We are concerned with the following nonlinear three-point fractional boundary value problem: $D_{0+}^{\alpha}u(t) + \lambda a(t)f(t, u(t)) = 0$, $0 < t < 1$, $u(0) = 0$, and $u(1) = \beta u(\eta)$, where $1 < \alpha \leq 2$, $0 < \beta < 1$, $0 < \eta < 1$, D_{0+}^{α} is the standard Riemann-Liouville fractional derivative, $a(t) > 0$ is continuous for $0 \leq t \leq 1$, and $f \geq 0$ is continuous on $[0, 1] \times [0, \infty)$. By using Krasnosel'skii's fixed-point theorem and the corresponding Green function, we obtain some results for the existence of positive solutions. At the end of this paper, we give an example to illustrate our main results.

1. Introduction

Fractional differential equations have been of great interest recently. With the development of nonlinear science, the researchers found that nonlinear fractional differential equations could describe something's changing rules more accurately. Therefore, it is significant to study nonlinear fractional differential equations to solve the nonlinear problems. Recently, many researchers paid attention to existence and multiplicity of solution of the boundary value problem for fractional differential equations with different boundary conditions, such as [1–10]. Bai and Lü [1] investigated the existence and multiplicity of positive solutions for nonlinear fractional boundary value problem:

$$\begin{aligned} D_{0+}^{\alpha}u(t) + f(t, u(t)) &= 0, \quad 0 < t < 1, \\ u(0) &= u(1) = 0, \end{aligned} \quad (1)$$

where $1 < \alpha \leq 2$ is a real number, D_{0+}^{α} is the standard Riemann-Liouville fractional derivative, and $f : [0, 1] \times [0, \infty) \rightarrow [0, \infty)$ is continuous. By means of some fixed-point theorems on cone, some existence and multiplicity results of positive solutions are obtained. Agarwal et al. [2]

investigated the existence of positive solutions for the singular fractional boundary value problem:

$$\begin{aligned} D_{0+}^{\alpha}u(t) + f(t, u(t), D^{\mu}u(t)) &= 0, \quad 0 < t < 1, \\ u(0) &= u(1) = 0, \end{aligned} \quad (2)$$

where $1 < \alpha \leq 2$, $\mu > 0$ are real numbers, f is positive, and D_{0+}^{α} is the standard Riemann-Liouville fractional derivative. By means of a fixed point theorem on cone, the existence of positive solutions is obtained. Delbosco and Rodino [3] investigated the nonlinear Dirichlet-type problem:

$$\begin{aligned} x^{\alpha-1}(D_{0+}^{\alpha}y)(x) &= f(y(x)), \quad 1 < \alpha < 2, \quad 0 \leq x \leq 1, \\ y(0) &= y(1) = 0. \end{aligned} \quad (3)$$

They proved that if $f(y)$ is a Lipschitzian function, then the problem has at least one solution $y(x)$ in a certain subspace of $C[0, 1]$. In this paper, we study the following three-point fractional boundary value problem. Consider

$$\begin{aligned} D_{0+}^{\alpha}u(t) + \lambda a(t)f(t, u(t)) &= 0, \quad 0 < t < 1, \\ u(0) &= 0, \quad \beta u(\eta) = u(1), \end{aligned} \quad (4)$$

where $1 < \alpha \leq 2$, $0 < \beta < 1$, $0 < \eta < 1$, D_{0+}^α is the standard Riemann-Liouville fractional derivative, $a(t) > 0$ is continuous, and $f \geq 0$ is continuous on $[0, 1] \times [0, \infty)$. By using Krasnosel'skii's fixed-point theorem, we get the existence of at least one positive solution.

2. Background Materials and Preliminaries

For convenience of the readers, we present here the necessary definitions from fractional calculus theory. These definitions can be found in the recent literature [1–5].

Definition 1. The fractional integral of order $\alpha > 0$ of a function $y : (0, \infty) \rightarrow R$ is given by

$$I_{0+}^\alpha y(t) = \frac{1}{\Gamma(\alpha)} \int_0^t (t-s)^{\alpha-1} y(s) ds, \quad (5)$$

provided that the right side is pointwise defined on $(0, \infty)$.

Definition 2. The fractional derivative of order $\alpha > 0$ of a function $y : (0, \infty) \rightarrow R$ is given by

$$D_{0+}^\alpha y(t) = \frac{1}{\Gamma(n-\alpha)} \left(\frac{d}{dt} \right)^n \int_0^t \frac{y(s)}{(t-s)^{\alpha-n+1}} ds, \quad n = [\alpha] + 1, \quad (6)$$

where $n = [\alpha] + 1$, provided that the right side is pointwise defined on $(0, \infty)$.

Lemma 3. Let $\alpha > 0$, if we assume $u \in C(0, 1) \cap L(0, 1)$, then the fractional differential equation $D_{0+}^\alpha u(t) = 0$ has

$$u(t) = C_1 t^{\alpha-1} + C_2 t^{\alpha-2} + \dots + C_N t^{\alpha-N}, \quad (7)$$

$$C_i \in R, \quad i = 1, 2, \dots, N$$

as unique solutions.

Lemma 4. Assume that $u \in C(0, 1) \cap L(0, 1)$ with a fractional derivative of order $\alpha > 0$ that belongs to $C(0, 1) \cap L(0, 1)$. Then

$$I_{0+}^\alpha D_{0+}^\alpha u(t) = u(t) + C_1 t^{\alpha-1} + C_2 t^{\alpha-2} + \dots + C_N t^{\alpha-N} \quad (8)$$

for some $C_i \in R$, $i = 1, 2, \dots, N$.

