We perform a comparison between the fractional iteration and decomposition methods applied to the wave equation on Cantor set. The operators are taken in the local sense. The results illustrate the significant features of the two methods which are both very effective and straightforward for solving the differential equations with local fractional derivative.
Recently, the wave equation on Cantor sets (local fractional wave equation) was given by [35]
\[
\frac{\partial^{2\alpha}u(x,t)}{\partial^2 t^{2\alpha}} - \alpha^{2\alpha} \frac{\partial^{2\alpha}u(x,t)}{\partial x^{2\alpha}} = 0,
\]  
(1)
where the operators are local fractional ones [16–19, 35, 36].

Following (1), a wave equation on Cantor sets was proposed as follows [36]:
\[
\frac{\partial^{2\alpha}u(x,t)}{\partial t^{2\alpha}} - \frac{x^{2\alpha}}{\Gamma(1+2\alpha)} \frac{\partial^{2\alpha}u(x,t)}{\partial x^{2\alpha}} = 0,
\]  
(2)
where \(u(x,t)\) is a fractal wave function.

In this paper, our purpose is to compare the local fractional variational iteration and decomposition methods for solving the local fractional differential equations. For illustrating the concepts we adopt one example for solving the wave equation on Cantor sets with local fractional operator.

Bearing these ideas in mind, the paper is organized as follows. In Section 2, we present basic definitions and provide some properties of local fractional derivative and integration. In Section 3, we introduce the local fractional variational iteration and the decomposition methods. In Section 4, we discuss one application. Finally, in Section 5 we outline the main conclusions.

2. Mathematical Tools

We recall in this section the notations and some properties of the local fractional operators [15–19, 35, 36].

Definition 1 (see [15–19, 35, 36]). The function \(f(x)\) is local fractional continuous, if it is valid for
\[
|f(x) - f(x_0)| < \varepsilon^\alpha,
\]  
(3)
where \(|x - x_0| < \delta\), for \(\varepsilon > 0\) and \(\varepsilon \in R\).

We notice that there are existence conditions of local fractional continuities that operating functions are right-hand and left-hand local fractional continuity. Meanwhile, the right-hand local fractional continuity is equal to its left-hand local fractional continuity. For more details, see [35].

Following (4), we have [15–19, 35, 36]
\[
\rho^\alpha |x - x_0|^\alpha \leq |f(x) - f(x_0)| \leq \kappa^\alpha |x - x_0|^\alpha
\]  
(4)
with \(|x - x_0| < \delta\), for \(\varepsilon, \delta > 0\) and \(\varepsilon, \delta, \kappa, \rho \in R\).

For a fractal set \(F\), there is a fractal measure [35]
\[
H^\alpha(F \cap (x, x_0)) = (x - x_0)^\alpha,
\]  
(5)
where \(f(x)\) presents a bi-Lipschitz mapping with fractal dimension \(\alpha\) and \(H^\alpha\) denotes a Hausdorff dimension.

We verify that there is a measure
\[
H^1(F \cap (x, x_0)) = x - x_0
\]  
(6)
in the case of \(\alpha = 1\) and \(f(x)\) is a Lipschitz mapping. If \(F\) is a Cantor set, we have \(H^{\alpha\alpha}/ln^3(F \cap (x, x_0)) = (x - x_0)^{ln^2/ln^3} = (x - x_0)^{ln\alpha/ln\alpha}\) with \(\alpha = ln 2/ln 3\).

Definition 2 (see [15–19, 35, 36]). The local fractional derivative of \(f(x)\) at \(x = x_0\) is defined as [16–20]
\[
f^{(\alpha)}(x_0) = \frac{d^\alpha f(x)}{dx^\alpha} \bigg|_{x = x_0} = \lim_{x \to x_0} \frac{\Delta^\alpha (f(x) - f(x_0))}{(x - x_0)^\alpha},
\]  
(7)
where
\[
\Delta^\alpha (f(x) - f(x_0)) \equiv \Gamma(1 + \alpha) \Delta (f(x) - f(x_0)).
\]  
(8)

We find that the existence condition for local fractional derivative of \(f(x)\) is that the right-hand local fractional derivative is equal to the left-hand local fractional derivative (see, e.g., [16, 35] and the references therein).

Definition 3 (see [15–19, 35, 36]). A partition of the interval \([a, b]\) is denoted as \((t_j, t_{j+1})\), \(j = 0, \ldots, N - 1\), \(t_0 = a\), and \(t_N = b\) with \(\Delta t_j = t_{j+1} - t_j\) and \(\Delta t = \max\{\Delta t_0, \Delta t_1, \Delta t_2, \ldots\}\). Local fractional integral of \(f(x)\) in the interval \([a, b]\) is given by
\[
a^b_a I^{(\alpha)} f(x) = \frac{1}{\Gamma(1 + \alpha)} \int_a^b f(t)(dt)^\alpha
\]  
(9)
\[
= \frac{1}{\Gamma(1 + \alpha)} \lim_{\Delta t \to 0} \sum_{j=0}^{N-1} f(t_j) (\Delta t_j)^\alpha.
\]

If the functions are local fractional continuous then the local fractional derivatives and integrals exist. That is to say, operating functions have nondifferentiable and fractal properties (see [35] and the references therein).

