings to the common fixed point problem of an asymptotically strict pseudocontractive mapping in the intermediate sense and infinitely many nonexpansive mappings and generalizes Ceng et al.'s [20, Theorem 1] to the setting of finitely many variational inequalities. The proof of Theorem 23 depends on the properties of the $V$-strongly positive bounded linear operator $V$ with $V \in (1, 2]$, the result on the $W$-mappings $W_n$ and $W$ (i.e., $\lim_{n \to 0} \| W_n x_n - W x_n \| = 0$ for any bounded sequence $\{x_n\} \subset C$) (see [45, Remark 3.2]), and the properties of asymptotically strict pseudocontractive mapping in the intermediate sense (see Lemmas 15–18).

**Remark 27.** Theorem 23 extends, improves, supplements, and develops Yao et al.'s [30, Theorem 3.1] in the following aspects.

(i) Theorem 23 generalizes and extends [30, Theorem 3.1] from the asymptotically $k$-strict pseudocontractive mapping to the asymptotically $k$-strict pseudocontractive mapping in the intermediate sense and from the MEP to the GMEP and generalizes [30, Theorem 3.1] to the setting of SGEP.

(ii) We add finitely many variational inequalities and infinitely many nonexpansive mappings $\{T_n\}_{m=1}^\infty$.
in our algorithm such that it can be applied to find a common solution of the GMEP (5), the SGEP (12), finitely many variational inequalities for inverse strongly monotone mappings, and the common fixed point problem of an asymptotically \( k \)-strict pseudocontractive mapping in the intermediate sense and infinitely many nonexpansive mappings \( \{T_n\}_{n=1}^\infty \).

4. Weak Convergence Theorem

In this section, we will propose and analyze another iterative algorithm (involving no shrinking projection method) for finding a solution of the system of generalized equilibria with constraints of several problems: a generalized mixed equilibrium problem, finitely many variational inequalities, and the common fixed point problem of an asymptotically strict pseudocontractive mapping in the intermediate sense and infinitely many nonexpansive mappings in a real Hilbert space. Moreover, under mild conditions we will prove weak convergence of the proposed algorithm.

**Theorem 28.** Let \( C, N, \Theta, \Theta_1, \Theta_2, \varphi, A, A_k, B_1, V, \{T_n\}_{n=1}^\infty \), \( \{\lambda_n\} \), and \( W_n \) be the same notations as in Theorem 23, where \( k \in \{1, 2\} \) and \( i \in \{1, 2, \ldots, N\} \). Let \( S: C \to C \) be a uniformly continuous asymptotically \( k \)-strict pseudocontractive mapping in the intermediate sense for some \( 0 \leq k < 1 \) with the sequence \( \{\gamma_k\} \subset (0, \infty) \) such that \( \sum_{n=1}^\infty \gamma_n < \infty \) and \( \{\epsilon_n\} \subset (0, \infty) \) such that \( \sum_{n=1}^\infty \epsilon_n < \infty \). Assume that \( \Omega \cap \bigcap_{i=1}^N \text{Fix}(B_i) \cap \text{GMEP}(\Theta, \varphi, A) \cap \text{SGEP}(G) \cap \bigcap_{i=1}^N \text{VI}(C, A_i) \cap \text{Fix}(S) \) is nonempty where \( G \) is defined as in Proposition CY. Let \( \{r_n\} \) be a sequence in \( [0, 2\epsilon] \) and let \( \{\alpha_n\}, \{\beta_n\}, \{\gamma_n\}, \) and \( \{\delta_n\} \) be sequences in \( [0, 1] \) such that \( \sum_{n=1}^\infty \alpha_n < \infty \), \( 0 < \alpha \leq \alpha_n \leq 1 \), and \( 0 < k + \epsilon \leq \delta_n \leq \delta < 1 \). Pick any \( x_1 \in H \) and let \( \{x_n\} \) be a sequence generated by the following algorithm:

