Circulant matrices may play a crucial role in solving various differential equations. In this paper, the techniques used herein are based on the inverse factorization of polynomial. We give the explicit determinants of the RFP\(_r\)\(_L\)\(_r\)\(_R\) circulant matrices and RLP\(_r\)\(_F\)\(_r\)\(_L\) circulant matrices involving Fibonacci, Lucas, Pell, and Pell-Lucas number, respectively.

1. Introduction

It has been found out that circulant matrices play an important role in solving differential equations in various fields such as Lin and Yang discretized the partial integrodifferential equation (PIDE) in pricing options with the preconditioned conjugate gradient (PCG) method, where constructed the circulant preconditioners. By using the FFT, the cost for each linear system is \(O(n \log n)\) where \(n\) is the size of the system in [1]. Lei and Sun [2] proposed the preconditioned CGNR (PCGNR) method with a circulant preconditioner to solve such Toeplitz-like systems. Kloeden et al. adopted the simplest approximation schemes for (1) in [3] with the Euler method, which reads (5) in [3]. They exploited that the covariance matrix of the increments can be embedded in a circulant matrix. The total loops can be done by fast Fourier transformation, which leads to a total computational cost of \(O(m \log m) = O(n \log n)\). By using a Strang-type block-circulant preconditioner, Zhang et al. [4] speeded up the convergent rate of boundary-value methods. In [5], the resulting dense linear system exhibits so much structure that it can be solved very efficiently by a circulant preconditioned conjugate gradient method. Ahmed et al. used coupled map lattices (CML) as an alternative approach to include spatial effects in FOS. Consider the l-system CML (10) in [6]. They claimed that the system is stable if all the eigenvalues of the circulant matrix satisfy (2) in [6]. Wu and Zou in [7] discussed the existence and approximation of solutions of asymptotic or periodic boundary-value problems of mixed functional differential equations. They focused on (5.13) in [7] with a circulant matrix, whose principal diagonal entries are zeroes.

Circulant matrix family have important applications in various disciplines including image processing, communications, signal processing, encoding, and preconditioner. They have been put on firm basis with the work of Davis [8] and Jiang and Zhou [9]. The circulant matrices, long a fruitful subject of research, have in recent years been extended in many directions [10–13]. The \(f(x)\)-circulant matrices are another natural extension of this well-studied class and can be found in [14–20]. The \(f(x)\)-circulant matrix has a wide application, especially on the generalized cyclic codes in [14]. The properties and structures of the \(x^n - rx - r\)-circulant matrices, which are called RFP\(_r\)\(_L\)\(_r\)\(_R\) circulant matrices, are better than those of the general \(f(x)\)-circulant matrices, so there are good algorithms for determinants.

There are many interests in properties and generalization of some special matrices with famous numbers. Jaiswal evaluated some determinants of circulant whose elements are the generalized Fibonacci numbers [21]. Dazheng gave the determinant of the Fibonacci-Lucas quasicyclic matrices [22]. Lind presented the determinants of circulant and skew circulant involving Fibonacci numbers in [23]. Shen et al. [24] discussed the determinant of circulant matrix involving...

Firstly, we introduce the definitions of the RFPrLrR circulant matrices and RLPrFrL circulant matrices and properties of the related famous numbers. Then, we present the main results and the detailed process.

2. Definition and Lemma

Definition 1. A row first-plus-r-last r-right (RFPrLrR) circulant matrix with the first row \((a_0, a_1, \ldots, a_{n-1})\), denoted by RFPrLrcirc, fr\((a_0, a_1, \ldots, a_{n-1})\), means a square matrix of the form

\[
\begin{pmatrix}
  a_0 & \cdots & a_{n-3} & a_{n-2} & a_{n-1} \\
  r a_{n-1} & a_0 + r a_{n-1} & a_1 + r a_{n-1} & \cdots & \cdots \\
  r a_{n-2} & \cdots & a_0 + r a_{n-2} & \cdots & \cdots \\
  \cdots & \cdots & \cdots & \cdots & \cdots \\
  r a_0 & r a_2 & \cdots & a_0 + r a_0 & \cdots \\
  \cdots & \cdots & \cdots & \cdots & \cdots
\end{pmatrix}
\]  

(1)

Note that the RFPrLrR circulant matrix is a \(x^n - rx - r\) circulant matrix, which is neither an extension nor special case of the circulant matrix [8]. They are two completely different kinds of special matrices.