Definition 5. Let E be a real Banach space. A nonempty closed convex set $K \subset E$ is called cone of E if it satisfies the following conditions:

- (1) $x \in K$, $\sigma > 0$ implies $\sigma x \in K$;
- (2) $x \in K$, $-x \in K$ implies $x = 0$.

Lemma 6. Let E be a Banach space and let $K \subset E$ be a cone in E . Assume that Ω_1 and Ω_2 are open subsets of E with $0 \in \Omega_1$, $\overline{\Omega}_1 \subset \Omega_2$. Let $T : K \cap (\overline{\Omega}_2 \setminus \Omega_1) \rightarrow K$ be a completely continuous operator. In addition, suppose that either

$$(H1) \quad \|Tu\| \leq \|u\|, \forall u \in K \cap \partial\Omega_1 \text{ and } \|Tu\| \geq \|u\|, \forall u \in K \cap \partial\Omega_2 \text{ or}$$

$$(H2) \quad \|Tu\| \geq \|u\|, \forall u \in K \cap \partial\Omega_1 \text{ and } \|Tu\| \leq \|u\|, \forall u \in K \cap \partial\Omega_2$$

holds. Then T has a fixed point in $K \cap (\overline{\Omega}_2 \setminus \Omega_1)$.

In the following, we present the Green function of fractional differential equation boundary value problem.

Lemma 7 (see [4]). Let $y \in C[0, 1]$, then the boundary value problem

$$\begin{aligned} D_{0+}^\alpha u(t) + y(t) &= 0, \quad 0 < t < 1, \\ u(0) &= 0, \quad \beta u(\eta) = u(1) \end{aligned} \quad (9)$$

has a unique solution

$$u(t) = \int_0^1 G(t, s) y(s) ds, \quad (10)$$

where

$$G(t, s) = \begin{cases} \left([t(1-s)]^{\alpha-1} - \beta t^{\alpha-1} (\eta-s)^{\alpha-1} - (t-s)^{\alpha-1} (1-\beta\eta^{\alpha-1}) \right) \times (1-\beta\eta^{\alpha-1}) \Gamma(\alpha)^{-1}, & 0 \leq s \leq \min\{t, \eta\} \leq 1; \\ \frac{[t(1-s)]^{\alpha-1} - (t-s)^{\alpha-1} (1-\beta\eta^{\alpha-1})}{(1-\beta\eta^{\alpha-1}) \Gamma(\alpha)}, & 0 < \eta \leq s \leq t \leq 1; \\ \frac{[t(1-s)]^{\alpha-1} - \beta t^{\alpha-1} (\eta-s)^{\alpha-1}}{(1-\beta\eta^{\alpha-1}) \Gamma(\alpha)}, & 0 \leq t \leq s \leq \eta < 1; \\ \frac{[t(1-s)]^{\alpha-1}}{(1-\beta\eta^{\alpha-1}) \Gamma(\alpha)}, & 0 \leq \max\{t, \eta\} \leq s \leq 1. \end{cases} \quad (11)$$

Lemma 8. The function $G(t, s)$ defined by (11) satisfies $G(t, s) > 0$ for $t, s \in (0, 1)$.

Proof. (1) For $0 \leq s \leq \min\{t, \eta\} \leq 1$,

$$\begin{aligned} G(t, s) &= \frac{[t(1-s)]^{\alpha-1} - \beta t^{\alpha-1} (\eta-s)^{\alpha-1} - (t-s)^{\alpha-1} (1-\beta\eta^{\alpha-1})}{(1-\beta\eta^{\alpha-1}) \Gamma(\alpha)}. \end{aligned} \quad (12)$$

Let $F(t, s, \eta) = [t(1-s)]^{\alpha-1} - \beta t^{\alpha-1} (\eta-s)^{\alpha-1} - (t-s)^{\alpha-1} (1-\beta\eta^{\alpha-1})$. There is

$$\begin{aligned} \frac{\partial F(t, s, \eta)}{\partial \eta} &= -\beta t^{\alpha-1} (\alpha-1) (\eta-s)^{\alpha-2} + (\alpha-1) (t-s)^{\alpha-1} \beta \eta^{\alpha-2} \\ &= \beta (\alpha-1) \left[(t-s)^{\alpha-1} \eta^{\alpha-2} - t^{\alpha-1} (\eta-s)^{\alpha-2} \right] \\ &\leq \beta (\alpha-1) \left[t^{\alpha-1} \eta^{\alpha-2} - t^{\alpha-1} (\eta-s)^{\alpha-2} \right] \\ &= \beta (\alpha-1) t^{\alpha-1} \left[\eta^{\alpha-2} - (\eta-s)^{\alpha-2} \right]. \end{aligned} \quad (13)$$

With $0 < \beta < 1, 1 < \alpha \leq 2$, there is $\partial F / \partial \eta < 0$. Hence, function $F(t, s, \eta)$ is monotonically decreasing in η . With $0 < \eta < 1, F(t, s, \eta) > F(t, s, \eta)_{\min} = F(t, s, 1)$. Let $\eta = 1$, there is

$$\begin{aligned} F(t, s, 1) &= [t(1-s)]^{\alpha-1} - \beta t^{\alpha-1}(1-s)^{\alpha-1} - (t-s)^{\alpha-1}(1-\beta) \\ &= (1-\beta) \{ [t(1-s)]^{\alpha-1} - (t-s)^{\alpha-1} \} \\ &= (1-\beta) [(t-ts)^{\alpha-1} - (t-s)^{\alpha-1}]. \end{aligned} \quad (14)$$

With $0 < s \leq t < 1, 1 < \alpha \leq 2$, we have $(t-ts)^{\alpha-1} - (t-s)^{\alpha-1} \geq 0$. With $1-\beta > 0$, there is $F(t, s, 1) \geq 0$, then $F(t, s, \eta) > F(t, s, 1) \geq 0$, there is $G(t, s) > 0$.