\[
\begin{align*}
  u_n &= \xi^{(\alpha, \varphi)}(r_nA)x_n, \\
  v_n &= P_C(I - \lambda N B_N)u_n \\
  &\quad \times P_C(I - \lambda N^{-1} B_N^{-1}) \cdots P_C(I - \lambda N^{-1} B_1)u_n, \\
  z_n &= \beta_n x_n + \sigma_n G v_n + \left((1 - \beta_n) I - \sigma_n V\right) W_n G v_n, \\
  k_n &= \delta_n z_n + (1 - \delta_n) S^2 z_n, \\
  x_{n+1} &= (1 - \alpha_n) x_n + \alpha_n k_n, \quad \forall n \geq 1,
\end{align*}
\]

where \( \gamma_k \in (0, 2\epsilon_k) \), \( k \in \{1, 2\} \), \( \{\lambda_k\} \subset [a, b] \subset (0, 2\epsilon) \), \( \forall i \in \{1, 2, \ldots, N\} \). Assume that the conditions (i)-(iii) are satisfied. Then \( \{x_n\} \) converges weakly to \( x^* := \lim_{n \to \infty} P_{\Omega} x_n \) provided that \( S^{(\alpha, \varphi)} \) is firmly nonexpansive.

**Proof.** As \( \lim_{n \to \infty} \sigma_n = 0 \), \( 0 < \liminf_{n \to \infty} \beta_n \leq \limsup_{n \to \infty} \beta_n < 1 \) and \( 0 < \liminf_{n \to \infty} \gamma_n \leq \limsup_{n \to \infty} \gamma_n < 2\epsilon \), we may assume, without loss of generality, that \( \{\beta_n\} \subset [a, b] \subset [0, 1], \{r_n\} \subset [c, \epsilon] \subset (0, 2\epsilon) \), and \( \beta_n + \sigma_n \|V\| \leq 1 \) for all \( n \geq 1 \). First, let us show that \( \lim_{n \to \infty} \|x_n - p\| = 0 \) exists for any \( p \in \Omega \). Put

\[
\Lambda_n^i = P_C(I - \lambda N B_i) \cdots P_C(I - \lambda N^{-1} B_1) (I - \lambda N B_i)
\]

for all \( i \in \{1, 2, \ldots, N\} \), \( n \geq 1 \), and \( \Lambda_0^i = I \), where \( I \) is the identity mapping on \( H \). Then we get \( v_n = \Lambda_n^N u_n \). Take \( p \in \Omega \) arbitrarily. Repeating the same arguments as in the proof of Theorem 23, we can obtain that

\[
\begin{align*}
  \|v_n - p\| &\leq \|u_n - p\|, \quad n \geq 1, \\
  \|v_n - p\| &\leq \|u_n - p\|, \quad n \geq 1, \\
  \|v_n - p\| &\leq \|u_n - p\|, \quad n \geq 1.
\end{align*}
\]
Utilizing (145) and (152), we obtain

$$
\begin{align*}
\|x_{n+1} - p\|^2 &\leq (1 - \alpha_n) \|x_n - p\|^2 + \alpha_n \|k_n - p\|^2 \\
&\leq (1 - \alpha_n) \|x_n - p\|^2 + \alpha_n \left[ (1 + \gamma_n) \left( \|x_n - p\|^2 + \sigma_n \frac{(I - V)p}{\beta - 1} \right) + c_n \right] \\
&\leq (1 + \gamma_n) \left( \|x_n - p\|^2 + \sigma_n \frac{(I - V)p}{\beta - 1} \right) + c_n \\
&= \|x_n - p\|^2 + \gamma_n \|x_n - p\|^2 + \sigma_n (1 + \gamma_n) \frac{(I - V)p}{\beta - 1} + c_n,
\end{align*}
$$

(154)

Since $\sum_{n=1}^{\infty} \sigma_n < \infty$, $\sum_{n=1}^{\infty} \gamma_n < \infty$, and $\sum_{n=1}^{\infty} \bar{\gamma}_n < \infty$, by Lemma 21 we have that $\lim_{n \to \infty} \|x_n - p\|$ exists. Thus $\{x_n\}$ is bounded and so are the sequences $\{u_n\}$, $\{v_n\}$, $\{z_n\}$, and $\{k_n\}$.

