Using Bregman functions, we introduce the new concept of Bregman generalized f -projection operator $\text{Proj}_C^{f,g} : E^* \rightarrow C$, where E is a reflexive Banach space with dual space E^* ; $f : E \rightarrow \mathbb{R} \cup \{+\infty\}$ is a proper, convex, lower semicontinuous and bounded from below function; $g : E \rightarrow \mathbb{R}$ is a strictly convex and Gâteaux differentiable function; and C is a nonempty, closed, and convex subset of E . The existence of a solution for a class of variational inequalities in Banach spaces is presented.

1. Introduction

Many nonlinear problems in functional analysis can be reduced to the search of fixed points of nonlinear operators. See, for example, [1–14] and the references therein. Let E be a (real) Banach space with norm $\|\cdot\|$ and dual space E^* . For any x in E , we denote the value of x^* in E^* at x by $\langle x, x^* \rangle$. When $\{x_n\}_{n \in \mathbb{N}}$ is a sequence in E , we denote the strong convergence of $\{x_n\}_{n \in \mathbb{N}}$ to $x \in E$ by $x_n \rightarrow x$ and the weak convergence by $x_n \rightharpoonup x$. Let C be a nonempty subset of E and $T : C \rightarrow E$ be a mapping. We denote by $F(T) = \{x \in C : Tx = x\}$ the set of *fixed points* of T . Let C be a nonempty, closed, and convex subset of a smooth Banach space E ; let T be a mapping from C into itself. A point $p \in C$ is said to be an *asymptotic fixed point* [15] of T if there exists a sequence $\{x_n\}_{n \in \mathbb{N}}$ in C which converges weakly to p and $\lim_{n \rightarrow \infty} \|x_n - Tx_n\| = 0$. We denote the set of all asymptotic fixed points of T by $\hat{F}(T)$. A point $p \in C$ is called a *strong asymptotic fixed point* of T if there exists a sequence $\{x_n\}_{n \in \mathbb{N}}$ in C which converges strongly to p and $\lim_{n \rightarrow \infty} \|x_n - Tx_n\| = 0$. We denote the set of all strong asymptotic fixed points of T by $\bar{F}(T)$.

We recall the definition of Bregman distances. Let $g : E \rightarrow \mathbb{R}$ be a strictly convex and Gâteaux differentiable function on a Banach space E . The *Bregman distance* [16]

(see also [17, 18]) corresponding to g is the function $D_g : E \times E \rightarrow \mathbb{R}$ defined by

$$D_g(x, y) = g(x) - g(y) - \langle x - y, \nabla g(y) \rangle, \quad \forall x, y \in E. \quad (1)$$

It follows from the strict convexity of g that $D_g(x, y) \geq 0$ for all x, y in E . However, D_g might not be symmetric and D_g might not satisfy the triangular inequality.

When E is a smooth Banach space, setting $g(x) = \|x\|^2$ for all x in E , we have that $\nabla g(x) = 2Jx$ for all x in E . Here J is the normalized duality mapping from E into E^* . Hence, $D_g(\cdot, \cdot)$ reduces to the usual map $\phi(\cdot, \cdot)$ as

$$D_g(x, y) = \phi(x, y) := \|x\|^2 - 2\langle x, Jy \rangle + \|y\|^2, \quad \forall x, y \in E. \quad (2)$$

If E is a Hilbert space, then $D_g(x, y) = \|x - y\|^2$.

Let $g : E \rightarrow \mathbb{R}$ be strictly convex and Gâteaux differentiable and $C \subseteq E$ be nonempty. A mapping $T : C \rightarrow E$ is said to be

(i) Bregman nonexpansive if

$$D_g(Tx, Ty) \leq D_g(x, y), \quad \forall x, y \in C. \quad (3)$$

(ii) *Bregman quasi-nonexpansive* if $F(T) \neq \emptyset$ and

$$D_g(p, Tx) \leq D_g(p, x), \quad \forall x \in C, \quad \forall p \in F(T). \quad (4)$$

(iii) *Bregman relatively nonexpansive* if the following conditions are satisfied:

- (1) $F(T)$ is nonempty;
- (2) $D_g(p, Tv) \leq D_g(p, v)$, $\forall p \in F(T)$, $v \in C$;
- (3) $\hat{F}(T) = F(T)$;

(iv) *Bregman weak relatively nonexpansive* if the following conditions are satisfied:

- (1) $F(T)$ is nonempty;
- (2) $D_g(p, Tv) \leq D_g(p, v)$, $\forall p \in F(T)$, $v \in C$;
- (3) $\tilde{F}(T) = F(T)$.

It is clear that any Bregman relatively nonexpansive mapping is a Bregman quasi-nonexpansive mapping. It is also obvious that every Bregman relatively nonexpansive mapping is a Bregman weak relatively nonexpansive mapping, but the converse is not true in general; see, for example, [19]. Indeed, for any mapping $T : C \rightarrow C$ we have $F(T) \subset \tilde{F}(T) \subset \hat{F}(T)$. If T is Bregman relatively nonexpansive, then $F(T) = \tilde{F}(T) = \hat{F}(T)$.

Let E be a reflexive Banach space, let $f : E \rightarrow \mathbb{R} \cup \{+\infty\}$ be a proper, convex, lower semicontinuous function, let $g : E \rightarrow \mathbb{R}$ be strictly convex and Gâteaux differentiable, and let $C \subseteq E$ be nonempty. We define a functional $H : E \times E^* \rightarrow \mathbb{R} \cup \{+\infty\}$ by

$$H(x, x^*) = g(x) - \langle x, x^* \rangle + g^*(x^*) + f(x), \quad (5)$$

$$x \in E, \quad x^* \in E^*.$$

It could easily be seen that H satisfies the following properties:

- (1) $H(x, x^*)$ is convex and continuous with respect to x^* when x is fixed;
- (2) $H(x, x^*)$ is convex and lower semicontinuous with respect to x when x^* is fixed.

Definition 1. Let E be a Banach space with dual space E^* , let $f : E \rightarrow \mathbb{R} \cup \{+\infty\}$ be a proper, convex, lower semicontinuous function, let $g : E \rightarrow \mathbb{R}$ be strictly convex and Gâteaux differentiable, and let C be a nonempty, closed subset of E . We say that $\text{Proj}_C^{f,g} : E^* \rightarrow 2^C$ is a Bregman generalized f -projection operator if

$$\text{Proj}_C^{f,g} = \left\{ z \in C : H(z, x^*) = \inf_{y \in C} H(y, x^*) \right\}, \quad \forall x^* \in E^*. \quad (6)$$

In this paper, using Bregman functions, we introduce the new concept of Bregman generalized f -projection operator $\text{Proj}_C^{f,g} : E^* \rightarrow C$, where E is a reflexive Banach space with dual space E^* , $f : E \rightarrow \mathbb{R} \cup \{+\infty\}$ is a proper, convex, lower

semicontinuous, and bounded from below function, $g : E \rightarrow \mathbb{R}$ is a strictly convex and Gâteaux differentiable function, and C is a nonempty, closed, and convex subset of E . The existence of a solution for a class of variational inequalities in Banach spaces is presented. Our results improve and generalize some known results in the current literature; see, for example, [20, 21].