(2) For $0 < \eta \leq s \leq t < 1$,

$$G(t, s) = \frac{[t(1-s)]^{\alpha-1} - (t-s)^{\alpha-1}(1-\beta\eta^{\alpha-1})}{(1-\beta\eta^{\alpha-1})\Gamma(\alpha)}. \quad (15)$$

Let $F(t, s, \eta) = [t(1-s)]^{\alpha-1} - (t-s)^{\alpha-1}(1-\beta\eta^{\alpha-1})$; it is obvious that function $F(t, s, \eta)$ is monotonically increasing in η , when $\eta = 0$,

$$\begin{aligned} F(t, s, \eta)_{\min} &= F(t, s, 0) \\ &= [t(1-s)]^{\alpha-1} - (t-s)^{\alpha-1} \\ &= (t-ts)^{\alpha-1} - (t-s)^{\alpha-1}. \end{aligned} \quad (16)$$

With $0 \leq s \leq t < 1, 0 < \alpha - 1 \leq 1$, there is $(t-ts)^{\alpha-1} \geq (t-s)^{\alpha-1}$; we have $F(t, s, \eta) > F(t, s, 0) \geq 0$, then $G(t, s) > 0$.

(3) For $0 < t \leq s \leq \eta < 1$,

$$G(t, s) = \frac{[t(1-s)]^{\alpha-1} - \beta t^{\alpha-1}(\eta-s)^{\alpha-1}}{(1-\beta\eta^{\alpha-1})\Gamma(\alpha)}. \quad (17)$$

Let $F(t, s, \eta) = [t(1-s)]^{\alpha-1} - \beta t^{\alpha-1}(\eta-s)^{\alpha-1}$, then $F(t, s, \eta)$ is monotonically decreasing in η ,

$$\begin{aligned} F(t, s, \eta)_{\min} &= F(t, s, 1) \\ &= [t(1-s)]^{\alpha-1} - \beta t^{\alpha-1}(1-s)^{\alpha-1} \\ &= (1-\beta) [t(1-s)]^{\alpha-1}. \end{aligned} \quad (18)$$

With $0 < \beta < 1, 0 < t \leq s < 1$, there is $F(t, s, \eta) > 0$, then $F(t, s, \eta) > F(t, s, 1) \geq 0$, hence $G(t, s) > 0$.

(4) For $0 \leq \max\{t, \eta\} \leq s \leq 1$,

$$G(t, s) = \frac{[t(1-s)]^{\alpha-1}}{(1-\beta\eta^{\alpha-1})\Gamma(\alpha)} > 0. \quad (19)$$

Therefore, $G(t, s) > 0$ for $t, s \in (0, 1)$. The proof is complete. $\square$

Lemma 9. $G(t, s) \leq G(s, s)$ for $t, s \in [0, 1]$.

Proof. To get $G(t, s) \leq G(s, s)$, firstly, we prove the following inequality:

$$\frac{t^a - s^a}{(t-s)^a} \leq \frac{1 - s^a}{(1-s)^a}, \quad (20)$$

where $a = \alpha - 1, 0 \leq s < t \leq 1$. Let $f(t) = (t^a - s^a)/(t-s)^a$, then

$$\begin{aligned} f'(t) &= \frac{at^{a-1}(t-s)^a - a(t^a - s^a)(t-s)^{a-1}}{(t-s)^{2a}} \\ &= \frac{a(t-s)^{a-1}}{(t-s)^{2a}} \cdot [t^{a-1}(t-s) - (t^a - s^a)] \\ &= \frac{a(t-s)^{a-1}}{(t-s)^{2a}} \cdot s(s^{a-1} - t^{a-1}). \end{aligned} \quad (21)$$

With $1 < \alpha \leq 2$, there is $a - 1 \leq 0$; with $s < t$, there is $s^{a-1} > t^{a-1}$; then $f'(t) > 0$. It means that $f(t)$ is monotonically increasing in t , then $f(t) \leq f(1)$; we have

$$\frac{t^a - s^a}{(t-s)^a} \leq \frac{1 - s^a}{(1-s)^a}. \quad (22)$$

Here we prove $G(t, s) \leq G(s, s)$.

(1) For $0 \leq s \leq \min\{t, \eta\} \leq 1$,

$$\begin{aligned} G(t, s) &= \frac{[t(1-s)]^{\alpha-1} - \beta t^{\alpha-1}(\eta-s)^{\alpha-1} - (t-s)^{\alpha-1}(1-\beta\eta^{\alpha-1})}{(1-\beta\eta^{\alpha-1})\Gamma(\alpha)}, \\ G(s, s) &= \frac{[s(1-s)]^{\alpha-1} - \beta s^{\alpha-1}(\eta-s)^{\alpha-1}}{(1-\beta\eta^{\alpha-1})\Gamma(\alpha)}. \end{aligned} \quad (23)$$

With $(1-\beta\eta^{\alpha-1})\Gamma(\alpha) > 0$, $G(t, s) \leq G(s, s)$ is equivalent to

$$\frac{t^a - s^a}{(t-s)^a} [(1-s)^a - \beta(\eta-s)^a] \leq 1 - \beta\eta^a \quad (24)$$

or

$$(t^a - s^a) [(1-s)^a - \beta(\eta-s)^a] \leq (1 - \beta\eta^a)(t-s)^a. \quad (25)$$

(a) For $s = t$, $(t^a - s^a)[(1-s)^a - \beta(\eta-s)^a] = (1 - \beta\eta^a)(t-s)^a = 0$;