Also, utilizing Lemmas 8 and 9(b), we obtain from (145), (148), (149), and (152) that

$$
\begin{align*}
\|z_n - p\|^2 \\
&= \|\beta_n (x_n - p) + (1 - \beta_n)(W_n G V_n - p)\| \\
&\leq \|\beta_n (x_n - p) + (1 - \beta_n)(W_n G V_n - p)\|^2 \\
&\leq \|\beta_n (x_n - p) + (1 - \beta_n)(W_n G V_n - p)\|^2 + 2\sigma_n \langle G V_n - W_n G V_n, z_n - p \rangle \\
&= \beta_n \|x_n - p\|^2 + (1 - \beta_n) \|W_n G V_n - p\|^2 \\
&\leq \beta_n \|x_n - p\|^2 + \frac{(1 - \beta_n) \|W_n G V_n\|^2}{\beta - 1} \\
&\leq \|x_n - p\|^2 + 2\sigma_n \|G V_n - W_n G V_n\| \|z_n - p\|,
\end{align*}
$$

(155)

and hence

$$
\begin{align*}
\|x_{n+1} - p\|^2 &\leq (1 - \alpha_n) \|x_n - p\|^2 + \alpha_n \|k_n - p\|^2 \\
&\leq (1 - \alpha_n) \|x_n - p\|^2 + \alpha_n \left[ (1 + \gamma_n) \|z_n - p\|^2 + c_n \right] \\
&\leq (1 - \alpha_n) \|x_n - p\|^2 + \alpha_n \left[ (1 + \gamma_n) \|z_n - p\|^2 + c_n \right] \\
&\leq \|x_n - p\|^2 + (1 - \alpha_n) \|x_n - p\|^2 + \alpha_n \|k_n - p\|^2 \\
&\leq \|x_n - p\|^2 + \alpha_n \left[ (1 + \gamma_n) \|z_n - p\|^2 + (1 - \delta_n) \right] \times (k - \delta_n) \|z_n - S' z_n\|^2 + c_n.
\end{align*}
$$

(156)

So, it follows that

$$
\begin{align*}
\alpha (1 + \gamma_n) a (1 - \bar{a}) \|x_n - W_n G V_n\|^2 \\
&\leq \alpha_n (1 + \gamma_n) \beta_n (1 - \beta_n) \|x_n - W_n G V_n\|^2 \\
&\leq \|x_n - p\|^2 - \|x_{n+1} - p\|^2 + \gamma_n \|x_n - p\|^2 \\
&+ 2\sigma_n (1 + \gamma_n) \|G V_n - W_n G V_n\| \|z_n - p\| + c_n.
\end{align*}
$$

(157)

Since $\lim_{n \to \infty} \sigma_n = 0$, $\lim_{n \to \infty} \gamma_n = 0$, and $\lim_{n \to \infty} \gamma_n = 0$, it follows from the existence of $\lim_{n \to \infty} \|x_n - p\|$ and the boundedness of $\{x_n\}$, $\{z_n\}$, and $\{v_n\}$ that

$$
\lim_{n \to \infty} \|x_n - W_n G V_n\| = 0.
$$

(158)

Note that

$$
\begin{align*}
\|z_n - x_n\| \\
&= \| (1 - \beta_n)(W_n G V_n - x_n) + \sigma_n (G V_n - W_n G V_n) \| \\
&\leq \|W_n G V_n - x_n\| + \sigma_n \|G V_n - W_n G V_n\|.
\end{align*}
$$

(159)

Hence, it follows from (158) and $\lim_{n \to \infty} \sigma_n = 0$ that

$$
\lim_{n \to \infty} \|x_n - z_n\| = 0.
$$

(160)