We define \(\Theta_{(r,r)}\) as the basic RFPrLrR circulant matrix; that is,

\[
\Theta_{(r,r)} = \begin{pmatrix}
  0 & 1 & 0 & \cdots & 0 & 0 \\
  0 & 0 & 1 & \cdots & 0 & 0 \\
  \cdots & \cdots & \cdots & \cdots & \cdots \\
  0 & 0 & 0 & \cdots & 0 & 1 \\
  r & r & 0 & \cdots & 0 & 0 \\
\end{pmatrix}
\]

(2)

Both the minimal polynomial and the characteristic polynomial of \(\Theta_{(r,r)}\) are \(g(x) = x^n - rx - r\), which has only simple roots, denoted by \(\epsilon_k\) (\(k = 1, 2, \ldots, n\)). In addition, \(\Theta_{(r,r)}\) satisfies \(\Theta_{(r,r)}^j = \text{RFPrLrcirc, fr}(0,0,0,\ldots,0)\) and \(\Theta_{(r,r)}^n = rI_n + r\Theta_{(r,r)}\). Then a matrix \(A\) can be written in the form

\[
A = f(\Theta_{(r,r)}) = \sum_{j=0}^{n-1} a_j \Theta_{(r,r)}^j
\]

if and only if \(A\) is a RFMrLrR circulant matrix, where the polynomial \(f(x) = \sum_{j=0}^{n-1} a_j x^j\) is called the representer of the RFPrLrR circulant matrix \(A\).

Since \(\Theta_{(r,r)}\) is nonderogatory, then \(A\) is a RFMrLrR circulant matrix if and only if \(A\) commutes with \(\Theta_{(r,r)}\); that is, \(A\Theta_{(r,r)} = \Theta_{(r,r)}A\). Because of the representation, RFMrLrR circulant matrices have very nice structure and the algebraic properties also can be easily attained. Moreover, the product of two RFMrLrR circulant matrices and the inverse \(A^{-1}\) are again RFMrLrR circulant matrices.

Definition 2. A row last-plus-r-first r-left (RLPrFrL) circulant matrix with the first row \((a_0, a_1, \ldots, a_{n-1})\), denoted by RLPrFrLcirc, fr\((a_0, a_1, \ldots, a_{n-1})\), means a square matrix of the form

\[
\begin{pmatrix}
  a_0 & \cdots & a_{n-2} & a_{n-1} \\
  a_1 & \cdots & a_{n-1} + ra_0 & r a_0 \\
  a_2 & \cdots & ra_1 + ra_0 & ra_1 \\
  \cdots & \cdots & \cdots & \cdots \\
  a_{n-1} + ra_0 & \cdots & ra_{n-3} + ra_{n-2} & ra_{n-2}
\end{pmatrix}
\]  

(4)

Let \(A = \text{RLPrFrLcirc, fr}(a_0, a_1, \ldots, a_{n-1})\) and \(B = \text{RLPrFrLcirc, fr}(a_{n-1}, a_{n-2}, \ldots, a_0)\). By explicit computation, we find

\[
A = B^T n,
\]

where \(B^T\) is the backward identity matrix of the form

\[
\begin{pmatrix}
  1 & 0 & \cdots & 0 \\
  \vdots & \ddots & \cdots & \vdots \\
  0 & \cdots & 1 & 0 \\
  0 & \cdots & 0 & 1
\end{pmatrix}
\]

(5)

The Fibonacci, Lucas, Pell, and the Pell-Lucas sequences [30–36] are defined by the following recurrence relations, respectively:

\[
\begin{align*}
F_{n+1} &= F_n + F_{n-1}, & \text{where } F_0 = 0, F_1 = 1, \\
L_{n+1} &= L_n + L_{n-1}, & \text{where } L_0 = 2, L_1 = 1, \\
P_{n+1} &= 2P_n + P_{n-1}, & \text{where } P_0 = 0, P_1 = 1, \\
Q_{n+1} &= 2Q_n + Q_{n-1}, & \text{where } Q_0 = 2, Q_1 = 2.
\end{align*}
\]

The first few values of these sequences are given by the following table \((n \geq 0)\):

\[
\begin{array}{cccccccc}
  n & 0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 \\
  F_n & 0 & 1 & 1 & 2 & 3 & 5 & 8 & 13 \\
  L_n & 2 & 1 & 3 & 4 & 7 & 11 & 18 & 29 \\
  P_n & 0 & 1 & 2 & 5 & 12 & 29 & 70 & 169 \\
  Q_n & 2 & 2 & 6 & 14 & 34 & 82 & 198 & 478 \\
\end{array}
\]