Some properties of local fractional derivative and integrals are given in [35].

3. Analytical Methods

In order to illustrate two analytical methods, we investigate the nonlinear local fractional equation as follows:
\[
L^{(n)}_\alpha u + R_\alpha u = 0,
\]  
(10)
where \(L^{(n)}_\alpha\) is linear local fractional operators, respectively, with \(n = 1, 2\) and \(R_\alpha\) is linear local fractional operators of order less than \(L^{(n)}_\alpha\).

3.1. Local Fractional Variational Iteration Method. The local fractional variational iteration algorithm is given by [16, 17] on the line of the formalism suggested in [35]
\[
u_{n+1}(t) = u_n(t) + \frac{1}{\Gamma(1 + \alpha)} \times \int_0^t \frac{\lambda^\alpha}{\Gamma(1 + \alpha)} \left\{L^{(n)}_\alpha u_n(s) + R_\alpha u_n(s)\right\} (ds)^\alpha.
\]  
(11)
Here, we can construct a correction functional as follows [16, 17]:
\[
u_{n+1}(t) = u_n(t) + \frac{1}{\Gamma(1 + \alpha)} \times \int_0^t \frac{\lambda^\alpha}{\Gamma(1 + \alpha)} \left\{L^{(n)}_\alpha u_n(s) + R_\alpha u_n(s)\right\} (ds)^\alpha,
\]  
(12)
where $u_n$ is considered as a restricted local fractional variation; that is, $\delta^\alpha u_n = 0$ (for more details, see [35]).

For $n = 2$, we have

$$\lambda^\alpha = \frac{(s-t)^\alpha}{\Gamma (1+\alpha)}, \quad (13)$$

so that iteration is expressed as

$$u_{n+1}(t) = u_n(t) + \frac{1}{\Gamma (1+\alpha)} \int_0^t \frac{(s-t)^\alpha}{\Gamma (1+\alpha)} \left\{ \frac{\partial^\alpha}{\partial x^\alpha} u_n(s) + R_\alpha u_n(s) \right\} (ds)^\alpha. \quad (14)$$

Finally, the solution is

$$u(x) = \lim_{n \to \infty} u_n(x). \quad (15)$$

### 3.2. Local Fractional Decomposition Method

When $L^{(n)}_\alpha$ in (10) is a local fractional differential operator of order $2\alpha$, we denote it as

$$L^{(2\alpha)}_\alpha = \frac{\partial^{2\alpha}}{\partial x^{2\alpha}}, \quad (16)$$

and

$$R_\alpha u(t) = \frac{\partial^\alpha}{\partial x^\alpha} u(t) + f(t).$$

By defining the $n$-fold local fractional integral operator

$$L^{(-2\alpha)}_\alpha m(s) = \frac{\partial^{2\alpha}}{\partial x^{2\alpha}} \left[ \frac{\partial}{\partial x} \right] m(s), \quad (17)$$

we get

$$L^{(-2\alpha)}_\alpha u(s) = L^{(-2\alpha)}_\alpha R_\alpha u(s). \quad (18)$$

Thus,

$$u(s) = r(x) + L^{(-2\alpha)}_\alpha R_\alpha u(s), \quad (19)$$

where the term $r(x)$ is to be determined from the fractal initial conditions.

Therefore, we get the iterative formula as follows:

$$u(x) = u_0(x) + L^{(-2\alpha)}_\alpha R_\alpha u(s), \quad (20)$$

with $u_0(x) = r(x)$.

Hence, for $n \geq 0$, we have the following recurrence relationship:

$$u_{n+1}(x) = L^{(-2\alpha)}_\alpha R_\alpha u_n(s), \quad (21)$$

$$u_0(x) = r(x).$$

Finally, the solution can be constructed as

$$u(x) = \lim_{n \to \infty} \phi_\alpha(x) = \lim_{n \to \infty} \sum_{n=0}^{\infty} \phi_n(x). \quad (22)$$

For more details, see [18].

### 4. An Illustrative Example

In this section one example for wave equation is presented in order to demonstrate the simplicity and the efficiency of the above methods.

In (2), we consider the following initial and boundary conditions:

$$\frac{\partial^\alpha u(x,0)}{\partial t^\alpha} = 0, \quad u(x,0) = x^{2\alpha} \Gamma(1+2\alpha). \quad (23)$$