In the meantime, from (152) and (155) it follows that

$$
\begin{align*}
\|x_{n+1} - p\|^2 &\leq (1 - \alpha_n) \|x_n - p\|^2 + \alpha_n \|k_n - p\|^2 \\
&\leq (1 - \alpha_n) \|x_n - p\|^2 + \alpha_n \left[ (1 + \gamma_n) \|z_n - p\|^2 + c_n \right] \\
&\leq (1 - \alpha_n) \|x_n - p\|^2 + \alpha_n \left[ (1 + \gamma_n) \|z_n - p\|^2 + (1 - \delta_n) \right] \times (k - \delta_n) \|z_n - S' z_n\|^2 + c_n.
\end{align*}
$$
\[ \leq (1 - \alpha_n) \| x_n - p \|^2 \]
\[ + \alpha_n \left( (1 + \gamma_n) \times \left( \| x_n - p \|^2 + 2\sigma_n \| G v_n - \nabla W_n G v_n \| \| z_n - p \| \) + (1 - \delta_n) (k - \delta_n) \| z_n - S^\infty z_n \|^2 + c_n \right) \]
\[ \leq (1 - \alpha_n) \| x_n - p \|^2 + \alpha_n (1 + \gamma_n) \times \left( \| x_n - p \|^2 + 2\sigma_n \| G v_n - \nabla W_n G v_n \| \| z_n - p \| \right) + \alpha_n (1 - \delta_n) (k - \delta_n) \| z_n - S^\infty z_n \|^2 + c_n \]
\[ \leq (1 - \alpha_n) \| x_n - p \|^2 + 2\sigma_n (1 + \gamma_n) \times \left( \| x_n - p \|^2 + 2\sigma_n \| G v_n - \nabla W_n G v_n \| \| z_n - p \| \right) + \alpha_n (1 - \delta_n) (k - \delta_n) \| z_n - S^\infty z_n \|^2 + c_n, \]

which, together with \( 0 < k + \epsilon \leq \delta_n \leq d < 1 \), leads to
\[ \alpha (1 - d) e \| z_n - S^\infty z_n \|^2 \]
\[ \leq \alpha_n (1 - \delta_n) (k - \delta_n) \| z_n - S^\infty z_n \|^2 \]
\[ \leq \| x_n - p \|^2 + \gamma_n \| x_n - p \|^2 \]
\[ + 2\sigma_n (1 + \gamma_n) \times \left( \| x_n - p \|^2 + 2\sigma_n \| G v_n - \nabla W_n G v_n \| \| z_n - p \| \right) + \alpha_n (1 - \delta_n) (k - \delta_n) \| z_n - S^\infty z_n \|^2 + c_n, \]
\[ \leq 0. \] (163)

Since \( k_n - z_n = (1 - \delta_n) (S^\infty z_n - z_n) \), from (163) we have
\[ \lim_{n \to \infty} \| k_n - z_n \| = 0. \] (164)

Note that
\[ \| x_{n+1} - x_n \| = \alpha_n \| k_n - x_n \| \leq \| k_n - z_n \| + \| z_n - x_n \|. \] (165)

Hence from (160) and (164) we have
\[ \lim_{n \to \infty} \| x_{n+1} - x_n \| = 0. \] (166)

Repeating the same arguments as those of Step 3 in the proof of Theorem 23, we can obtain that \( \| x_n - u_{n,i} \| \to 0 \), \( \| x_n - v_{n,i} \| \to 0 \), \( \| x_n - G v_n \| \to 0 \), \( \| x_n - W x_n \| \to 0 \), \( \| z_n - S z_n \| \to 0 \), and \( \| \Lambda_n^u u_n - \Lambda_n^u u_n \| \to 0 \), \( i \in \{1, 2, \ldots, N\} \) as \( n \to \infty \).

Since \( \{x_n\} \) is bounded, there exists a subsequence \( \{x_{n_j}\} \) of \( \{x_n\} \) which converges weakly to \( w \). It is easy to see that \( v_{n_j} \to w \), \( u_{n_j} \to w \), \( \Lambda_n^u u_{n,j} \to w \), and \( z_{n_j} \to w \), where \( m \in \{1, 2, \ldots, N\} \). Since \( S \) is uniformly continuous and \( \| z_n - S z_n \| \to 0 \) as \( n \to \infty \), we get \( \lim_{n \to \infty} \| z_n - S^\infty z_n \| = 0 \) for any \( m \geq 1 \). Hence from Lemma 17, we obtain \( w \in \text{Fix}(S) \). In the meantime, utilizing Lemma 12, we deduce from \( v_{n_j} \to w \), \( x_{n_j} \to w \), \( \| v_{n_j} - G v_n \| \to 0 \), and \( \| x_{n_j} - W x_n \| \to 0 \) that \( w \in \text{SGEP}(G) \) and \( w \in \text{Fix}(W) = \bigcap_{m=1}^{N} \text{Fix}(T_m) \) (due to Lemma 11).