(8)

The sequences \(\{F_n\}, \{L_n\}, \{P_n\}, \text{and } \{Q_n\}\) are given by the Binet formulae

\[
\begin{align*}
F_n &= \frac{\alpha^n - \beta^n}{\alpha - \beta}, & L_n &= \alpha^n + \beta^n, \\
P_n &= \frac{\alpha_1^n - \beta_1^n}{\alpha_1 - \beta_1}, & Q_n &= \alpha_1^n + \beta_1^n,
\end{align*}
\]

(9)

where \(\alpha, \beta\) are the roots of the characteristic equation \(x^2 - x - 1 = 0\) and \(\alpha_1, \beta_1\) are the roots of the characteristic equation \(x^2 - 2x - 1 = 0\).

By Proposition 5.1 in [14], we deduce the following lemma.
Lemma 3. Let \( A = \text{RFPrLRcirc}_{fr}(a_0, \ldots, a_{n-1}) \); then the eigenvalues of \( A \) are

\[
f(\lambda) = \sum_{i=0}^{n-1} (a_i \lambda^i),
\]

and in addition,

\[
\text{det } A = \prod_{k=1}^{n} \left( a_k \lambda^k \right),
\]

where \( \lambda_k (k = 1, 2, \ldots, n) \) are the roots of the equation

\[
x^n - rz - r = 0.
\]

Lemma 4. Consider

\[
\prod_{k=1}^{n} \left( c + \lambda_k b + \lambda_k^2 a \right) = c^n - rc \left[(as)^{n-1} + (at)^{n-1}\right] - r \left[(as)^n + (at)^n\right] + r^2 a^{n-1} (c - b + a),
\]

where

\[
s = \frac{-b + \sqrt{b^2 - 4ac}}{2a}, \quad t = \frac{-b - \sqrt{b^2 - 4ac}}{2a},
\]

and \( \lambda_k (k = 1, 2, \ldots, n) \) satisfy (12), \( a, b, c \in \mathbb{R}, a \neq 0 \).

Proof. Consider

\[
\prod_{k=1}^{n} \left( c + \lambda_k b + \lambda_k^2 a \right) = d^n \prod_{k=1}^{n} \left( \lambda_k^2 + \frac{b}{a} \lambda_k + \frac{c}{a} \right)
\]

\[
= d^n \prod_{k=1}^{n} \left( \lambda_k - s \right) \left( \lambda_k - t \right)
\]

\[
= d^n \prod_{k=1}^{n} \left( s - \lambda_k \right) \left( t - \lambda_k \right),
\]

while

\[
s + t = \frac{-b}{a}, \quad st = \frac{c}{a},
\]

\[
s = \frac{-b + \sqrt{b^2 - 4ac}}{2a}, \quad t = \frac{-b - \sqrt{b^2 - 4ac}}{2a}.
\]

Since \( \lambda_k (k = 1, 2, \ldots, n) \) satisfy (12), we must have

\[
x^n - rz - r = \prod_{k=1}^{n} \left( x - \lambda_k \right).
\]

Proof. The matrix \( A \) can be written as

\[
A = \begin{pmatrix}
F_0 & F_1 & \cdots & F_{n-1} \\
F_{r-1} & F_0 + rF_{r-1} & \cdots & F_{n-2} \\
\vdots & \vdots & \ddots & \vdots \\
F_2 & rF_1 + rF_2 & \cdots & F_1 \\
F_1 & rF_2 + rF_1 & \cdots & F_0 + rF_{n-1}
\end{pmatrix}.
\]
Using Lemma 3, the determinant of $A$ is

$$
\det A = \prod_{k=1}^{n} \left( \frac{\alpha - \beta}{\alpha - \beta} \varepsilon_k + \cdots + \frac{\alpha^{n-1} - \beta^{n-1}}{\alpha - \beta} \varepsilon_k \right)
$$

(22)

Using Lemma 4, we obtain

$$
\det A = \frac{(-rF_n)^n - (-r)^{n-1}F_{n-1}}{1 - rL_{n-1} - rL_n + (-1)^{n-1}r^2} + \left( -r \right)^{n-1}F_{n-1} \frac{g_1^{n-1} + h_1^{n-1}}{1 - rL_{n-1} - rL_n + (-1)^{n-1}r^2}
$$

(23)

where

$$
g_1 = \frac{(rF_n + rF_{n-1} - 1)}{-2rF_n} + \sqrt{r^2(F_n - F_{n-1})^2 - 2r(F_n + F_{n+1})},
$$

$$
h_1 = \frac{(rF_n + rF_{n-1} - 1)}{-2rF_n} - \sqrt{r^2(F_n - F_{n-1})^2 - 2r(F_n + F_{n+1})},
$$

(24)

Using the method in Theorem 5 similarly, we also have the following.

