We study the existence of positive solution for the eigenvalue problem of semipositone fractional order differential equation with multipoint boundary conditions by using known Krasnosel’skii’s fixed point theorem. Some sufficient conditions that guarantee the existence of at least one positive solution for eigenvalues \( \lambda > 0 \) sufficiently small and \( \lambda > 0 \) sufficiently large are established.

1. Introduction

In this paper, we study the existence of positive solutions to the following eigenvalue problem of semipositone fractional order differential equation with multipoint boundary conditions:

\[
-\mathcal{D}_t^\alpha x(t) = \lambda f(t, x(t), \mathcal{D}_t^\gamma x(t)), \quad t \in (0, 1), \\
\mathcal{D}_t^\gamma x(0) = 0, \quad \mathcal{D}_t^{\gamma+1} x(0) = 0, \\
\mathcal{D}_t^\gamma x(1) = \sum_{j=1}^{m-2} a_j \mathcal{D}_t^\gamma x(\xi_j),
\]

where \( 3 < \alpha \leq 4, 0 < \gamma \leq \alpha - 2, 0 < \xi_1 < \xi_2 < \cdots < \xi_{m-2} < 1, a_j \in [0, +\infty) \) with \( 0 < \sum_{j=1}^{m-2} a_j \xi_j^{\alpha-\gamma-1} < 1 \), \( \lambda \) is a positive parameter, and \( \mathcal{D}_t^\gamma, \mathcal{D}_t^\alpha \) are the standard Riemann-Liouville derivative. Throughout the paper, we assume that \( f \) is semipositone; that is, \( f : [0, 1] \times [0, +\infty) \to \mathbb{R} \) is continuous and there exists \( M > 0 \), such that \( f(t, x) \geq -M \), for any \( (t, x) \in [0, 1] \times [0, \infty) \).

The multipoint boundary value problems (BVPs for short) for ordinary differential equations arise in a variety of different applied mathematics and physics. Recently, Feng and Bai [1] investigated the existence of positive solutions for a semipositone second-order multipoint boundary value problem:

\[
x''(t) + \lambda f(t, x(t)) = 0, \quad t \in (0, 1), \\
x'(0) = \sum_{j=1}^{m-2} a_j x(\xi_j), \quad x(1) = \sum_{j=1}^{m-2} b_j x(\xi_j).
\]

By using Krasnosel’skii’s fixed point theorem, some sufficient conditions that guarantee the existence of at least one positive solution are obtained. In [2], a \((n-1, 1)\)-type conjugate boundary value problem for the nonlinear fractional differential equation,

\[
\mathcal{D}_t^\alpha x(t) + \lambda f(t, x(t)) = 0, \quad t \in (0, 1), \\
x'(0) = 0, \quad 0 \leq j \leq n-2, \quad x(1) = 0,
\]

is considered. Based on the nonlinear alternative of Leray-Schauder type and Krasnosel’skii’s fixed-point theorems, the existence of positive solution of the semipositone boundary value problems (3) for a sufficiently small \( \lambda > 0 \) was given. In recent paper [3], Zhang et al. established the existence of multiple positive solutions for a general higher
order fractional differential equation with derivatives and a negatively Carathéodory perturbed term:

\[-\mathcal{D}^\alpha x(t) = p(t) f(t, x(t), \mathcal{D}^\mu x(t), \mathcal{D}^\nu x(t), \ldots, \mathcal{D}^{\mu-1} x(t)) \]

\[- g(t, x(t), \mathcal{D}^\mu x(t), \mathcal{D}^\nu x(t), \ldots, \mathcal{D}^{\mu-1} x(t)), \]

\[\mathcal{D}^\mu x(0) = 0, \quad 1 \leq i \leq n-1,\]

\[\mathcal{D}^{\mu-1} x(0) = 0, \quad \mathcal{D}^{\mu-1} x(1) = \sum_{j=1}^{m-2} a_j \mathcal{D}^{\mu-1} x(\xi_j).\]  

(4)

Some local and nonlocal growth conditions were adopted to guarantee the existence of at least two positive solutions for the higher order fractional differential equation (4). For the recent work in application, the reader is referred to [4–20].

Inspired by the above work, in this paper we study the existence of positive solutions to the semipositone BVP (1). Here we also emphasize that the main results of this paper contain not only the cases for \( \lambda > 0 \) sufficiently small, but also for \( \lambda > 0 \) sufficiently large, which is different from [2, 3].

2. Preliminaries and Lemmas

Definition 1 (see [21–24]). The fractional integral of order \( \alpha > 0 \) of a function \( x : (a, +\infty) \to \mathbb{R} \) is given by

\[I^\alpha x(t) = \frac{1}{\Gamma(\alpha)} \int_a^t (t-s)^{\alpha-1} x(s) \, ds, \]

provided that the right-hand side is pointwisely on \((a, +\infty)\).

Definition 2 (see [21–24]). The Riemann-Liouville fractional derivative of order \( \alpha > 0 \) of a function \( x : (a, +\infty) \to \mathbb{R} \) is given by

\[D^\alpha_x x(t) = \frac{1}{\Gamma(n-\alpha)} \frac{d^n}{dt^n} \int_a^t (t-s)^{n-\alpha-1} x(s) \, ds, \]

where \( n = [\alpha] + 1, [\alpha] \) denotes the integer part of the number \( \alpha \), and \( t > a \), provided that the right-hand side is defined on \((a, +\infty)\).