Repeating the same arguments as those of Step 4 in the proof of Theorem 23, we can conclude that \( w \in \bigcap_{i=1}^{N} \text{VI}(C, B_m) \) and \( w \in \text{GMEP}(\Theta, \varphi, A) \). Consequently, \( w \in \Omega \). This shows that \( \omega_n(x_n) \subset \Omega \).

Next let us show that \( \omega_n(x_n) \) is a single-point set. As a matter of fact, let \( \{x_{n_k}\} \) be another subsequence of \( \{x_n\} \) such that \( x_{n_k} \to w' \). Then we get \( w' \in \Omega \). If \( w \neq w' \), from the Opial condition, we have
\[ \lim_{n \to \infty} \| x_n - w \| \]
\[ = \lim_{i \to \infty} \| x_{n_i} - w \| < \lim_{i \to \infty} \| x_{n_i} - w' \| \] (167)
\[ = \lim_{j \to \infty} \| x_j - w' \| = \lim_{j \to \infty} \| x_{n_j} - w' \| \]
\[ < \lim_{n \to \infty} \| x_n - w \|. \] (168)

This attains a contradiction. So we have \( w = w' \). Put \( w_n = P_{\Omega} x_n \). Since \( w \in \Omega \), we have \( \langle x_n - w_n, w_n - w \rangle \geq 0 \). By Lemma 21, we have that \( \{w_n\} \) converges strongly to some \( \bar{w} \in \Omega \). Since \( \{x_n\} \) converges weakly to \( w \), we have
\[ \langle w - \bar{w}, w - w \rangle \geq 0. \] (169)

Therefore we obtain \( w = \bar{w} = \lim_{n \to \infty} P_{\Omega} x_n \). This completes the proof. \( \square \)

**Corollary 29.** Choose \( N = 2 \) in Theorem 28. For any \( x_1 \in H \) the iterative scheme (145) reduces to the following iterative one:
\[ u_n = S_n^{(\varphi, \theta)} (I - r_n A) x_n, \]
\[ v_n = P_C (I - \lambda_n B_n) u_n, \]
\[ z_n = \beta_n x_n + (1 - \beta_n) G v_n, \]
\[ k_n = \delta_n z_n + (1 - \delta_n) S^\infty z_n, \]
\[ x_{n+1} = (1 - \alpha_n) x_n + \alpha_n k_n, \quad \forall n \geq 1, \]

where \( \{k_n\} \subset (0, 2\delta_n) \) and \( \{\lambda_n\} \subset [a_i, b_i] \subset (0, 2\eta_i) \) for \( k = 1, 2 \) and \( i = 1, 2 \). Then \( \{x_n\} \) converges weakly to \( x^* = \lim_{n \to \infty} P_{\Omega} x_n \) provided that \( S_n^{(\varphi, \theta)} \) is firmly nonexpansive.
Corollary 30. Choose $N = 1$ and $T_n \equiv I$ the identity operator of $H$ in Theorem 28. For any $x_1 \in H$ the iterative scheme (145) reduces to the following iterative one:

$$ u_n = \frac{c^{(\theta, \varphi)}_n}{\gamma_n}(I - r_nA)x_n, $$

$$ v_n = P_C \left( I - \lambda_{1,n}B_1 \right) u_n, $$

$$ z_n = \beta_n x_n + \sigma_n Gv_n + \left( 1 - \beta_n \right) I - \sigma_n V \left[ Gv_n, \right. $$

$$ k_n = \delta_n x_n + \left( 1 - \delta_n \right) S^\ast z_n, $$

$$ x_{n+1} = \left( 1 - \alpha_n \right) x_n + \alpha_n k_n, \quad \forall n \geq 1, $$

where $\gamma_k \in (0, 2\xi_k)$ and $\lambda_{1,n} \in (0, 2\eta_1)$ for $k = 1, 2$. Then $\{x_n\}$ converges weakly to $x^* = \lim_{n \to \infty} P_{\Omega} x_n$ provided that $c^{(\theta, \varphi)}_n$ is firmly nonexpansive.