**Theorem 6.** Let $A' = \text{RFPrLrcirc}_r(F_{n-1}, \ldots, F_0)$. Then

$$
\det A' = \frac{(r - F_{n-1})^n - r(r - F_{n-1})(F_n - r)^{n-1}}{(-1)^n + rL_{n-1} - rL_n + r^2} - \frac{r(F_n - r)^n}{(-1)^n + rL_{n-1} - rL_n + r^2}.
$$

(25)

**Theorem 7.** Let $F = \text{RLPrFLrcirc}_r(F_0, \ldots, F_{n-1})$. Then

$$
\det F = \frac{(r - F_{n-1})^n - r(r - F_{n-1})(F_n - r)^{n-1}}{(-1)^n + rL_{n-1} - rL_n + r^2} \times (-1)^{n(n-1)/2} - \frac{r(F_n - r)^n}{(-1)^n + rL_{n-1} - rL_n + r^2}.
$$

(26)

**Proof.** The matrix $F$ can be written as

$$
F = \begin{pmatrix}
F_0 & \cdots & F_{n-2} & F_{n-1} \\
F_1 & \cdots & F_{n-3} + rF_{n-2} & \cdots \\
\vdots & \ddots & \ddots & \ddots \\
F_{n-1} + rF_0 & \cdots & rF_{n-3} + rF_{n-2} & rF_{n-1}
\end{pmatrix}
$$

(27)

Hence, we have

$$
\det F = \det A' \det \Gamma,
$$

(28)

where $A' = \text{RFPrLrcirc}_r(F_{n-1}, F_{n-2}, \ldots, F_0)$ and its determinant is obtained from Theorem 6,

$$
\det A' = \frac{(r - F_{n-1})^n - r(r - F_{n-1})(F_n - r)^{n-1}}{(-1)^n + rL_{n-1} - rL_n + r^2} - \frac{r(F_n - r)^n}{(-1)^n + rL_{n-1} - rL_n + r^2}.
$$

(29)

In addition,

$$
\det \Gamma = (-1)^{n(n-1)/2},
$$

(30)

so

$$
\det F = \frac{(r - F_{n-1})^n - r(r - F_{n-1})(F_n - r)^{n-1}}{(-1)^n + rL_{n-1} - rL_n + r^2} \times (-1)^{n(n-1)/2} - \frac{r(F_n - r)^n}{(-1)^n + rL_{n-1} - rL_n + r^2}.
$$

(31)

4. Determinant of the RFM_rLrR and RLM_rFrL Circulant Matrices with the Lucas Numbers

**Theorem 8.** Let $B = \text{RFPrLrcirc}_r(L_0, L_1, \ldots, L_{n-1})$. Then

$$
\det B = \frac{(2 - rL_n)^n}{1 - rL_{n-1} - rL_n + (-1)^{n-1}r^2} + \left( -r \right)^{n-1}L_{n-1} \frac{g_1^{n-1} + h_1^{n-1}}{1 - rL_{n-1} - rL_n + (-1)^{n-1}r^2} - \left( -r \right)^{n-1}L_{n-1} \frac{rL_n}{1 - rL_{n-1} - rL_n + (-1)^{n-1}r^2}.
$$

(32)
where

\[ g_2 = \frac{1 + rL_{n-1} + rL_n}{-2rL_{n-1}} + \frac{\sqrt{r^2(L_n - L_{n-1})^2 + 10rL_{n-1} + 2rL_n + 1}}{-2rL_{n-1}}, \] 

\[ h_2 = \frac{1 + rL_{n-1} + rL_n}{-2rL_{n-1}} - \frac{\sqrt{r^2(L_n - L_{n-1})^2 + 10rL_{n-1} + 2rL_n + 1}}{-2rL_{n-1}}. \]  

(33)

