Let K be a nonempty closed convex subset of a real Banach space E , let $S : K \rightarrow K$ be nonexpansive, and let $T : K \rightarrow K$ be Lipschitz strongly pseudocontractive mappings such that $p \in F(S) \cap F(T) = \{x \in K : Sx = Tx = x\}$ and $\|x - Sy\| \leq \|Sx - Ty\|$ and $\|x - Ty\| \leq \|Tx - Ty\|$ for all $x, y \in K$. Let $\{\beta_n\}$ be a sequence in $[0, 1]$ satisfying (i) $\sum_{n=1}^{\infty} \beta_n = \infty$; (ii) $\lim_{n \rightarrow \infty} \beta_n = 0$. For arbitrary $x_0 \in K$, let $\{x_n\}$ be a sequence iteratively defined by $x_n = Sy_n$, $y_n = (1 - \beta_n)x_{n-1} + \beta_nTx_{n-1}$, $n \geq 1$. Then the sequence $\{x_n\}$ converges strongly to a common fixed point p of S and T .

1. Introduction and Preliminaries

Let E be a real Banach space and let K be a nonempty convex subset of E . Let J denote the normalized duality mapping from E to 2^{E^*} defined by

$$J(x) = \{f^* \in E^* : \langle x, f^* \rangle = \|x\|^2, \|f^*\| = \|x\|\}, \quad x \in E, \quad (1)$$

where E^* denotes the dual space of E and $\langle \cdot, \cdot \rangle$ denotes the generalized duality pairing. We will denote the single-valued duality map by j .

Let $T : K \rightarrow K$ be a mapping.

Definition 1. The mapping T is said to be *Lipschitzian* if there exists $L > 1$ such that

$$\|Tx - Ty\| \leq L\|x - y\| \quad (2)$$

for all $x, y \in K$.

Definition 2. The mapping T is said to be *nonexpansive* if

$$\|Tx - Ty\| \leq \|x - y\| \quad (3)$$

for all $x, y \in K$.

Definition 3. The mapping T is said to be *pseudocontractive* if

$$\|x - y\| \leq \|x - y + t((I - T)x - (I - T)y)\| \quad (4)$$

for all $x, y \in K$ and $t > 0$.

Remark 4. As a consequence of a result of Kato [1], it follows from the inequality that T is pseudocontractive if and only if there exists $j(x - y) \in J(x - y)$ such that

$$\langle Tx - Ty, j(x - y) \rangle \leq \|x - y\|^2 \quad (5)$$

for all $x, y \in K$.

Definition 5. The mapping T is said to be *strongly pseudocontractive* if there exists a constant $t > 1$ such that

$$\|x - y\| \leq \|(1 + r)(x - y) - rt(Tx - Ty)\| \quad (6)$$

for all $x, y \in K$ and $r > 0$. Or equivalently (see [2]) one has for $0 < k < 1$

$$\langle Tx - Ty, j(x - y) \rangle \leq k\|x - y\|^2 \quad (7)$$

for all $x, y \in K$.

For a nonempty convex subset K of a normed space E , $T : K \rightarrow K$ is a mapping.

(I) The sequence $\{x_n\}$, defined by, for arbitrary $x_1 \in K$,

$$\begin{aligned} x_{n+1} &= (1 - a_n)x_n + a_nTy_n, \\ y_n &= (1 - b_n)x_n + b_nTx_n, \quad n \geq 1, \end{aligned} \quad (8)$$

where $\{a_n\}$ and $\{b_n\}$ are sequences in $[0, 1]$, is known as the Ishikawa iteration process [3].

If $b_n = 0$ for $n \geq 1$, then the Ishikawa iteration scheme becomes the Mann iteration process [4].

(S) The sequence $\{x_n\}$, defined by, for arbitrary $x_1 \in K$,

$$\begin{aligned} x_{n+1} &= Ty_n, \\ y_n &= (1 - b_n)x_n + b_nTx_n, \quad n \geq 1, \end{aligned} \quad (9)$$

where $\{b_n\}$ is a sequence in $[0, 1]$, is known as the S-iteration process [5, 6].