(b) for $s = t = \eta = 1$, $(t^a - s^a)[(1-s)^a - \beta(\eta-s)^a] = (1 - \beta\eta^a)(t-s)^a = 0$;

(c) for $s = \eta \leq t$,

$$\begin{aligned} (t^a - s^a) [(1-s)^a - \beta(\eta-s)^a] &= (t^a - \eta^a)(1 - \eta^a), \\ (1 - \beta\eta^a)(t-s)^a &= (1 - \beta\eta^a)(t - \eta)^a, \end{aligned} \quad (26)$$

if $t = \eta$, $(t^a - s^a)[(1-s)^a - \beta(\eta-s)^a] = (1 - \beta\eta^a)(t-s)^a = 0$; if $t > \eta$, from (22), we have $(t^a - \eta^a)/(t - \eta)^a \leq (1 - \eta^a)/(1 - \eta)^a \leq (1 - \beta\eta^a)/(1 - \eta)^a$;

(d) for $0 \leq s < t \leq 1$, $0 \leq s < \eta \leq 1$, if $(1-s)^a - \beta(\eta-s)^a < 0$; it is obvious that $(t^a - s^a)[(1-s)^a - \beta(\eta-s)^a] \leq (1 - \beta\eta^a)(t-s)^a$. If $(1-s)^a - \beta(\eta-s)^a > 0$, by (22), there is $(\eta^a - s^a)/(\eta-s)^a \leq (1-s^a)/(1-s)^a$; then

$$(\eta-s)^a \geq \frac{1-s^a}{(1-s)^a} (\eta^a - s^a). \quad (27)$$

Consider

$$\begin{aligned} & \frac{t^a - s^a}{(t-s)^a} [(1-s)^a - \beta(\eta-s)^a] \\ & \leq \frac{1-s^a}{(1-s)^a} [(1-s)^a - \beta(\eta-s)^a] \\ & = 1 - s^a - \beta \frac{1-s^a}{(1-s)^a} (\eta-s)^a \\ & \leq 1 - s^a - \beta \frac{1-s^a}{(1-s)^a} \cdot \frac{(1-s)^a}{1-s^a} \cdot (\eta^a - s^a) \\ & = 1 - \beta\eta^a - (1-\beta)s^a \\ & \leq 1 - \beta\eta^a. \end{aligned} \quad (28)$$

It means that $G(t, s) \leq G(s, s)$ holds.

(2) For $0 < \eta \leq s \leq t \leq 1$,

$$\begin{aligned} G(t, s) &= \frac{[t(1-s)]^{\alpha-1} - (t-s)^{\alpha-1} (1-\beta\eta^{\alpha-1})}{(1-\beta\eta^{\alpha-1})\Gamma(\alpha)}, \\ G(s, s) &= \frac{[s(1-s)]^{\alpha-1}}{(1-\beta\eta^{\alpha-1})\Gamma(\alpha)}. \end{aligned} \quad (29)$$

With $(1-\beta\eta^{\alpha-1})\Gamma(\alpha) > 0$, $G(t, s) \leq G(s, s)$ is equivalent to

$$[t(1-s)]^a - (t-s)^a (1-\beta\eta^a) \leq [s(1-s)]^a \quad (30)$$

or

$$(t^a - s^a)(1-s)^a \leq (t-s)^a (1-\beta\eta^a). \quad (31)$$

From (22), we have $((t^a - s^a)/(t-s)^a)(1-s)^a \leq 1 - s^a$; with $\eta \leq s$, $0 < \beta < 1$, we have $1 - s^a \leq 1 - \eta^a \leq 1 - \beta\eta^a$; then $((t^a - s^a)/(t-s)^a)(1-s)^a \leq 1 - \beta\eta^a$; with $s \leq t$, there is

$$(t^a - s^a)(1-s)^a \leq (t-s)^a (1-\beta\eta^a). \quad (32)$$

It means that $G(t, s) \leq G(s, s)$ holds.

(3) For $0 \leq t \leq s \leq \eta < 1$,

$$\begin{aligned} G(t, s) &= \frac{[t(1-s)]^{\alpha-1} - \beta t^{\alpha-1} (\eta-s)^{\alpha-1}}{(1-\beta\eta^{\alpha-1})\Gamma(\alpha)}, \\ G(s, s) &= \frac{[s(1-s)]^{\alpha-1} - \beta s^{\alpha-1} (\eta-s)^{\alpha-1}}{(1-\beta\eta^{\alpha-1})\Gamma(\alpha)}. \end{aligned} \quad (33)$$

With $(1-\beta\eta^{\alpha-1})\Gamma(\alpha) > 0$, $G(t, s) \leq G(s, s)$ is equivalent to

$$[t(1-s)]^a - \beta t^a (\eta-s)^a \leq [s(1-s)]^a - \beta s^a (\eta-s)^a \quad (34)$$

or

$$(t^a - s^a)(1-s)^a \leq \beta(t^a - s^a)(\eta-s)^a. \quad (35)$$

With $0 < \beta < 1$, $s \leq \eta$, there is $\beta(\eta-s)^a \leq (\eta-s)^a < (1-s)^a$; with $t \leq s$, there is

$$(t^a - s^a)(1-s)^a \leq \beta(t^a - s^a)(\eta-s)^a. \quad (36)$$

It means that $G(t, s) \leq G(s, s)$ holds.