Proof. The matrix \( B \) can be written as

\[ B = \begin{pmatrix} L_0 & L_1 & \cdots & L_{n-1} \\ rL_{n-1} & L_1 + rL_{n-1} & \cdots & L_{n-2} \\ \vdots & \vdots & \ddots & \vdots \\ rL_2 & rL_3 + rL_2 & \cdots & L_1 \\ rL_1 & rL_2 + rL_1 & \cdots & L_0 + rL_{n-1} \end{pmatrix}. \]  

(34)

Using Lemma 3, we have

\[ \det B = \prod_{k=1}^{n} \left( L_0 + L_1 \epsilon_k + \cdots + L_{n-1} \epsilon_k^{n-1} \right) \]

\[ = \prod_{k=1}^{n} \left[ 2 + (\alpha + \beta) \epsilon_k + \cdots + (\alpha^{n-1} + \beta^{n-1}) \epsilon_k^{n-1} \right] \]

\[ = \prod_{k=1}^{n} \left\{ -rL_{n-1} \epsilon_k^2 - (1 + rL_n + rL_{n-1}) \epsilon_k - 2 + rL_n \right\}. \]  

(35)

According to Lemma 4, we obtain

\[ \prod_{k=1}^{n} \left\{ -rL_{n-1} \epsilon_k^2 - (1 + rL_n + rL_{n-1}) \epsilon_k - 2 + rL_n \right\} \]

\[ = (2 - rL_n)^n - (r)^nL_{n-1}^{n-1} \left( 2 - rL_n \right) \left( g_2^{n-1} + h_2^{n-1} \right) \]

\[ - (r)^nL_{n-1}^{n-1} \left[ rL_{n-1} \left( g_2^n + h_2^n \right) + 3r \right]. \]  

Then, we get

\[ \det B = \frac{(2 - rL_n)^n}{1 - rL_{n-1} - rL_n + (-1)^{n-1}r^2} \]

\[ + \frac{(-r)^nL_{n-1}^{n-1} \left( 2 - rL_n \right) \left( g_2^{n-1} + h_2^{n-1} \right)}{1 - rL_{n-1} - rL_n + (-1)^{n-1}r^2} \]

\[ - \frac{(-r)^nL_{n-1}^{n-1} \left[ rL_{n-1} \left( g_2^n + h_2^n \right) - 3r \right]}{1 - rL_{n-1} - rL_n + (-1)^{n-1}r^2}. \]  

(37)

\[ g_3 = \frac{1 + rL_{n-1} + rL_n}{-2rL_{n-1}} + \frac{\sqrt{r^2(L_n - L_{n-1})^2 + 10rL_{n-1} + 2rL_n + 1}}{-2rL_{n-1}}, \]

\[ h_3 = \frac{1 + rL_{n-1} + rL_n}{-2rL_{n-1}} - \frac{\sqrt{r^2(L_n - L_{n-1})^2 + 10rL_{n-1} + 2rL_n + 1}}{-2rL_{n-1}}. \]  

Using the method in Theorem 8 similarly, we also have the following.

**Theorem 9.** Let \( \mathbb{BB}' = \text{RFPPrLRcirc}_f(L_{n-1}, \ldots, L_0). \) Then

\[ \det \mathbb{B}' = \frac{(-r - L_{n-1})^n}{(-1)^n + rL_{n-1} - rL_n + r^2} \]

\[ + \frac{2^{n-1}r^n (r + L_{n-1}) \left( g_3^{n-1} + h_3^{n-1} \right)}{(-1)^n + rL_{n-1} - rL_n + r^2}, \]  

(39)

where

\[ g_3 = \frac{L_n - r + \sqrt{(r - L_n)^2 + 8r \left( r + L_{n-1} \right)}}{4r}, \]

\[ h_3 = \frac{L_n - r - \sqrt{(r - L_n)^2 + 8r \left( r + L_{n-1} \right)}}{4r}. \]  

(40)

**Theorem 10.** Let \( \mathbb{LL}' = \text{RPLPrFLcirc}_f(L_0, L_1, \ldots, L_{n-1}). \) Then

\[ \det \mathbb{L}' = \frac{(-r - L_{n-1})^n}{(-1)^n + rL_{n-1} - rL_n + r^2} \]

\[ \times \frac{(-1)^{n(n-1)/2}}{(-1)^{n(n-1)/2}} \]

\[ + \frac{2^{n-1}r^n (r + L_{n-1}) \left( g_3^{n-1} + h_3^{n-1} \right)}{(-1)^n + rL_{n-1} - rL_n + r^2}, \]

\[ + \frac{2^{n-1}r^n \left[ -2r \left( g_3^n + h_3^n \right) + r \left( L_n - L_{n-1} \right) \right]}{(-1)^n + rL_{n-1} - rL_n + r^2}, \]  