Using (14) we have the iterative formula

$$u_{n+1}(x,t) = u_n(x,t) + \frac{1}{\Gamma (1+\alpha)} \int_0^t \frac{(s-t)^\alpha}{\Gamma (1+\alpha)} \left\{ \frac{\partial^{2\alpha}}{\partial x^{2\alpha}} u_n(s) - \frac{\partial^{2\alpha}}{\partial x^{2\alpha}} R_\alpha u_n(s) \right\} (ds)^\alpha, \quad (24)$$

where

$$u_0(x,t) = x^{2\alpha} \Gamma(1+2\alpha). \quad (25)$$

Thus, after computing (23) we obtain

$$u_1(x,t) = u_0(x,t) + \frac{1}{\Gamma (1+\alpha)} \int_0^t \frac{(s-t)^\alpha}{\Gamma (1+\alpha)} \left[ x^{2\alpha} \Gamma(1+2\alpha) \right] (ds)^\alpha = x^{2\alpha} \Gamma(1+2\alpha) \left[ 1 + \frac{t^{2\alpha}}{\Gamma (1+2\alpha)} \right],$$

$$u_2(x,t) = u_1(x,t) + \frac{1}{\Gamma (1+\alpha)} \int_0^t \frac{(s-t)^\alpha}{\Gamma (1+\alpha)} \left[ x^{2\alpha} \Gamma(1+2\alpha) \right] (ds)^\alpha = x^{2\alpha} \Gamma(1+2\alpha) \left[ 1 + \frac{t^{2\alpha}}{\Gamma (1+2\alpha)} + \frac{t^{4\alpha}}{\Gamma (1+4\alpha)} \right].$$
Abstract and Applied Analysis

\[ u_3(x,t) = u_2(x,t) + \frac{1}{\Gamma(1 + \alpha)} \int_0^t (s-t)^\alpha \frac{\partial^2 u_2(x,s)}{\partial s^{2\alpha}} (ds)^\alpha \]

\[ = u_2(x,t) + \frac{1}{\Gamma(1 + \alpha)} \int_0^t (s-t)^\alpha \frac{x^{2\alpha}}{\Gamma(1 + 2\alpha)} \frac{\partial^2 u_2(x,s)}{\partial x^{2\alpha}} (ds)^\alpha \]

\[ = u_2(x,t) + \frac{1}{\Gamma(1 + \alpha)} \int_0^t (s-t)^\alpha \left( - \frac{x^{2\alpha}}{\Gamma(1 + 2\alpha)} \frac{t^{6\alpha}}{\Gamma(1 + 6\alpha)} \right) (ds)^\alpha \]

Here, from (21) we get

\[ u_{n+1}(x,t) = o_t^{(\alpha)} t^{(\alpha)} \frac{x^{2\alpha}}{\Gamma(1 + 2\alpha)} \frac{\partial^2 u_n(x,s)}{\partial x^{2\alpha}} , \]

\[ u_0(x,t) = \frac{x^{2\alpha}}{\Gamma(1 + 2\alpha)} \]

Therefore, from (29) we give the components as follows:

\[ u_0(x,t) = \frac{x^{2\alpha}}{\Gamma(1 + 2\alpha)} , \]

\[ u_1(x,t) = \frac{x^{2\alpha}}{\Gamma(1 + 2\alpha)} t^{2\alpha} \]

\[ u_2(x,t) = \frac{x^{2\alpha}}{\Gamma(1 + 2\alpha)} \frac{t^{4\alpha}}{\Gamma(1 + 4\alpha)} \]

\[ u_3(x,t) = \frac{x^{2\alpha}}{\Gamma(1 + 2\alpha)} \frac{t^{6\alpha}}{\Gamma(1 + 6\alpha)} \]

\[ u_4(x,t) = \frac{x^{2\alpha}}{\Gamma(1 + 2\alpha)} \frac{t^{8\alpha}}{\Gamma(1 + 8\alpha)} \]

\[ u_n(x,t) = \frac{x^{2\alpha}}{\Gamma(1 + 2\alpha)} \frac{t^{2n\alpha}}{\Gamma(1 + 2n\alpha)} . \]

Consequently, the exact solution is given by

\[ u(x,t) = \lim_{n \to \infty} \sum_{n=0}^{\infty} u_n(x,t) \]

\[ = \lim_{n \to \infty} \sum_{n=0}^{\infty} \frac{x^{2\alpha}}{\Gamma(1 + 2\alpha)} \frac{t^{2n\alpha}}{\Gamma(1 + 2n\alpha)} \]

\[ = \frac{x^{2\alpha}}{\Gamma(1 + 2\alpha)} \cosh \left( x^{\alpha} \right) , \]

where

\[ \cosh \left( x^{\alpha} \right) = \sum_{n=0}^{\infty} \frac{t^{2n\alpha}}{\Gamma(1 + 2n\alpha)} . \]

The solution of (2) for \( \alpha = \ln 2/\ln 3 \) is depicted in Figure 1.

5. Conclusions

In this work, we developed a comparison between the variational iteration method and the decomposition method within local fractional operators. The two approaches constitute efficient tools to handle the approximation solutions for differential equations on Cantor sets with local fractional derivative. We notice that the fractional variational iteration method gives the several successive approximate formulas using the iteration of the correction local fractional functional. However, the local fractional decomposition method
provides the components of the exact solution, which is local fractional continuous function, where these components are also local fractional continuous functions. Both the variational iteration method and the decomposition method within local fractional operators provide the solution in successive components. The methods are structured to get the local fractional series solution, which is a nondifferentiable function.

Conflict of Interests