(4) For $0 < \max\{t, \eta\} \leq s \leq 1$,

$$\begin{aligned} G(t, s) &= \frac{[t(1-s)]^{\alpha-1}}{(1-\beta\eta^{\alpha-1})\Gamma(\alpha)}, \\ G(s, s) &= \frac{[s(1-s)]^{\alpha-1}}{(1-\beta\eta^{\alpha-1})\Gamma(\alpha)}. \end{aligned} \quad (37)$$

It is obvious that $G(t, s) \leq G(s, s)$. The proof is complete. $\square$

Lemma 10. $G(t, s) \geq q(k)G(s, s)$ for $t, s \in [1/k, 1 - (1/k)]$, where $k > 2$ is an integer and

$$\begin{aligned} q(k) &= \min \left\{ \frac{(1-\beta)[(1-(1/k))^{2(\alpha-1)} - (1-(2/k))^{\alpha-1}]}{(1/4)^{\alpha-1}}, \right. \\ & \quad \frac{(1-\beta)(1/k)^{2(\alpha-1)}}{(1/4)^{\alpha-1}}, \\ & \quad \left. \frac{(k-1)^{\alpha-1}/k^{2(\alpha-1)}}{(1/4)^{\alpha-1}} \right\}. \end{aligned} \quad (38)$$

Proof. From (11), we have

$$G(s, s) = \begin{cases} \frac{[s(1-s)]^{\alpha-1} - \beta s^{\alpha-1} (\eta-s)^{\alpha-1}}{(1-\beta\eta^{\alpha-1})\Gamma(\alpha)}, & s \leq \eta, \\ \frac{[s(1-s)]^{\alpha-1}}{(1-\beta\eta^{\alpha-1})\Gamma(\alpha)}, & s > \eta. \end{cases} \quad (39)$$

It is obvious that $[s(1-s)]^{\alpha-1}/(1-\beta\eta^{\alpha-1})\Gamma(\alpha) \geq ([s(1-s)]^{\alpha-1} - \beta s^{\alpha-1} (\eta-s)^{\alpha-1})/(1-\beta\eta^{\alpha-1})\Gamma(\alpha)$, for $t, s \in [1/k, 1 - (1/k)]$,

$$\begin{aligned} \max G(s, s) &= \frac{[s(1-s)]^{\alpha-1}}{(1-\beta\eta^{\alpha-1})\Gamma(\alpha)} \Big|_{s=1/2} \\ &= \frac{(1/4)^{\alpha-1}}{(1-\beta\eta^{\alpha-1})\Gamma(\alpha)}. \end{aligned} \quad (40)$$

(1) For $1/k \leq s \leq \min\{t, \eta\} \leq 1 - (1/k)$, let

$$\begin{aligned} F(t, s, \eta) &= [t(1-s)]^{\alpha-1} - \beta t^{\alpha-1} (\eta-s)^{\alpha-1} \\ & \quad - (t-s)^{\alpha-1} (1-\beta\eta^{\alpha-1}). \end{aligned} \quad (41)$$

By Lemma 8, for $\eta = 1$,

$$\begin{aligned}\bar{F}(t, s) &= F(t, s, \eta)_{\min} = F(t, s, 1) \\ &= [t(1-s)]^{\alpha-1} - \beta t^{\alpha-1}(1-s)^{\alpha-1} \\ &\quad - (t-s)^{\alpha-1}(1-\beta) \\ &= (1-\beta) \{ [t(1-s)]^{\alpha-1} - (t-s)^{\alpha-1} \} \\ &= (1-\beta) [(t-ts)^{\alpha-1} - (t-s)^{\alpha-1}], \\ \frac{\partial \bar{F}}{\partial s} &= (1-\beta)(\alpha-1) [(t-s)^{\alpha-2} - t^{\alpha-1}(1-s)^{\alpha-2}].\end{aligned}\quad (42)$$

With $1 < \alpha \leq 2, 0 \leq s \leq t \leq 1$, then $(t-s)^{\alpha-2} - t^{\alpha-1}(1-s)^{\alpha-2} > 0$; with $0 < \beta < 1$, $\partial \bar{F} / \partial s > 0$. It means that $\bar{F}(t, s)$ is monotonically increasing in s . Similarly,

$$\frac{\partial \bar{F}}{\partial t} = (1-\beta)(\alpha-1) [(t-ts)^{\alpha-2}(1-s) - (t-s)^{\alpha-2}] < 0. \quad (43)$$

It means that $\bar{F}(t, s)$ is monotonically decreasing in t . Therefore

$$\begin{aligned}\bar{F}(t, s) &\geq \min \bar{F}(t, s) = \bar{F}(t, s)|_{t=1-(1/k), s=1/k} \\ &= (1-\beta) \left[\left(1 - \frac{1}{k}\right)^{2(\alpha-1)} - \left(1 - \frac{2}{k}\right)^{\alpha-1} \right], \\ \min G(t, s) &= \frac{(1-\beta) \left[\left((1/k) - (1/k^2)\right)^{\alpha-1} - (1-(2/k))^{\alpha-1} \right]}{(1-\beta\eta^{\alpha-1})\Gamma(\alpha)}, \\ \frac{\min G(t, s)}{\max G(s, s)} &= \frac{(1-\beta) \left[(1-(1/k))^{2(\alpha-1)} - (1-(2/k))^{\alpha-1} \right]}{(1/4)^{\alpha-1}}.\end{aligned}\quad (44)$$

(2) For $1/k < \eta \leq s \leq t \leq 1 - (1/k)$, let

$$F(t, s, \eta) = [t(1-s)]^{\alpha-1} - (t-s)^{\alpha-1}(1-\beta\eta^{\alpha-1}). \quad (45)$$

By Lemma 8, for $\eta = 0$,

$$\begin{aligned}\bar{F}(t, s) &= F(t, s, \eta)_{\min} = F(t, s, 0) \\ &= [t(1-s)]^{\alpha-1} - (t-s)^{\alpha-1} \\ &= (t-ts)^{\alpha-1} - (t-s)^{\alpha-1}, \\ \frac{\partial \bar{F}}{\partial s} &= (\alpha-1) [(t-s)^{\alpha-2} - t^{\alpha-1}(1-s)^{\alpha-2}] > 0.\end{aligned}\quad (46)$$