In the following, we provide a numerical example to illustrate how Corollary 30 works.

Example 31. Let $H = \mathbb{R}^2$ with inner product $(\cdot, \cdot)$ and norm $\| \cdot \|$ as defined by

$$ \langle x, y \rangle = ac + bd, \quad \| x \| = \sqrt{a^2 + b^2}, $$

for all $x, y \in \mathbb{R}^2$ with $x = (a, b)$ and $y = (c, d)$. Let $C = \{(a, a) : a \in \mathbb{R}\}$. Clearly, $C$ is a nonempty closed convex subset of a real Hilbert space $H = \mathbb{R}^2$. Let $K(x) \equiv (1/2)|x|^2$, $\forall x \in H$, $\Theta(x, y) = \Theta_1(x, y) = \Theta_2(x, y) = 0$, $\forall (x, y) \in C \times C$, and $\varphi = 0$, $\forall x \in C$. Then $\Theta, \Theta_1$, and $\Theta_2$ are three bifunctions from $C \times C$ to $\mathbb{R}$ satisfying (H1)-(H4) and $\varphi : C \to \mathbb{R}$ is a lower semicontinuous and convex function. Let $V$ be a $\gamma$-strongly positive bounded linear operator with $\gamma \in (1, 2]$, let $A, A_k : H \to H$ and $B_1 : C \to H$ be $\xi$-inverse strongly monotone, $\xi_k$-inverse strongly monotone, and $\eta_1$-inverse strongly monotone, respectively, for $k = 1, 2$, and let $S : C \to C$ be a uniformly continuous asymptotically 3-strict pseudocontractive mapping in the intermediate sense for some $0 \leq k < 1$ with sequence $\{\gamma_k\} \subset [0, \infty)$ such that $\sum_{n=1}^{\infty} \gamma_n < \infty$ and $\{c_n\} \subset (0, \infty)$ such that $\sum_{n=1}^{\infty} c_n < \infty$ such that $\Omega := \text{GMEP}(\Theta, \varphi, A) \cap \text{SGEP}(G) \cap \text{VI}(C, B) \cap \text{Fix}(S)$ is nonempty, for instance, putting

$$ A = \begin{bmatrix} 3 & 2 \\ 2 & 5 \\ 5 & 5 \end{bmatrix}, \quad B_1 = S = \begin{bmatrix} 2 & 1 \\ 1 & 2 \\ 3 & 3 \end{bmatrix}, $$

$$ V = \frac{5}{4} A, \quad A_1 = I - A = \begin{bmatrix} 2 & 2 \\ 2 & 5 \\ 5 & 5 \end{bmatrix}, $$

$$ A_2 = I - B_1 = \begin{bmatrix} 1 & -1 \\ -1 & 1 \\ 1 & 3 \end{bmatrix}. $$

(172)

It is easy to see that $\|A\| = \|B_1\| = \|S\| = 1$, that $A$ is $\xi$-inverse strongly monotone with $\xi = 1/2$, that $V$ is a $5/4$-strongly
positive bounded linear operator, that $B_1, A_1$, and $A_2$ are $1/2$-inverse strongly monotone, and that $S$ is a nonexpansive mapping, that is, a uniformly continuous asymptotically 0-strict pseudocontractive mapping in the intermediate sense with sequences $\{\gamma_n\}$, $\{c_n\}$, $\{\epsilon_n\}$, $\{\beta_n\}$, $\{\delta_n\}$, $\{r_n\}$, $\{\sigma_n\}$, $\{\alpha_n\}$, $\{\beta_n\} \subset (0, 1)$, $\frac{1}{4} \sigma_n < \infty$ satisfying (1/4)$\sigma_n < \infty$. Moreover, it is clear that $\text{Fix}(S) = C$, $\text{GMEP}(\Theta, \varphi, A) = \{0\}$, $\text{VI}(C, B_1) = \{0\}$, and $\text{SGEP}(G) = C$. Hence, $\Omega := \text{GMEP}(\Theta, \varphi, A) \cap \text{SGEP}(G) \cap \text{VI}(C, B_1) \cap \text{Fix}(S) = \{0\}$. In this case, from iterative scheme (170) in Corollary 30, we obtain that, for any given $x_1 \in C$,