In the last few years or so, numerous papers have been published on the iterative approximation of fixed points of Lipschitz strongly pseudocontractive mappings using the Ishikawa iteration scheme (see, e.g., [3]). Results which had been known only in Hilbert spaces and only for Lipschitz mappings have been extended to more general Banach spaces (see, e.g., [7–13] and the references cited therein).

In 1974, Ishikawa [3] proved the following result.

Theorem 6. *Let K be a compact convex subset of a Hilbert space H and let $T : K \rightarrow K$ be a Lipschitzian pseudocontractive mapping. For arbitrary $x_1 \in K$, let $\{x_n\}$ be a sequence defined iteratively by*

$$\begin{aligned} x_{n+1} &= (1 - \alpha_n)x_n + \alpha_nTy_n, \\ y_n &= (1 - \beta_n)x_n + \beta_nTx_n, \quad n \geq 1, \end{aligned} \quad (10)$$

where $\{\alpha_n\}$ and $\{\beta_n\}$ are sequences satisfying

- (i) $0 \leq \alpha_n \leq \beta_n < 1$;
- (ii) $\lim_{n \rightarrow \infty} \beta_n = 0$;
- (iii) $\sum_{n=1}^{\infty} \alpha_n \beta_n = \infty$.

Then the sequence $\{x_n\}$ converges strongly to a fixed point of T .

In [7], Chidume extended the results of Schu [12] from Hilbert spaces to the much more general class of real Banach spaces and approximate the fixed points of pseudocontractive mappings. Also, in [14], he investigated the approximation of the fixed points of strongly pseudocontractive mappings.

In [15], Zhou and Jia gave the answer of the question raised by Chidume [14] and proved the following.

If X is a real Banach space with a uniformly convex dual X^* , K is a nonempty bounded closed convex subset of X , and $T : K \rightarrow K$ is a continuous strongly pseudocontractive mapping, then the Ishikawa iteration scheme converges strongly to the unique fixed point of T .

In [16], Liu et al. introduced the following condition.

Remark 7. Let $S, T : K \rightarrow K$ be two mappings. The mappings S and T are said to satisfy *condition (C1)* if

$$\|x - Ty\| \leq \|Sx - Ty\| \quad (C1)$$

for all $x, y \in K$.

In 2012, Kang et al. [17] established the strong convergence for the implicit S-iterative process associated with Lipschitzian hemiccontractive mappings in Hilbert spaces.

Theorem 8. *Let K be a compact convex subset of a real Hilbert space H and let $T : K \rightarrow K$ be a Lipschitzian hemiccontractive mapping satisfying*

$$\|x - Ty\| \leq \|Tx - Ty\| \quad (C2)$$

for all $x, y \in K$. Let $\{\beta_n\}$ be a sequence in $[0, 1]$ satisfying

- (i) $\sum_{n=1}^{\infty} \beta_n = \infty$;
- (ii) $\sum_{n=1}^{\infty} \beta_n^2 < \infty$.

For arbitrary $x_0 \in K$, let $\{x_n\}$ be a sequence iteratively defined by

$$\begin{aligned} x_n &= Ty_n, \\ y_n &= (1 - \beta_n)x_{n-1} + \beta_nTx_n, \quad n \geq 1. \end{aligned} \quad (11)$$

Then the sequence $\{x_n\}$ converges strongly to the fixed point x^* of T .

In 2013, Kang et al. [18] proved the following result.