2. Properties of Bregman Functions and Bregman Distances

Let E be a (real) Banach space, and let $g : E \rightarrow \mathbb{R}$. For any x in E , the *gradient* $\nabla g(x)$ is defined to be the linear functional in E^* such that

$$\langle y, \nabla g(x) \rangle = \lim_{t \rightarrow 0} \frac{g(x + ty) - g(x)}{t}, \quad \forall y \in E. \quad (7)$$

The function g is said to be *Gâteaux differentiable* at x if $\nabla g(x)$ is well defined, and g is *Gâteaux differentiable* if it is Gâteaux differentiable everywhere on E . We call g *Fréchet differentiable* at x (see, for example, [22, page 13] or [23, page 508]) if, for all $\epsilon > 0$, there exists $\delta > 0$ such that

$$|g(y) - g(x) - \langle y - x, \nabla g(x) \rangle| \leq \epsilon \|y - x\| \quad \text{whenever } \|y - x\| \leq \delta. \quad (8)$$

The function g is said to be *Fréchet differentiable* if it is Fréchet differentiable everywhere.

For any $r > 0$, let $B_r := \{z \in E : \|z\| \leq r\}$. A function $g : E \rightarrow \mathbb{R}$ is said to be

(i) *strongly coercive* if

$$\lim_{\|x_n\| \rightarrow +\infty} \frac{g(x_n)}{\|x_n\|} = +\infty; \quad (9)$$

(ii) *locally bounded* if $g(B_r)$ is bounded for all $r > 0$;

(iii) *locally uniformly smooth* on E ([24, pages 207, 221]) if the function $\sigma_r : [0, +\infty) \rightarrow [0, +\infty]$, defined by

$$\begin{aligned} \sigma_r(t) = \sup_{x \in B_r, y \in S_E, \alpha \in (0,1)} & \left((\alpha g(x + (1 - \alpha)ty) \right. \\ & \left. + (1 - \alpha)g(x - \alpha ty) - g(x)) \right. \\ & \left. \times (\alpha(1 - \alpha))^{-1} \right), \end{aligned} \quad (10)$$

satisfies

$$\lim_{t \downarrow 0} \frac{\sigma_r(t)}{t} = 0, \quad \forall r > 0; \quad (11)$$

(iv) *locally uniformly convex* on E (or *uniformly convex on bounded subsets* of E ([24, pages 203, 221])) if the

gauge $\rho_r : [0, +\infty) \rightarrow [0, +\infty]$ of uniform convexity of g , defined by

$$\rho_r(t) = \inf_{x, y \in B_r, \|x-y\|=t, \alpha \in (0,1)} \left((\alpha g(x) + (1-\alpha)g(y)) - g(\alpha x + (1-\alpha)y) \right) \times (\alpha(1-\alpha))^{-1}, \quad (12)$$

satisfies

$$\rho_r(t) > 0, \quad \forall r, t > 0. \quad (13)$$

For a locally uniformly convex map $g : E \rightarrow \mathbb{R}$, we have

$$g(\alpha x + (1-\alpha)y) \leq \alpha g(x) + (1-\alpha)g(y) - \alpha(1-\alpha)\rho_r(\|x-y\|), \quad (14)$$

for all x, y in B_r and for all α in $(0, 1)$.

Let E be a Banach space and $g : E \rightarrow \mathbb{R}$ a strictly convex and Gâteaux differentiable function. By (1), the Bregman distance satisfies [16]

$$D_g(x, z) = D_g(x, y) + D_g(y, z) + \langle x - y, \nabla g(y) - \nabla g(z) \rangle, \quad \forall x, y, z \in E. \quad (15)$$

In particular,

$$D_g(x, y) = -D_g(y, x) + \langle y - x, \nabla g(y) - \nabla g(x) \rangle, \quad \forall x, y \in E. \quad (16)$$

We call a function $g : E \rightarrow (-\infty, +\infty]$ lower semicontinuous if $\{x \in E : g(x) \leq r\}$ is closed for all r in $\mathbb{R}$. For a lower semicontinuous convex function $g : E \rightarrow \mathbb{R}$, the subdifferential ∂g of g is defined by

$$\partial g(x) = \{x^* \in E^* : g(x) + \langle y - x, x^* \rangle \leq g(y), \quad \forall y \in E\} \quad (17)$$

for all x in E . It is well known that $\partial g \subset E \times E^*$ is maximal monotone [25, 26]. For any lower semicontinuous convex function $g : E \rightarrow (-\infty, +\infty]$, the conjugate function g^* of g is defined by

$$g^*(x^*) = \sup_{x \in E} \{ \langle x, x^* \rangle - g(x) \}, \quad \forall x^* \in E^*. \quad (18)$$

It is well known that

$$g(x) + g^*(x^*) \geq \langle x, x^* \rangle, \quad \forall (x, x^*) \in E \times E^*, \quad (19)$$

$$(x, x^*) \in \partial g \text{ is equivalent to } g(x) + g^*(x^*) = \langle x, x^* \rangle. \quad (20)$$

We also know that if $g : E \rightarrow (-\infty, +\infty]$ is a proper lower semicontinuous convex function, then $g^* : E^* \rightarrow (-\infty, +\infty]$ is a proper weak* lower semicontinuous convex function. Here, saying g is proper we mean that $\text{dom } g := \{x \in E : g(x) < +\infty\} \neq \emptyset$.

The following definition is slightly different from that in Butnariu and Iusem [22].

Definition 2 (see [23]). Let E be a Banach space. A function $g : E \rightarrow \mathbb{R}$ is said to be a Bregman function if the following conditions are satisfied:

- (1) g is continuous, strictly convex, and Gâteaux differentiable;
- (2) the set $\{y \in E : D_g(x, y) \leq r\}$ is bounded for all x in E and $r > 0$.

The following lemma follows from Butnariu and Iusem [22] and Zălinescu [24].