$$ u_n = \frac{c^{(\theta, \varphi)}_n}{\gamma_n}(I - r_nA)x_n = P_C \left( I - \lambda_{1,n}B_1 \right) u_n = (1 - \lambda_{1,n}) u_n $$

$$ = (1 - \lambda_{1,n}) (1 - r_n) x_n, $$

$$ v_n = P_C \left( I - \lambda_{1,n}B_1 \right) u_n = (1 - \lambda_{1,n}) u_n $$

$$ = (1 - \lambda_{1,n}) (1 - r_n) x_n, $$

$$ z_n = \beta_n x_n + \sigma_n Gv_n + \left( 1 - \beta_n \right) I - \sigma_n V \left[ Gv_n, \right. $$

$$ k_n = \delta_n x_n + \left( 1 - \delta_n \right) S^\ast z_n, $$

$$ x_{n+1} = \left( 1 - \alpha_n \right) x_n + \alpha_n k_n, \quad \forall n \geq 1, $$

where $\gamma_k \in (0, \xi_k)$ and $\lambda_{1,n} \in (0, \eta_1)$ for $k = 1, 2$. Then $\{x_n\}$ converges weakly to $x^* = \lim_{n \to \infty} P_{\Omega} x_n$ provided that $c^{(\theta, \varphi)}_n$ is firmly nonexpansive.

Whenever $0 < \alpha < \alpha_n \leq 1$, $\{\lambda_{1,n}\} \subset [a_1, b_1] \subset (0, 1)$, $\{\beta_n\} \subset [c, \tilde{c}] \subset (0, 1)$, $\{r_n\} \subset [e, \tilde{e}] \subset (0, 1)$ and $\{\sigma_n\} \subset [0, 1]$ satisfying (1/4)$\sigma_n < 1 - \tilde{e}$, we have

$$ \| x_{n+1} \| = \left( 1 - \alpha_n + \alpha_n \left[ \beta_n + \left( 1 - \beta_n - \frac{1}{4} \sigma_n \right) \right] \right) $$

(173)
\[ x \left( 1 - \lambda_{1,n} \right) (1 - r_n) \right) \| x_n \| \]
\[ \leq \left[ 1 - \alpha_n + \alpha_n \left[ \beta_n + (1 - \beta_n) \right] \times (1 - \lambda_{1,n}) (1 - r_n) \right) \| x_n \| \]
\[ \leq \left[ 1 - \alpha_n + \alpha_n \left[ \beta_n + (1 - \beta_n) \right] \times (1 - a_1) (1 - e) \right) \| x_n \| \]
\[ = \left[ 1 - \alpha_n (1 - \beta_n) + \alpha_n (1 - \beta_n) \right] \times (1 - a_1) (1 - e) \right) \| x_n \| \]
\[ \leq \left[ 1 - \alpha (1 - \tilde{c}) (1 - (1 - a_1) (1 - e)) \right] \| x_n \| \]
\[ \vdots \]
\[ \leq \left[ 1 - \alpha (1 - \tilde{c}) (1 - (1 - a_1) (1 - e)) \right] \| x_1 \| . \quad \text{(174)} \]

Since \( 0 < \alpha (1 - \tilde{c}) (1 - (1 - a_1) (1 - e)) < 1 \), we immediately get
\[ \lim_{n \to \infty} \| x_n \| = 0. \quad \text{(175)} \]

This shows that \( \{ x_n \} \) converges to the unique element \( 0 \) of \( \Omega \).