Theorem 9. *Let K be a nonempty closed convex subset of a real Banach space E , let $S : K \rightarrow K$ be a nonexpansive mapping, and let $T : K \rightarrow K$ be a Lipschitz strongly pseudocontractive mapping such that $p \in F(S) \cap F(T) = \{x \in K : Sx = Tx = x\}$ and*

$$\|x - Sy\| \leq \|Sx - Sy\|, \quad \|x - Ty\| \leq \|Tx - Ty\| \quad (C3)$$

for all $x, y \in K$. Let $\{\beta_n\}$ be a sequence in $[0, 1]$ satisfying

- (i) $\sum_{n=1}^{\infty} \beta_n = \infty$;
- (ii) $\lim_{n \rightarrow \infty} \beta_n = 0$.

For arbitrary $x_1 \in K$, let $\{x_n\}$ be a sequence iteratively defined by

$$\begin{aligned} x_{n+1} &= Sy_n, \\ y_n &= (1 - \beta_n)x_n + \beta_nTx_n, \quad n \geq 1. \end{aligned} \quad (12)$$

Then the sequence $\{x_n\}$ converges strongly to a common fixed point p of S and T .

Keeping in view the importance of the implicit iteration schemes (see [17]) in this paper we establish the strong convergence theorem for the hybrid implicit S-iterative scheme associated with nonexpansive and Lipschitz strongly pseudocontractive mappings in real Banach spaces.

2. Main Results

We will need the following results.

Lemma 10 (see [19, 20]). *Let $J : E \rightarrow 2^{E^*}$ be the normalized duality mapping. Then for any $x, y \in E$, one has*

$$\begin{aligned} \|x + y\|^2 &\leq \|x\|^2 + 2 \langle y, j(x + y) \rangle, \\ \forall j(x + y) &\in J(x + y). \end{aligned} \quad (13)$$

Lemma 11 (see [13]). *Let $\{\rho_n\}$ and $\{\theta_n\}$ be nonnegative sequences satisfying*

$$\rho_{n+1} \leq (1 - \theta_n) \rho_n + b_n, \quad (14)$$

where $\theta_n \in [0, 1)$, $\sum_{n=1}^{\infty} \theta_n = \infty$, and $b_n = o(\theta_n)$. Then $\lim_{n \rightarrow \infty} \rho_n = 0$.

The following is our main result.

Theorem 12. *Let K be a nonempty closed convex subset of a real Banach space E , let $S : K \rightarrow K$ be a nonexpansive mapping, and let $T : K \rightarrow K$ be a Lipschitz strongly pseudocontractive mapping such that $p \in F(S) \cap F(T) = \{x \in K : Sx = Tx = x\}$ and condition (C3).*

Let $\{\beta_n\}$ be a sequence in $[0, 1]$ satisfying

- (i) $\sum_{n=1}^{\infty} \beta_n = \infty$;
- (ii) $\lim_{n \rightarrow \infty} \beta_n = 0$.

For arbitrary $x_0 \in K$, let $\{x_n\}$ be a sequence iteratively defined by

$$\begin{aligned} x_n &= Sy_n, \\ y_n &= (1 - \beta_n)x_{n-1} + \beta_n Tx_n, \quad n \geq 1. \end{aligned} \quad (15)$$

Then the sequence $\{x_n\}$ converges strongly to a common fixed point p of S and T .

Proof. For strongly pseudocontractive mappings, the existence of a fixed point follows from Deimling [21]. It is shown in [15] that the set of fixed points for strongly pseudocontractions is a singleton.

By (ii), since $\lim_{n \rightarrow \infty} \beta_n = 0$, there exists $n_0 \in \mathbb{N}$ such that $\forall n \geq n_0$,

$$\beta_n \leq \min \left\{ \frac{1}{4k}, \frac{1-k}{2(1+L)(1+2L)} \right\}, \quad (16)$$

where $k < 1/2$ and L is a Lipschitz constant of T . Consider

$$\begin{aligned} \|x_n - p\|^2 &= \langle x_n - p, j(x_n - p) \rangle \\ &= \langle Sy_n - p, j(x_n - p) \rangle \\ &= \langle Tx_n - p, j(x_n - p) \rangle + \langle Sy_n - Tx_n, j(x_n - p) \rangle \\ &\leq k\|x_n - p\|^2 + \|Sy_n - Tx_n\| \|x_n - p\|, \end{aligned} \quad (17)$$