Lemma 3. Let E be a reflexive Banach space and $g : E \rightarrow \mathbb{R}$ a strongly coercive Bregman function. Then

- (1) $\nabla g : E \rightarrow E^*$ is one-to-one, onto, and norm-to-weak* continuous;
- (2) $\langle x - y, \nabla g(x) - \nabla g(y) \rangle = 0$ if and only if $x = y$;
- (3) $\{x \in E : D_g(x, y) \leq r\}$ is bounded for all y in E and $r > 0$;
- (4) $\text{dom } g^* = E^*$, g^* is Gâteaux differentiable and $\nabla g^* = (\nabla g)^{-1}$.

The following two results follow from [24, Proposition 3.6.4].

Proposition 4. Let E be a reflexive Banach space and let $g : E \rightarrow \mathbb{R}$ be a convex function which is locally bounded. The following assertions are equivalent:

- (1) g is strongly coercive and locally uniformly convex on E ;
- (2) $\text{dom } g^* = E^*$, g^* is locally bounded and locally uniformly smooth on E ;
- (3) $\text{dom } g^* = E^*$, g^* is Fréchet differentiable and ∇g^* is uniformly norm-to-norm continuous on bounded subsets of E^* .

Proposition 5. Let E be a reflexive Banach space and $g : E \rightarrow \mathbb{R}$ a continuous convex function which is strongly coercive. The following assertions are equivalent:

- (1) g is locally bounded and locally uniformly smooth on E ;
- (2) g^* is Fréchet differentiable and ∇g^* is uniformly norm-to-norm continuous on bounded subsets of E ;
- (3) $\text{dom } g^* = E^*$, g^* is strongly coercive and locally uniformly convex on E .

Let E be a Banach space and let C be a nonempty convex subset of E . Let $g : E \rightarrow \mathbb{R}$ be a strictly convex and Gâteaux differentiable function. Then, we know from [27] that for x in E and x_0 in C , we have

$$D_g(x_0, x) = \min_{y \in C} D_g(y, x) \quad (21)$$

$$\text{iff } \langle y - x_0, \nabla g(x) - \nabla g(x_0) \rangle \leq 0, \quad \forall y \in C.$$

Further, if C is a nonempty, closed, and convex subset of a reflexive Banach space E and $g : E \rightarrow \mathbb{R}$ is a strongly coercive Bregman function, then, for each x in E , there exists a unique x_0 in C such that

$$D_g(x_0, x) = \min_{y \in C} D_g(y, x). \quad (22)$$

The Bregman projection proj_C^g from E onto C defined by $\text{proj}_C^g(x) = x_0$ has the following property:

$$D_g(y, \text{proj}_C^g x) + D_g(\text{proj}_C^g x, x) \leq D_g(y, x), \quad (23)$$

$$\forall y \in C, \quad \forall x \in E.$$

See [22] for details.

Lemma 6 (see [9]). *Let E be a Banach space and $g : E \rightarrow \mathbb{R}$ a Gâteaux differentiable function which is locally uniformly convex on E . Let $\{x_n\}_{n \in \mathbb{N}}$ and $\{y_n\}_{n \in \mathbb{N}}$ be bounded sequences in E . Then the following assertions are equivalent:*

- (1) $\lim_{n \rightarrow \infty} D_g(x_n, y_n) = 0$;
- (2) $\lim_{n \rightarrow \infty} \|x_n - y_n\| = 0$.

Lemma 7 (see [23, 28]). *Let E be a reflexive Banach space, let $g : E \rightarrow \mathbb{R}$ be a strongly coercive Bregman function, and let V be the function defined by*

$$V(x, x^*) = g(x) - \langle x, x^* \rangle + g^*(x^*), \quad \forall x \in E, \forall x^* \in E^*. \quad (24)$$

The following assertions hold:

- (1) $D_g(x, \nabla g^*(x^*)) = V(x, x^*)$ for all x in E and x^* in E^* ;
- (2) $V(x, x^*) + \langle \nabla g^*(x^*) - x, y^* \rangle \leq V(x, x^* + y^*)$ for all x in E and x^*, y^* in E^* .

It also follows from the definition that V is convex in the second variable x^* , and

$$V(x, \nabla g(y)) = D_g(x, y). \quad (25)$$

Lemma 8 (see [29, Proposition 23.1]). *Let E be a real Banach space and let $f : E \rightarrow \mathbb{R} \cup \{+\infty\}$ be a lower semicontinuous convex function. Then there exist $x^* \in E^*$ and $a \in \mathbb{R}$ such that*

$$f(x) \geq x^*(x) + a, \quad \forall x \in E. \quad (26)$$

3. Properties of Bregman f -Projection Operator $\text{Proj}_C^{f,g}$

Theorem 9. *Let C be a nonempty, closed, and convex subset of a reflexive Banach space E . Let $f : E \rightarrow \mathbb{R} \cup \{+\infty\}$ be a proper, convex, lower semicontinuous function and let $g : E \rightarrow \mathbb{R}$ be strictly convex, continuous, strongly coercive, Gâteaux differentiable, locally bounded, and locally uniformly convex on E . Then $\text{Proj}_C^{f,g}(x^*) \neq \emptyset$ for all $x^* \in E^*$.*

Proof. Let $x^* \in E^*$ and $\lambda = \inf_{y \in C} H(y, x^*)$. Then there exists a sequence $\{x_n\}_{n \in \mathbb{N}} \subset C$ such that $\lambda = \lim_{n \rightarrow \infty} H(x_n, x^*)$. We consider the following two possible cases.

Case 1. If C is bounded, then there exists a subsequence $\{x_{n_j}\}_{j \in \mathbb{N}}$ of $\{x_n\}_{n \in \mathbb{N}}$ and $x \in C$ such that $x_{n_j} \rightarrow x$ as $j \rightarrow \infty$. Since $H(z, x^*)$ is convex and lower semicontinuous with respect to z , we deduce that $H(z, x^*)$ is convex and weakly lower semicontinuous with respect to z . This implies that

$$H(x, x^*) \leq \liminf_{n \rightarrow \infty} H(x_n, x^*) = \lim_{n \rightarrow \infty} H(x_n, x^*) = \inf_{y \in C} H(y, x^*) \quad (27)$$

and hence $x \in \text{Proj}_C^{f,g}(x^*)$. This shows that $\text{Proj}_C^{f,g} \neq \emptyset$.