(41)

where

\[ g_3 = \frac{L_n - r + \sqrt{(r - L_n)^2 + 8r \left( r + L_{n-1} \right)}}{4r}, \]

\[ h_3 = \frac{L_n - r - \sqrt{(r - L_n)^2 + 8r \left( r + L_{n-1} \right)}}{4r}. \]  

(42)
Abstract and Applied Analysis

Proof. The matrix \( L \) can be written as
\[
L = \begin{pmatrix}
L_0 & \cdots & L_{n-2} & L_{n-1} \\
L_1 & \cdots & L_{n-1} + rL_0 & rL_0 \\
\vdots & \ddots & \ddots & \vdots \\
L_{n-2} & \cdots & rL_{n-4} + rL_{n-3} & rL_{n-3} \\
L_{n-1} - rL_0 & \cdots & rL_{n-3} + rL_{n-2} & rL_{n-2}
\end{pmatrix}
\]
where
\[
\begin{pmatrix}
0 & 0 & \cdots & 0 & 1 \\
0 & \cdots & 0 & 1 & 0 \\
\vdots & \ddots & \ddots & \ddots & \vdots \\
0 & 1 & \cdots & 0 & 0 \\
1 & 0 & \cdots & 0 & 0
\end{pmatrix} = B I.
\]
Thus, we have
\[
\det L = \det B \det \Gamma,
\]
where matrix \( B^t = \text{RFPrLRcirc_fr}(L_{n-1}, \ldots, L_0) \) and its determinant can be obtained from Theorem 9,
\[
\det B = \frac{(-r - L_{n-1})^n}{(-1)^n + rL_{n-1} - rL_n + r^2}
+ \frac{2^{n-1}r^n (r + L_{n-1}) (g_3^{n-1} + h_3^{n-1})}{(-1)^n + rL_{n-1} - rL_n + r^2}
+ \frac{2^{n-1}r^n [-2r (g_3^n + h_3^n) + r (L_n - L_{n-1})]}{(-1)^n + rL_{n-1} - rL_n + r^2},
\]
where
\[
g_3 = \frac{L_n - r + \sqrt{(r - L_n)^2 + 8r (r + L_n)}}{4r},
\]
\[
h_3 = \frac{L_n - r - \sqrt{(r - L_n)^2 + 8r (r + L_n)}}{4r}.
\]
In addition,
\[
\det \Gamma = (-1)^{n(n-1)/2},
\]
so the determinant of matrix \( L \) is
\[
\begin{align*}
\det L &= \frac{(-r - L_{n-1})^n}{(-1)^n + rL_{n-1} - rL_n + r^2} (-1)^{n(n-1)/2} \\
&\quad + \frac{2^{n-1}r^n (r + L_{n-1}) (g_3^{n-1} + h_3^{n-1})}{(-1)^n + rL_{n-1} - rL_n + r^2} (-1)^{n(n-1)/2} \\
&\quad + \frac{2^{n-1}r^n [-2r (g_3^n + h_3^n) + r (L_n - L_{n-1})]}{(-1)^n + rL_{n-1} - rL_n + r^2} (-1)^{n(n-1)/2} \\
&\quad \times (-1)^{n(n-1)/2}.
\end{align*}
\]
where
\[
g_3 = \frac{L_n - r + \sqrt{(r - L_n)^2 + 8r (r + L_n)}}{4r},
\]
\[
h_3 = \frac{L_n - r - \sqrt{(r - L_n)^2 + 8r (r + L_n)}}{4r}.
\]
\]

5. Determinants of the RFP\(_r\)LR\(_r\) and RLP\(_r\)Fr\(_r\) Circulant Matrix with the Pell Numbers

Theorem 11. If \( C = \text{RFPrLrRcirc},fr(P_0, P_1, \ldots, P_{n-1}) \), then
\[
\det C = \frac{(-rP_n)^n}{1 - rP_{n-1} - rP_n + 2(-1)^{n-1}r^2}
+ \frac{\left[ P_n (g_4^{n-1} + h_4^{n-1}) + P_{n-1} (g_4^n + h_4^n) - 1 \right]}{1 - rP_{n-1} - rP_n + 2(-1)^{n-1}r^2}
\]
\times (-r)^{n+1} P_{n+1},
\]
where
\[
g_4 = \frac{rP_{n+1} + rP_n - 1}{-2r P_{n-1}}
+ \frac{\sqrt{r^2 (P_n - P_{n-1})^2 - 2r (P_n + P_{n-1}) + 1}}{2r P_{n-1}},
\]
\[
h_4 = \frac{rP_{n+1} + rP_n - 1}{-2r P_{n-1}}
- \frac{\sqrt{r^2 (P_n - P_{n-1})^2 - 2r (P_n + P_{n-1}) + 1}}{2r P_{n-1}}.
\]