It means that $\bar{F}(t, s)$ is monotonically increasing in s

$$\frac{\partial \bar{F}}{\partial t} = (\alpha-1) [(1-s)^{\alpha-1}t^{\alpha-2} - (t-s)^{\alpha-2}] < 0. \quad (47)$$

It means that $\bar{F}(t, s)$ is monotonically decreasing in t

$$\begin{aligned}\bar{F}(t, s) &\geq \min \bar{F}(t, s) = \bar{F}(t, s)|_{t=1-(1/k), s=1/k} \\ &= \left(1 - \frac{1}{k}\right)^{2(\alpha-1)} - \left(1 - \frac{2}{k}\right)^{\alpha-1}, \\ \min G(t, s) &= \frac{(1-\beta) \left[(1-(1/k))^{2(\alpha-1)} - (1-(2/k))^{\alpha-1} \right]}{(1-\beta\eta^{\alpha-1})\Gamma(\alpha)}, \\ \frac{\min G(t, s)}{\max G(s, s)} &= \frac{(1-\beta) \left[(1-(1/k))^{2(\alpha-1)} - (1-(2/k))^{\alpha-1} \right]}{(1/4)^{\alpha-1}}.\end{aligned}\quad (48)$$

(3) For $1/k \leq t \leq s \leq \eta < 1 - (1/k)$, let

$$F(t, s, \eta) = [t(1-s)]^{\alpha-1} - \beta t^{\alpha-1}(\eta-s)^{\alpha-1}. \quad (49)$$

By Lemma 8, for $\eta = 1$,

$$\begin{aligned}\bar{F}(t, s) &= F(t, s, \eta)_{\min} = F(t, s, 1) \\ &= [t(1-s)]^{\alpha-1} - \beta t^{\alpha-1}(1-s)^{\alpha-1} \\ &= (1-\beta) [t(1-s)]^{\alpha-1},\end{aligned}\quad (50)$$

$$\frac{\partial \bar{F}}{\partial s} = (\alpha-1)t^{\alpha-1}(\beta-1)(1-s)^{\alpha-2} < 0;$$

then $\bar{F}(t, s)$ is monotonically decreasing in s . Consider

$$\frac{\partial \bar{F}}{\partial t} = (\alpha-1)(1-\beta)t^{\alpha-2}(1-s)^{\alpha-1} > 0; \quad (51)$$

then $\bar{F}(t, s)$ is monotonically increasing in t . Therefore,

$$\begin{aligned}\bar{F}(t, s) &\geq \min \bar{F}(t, s) = \bar{F}(t, s)|_{t=1/k, s=1-(1/k)} = \frac{1-\beta}{k^{2(\alpha-1)}}, \\ \min G(t, s) &= \frac{(1-\beta)(1/k^{2(\alpha-1)})}{(1-\beta\eta^{\alpha-1})\Gamma(\alpha)}, \\ \frac{\min G(t, s)}{\max G(s, s)} &= \frac{(1-\beta)(1/k)^{2(\alpha-1)}}{(1/4)^{\alpha-1}}.\end{aligned}\quad (52)$$

(4) For $1/k \leq \max\{t, \eta\} \leq s \leq 1 - (1/k)$, let

$$F(t, s) = [t(1-s)]^{\alpha-1}. \quad (53)$$

It is obvious that $F(t, s)$ is monotonically increasing in t and monotonically decreasing in s ; then

$$\begin{aligned}F(t, s) &\geq \min F(t, s) = F(t, s)|_{t=1/k, s=1-(1/k)} \\ &= \left(\frac{1}{k} - \frac{1}{k^2}\right)^{\alpha-1};\end{aligned}\quad (54)$$

we have

$$\min G(t, s) = \frac{\left((1/k) - (1/k^2)\right)^{\alpha-1}}{(1-\beta\eta^{\alpha-1})\Gamma(\alpha)}; \quad (55)$$

there is

$$\frac{\min G(t, s)}{\max G(s, s)} = \frac{(k-1)^{\alpha-1}/k^{2(\alpha-1)}}{(1/4)^{\alpha-1}}. \quad (56)$$

Let

$$q(k) = \min \left\{ \frac{(1-\beta) \left[(1-(1/k))^{2(\alpha-1)} - (1-(2/k))^{\alpha-1} \right]}{(1/4)^{\alpha-1}}, \right. \\ \left. \frac{(1-\beta)(1/k)^{2(\alpha-1)}}{(1/4)^{\alpha-1}}, \right. \\ \left. \frac{(k-1)^{\alpha-1}/k^{2(\alpha-1)}}{(1/4)^{\alpha-1}} \right\}. \quad (57)$$

Therefore, $G(t, s)/G(s, s) \geq \min G(t, s)/\max G(s, s) = q(k) \neq 0$.

The proof is complete. $\square$

We consider the Banach space $X = C[0, 1]$ equipped with standard norm $\|u\| = \max_{0 \leq t \leq 1} |u(t)|$, $u \in X$. We define a cone P by

$$P = \left\{ u \in X : u(t) \geq 0, t \in [0, 1], \right. \\ \left. \min_{t \in [1/k, 1-1/k]} u(t) \geq q(k) \|u\| \right\}. \quad (58)$$

Define an integral operator $T : P \rightarrow X$ by

$$(Tu)(t) = \lambda \int_0^1 G(t, s) a(s) f(s, u(s)) ds, \quad (59) \\ 0 \leq t \leq 1, \quad u \in P.$$

Lemma 11. *It holds the following.*

- (1) $T : P \rightarrow P$ is completely continuous.
- (2) $u(t)$ is a positive solution of the fractional boundary value problem (4) if and only if $u(t)$ is a fixed point of the operator T in cone P .