Case 2. Assume that C is unbounded. Since $f : C \rightarrow \mathbb{R} \cup \{+\infty\}$ is proper, convex, and lower semicontinuous, we know that the function $f_C : E \rightarrow \mathbb{R} \cup \{+\infty\}$, defined by

$$f_C(x) = \begin{cases} f(x), & \text{if } x \in C, \\ +\infty, & \text{if } x \notin C, \end{cases} \quad (28)$$

is proper, convex, and lower semicontinuous. In view of Lemma 8, there exist $x^* \in E^*$ and $a \in \mathbb{R}$ such that

$$f_C(x) \geq \langle x, x^* \rangle + a, \quad \forall x \in E. \quad (29)$$

This implies that for any $x^* \in E^*$ and $x \in C$

$$\begin{aligned} H(x, x^*) &= g(x) - \langle x, x^* \rangle + g^*(x^*) + f(x) \\ &\geq g(x) + g^*(x^*) + a. \end{aligned} \quad (30)$$

Next, we show that $\{x_n\}_{n \in \mathbb{N}}$ is bounded. If not, then there exists a subsequence $\{x_{n_j}\}_{j \in \mathbb{N}}$ of $\{x_n\}_{n \in \mathbb{N}}$ such that $\|x_{n_k}\| \rightarrow +\infty$ as $k \rightarrow \infty$. Since g is strongly coercive, we conclude that

$$\lim_{\|x_{n_k}\| \rightarrow +\infty} \frac{H(x_{n_k}, x^*)}{\|x_{n_k}\|} \geq \lim_{\|x_{n_k}\| \rightarrow +\infty} \frac{g(x_{n_k})}{\|x_{n_k}\|} = +\infty. \quad (31)$$

This implies that

$$\lim_{\|x_{n_k}\| \rightarrow +\infty} H(x_{n_k}, x^*) = +\infty. \quad (32)$$

Since f is proper in C , we obtain that $\lambda = \inf_{y \in C} H(y, x^*) = \lim_{n \rightarrow \infty} H(x_n, x^*) < +\infty$ which contradicts (31). By a similar argument, as in Case 1, we can prove that $\text{Proj}_C^{f,g}(x^*) \neq \emptyset$ which completes the proof. $\square$

Theorem 10. *Let C be a nonempty, closed, and convex subset of a reflexive Banach space E . Let $g : E \rightarrow \mathbb{R}$ be strictly convex, continuous, strongly coercive, Gâteaux differentiable, locally bounded, and locally uniformly convex on E . Then the following assertions hold:*

- (i) for any given $x^* \in E^*$, $\text{Proj}_C^{f,g}(x^*)$ is a nonempty, closed, and convex subset of C ;

(ii) $\text{Proj}_C^{f,g}$ is monotone; that is, for any $x^*, y^* \in E^*$, $x \in \text{Proj}_C^{f,g}(x^*)$ and $y \in \text{Proj}_C^{f,g}(y^*)$,

$$\langle x - y, x^* - y^* \rangle \geq 0; \quad (33)$$

(iii) For any given $x^* \in E^*$, $x \in \text{Proj}_C^{f,g}(x^*)$ if and only if

$$\langle x - y, x^* - \nabla g(x) \rangle + f(y) - f(x) \geq 0; \quad (34)$$

Proof. (i) Let $x^* \in E^*$ be fixed. In view of Theorem 9, we conclude that $\text{Proj}_C^{f,g}(x^*) \neq \emptyset$. According to (20) we have $g(x) + g^*(x^*) - \langle x, x^* \rangle \geq 0$, $\forall (x, x^*) \in E \times E^*$. Let us prove that $\text{Proj}_C^{f,g}(x^*)$ is closed. Let $\{x_n\}_{n \in \mathbb{N}} \subset \text{Proj}_C^{f,g}(x^*)$ and $x_n \rightarrow x$ as $n \rightarrow \infty$. In view of (6), we deduce that

$$\begin{aligned} G(x, x^*) &\leq \liminf_{n \rightarrow \infty} H(x_n, x^*) \\ &= \liminf_{n \rightarrow \infty} H(x_n, x^*) = \inf_{y \in C} H(y, x^*). \end{aligned} \quad (35)$$

This implies that $x \in \text{Proj}_C^{f,g}(x^*)$ and hence $\text{Proj}_C^{f,g}(x^*)$ is closed. Next, we show that $\text{Proj}_C^{f,g}(x^*)$ is convex. Let $x_1, x_2 \in \text{Proj}_C^{f,g}(x^*)$ and $0 \leq t \leq 1$. By the property (2) of the functional H , we obtain

$$\begin{aligned} H(tx_1 + (1-t)x_2, x^*) &\leq tH(x_1, x^*) + (1-t)H(x_2, x^*) \\ &= t \inf_{y \in C} H(y, x^*) + (1-t) \inf_{y \in C} H(y, x^*) \\ &= \inf_{y \in C} H(y, x^*). \end{aligned} \quad (36)$$

Thus, we have $tx_1 + (1-t)x_2 \in \text{Proj}_C^{f,g}(x^*)$ and hence $\text{Proj}_C^{f,g}(x^*)$ is convex.

(ii) Let $x_1^*, x_2^* \in E^*$, $x_1 \in \text{Proj}_C^{f,g}(x_1^*)$, and $x_2 \in \text{Proj}_C^{f,g}(x_2^*)$. Then we have

$$\begin{aligned} g(x_1) - \langle x_1, x_1^* \rangle + g^*(x_1^*) + f(x_1) &\leq g(x_2) - \langle x_2, x_2^* \rangle + g^*(x_2^*) + f(x_2), \\ g(x_2) - \langle x_2, x_2^* \rangle + g^*(x_2^*) + f(x_2) &\leq g(x_1) - \langle x_1, x_1^* \rangle + g^*(x_1^*) + f(x_1). \end{aligned} \quad (37)$$

In view of (37), we conclude that $\text{Proj}_C^{f,g}(x^*)$ is monotone.

(iii) It is a simple matter to see that $x \in \text{Proj}_C^{f,g}(x^*)$ implies that

$$\langle x^* - \nabla g(x), x - y \rangle + f(y) - f(x) \geq 0, \quad \forall y \in C. \quad (38)$$

To this end, let $y \in C$ and $t \in (0, 1]$ be arbitrarily chosen. By the definition of $\text{Proj}_C^{f,g}(x^*)$ we see that

$$H(x, x^*) \leq H(x + t(y - x), x^*). \quad (39)$$

Therefore,

$$\begin{aligned} g(x) + g^*(x^*) - \langle x, x^* \rangle + f(x) &\leq g(x + t(y - x)) + g^*(x^*) \\ &\quad - \langle x + t(y - x), x^* \rangle + f(x + t(y - x)) \\ &\leq g(x + t(y - x)) + g^*(x^*) \\ &\quad - \langle x + t(y - x), x^* \rangle + tf(y) + (1-t)f(x) \end{aligned} \quad (40)$$

and hence

$$\langle t(y - x), x^* \rangle \leq g(x + t(y - x)) + t(f(y) - f(x)). \quad (41)$$