Proof. The matrix \( C \) can be written as
\[
C = \begin{pmatrix}
P_0 & P_1 & \cdots & P_{n-1} \\
rP_n & P_0 + rP_{n-1} & P_1 & \cdots & P_{n-2} \\
\vdots & \vdots & \ddots & \ddots & \vdots \\
rP_1 & rP_2 & \cdots & P_0 + rP_{n-1}
\end{pmatrix}_{n \times n},
\]
Using Lemma 3, the determinant of \( C \) is
\[
\det C = \prod_{k=1}^n \left( P_0 + P_1 e_k + \cdots + P_{n-1} e_k^{n-1} \right)
= \prod_{k=1}^n \left( \frac{\alpha_1 - \beta_1 e_k + \cdots + \alpha_1^{n-1} - \beta_1^{n-1} e_k^{n-1}}{\alpha_1 - \beta_1} \right)
= \prod_{k=1}^n \left( -rP_{n-1} e_k^2 + (1 - rP_{n-1} - rP_n) e_k - rP_n \right)
\]
\[
= \prod_{k=1}^n \left( -2rP_{n-1} e_k^2 + (1 - 2rP_{n-1}) e_k - rP_n \right).
\]
According to Lemma 4, we can get
\[ \det C = \frac{(-r P_n)^n}{1 - r Q_{n-1} - r Q_n + 2(-1)^{n-1} r^2} + \frac{[P_n (g_4^{-1} + h_4^{-1}) + P_{n-1} (g_4^n + h_4^n) - 1]}{1 - r Q_{n-1} - r Q_n + 2(-1)^{n-1} r^2} \times (-r)^{n+1} b^{n-1}, \]
where
\[ g_4 = \frac{r P_{n+1} - P_n - 1}{2r P_{n+1}} \]
\[ h_4 = \frac{r P_{n+1} - P_n - 1}{2r P_{n+1}} \]
\[ \sqrt{r^2 (P_n - P_{n-1})^2 - 2r (P_n + P_{n-1}) + 1} \]

Then we can get
\[ \det \mathcal{P} = \det C \, \det \Gamma, \quad (59) \]
where \( C' = \text{FLR}_{\text{PPLR}}(P_{n-1}, P_{n-2}, \ldots, P_0) \) and its determinant could be obtained through Theorem 12; namely,
\[ \det C' = \frac{(r - P_{n-1})^n - (P_n - r)^{n-1} (r P_n - r P_{n-1})}{(1)^n + r Q_{n-1} - r Q_n + 2r^2}, \quad (60) \]
\[ \det \Gamma = (-1)^{n(n-1)/2}. \quad (61) \]

6. Determinants of the RFP\textsubscript{L}R and RLP\textsubscript{F}L Circulant Matrix with the Pell-Lucas Numbers

Theorem 12. If \( \mathcal{C}' = \text{RFP}_{\text{PPLR}} \circ \text{circ}_{fr}(P_{n-1}, P_{n-2}, \ldots, P_0) \), then
\[ \det \mathcal{C}' = \frac{(r - P_{n-1})^n - (P_n - r)^{n-1} (r P_n - r P_{n-1})}{(1)^n + r Q_{n-1} - r Q_n + 2r^2}. \quad (56) \]

Theorem 13. If \( \mathcal{P} = \text{RLP}_{\text{FLL}} \circ \text{circ}_{fr}(P_0, P_1, \ldots, P_{n-1}) \), then one has
\[ \det \mathcal{P} = \frac{(r - P_{n-1})^n - (P_n - r)^{n-1} (r P_n - r P_{n-1})}{(1)^n + r Q_{n-1} - r Q_n + 2r^2} \times (-1)^{n(n-1)/2}. \quad (57) \]