Proof. For $u \in P, t \in [1/k, 1 - (1/k)]$, by Lemma 10, $G(t, s) \geq q(k)G(s, s)$; for $t, s \in [1/k, 1 - (1/k)]$,

$$Tu(t) = \lambda \int_0^1 G(t, s) a(s) f(s, u(s)) ds \\ \geq \lambda q(k) \int_0^1 G(s, s) a(s) f(s, u(s)) ds \\ = \lambda q(k) \max_{1/k \leq t \leq 1-1/k} \int_0^1 G(t, s) a(s) f(s, u(s)) ds \\ = q(k) \|Tu(t)\|. \quad (60)$$

It is obvious that $\min_{1/k \leq t \leq 1-1/k} (Tu)(t) \geq q(k) \|Tu\|$, $TP \subseteq P$. Thus $TP \subset P$. In addition, standard arguments show that T is completely continuous.

(2) It is obvious that $u(t)$ is the positive solution of BVP (4) if and only if

$$u(t) = \lambda \int_0^1 G(t, s) a(s) f(s, u(s)) ds, \quad 0 \leq t \leq 1. \quad (61)$$

It can be proved by the definition of integral operator T . $\square$

3. Main Results

We denote some important constants as follows:

$$A = \int_0^1 G(s, s) a(s) q(k) ds, \\ B = \int_0^1 G(s, s) a(s) ds, \\ F_0 = \lim_{u \rightarrow 0^+} \sup \max_{0 \leq t \leq 1} \frac{f(t, u(t))}{u(t)}, \\ f_0 = \lim_{u \rightarrow +\infty} \inf \min_{0 \leq t \leq 1} \frac{f(t, u(t))}{u(t)}, \\ F_\infty = \lim_{u \rightarrow 0^+} \sup \max_{0 \leq t \leq 1} \frac{f(t, u(t))}{u(t)}, \\ f_\infty = \lim_{u \rightarrow +\infty} \inf \min_{0 \leq t \leq 1} \frac{f(t, u(t))}{u(t)}. \quad (62)$$

Here we assume that $1/Af_\infty = 0$ if $f_\infty \rightarrow \infty$, $1/BF_0 = \infty$ if $F_0 \rightarrow 0$, $1/Af_0 = 0$ if $f_0 \rightarrow \infty$, and $1/BF_\infty = \infty$ if $F_\infty \rightarrow 0$.

Theorem 12. *Suppose that $Af_\infty > BF_0$, then for each $\lambda \in (1/Af_\infty, 1/BF_0)$, BVP (4) has at least one positive solution.*

Proof. We choose $\varepsilon > 0$ sufficiently small such that $(F_0 + \varepsilon)\lambda B \leq 1$. By the definition of F_0 , we can see that there exists $l_1 > 0$, such that $f(t, u(t)) \leq (F_0 + \varepsilon)u(t)$ for $0 \leq u \leq l_1$. For $u \in P$ with $\|u\| = l_1$, we have

$$\|Tu(t)\| = \lambda \int_0^1 G(s, s) a(s) f(s, u(s)) ds \\ \leq \lambda \int_0^1 G(s, s) a(s) (F_0 + \varepsilon) u(s) ds \\ \leq \lambda (F_0 + \varepsilon) \|u\| \int_0^1 G(s, s) a(s) ds \\ = \lambda B (F_0 + \varepsilon) \|u\| \\ \leq \|u\|. \quad (63)$$

Then we have $\|Tu\| \leq \|u\|$. Thus if we let $\Omega_1 = \{u \in X : \|u\| < l_1\}$, then $\|Tu\| \leq \|u\|$ for $u \in P \cap \partial\Omega_1$. We choose $\delta > 0$ and $c \in (0, 1/4)$ such that $\lambda(f_\infty - \delta)A \geq 1$. There exists $l_2 > l_1 > 0$,

such that $f(t, u) \geq (f_\infty - \delta)u$ for $u > l_2$. Therefore, for each $u \in P$ with $\|u\| = l_2$, we have

$$\begin{aligned} \|Tu(t)\| &= \lambda \int_0^1 G(s, s) a(s) f(s, u(s)) ds \\ &\geq \lambda \int_c^1 G(s, s) a(s) (f_\infty - \delta) u(s) ds \\ &\geq \lambda (f_\infty - \delta) \|u\| \int_c^1 G(s, s) a(s) q(k) ds \\ &\geq \lambda (f_\infty - \delta) A \cdot \|u\| \\ &\geq \|u\|. \end{aligned} \quad (64)$$

Thus if we let $\Omega_2 = \{u \in E : \|u\| < l_2\}$, then $\bar{\Omega}_1 \subset \Omega_2$ and $\|Tu\| \geq \|u\|$ for $u \in P \cap \partial\Omega_2$. Condition (H1) of Krasnosel'skii's fixed point theorem is satisfied. So there exists a fixed point of T in P . This completes the proof. $\square$

Theorem 13. Suppose that $Af_0 > BF_\infty$, then for each $\lambda \in (1/Af_0, 1/BF_\infty)$, BVP (4) has at least one positive solution.