On the other hand, by the definition of Bregman distance, we obtain that

$$g(x) + g(x + t(y - x)) \geq \langle t(x - y), \nabla g(x + t(y - x)) \rangle. \quad (42)$$

This, together with (41), implies that

$$\langle x - y, \nabla g(x + t(y - x)) \rangle \geq f(x) - f(y) + \langle x - y, x^* \rangle. \quad (43)$$

Since ∇g is demi-continuous, letting $t \rightarrow 0$ in (43), we conclude that

$$\langle x - y, \nabla g(x) - x^* \rangle + f(y) - f(x) \geq 0. \quad (44)$$

Conversely, assume that

$$\langle x - y, \nabla g(x) - x^* \rangle + f(y) - f(x) \geq 0, \quad \forall y \in K. \quad (45)$$

This implies that

$$\begin{aligned} g(y) - g(x) &\geq \langle x - y, \nabla g(x) \rangle \\ &\geq \langle x - y, x^* \rangle + f(y) - f(x) \geq 0 \end{aligned} \quad (46)$$

$\forall y \in K.$

□

4. Applications to Variational Inequalities

In this section, we investigate the existence of solution to the following variational inequality problem: find the point $x \in C$ such that

$$\langle y - x, Ax \rangle + f(y) - f(x) \geq 0, \quad \forall y \in C, \quad (47)$$

where C is a nonempty, closed, and convex subset of the Banach space E , and $A : C \rightarrow E^*$ and $f : C \rightarrow \mathbb{R} \cup \{+\infty\}$ are two mappings.

Definition 11 (KKM mapping [30]). Let C be a nonempty subset of a linear space X . A set-valued mapping $G : C \rightarrow 2^X$ is

called a KKM mapping if, for any finite subset $\{y_1, y_2, \dots, y_n\}$ of C , we have

$$\text{co}\{y_1, y_2, \dots, y_n\} \subset \bigcup_{i=1}^n G(y_i), \quad (48)$$

where $\text{co}\{y_1, y_2, \dots, y_n\}$ denotes the convex hull of $\{y_1, y_2, \dots, y_n\}$.

Lemma 12 (Fan KKM Theorem [30]). *Let C be a nonempty convex subset of a Hausdorff topological vector X and let $G : C \rightarrow 2^X$ be a KKM mapping with closed values. If there exists a point $y_0 \in C$ such that $G(y_0)$ is a compact subset of C , then $\bigcap_{y \in C} G(y) \neq \emptyset$.*

Theorem 13. *Let C be a nonempty, closed, and convex subset of a reflexive Banach space E with dual space E^* . Let $g : E \rightarrow \mathbb{R}$ be strictly convex, continuous, strongly coercive, Gâteaux differentiable, locally bounded and locally uniformly convex on E . Let $A : C \rightarrow E^*$ be a continuous mapping and $f : E \rightarrow \mathbb{R} \cup \{+\infty\}$ be a proper, convex, lower semicontinuous function. If there exists an element $y_0 \in C$ such that*

$$\begin{aligned} \{x \in C : \langle y_0 - x, \nabla g(x) - Ax \rangle \\ + g(x) + f(x) \leq g(y_0) + f(y_0)\} \end{aligned} \quad (49)$$

is a compact subset of C , then the variational inequality (47) has a solution.

Proof. In view of Theorem 10, we need to prove that the following inclusion has a solution:

$$x \in \text{Proj}_C^{f,g}(\nabla g(x) - Ax). \quad (50)$$

We define a set-valued mapping $V : C \rightarrow 2^C$ by

$$\begin{aligned} V(y) \\ = \{x \in C : H(x, \nabla g(x) - Ax) \leq H(y, \nabla g(x) - Ax)\}. \end{aligned} \quad (51)$$

It is obvious that, for any $y \in C$, $V(y) \neq \emptyset$. Let us prove that $V(y)$ is closed for any $y \in C$. Let $\{x_n\}_{n \in \mathbb{N}} \subset V(y)$ and $x_n \rightarrow x$ as $n \rightarrow \infty$. Then,

$$H(x_n, \nabla g(x_n) - Ax_n) \leq H(y, \nabla g(x_n) - Ax_n). \quad (52)$$

This implies that

$$\begin{aligned} -\langle x_n, \nabla g(x_n) - Ax_n \rangle + g(x_n) + f(x_n) \\ \leq -\langle y, \nabla g(x_n) - Ax_n \rangle + g(y) + f(y). \end{aligned} \quad (53)$$

Since ∇g and A are continuous and f is lower semicontinuous, we conclude that

$$\begin{aligned} -\langle x, \nabla g(x) - Ax \rangle + g(x) + f(x) \\ \leq -\langle y, \nabla g(x) - Ax \rangle + g(y) + f(y). \end{aligned} \quad (54)$$

Therefore,

$$H(x, \nabla g(x) - Ax) \leq H(y, \nabla g(x) - Ax), \quad (55)$$

which implies that $x \in V(y)$. Now, we prove that $V : C \rightarrow 2^C$ is a KKM mapping. Indeed, suppose $y_1, y_2, \dots, y_n \in C$ and $0 < a_1, a_2, \dots, a_n \leq 1$ with $\sum_{i=1}^n a_i = 1$. Let $z = \sum_{i=1}^n a_i y_i$. In view of the property (2) of H , we obtain

$$\begin{aligned} H(z, \nabla g(z) - Az) \\ = H\left(\sum_{i=1}^n a_i y_i, \nabla g(z) - Az\right) \leq \sum_{i=1}^n a_i H(y_i, \nabla g(z) - Az) \end{aligned} \quad (56)$$

and hence

$$H(z, \nabla g(z) - Az) \leq \max_{1 \leq i \leq n} H(y_i, \nabla g(z) - Az). \quad (57)$$

Hence there exists at least one number $j = 1, 2, \dots, n$, such that

$$H(z, \nabla g(z) - Az) \leq H(y_j, \nabla g(z) - Az). \quad (58)$$

that is, $z \in V(y)$. Thus, V is a KKM mapping.