Proof. The matrix \( \mathcal{P} \) can be written as
\[
\begin{pmatrix}
- P_{n-1} & P_{n-2} & \cdots & P_0 \\
- P_{n-2} & P_{n-3} & \cdots & P_1 \\
\vdots & \vdots & \ddots & \vdots \\
- P_0 & - P_1 & \cdots & P_{n-1} \\
0 & 0 & \cdots & 0 \\
0 & 0 & \cdots & 0 \\
\vdots & \vdots & \ddots & \vdots \\
0 & 0 & \cdots & 0 \\
1 & 0 & \cdots & 0
\end{pmatrix}
\]
\[
\begin{pmatrix}
0 & 0 & \cdots & 0 & 1 \\
0 & 0 & \cdots & 0 & 1 \\
\vdots & \vdots & \ddots & \vdots & \vdots \\
0 & 0 & \cdots & 0 & 1 \\
1 & 0 & \cdots & 0
\end{pmatrix}
\]
\[
\begin{pmatrix}
P_0 & P_1 & \cdots & P_{n-2} \\
P_1 & P_0 & \cdots & P_{n-3} \\
\vdots & \vdots & \ddots & \vdots \\
P_{n-2} & P_{n-3} & \cdots & P_0 \\
0 & 0 & \cdots & 0 \\
0 & 0 & \cdots & 0 \\
\vdots & \vdots & \ddots & \vdots \\
0 & 0 & \cdots & 0 \\
1 & 0 & \cdots & 0
\end{pmatrix}
\]
\[
\begin{pmatrix}
P_0 & P_1 & \cdots & P_{n-2} \\
P_1 & P_0 & \cdots & P_{n-3} \\
\vdots & \vdots & \ddots & \vdots \\
P_{n-2} & P_{n-3} & \cdots & P_0 \\
0 & 0 & \cdots & 1 \\
0 & 0 & \cdots & 0 \\
\vdots & \vdots & \ddots & \vdots \\
0 & 0 & \cdots & 1 \\
1 & 0 & \cdots & 0
\end{pmatrix}
\]

where
\[ g_5 = \frac{2 + r Q_{n-1} + r Q_n}{-2r Q_{n-1}} \]
\[ h_5 = \frac{2 + r Q_{n-1} + r Q_n}{-2r Q_{n-1}} \]
\[ \sqrt{r^2 (Q_n - Q_{n-1})^2 + 12 r Q_{n-1} + 4 r Q_n + 4}, \]
\[ \sqrt{r^2 (Q_n - Q_{n-1})^2 + 12 r Q_{n-1} + 4 r Q_n + 4}, \]

Proof. The method is similar to Theorem 11. 

Certainly, we can get the following theorem.
Theorem 15. If $D' = RFP_{fr}LR_{circ}(Q_{n-1}, \ldots, Q_1, Q_0)$, then one gets
\[
det D' = (−2r − rQ_{n−1})^n - 2^{−n−1}r^nK
\]
where
\[
K = (−2r − Q_{n−1})(g_6^{n−1} + h_6^{n−1}) + 2r(g_6^6 + h_6^6)
\]

\[
− r(Q_n − Q_{n−1}),
\]
\[
g_6 = \frac{Q_n + \sqrt{Q_n^2 + 8rQ_{n−1} + 16r^2}}{4r},
\]
\[
h_6 = \frac{Q_n - \sqrt{Q_n^2 + 8rQ_{n−1} + 16r^2}}{4r}.
\]

Theorem 16. If $Q = RLPr FR_{circ}(Q_0, Q_1, \ldots, Q_{n−1})$, then
\[
det Q = (−2r − rQ_{n−1})^n - 2^{−n−1}r^nK
\]
\[
(−1)^n + rQ_{n−1} − rQ_n + 2r^2(−1)^{n(n−1)/2},
\]
where
\[
K = (−2r − Q_{n−1})(g_6^{n−1} + h_6^{n−1}) + 2r(g_6^6 + h_6^6)
\]

\[
− r(Q_n − Q_{n−1}),
\]
\[
g_6 = \frac{Q_n + \sqrt{Q_n^2 + 8rQ_{n−1} + 16r^2}}{4r},
\]
\[
h_6 = \frac{Q_n - \sqrt{Q_n^2 + 8rQ_{n−1} + 16r^2}}{4r}.
\]

7. Conclusion

The determinant problems of the RFPPr Lr R circulant matrices and RLPPrFrL circulant matrices involving the Fibonacci, Lucas, Pell, and Pell-Lucas number are considered in this paper. The explicit determinants are presented by using some terms of these numbers.

Conflict of Interests

The authors declare that there is no conflict of interests regarding the publication of this paper.