where

$$\begin{aligned} \|Sy_n - Tx_n\| &\leq \|Sy_n - Ty_n\| + \|Ty_n - Tx_n\| \\ &\leq \|x_n - Sy_n\| + \|x_n - Ty_n\| + \|Ty_n - Tx_n\| \\ &\leq \|Sx_n - Sy_n\| + \|Tx_n - Ty_n\| + \|Ty_n - Tx_n\| \\ &= \|Sx_n - Sy_n\| + 2\|Tx_n - Ty_n\| \\ &\leq (1 + 2L) \|x_n - y_n\|, \end{aligned} \quad (18)$$

$$\begin{aligned} \|x_n - y_n\| &\leq \|x_n - x_{n-1}\| + \|x_{n-1} - y_n\| \\ &= \|Sy_n - x_{n-1}\| + \|x_{n-1} - y_n\| \\ &\leq \|Sx_{n-1} - Sy_n\| + \|x_{n-1} - y_n\| \\ &\leq 2\|x_{n-1} - y_n\| \\ &= 2\beta_n \|x_{n-1} - Tx_n\| \\ &\leq 2\beta_n (\|x_{n-1} - p\| + \|p - Tx_n\|) \\ &\leq 2\beta_n (\|x_{n-1} - p\| + L\|x_n - p\|), \end{aligned} \quad (19)$$

and consequently from (18) and (19), we obtain

$$\begin{aligned} \|Sy_n - Tx_n\| &\leq 2(1 + 2L)\beta_n \|x_{n-1} - p\| \\ &\quad + 2L(1 + 2L)\beta_n \|x_n - p\|. \end{aligned} \quad (20)$$

Substituting (20) in (17) and using (16), we get

$$\begin{aligned} \|x_n - p\| &\leq \frac{2(1 + 2L)\beta_n}{1 - k - 2L(1 + 2L)\beta_n} \|x_{n-1} - p\| \\ &\leq \|x_{n-1} - p\| \quad \text{for } n \geq n_0. \end{aligned} \quad (21)$$

So, from the above discussion, we can conclude that the sequence $\{x_n - p\}$ is bounded. Since T is Lipschitzian, so $\{Tx_n - p\}$ is also bounded. Let $M_1 = \sup_{n \geq 1} \|x_n - p\| + \sup_{n \geq 1} \|Tx_n - p\|$. Also by (ii), we have

$$\begin{aligned} \|x_{n-1} - y_n\| &= \beta_n \|x_{n-1} - Tx_n\| \\ &\leq M_1 \beta_n \\ &\rightarrow 0 \end{aligned} \quad (22)$$

as $n \rightarrow \infty$, which implies that $\{x_{n-1} - y_n\}$ is bounded, so let $M_2 = \sup_{n \geq 1} \|x_{n-1} - y_n\| + M_1$. Further

$$\begin{aligned} \|y_n - p\| &\leq \|y_n - x_{n-1}\| + \|x_{n-1} - p\| \\ &\leq M_2, \end{aligned} \quad (23)$$

which implies that $\{y_n - p\}$ is bounded. Therefore $\{Ty_n - p\}$ is also bounded.

Set

$$M_3 = \sup_{n \geq 1} \|y_n - p\| + \sup_{n \geq 1} \|Ty_n - p\|. \quad (24)$$

Denote $M = M_1 + M_2 + M_3$. Obviously $M < \infty$. Now, from (15), for all $n \geq 1$, we obtain