If $x \in V(y_0)$, then $H(z, \nabla g(z) - Az) \leq H(y_0, \nabla g(z) - Az)$. By the definition of H , we obtain

$$\begin{aligned} -\langle x, \nabla g(x) - Ax \rangle + g(x) + f(x) \\ \leq -\langle y_0, \nabla g(x) - Ax \rangle + g(y_0) + f(y_0) \end{aligned} \quad (59)$$

which is equivalent to

$$\langle y_0 - x, \nabla g(x) - Ax \rangle + g(x) + f(x) \leq g(y_0) + f(y_0). \quad (60)$$

Therefore,

$$\begin{aligned} V(y_0) = \{x \in C : \langle \nabla g(x) - Ax, y_0 - x \rangle \\ + g(x) + f(x) \leq g(y_0) + f(y_0)\}. \end{aligned} \quad (61)$$

In view of (49), we deduce that $V(y_0)$ is compact. It follows from Lemma 12 that $\bigcap_{y \in C} V(y) \neq \emptyset$. Hence there exists at least one $x_0 \in \bigcap_{y \in C} V(y)$; that is,

$$H(x_0, \nabla g(x_0) - Ax_0) \leq H(y, \nabla g(x_0) - Ax_0), \quad \forall y \in C. \quad (62)$$

In view of the definition of Bregman f -projection operator $\text{Proj}_C^{f,g}$, we conclude that

$$x_0 \in \text{Proj}_C^{f,g}(\nabla g(x_0) - Ax_0). \quad (63)$$

This completes the proof. $\square$

Theorem 14. *Let E be a reflexive Banach space and $g : E \rightarrow \mathbb{R}$ a strongly coercive Bregman function which is bounded on bounded subsets and uniformly convex and uniformly smooth on bounded subsets of E . Let $f : E \rightarrow \mathbb{R} \cup \{+\infty\}$ be a proper,*

convex, lower semicontinuous function. Let C be a nonempty, closed, and convex subset of E and let $T : C \rightarrow C$ be a Bregman weak relatively nonexpansive mapping. Let $\{\alpha_n\}_{n \in \mathbb{N} \cup \{0\}}$ be a sequence in $(0, 1)$ such that $\liminf_{n \rightarrow \infty} \alpha_n(1 - \alpha_n) > 0$. Let $\{x_n\}_{n \in \mathbb{N} \cup \{0\}}$ be a sequence generated by

$x_0 = x \in C$ chosen arbitrarily,

$$C_0 = C,$$

$$y_n = \nabla g^* [\alpha_n \nabla g(x_n) + (1 - \alpha_n) \nabla g(Tx_n)], \quad (64)$$

$$C_{n+1} = \{z \in C_n : H(z, \nabla g(y_n)) \leq H(z, \nabla g(x_n))\},$$

$$x_{n+1} = \text{Proj}_{C_{n+1}}^g x, \quad n \in \mathbb{N} \cup \{0\},$$

where ∇g is the gradient of g . Then $\{x_n\}_{n \in \mathbb{N}}$, $\{Tx_n\}_{n \in \mathbb{N}}$, and $\{y_n\}_{n \in \mathbb{N}}$ converge strongly to $\text{Proj}_F^g x_0$.

Proof. We divide the proof into several steps.

Step 1. We prove that C_n is closed and convex for each $n \in \mathbb{N} \cup \{0\}$.

It is clear that $C_0 = C$ is closed and convex. Let C_m be closed and convex for some $m \in \mathbb{N}$. For $z \in C_m$, we see that

$$H(z, \nabla g(y_m)) \leq H(z, \nabla g(x_m)) \quad (65)$$

is equivalent to

$$\begin{aligned} & \langle z, \nabla g(x_m) - \nabla g(y_m) \rangle \\ & \leq g(y_m) - g(x_m) \\ & \quad + \langle x_m, \nabla g(x_m) \rangle - \langle y_m, \nabla g(y_m) \rangle. \end{aligned} \quad (66)$$

It could easily be seen that C_{m+1} is closed and convex. Therefore, C_n is closed and convex for each $n \in \mathbb{N} \cup \{0\}$.

Step 2. We claim that $F \subset C_n$ for all $n \in \mathbb{N} \cup \{0\}$.

It is obvious that $F \subset C_0 = C$. Assume now that $F \subset C_m$ for some $m \in \mathbb{N}$. Employing Lemma 7, for any $w \in F \subset C_m$, we obtain

$$\begin{aligned} & H(w, \nabla g(y_m)) \\ & = H(w, \nabla g(y_m)) \\ & = g(w) - \langle w, \nabla g(y_m) \rangle + g^*(\nabla g(y_m)) + f(w) \\ & = V(w, \alpha_m \nabla g(x_m) + (1 - \alpha_m) \nabla g(Tx_m)) + f(w) \\ & = g(w) - \langle w, \alpha_m \nabla g(x_m) + (1 - \alpha_m) \nabla g(Tx_m) \rangle \\ & \quad + g^*(\alpha_m \nabla g(x_m) + (1 - \alpha_m) \nabla g(Tx_m)) + f(w) \\ & \leq \alpha_m g(w) + (1 - \alpha_m) g(w) \\ & \quad + \alpha_m g^*(\nabla g(x_m)) + (1 - \alpha_m) g^*(\nabla g(Tx_m)) + f(w) \\ & = \alpha_m V(w, \nabla g(x_m)) + (1 - \alpha_m) V(w, \nabla g(Tx_m)) + f(w) \end{aligned}$$

$$\begin{aligned} & = \alpha_m D_g(w, x_m) + (1 - \alpha_m) D_g(w, Tx_m) + f(w) \\ & \leq \alpha_m D_g(w, x_m) + (1 - \alpha_m) D_g(w, x_m) + f(w) \\ & = D_g(w, x_m) + f(w) \\ & = V(w, \nabla g(x_m)) + f(w) \\ & = H(w, \nabla g(x_m)). \end{aligned}$$

(67)

This proves that $w \in C_{m+1}$ and hence $F \subset C_n$ for all $n \in \mathbb{N} \cup \{0\}$.

Step 3. We prove that $\{x_n\}_{n \in \mathbb{N}}$, $\{y_n\}_{n \in \mathbb{N}}$, and $\{Tx_n\}_{n \in \mathbb{N}}$ are bounded sequences in C .