Proof. Choose $\varepsilon > 0$ sufficiently small such that $(f_0 - \varepsilon)\lambda A \geq 1$. From the definition of f_0 , we see that there exists $l_1 > 0$, such that $f(t, u) \geq (f_0 - \varepsilon)u$ for $0 < u \leq l_1$. If $u \in P$ with $\|u\| = l_1$, we have

$$\begin{aligned} \|Tu(t)\| &= \lambda \int_0^1 G(s, s) a(s) f(s, u(s)) ds \\ &\geq \lambda (f_0 - \varepsilon) \|u\| A \\ &\geq \|u\|. \end{aligned} \quad (65)$$

Let $\Omega_1 = \{u \in X : \|u\| < l_1\}$; then we have $\|Tu\| \geq \|u\|$ for $u \in P \cap \partial\Omega_1$. Choose $\delta > 0, c \in (0, 1/4)$; then we have $\lambda(F_\infty + \delta)A \leq 1$. There exists $l_2 > l_1 > 0$, such that $f(t, u) \leq (F_\infty + \delta)u$ for $u > l_2$. For each $u \in P$ with $\|u\| = l_2$, we have

$$\begin{aligned} \|Tu(t)\| &= \lambda \int_0^1 G(s, s) a(s) f(s, u(s)) ds \\ &\leq \lambda \int_c^1 G(s, s) a(s) (F_\infty + \delta) u(s) ds \\ &\leq \lambda (F_\infty + \delta) \|u\| \int_c^1 G(s, s) a(s) q(k) ds \\ &\leq \lambda (F_\infty + \delta) A \cdot \|u\| \\ &\leq \|u\|. \end{aligned} \quad (66)$$

Let $\Omega_2 = \{u \in E : \|u\| < l_2\}$; then $\bar{\Omega}_1 \subset \Omega_2$, and we have $\|Tu\| \leq \|u\|$ for $u \in P \cap \partial\Omega_2$. Condition (H2) of Krasnosel'skii's fixed-point theorem is satisfied. So there exists a fixed point of T in P . This completes the proof. $\square$

4. An Example

Example 1. Consider the following three-point fractional boundary value problem:

$$\begin{aligned} D_{0+}^{3/2} u(t) + \lambda f(t, u(t)) &= 0, \quad 0 < t < 1, \\ u(0) &= 0, \quad u(1) = \frac{1}{2} u\left(\frac{1}{3}\right), \end{aligned} \quad (67)$$

where $f(t, u(t)) = ((t+1)(2014u^3 + u)/(u^2 + 1)) + u(\sin u + 1)$, $a(t) = 1$.

By calculations,

$$\begin{aligned} G(s, s) &= \begin{cases} \frac{[s(1-s)]^{\alpha-1} - \beta s^{\alpha-1}(\eta-s)^{\alpha-1}}{(1-\beta\eta^{\alpha-1})\Gamma(\alpha)}, & 0 \leq s = t \leq \eta \leq 1, \\ \frac{[s(1-s)]^{\alpha-1}}{(1-\beta\eta^{\alpha-1})\Gamma(\alpha)}, & 0 \leq \eta \leq t = s \leq 1, \end{cases} \\ \int_0^1 G(s, s) ds &= \int_0^\eta \frac{[s(1-s)]^{\alpha-1} - \beta s^{\alpha-1}(\eta-s)^{\alpha-1}}{(1-\beta\eta^{\alpha-1})\Gamma(\alpha)} ds \\ &\quad + \int_\eta^1 \frac{[s(1-s)]^{\alpha-1}}{(1-\beta\eta^{\alpha-1})\Gamma(\alpha)} ds \\ &= \int_0^1 \frac{[s(1-s)]^{\alpha-1}}{(1-\beta\eta^{\alpha-1})\Gamma(\alpha)} ds \\ &\quad - \int_0^\eta \frac{\beta s^{\alpha-1}(\eta-s)^{\alpha-1}}{(1-\beta\eta^{\alpha-1})\Gamma(\alpha)} ds \\ &= \frac{1}{1 - (1/2)(1/3)^{1/2}\Gamma(3/2)} \\ &\quad \times \left\{ \int_0^1 [s(1-s)]^{1/2} ds - \int_0^{1/3} \frac{1}{2} s^{1/2}(\eta-s)^{1/2} ds \right\} \\ &= 0.58832. \end{aligned} \quad (68)$$

Let $k = 10$, then

$$\begin{aligned} q(k) \min &\left\{ \frac{(1-\beta) \left[(1-(1/k))^{2(\alpha-1)} - (1-(2/k))^{\alpha-1} \right]}{(1/4)^{\alpha-1}}, \right. \\ &\quad \frac{(1-\beta)(1/k)^{2(\alpha-1)}}{(1/4)^{\alpha-1}}, \\ &\quad \left. \frac{(k-1)^{\alpha-1}/k^{2(\alpha-1)}}{(1/4)^{\alpha-1}} \right\} \\ &= 0.00557, \end{aligned}$$

$$\begin{aligned}
f_{\infty} &= \lim_{u \rightarrow +\infty} \inf \min_{0 \leq t \leq 1} \left[\frac{(t+1)(2014u^2+1)}{u^2+1} + \sin u + 1 \right] \\
&= 2014, \\
F_0 &= \lim_{u \rightarrow 0^+} \sup \max_{0 \leq t \leq 1} \left[\frac{(t+1)(2014u^2+1)}{u^2+1} + \sin u + 1 \right] \\
&= 4.
\end{aligned} \tag{69}$$

Consider

$$A = \int_0^1 G(s, s) a(s) q(k) ds = 0.00328, \tag{70}$$

$$B = \int_0^1 G(s, s) a(s) ds = 0.58832. \tag{71}$$

The condition $Af_{\infty} > BF_0$ is obtained. From Theorem 12, we see that if $\lambda \in (0.15138, 0.42494)$, the problem (67) has a positive solution.

Conflict of Interests

The authors declare that there is no conflict of interests regarding the publication of this paper.