$$\|x_n - p\|^2 = \|Sy_n - p\|^2 \leq \|y_n - p\|^2, \quad (25)$$

and by Lemma 10,

$$\begin{aligned} & \|y_n - p\|^2 \\ &= \|(1 - \beta_n)x_{n-1} + \beta_n Tx_n - p\|^2 \\ &= \|(1 - \beta_n)(x_{n-1} - p) + \beta_n(Tx_n - p)\|^2 \\ &\leq (1 - \beta_n)^2 \|x_{n-1} - p\|^2 + 2\beta_n \langle Tx_n - p, j(y_n - p) \rangle \\ &= (1 - \beta_n)^2 \|x_{n-1} - p\|^2 + 2\beta_n \langle Ty_n - p, j(y_n - p) \rangle \\ &\quad + 2\beta_n \langle Tx_n - Ty_n, j(y_n - p) \rangle \\ &\leq (1 - \beta_n)^2 \|x_{n-1} - p\|^2 + 2k\beta_n \|y_n - p\|^2 \\ &\quad + 2\beta_n \|Tx_n - Ty_n\| \|y_n - p\| \\ &\leq (1 - \beta_n)^2 \|x_{n-1} - p\|^2 + 2k\beta_n \|y_n - p\|^2 \\ &\quad + 2ML\beta_n \|x_n - y_n\|, \quad \forall j(y_n - p) \in J(y_n - p), \end{aligned} \quad (26)$$

which implies that

$$\begin{aligned} & \|y_n - p\|^2 \\ &\leq \frac{(1 - \beta_n)^2}{1 - 2k\beta_n} \|x_{n-1} - p\|^2 + \frac{2ML\beta_n}{1 - 2k\beta_n} \|x_n - y_n\| \\ &\leq (1 - \beta_n) \|x_{n-1} - p\|^2 + 4ML\beta_n \|x_n - y_n\| \quad \text{for } n \geq n_0. \end{aligned} \quad (27)$$

Because of (16), we have $(1 - \beta_n)/(1 - 2k\beta_n) \leq 1$ and $1/(1 - 2k\beta_n) \leq 2$. Also, by (ii) and (19), $\|x_n - y_n\| \leq 2M(1+L)\beta_n \rightarrow 0$ as $n \rightarrow \infty$.

Hence (25) and (27) give

$$\|x_n - p\|^2 \leq (1 - \beta_n) \|x_{n-1} - p\|^2 + 4ML\beta_n \|x_n - y_n\|. \quad (28)$$

For all $n \geq 1$, put

$$\begin{aligned} \rho_n &= \|x_{n-1} - p\|, \\ \theta_n &= \beta_n, \\ b_n &= 4ML\beta_n \|x_n - y_n\|; \end{aligned} \quad (29)$$

then according to Lemma 11, we obtain from (28) that

$$\lim_{n \rightarrow \infty} \|x_n - p\| = 0. \quad (30)$$

This completes the proof. $\square$

Corollary 13. Let K be a nonempty closed convex subset of a real Hilbert space H , let $S : K \rightarrow K$ be a nonexpansive mapping, and let $T : K \rightarrow K$ be a Lipschitz strongly pseudocontractive mapping such that $p \in F(S) \cap F(T) = \{x \in K : Sx = Tx = x\}$ and condition (C3). Let $\{\beta_n\}$ be a sequence in $[0, 1]$ satisfying conditions (i) and (ii) in Theorem 12.

For arbitrary $x_0 \in K$, let $\{x_n\}$ be a sequence iteratively defined by (15). Then the sequence $\{x_n\}$ converges strongly to a common fixed point p of S and T .

Example 14. As a particular case, we may choose, for instance, $\beta_n = 1/n$.

Remark 15. (1) Condition (C2) is due to Kang et al. [17] and condition (C1) with $S = T$ becomes condition (C2).

(2) Condition (C3) is due to Kang et al. [18] and condition (C3) with $S = T$ becomes condition (C2).

Conflict of Interests

The authors declare that there is no conflict of interests regarding the publication of this paper.

Acknowledgments

The authors would like to thank the editor and all referees for their valuable comments and suggestions for improving the paper. This study was supported by research funds from Dong-A University.