Since $x_n = \text{proj}_{C_n}^g x$, we get that

$$H(x_n, \nabla g(x)) \leq H(w, \nabla g(x)) \quad (68)$$

for each $w \in F(T)$. This implies that the sequence $\{H(w, \nabla g(x_n))\}_{n \in \mathbb{N}}$ is bounded and hence there exists $M_1 > 0$ such that

$$H(x_n, \nabla g(x)) \leq M_1, \quad \forall n \in \mathbb{N}. \quad (69)$$

We claim that the sequence $\{x_n\}_{n \in \mathbb{N}}$ is bounded. Assume on the contrary that $\|x_n\| \rightarrow \infty$ as $n \rightarrow \infty$. In view of Lemma 8, there exist $x^* \in E^*$ and $a \in \mathbb{R}$ such that

$$f(x) \geq \langle x_n, x^* \rangle + a, \quad \forall n \in \mathbb{N}. \quad (70)$$

From the definition of Bregman distance, it follows that

$$\begin{aligned} & M_1 \geq H(x_n, \nabla g(x)) \\ & = g(x_n) - g(x) - \langle x_n - x, \nabla g(x) \rangle + f(x_n) \\ & \geq g(x_n) - g(x) - \langle x_n, \nabla g(x) - x^* \rangle + \langle x, \nabla g(x) \rangle + a \\ & \geq g(x_n) - g(x) - \|x_n\| \|\nabla g(x) - x^*\| \\ & \quad + \langle x, \nabla g(x) \rangle + a, \quad \forall n \in \mathbb{N}. \end{aligned} \quad (71)$$

Without loss of generality, we may assume that $\|x_n\| \neq 0$ for each $n \in \mathbb{N}$. This implies that

$$\begin{aligned} \frac{M_1}{\|x_n\|} & \geq \frac{g(x_n)}{\|x_n\|} - \frac{g(x)}{\|x_n\|} - \|\nabla g(x) - x^*\| \\ & \quad + \frac{\langle x, \nabla g(x) \rangle}{\|x_n\|} + \frac{a}{\|x_n\|}, \quad \forall n \in \mathbb{N}. \end{aligned} \quad (72)$$

Since g is strongly coercive, by letting $n \rightarrow \infty$ in (72), we conclude that $0 \geq \infty$, which is a contradiction. Therefore, $\{x_n\}_{n \in \mathbb{N}}$ is bounded. Since $\{T_n\}_{n \in \mathbb{N}}$ is an infinite family of Bregman weak relatively nonexpansive mappings from C into itself, we have for any $q \in F$ that

$$D_g(q, Tx_n) \leq D_g(q, x_n), \quad \forall n \in \mathbb{N}. \quad (73)$$

This, together with Definition 2 and the boundedness of $\{x_n\}_{n \in \mathbb{N}}$, implies that the sequence $\{T_n x_n\}_{n \in \mathbb{N}}$ is bounded.

Step 4. We show that $x_n \rightarrow v$ for some $v \in F$, where $v = \text{proj}_F^g x$.

From Step 3 we know that $\{x_n\}_{n \in \mathbb{N}}$ is bounded. By the construction of C_n , we conclude that $C_m \subset C_n$ and $x_m = \text{proj}_{C_m}^g x \in C_m \subset C_n$ for any positive integer $m \geq n$. This, together with (23), implies that

$$\begin{aligned} D_g(x_m, x_n) &= D_g(x_m, \text{proj}_{C_n}^g x) \leq D_g(x_m, x) \\ &\quad - D_g(\text{proj}_{C_n}^g x, x) = D_g(x_m, x) - D_g(x_n, x). \end{aligned} \quad (74)$$

In view of (21), we conclude that

$$\begin{aligned} D_g(x_n, x) &= D_g(\text{proj}_{C_n}^g x, x) \leq D_g(w, x) - D_g(w, x_n) \\ &\leq D_g(w, x), \quad \forall w \in F \subset C_n, n \in \mathbb{N} \cup \{0\}. \end{aligned} \quad (75)$$

It follows from (75) that the sequence $\{D_g(x_n, x)\}_{n \in \mathbb{N}}$ is bounded and hence there exists $M_2 > 0$ such that

$$D_g(x_n, x) \leq M_2, \quad \forall n \in \mathbb{N}. \quad (76)$$

In view of (64), we conclude that

$$D_g(x_n, x) \leq D_g(x_n, x) + D_g(x_m, x_n) \leq D_g(x_m, x), \quad \forall m \geq n. \quad (77)$$

This proves that $\{D_g(x_n, x)\}_{n \in \mathbb{N}}$ is an increasing sequence in $\mathbb{R}$ and hence the limit $\lim_{n \rightarrow \infty} D_g(x_n, x)$ exists. Letting $m, n \rightarrow \infty$ in (74), we deduce that $D_g(x_m, x_n) \rightarrow 0$. In view of Lemma 6, we obtain that $\|x_m - x_n\| \rightarrow 0$ as $m, n \rightarrow \infty$. This means that $\{x_n\}_{n \in \mathbb{N}}$ is a Cauchy sequence. Since E is a Banach space and C is closed and convex, we conclude that there exists $v \in C$ such that

$$\lim_{n \rightarrow \infty} \|x_n - v\| = 0. \quad (78)$$

Now, we show that $v \in F$. In view of Lemma 6 and (78), we obtain

$$\lim_{n \rightarrow \infty} D_g(x_{n+1}, x_n) = 0. \quad (79)$$

Since $x_{n+1} \in C_{n+1}$, we conclude that

$$D_g(x_{n+1}, y_n) \leq D_g(x_{n+1}, x_n). \quad (80)$$

This, together with (79), implies that

$$\lim_{n \rightarrow \infty} D_g(x_{n+1}, y_n) = 0. \quad (81)$$

It follows from Lemma 6, (79), and (81) that

$$\lim_{n \rightarrow \infty} \|x_{n+1} - x_n\| = 0, \quad \lim_{n \rightarrow \infty} \|x_{n+1} - y_n\| = 0. \quad (82)$$

In view of (78), we get

$$\lim_{n \rightarrow \infty} \|y_n - u\| = 0. \quad (83)$$

From (78) and (83), it follows that

$$\lim_{n \rightarrow \infty} \|x_n - y_n\| = 0. \quad (84)$$

Since ∇g is uniformly norm-to-norm continuous on any bounded subset of E , we obtain

$$\lim_{n \rightarrow \infty} \|\nabla g(x_n) - \nabla g(y_n)\| = 0. \quad (85)$$

Applying Lemma 6 we derive that

$$\lim_{n \rightarrow \infty} D_g(y_n, x_n) = 0. \quad (86)$$

It follows from the three-point identity (see (14)) that for any $w \in F$

$$\begin{aligned} &|D_g(w, x_n) - D_g(w, y_n)| \\ &= |D_g(w, y_n) + D_g(y_n, x_n) \\ &\quad + \langle w - y_n, \nabla g(y_n) - \nabla g(x_n) \rangle - D_g(w, y_n)| \\ &= |D_g(y_n, x_n) - \langle w - y_n, \nabla g(y_n) - \nabla g(x_n) \rangle| \\ &\leq D_g(y_n, x_n) + \|w - y_n\| \|\nabla g(y_n) - \nabla g(x_n)\| \\ &\rightarrow 0 \end{aligned} \quad (87)$$

as $n \rightarrow \infty$.

The function g is bounded on bounded subsets of E and, thus, ∇g is also bounded on bounded subsets of E^* (see, e.g., [22, Proposition 1.1.11], for more details). This implies that the sequences $\{\nabla g(x_n)\}_{n \in \mathbb{N}}$, $\{\nabla g(y_n)\}_{n \in \mathbb{N}}$, and $\{\nabla g(Tx_n) : n \in \mathbb{N} \cup \{0\}\}$ are bounded in E^* .

In view of Proposition 4(3), we know that $\text{dom } g^* = E^*$ and g^* is strongly coercive and uniformly convex on bounded subsets of E^* . Let $s_1 = \sup\{\|\nabla g(x_n)\|, \|\nabla g(Tx_n)\| : n \in \mathbb{N} \cup \{0\}\}$ and $\rho_{s_1}^* : E^* \rightarrow \mathbb{R}$ be the gauge of uniform convexity of the conjugate function g^* . We prove that for any $w \in F$

$$\begin{aligned} D_g(w, y_n) &\leq D_g(w, x_n) - \alpha_n(1 - \alpha_n)\rho_{s_1}^* \\ &\quad \times (\|\nabla g(x_n) - \nabla g(Tx_n)\|). \end{aligned} \quad (88)$$

Let us show (88). For any given $w \in F(T)$, in view of the definition of the Bregman distance (see (2)) and Lemma 6, we obtain

$$\begin{aligned}
 D_g(w, y_n) &= D_g(w, \nabla g^*[\alpha_n \nabla g(x_n) + (1 - \alpha_n) \nabla g(Tx_n)]) \\
 &= V(w, \alpha_n \nabla g(x_n) + (1 - \alpha_n) \nabla g(Tx_n)) \\
 &= g(w) - \langle w, \alpha_n \nabla g(x_n) + (1 - \alpha_n) \nabla g(Tx_n) \rangle \\
 &\quad + g^*(\alpha_n \nabla g(x_n) + (1 - \alpha_n) \nabla g(Tx_n)) \\
 &\leq \alpha_n g(w) + (1 - \alpha_n) g(w) - \alpha_n \langle w, \nabla g(x_n) \rangle \\
 &\quad - (1 - \alpha_n) \langle w, \nabla g(Tx_n) \rangle \\
 &\quad + \alpha_n g^*(\nabla g(x_n)) + (1 - \alpha_n) g^*(\nabla g(Tx_n)) \\
 &\quad - \alpha_n (1 - \alpha_n) \rho_{s_1}^*(\|\nabla g(x_n) - \nabla g(Tx_n)\|) \\
 &= \alpha_n V(w, \nabla g(x_n)) + (1 - \alpha_n) V(w, \nabla g(Tx_n)) \\
 &\quad - \alpha_n (1 - \alpha_n) \rho_{s_1}^*(\|\nabla g(x_n) - \nabla g(Tx_n)\|) \\
 &= \alpha_n D_g(w, x_n) + (1 - \alpha_n) D_g(w, Tx_n) \\
 &\quad - \alpha_n (1 - \alpha_n) \rho_{s_1}^*(\|\nabla g(x_n) - \nabla g(Tx_n)\|) \\
 &\leq \alpha_n D_g(w, x_n) + (1 - \alpha_n) D_g(w, x_n) \\
 &\quad - \alpha_n (1 - \alpha_n) \rho_{s_1}^*(\|\nabla g(x_n) - \nabla g(Tx_n)\|) \\
 &= D_g(w, x_n) - \alpha_n (1 - \alpha_n) \rho_{s_1}^*(\|\nabla g(x_n) - \nabla g(Tx_n)\|). \tag{89}
 \end{aligned}$$

In view of (87), we get that

$$D_g(w, x_n) - D_g(w, y_n) \longrightarrow 0 \quad \text{as } n \longrightarrow \infty. \tag{90}$$

In view of (87) and (88), we conclude that

$$\begin{aligned}
 &\alpha_n (1 - \alpha_n) \rho_{s_1}^*(\|\nabla g(x_n) - \nabla g(Tx_n)\|) \\
 &\leq D_g(w, x_n) - D_g(w, y_n) \longrightarrow 0
 \end{aligned} \tag{91}$$

as $n \rightarrow \infty$. From the assumption $\liminf_{n \rightarrow \infty} \alpha_n (1 - \alpha_n) > 0$, we get

$$\lim_{n \rightarrow \infty} \rho_{s_1}^*(\|\nabla g(x_n) - \nabla g(Tx_n)\|) = 0. \tag{92}$$

Therefore, from the property of $\rho_{s_1}^*$ we deduce that

$$\lim_{n \rightarrow \infty} \|\nabla g(x_n) - \nabla g(Tx_n)\| = 0. \tag{93}$$

Since ∇g^* is uniformly norm-to-norm continuous on bounded subsets of E^* , we arrive at

$$\lim_{n \rightarrow \infty} \|x_n - Tx_n\| = 0. \tag{94}$$

This implies that $v \in F(T)$.

Finally, we show that $v = \text{proj}_F^g x$. From $x_n = \text{proj}_{C_n}^g x$, we conclude that

$$\langle z - x_n, \nabla g(x_n) - \nabla g(x) \rangle \geq 0, \quad \forall z \in C_n. \tag{95}$$

Since $F \subset C_n$ for each $n \in \mathbb{N}$, we obtain

$$\langle z - x_n, \nabla g(x_n) - \nabla g(x) \rangle \geq 0, \quad \forall z \in F. \tag{96}$$

Letting $n \rightarrow \infty$ in (96), we deduce that

$$\langle z - v, \nabla g(u) - \nabla g(x) \rangle \geq 0, \quad \forall z \in F. \tag{97}$$

In view of (21), we have $v = \text{proj}_F^g x$, which completes the proof. $\square$

Remark 15. Theorem 14 improves Theorem 4.1 of [20] in the following aspects.

- (1) For the structure of Banach spaces, we extend the duality mapping to more general case, that is, a convex, continuous, and strongly coercive Bregman function which is bounded on bounded subsets and uniformly convex and uniformly smooth on bounded subsets.
- (2) For the mappings, we extend the mapping from a relatively nonexpansive mapping to a Bregman weak relatively nonexpansive mapping. We remove the assumption $\hat{F}(T) = F(T)$ on the mapping T and extend the result to a Bregman weak relatively nonexpansive mapping, where $\hat{F}(T)$ is the set of asymptotic fixed points of the mapping T .
- (3) Theorems 9 and 10 extend and improve corresponding results of [20].