Lemma 3 (see [21–24]). Assuming that \( x \in L^1[0,1] \) with a fractional derivative of order \( \alpha > 0 \), then

\[I^\alpha D^\alpha x(t) = x(t) + c_1 t^{\alpha-1} + c_2 t^{\alpha-2} + \cdots + c_n t^{\alpha-n}, \]

where \( c_i \in \mathbb{R}, i = 1, 2, \ldots, n, n = [\alpha] + 1. \)

Lemma 4 (see [3]). Suppose that \( h \in L^1[0,1] \). Then the following boundary value problem

\[\mathcal{D}^{\alpha-1} x(t) + h(t) = 0, \quad t \in (0,1),\]

\[x(0) = x'(0) = 0, \quad x(1) = \sum_{j=1}^{m-2} a_j x(\xi_j) \]

has a unique solution

\[x(t) = \int_0^1 G(t, s) h(s) \, ds, \]

where

\[G(t, s) = g(t, s) + \frac{\mu^{\alpha-1}}{1 - \sum_{j=1}^{n-2} a_j \mu^{\alpha-1}} \sum_{j=1}^{m-2} a_j g(\xi_j, s) \]

is the Green function of the boundary value problem (8) and

\[g(t, s) = \begin{cases} (t(1-s))^{\alpha-1} - (t-s)^{\alpha-1}, & 0 \leq s \leq t \leq 1, \\ \frac{\Gamma(\alpha-\gamma)}{\Gamma(\alpha-\gamma)} (t(1-s))^{\alpha-1} - (t-s)^{\alpha-1}, & 0 \leq t \leq s \leq 1. \end{cases} \]

(11)

Lemma 5 (see [2]). The function \( g(t, s) \) in Lemma 4 has the following properties:

(R1) \( g(t, s) = g(1-s, 1-t) \), for \( t, s \in [0,1] \);

(R2) \( \Gamma(\alpha-\gamma) k(t) q(s) \leq g(t, s) \leq (\alpha - \gamma - 1) q(s), \) for \( t, s \in [0,1] \);

(R3) \( \Gamma(\alpha-\gamma) k(t) q(s) \leq g(t, s) \leq (\alpha - \gamma - 1) k(t), \) for \( t, s \in [0,1], \)

\[k(t) = \frac{t^{\alpha-1}(1-t)}{\Gamma(\alpha-\gamma)}, \quad q(t) = \frac{s(1-s)^{\alpha-1}}{\Gamma(\alpha-\gamma)}. \]

(12)

Lemma 6. The following boundary value problem

\[D^\alpha_t x(t) + \lambda M = 0, \quad t \in (0,1), \]

\[x(0) = x'(0) = 0, \quad x(1) = \sum_{j=1}^{m-2} a_j x(\xi_j) \]

has a unique solution \( w \), which satisfies

\[w(t) \leq \frac{4\lambda M \sigma(t)}{1 - \sum_{j=1}^{n-2} a_j \mu^{\alpha-1}}, \]

\[\sigma(t) = \left( 1 - \sum_{j=1}^{m-2} a_j \mu^{\alpha-1} \right) k(t) + \sum_{j=1}^{m-2} a_j k(\xi_j) t^{\alpha-1} \leq t^{\alpha-1}. \]

(14)

Proof. By Lemma 4, the unique solution of (13) is

\[w(t) = \lambda M \int_0^t G(t, s) \, ds. \]

(15)

So

\[w(t) = \lambda M \int_0^t \frac{1}{1 - \sum_{j=1}^{n-2} a_j \mu^{\alpha-1}} \left( k(t) + \frac{\sum_{j=1}^{m-2} a_j k(\xi_j)}{1 - \sum_{j=1}^{m-2} a_j \mu^{\alpha-1}} t^{\alpha-1} \right) ds \]

\[\leq \frac{4\lambda M \sigma(t)}{1 - \sum_{j=1}^{n-2} a_j \mu^{\alpha-1}}, \]

(16)
and by $\alpha - \gamma \geq 2$, we have $\Gamma(\alpha - \gamma) \geq 1$, so
\[
\sigma(t) = \left(1 - \sum_{j=1}^{m-2} a_j \psi_{\alpha-\gamma-1,j}^1 \right) k(t) + \sum_{j=1}^{m-2} a_j k(\xi_j)^{\alpha-\gamma-1}
\]
\[
= \frac{1}{\Gamma(\alpha - \gamma)} \left(1 - \sum_{j=1}^{m-2} a_j \psi_{\alpha-\gamma-1,j}^1 \right) t^{\alpha-\gamma-1} (1 - t)
\]
\[
+ \frac{1}{\Gamma(\alpha - \gamma)} \sum_{j=1}^{m-2} a_j \psi_{\alpha-\gamma-1,j}^1 \Gamma(\alpha - \gamma) t^{\alpha-\gamma-1}
\]
\[
\leq \left(1 - \sum_{j=1}^{m-2} a_j \psi_{\alpha-\gamma-1,j}^1 \right) t^{\alpha-\gamma-1}
\]
\[
+ \sum_{j=1}^{m-2} a_j \psi_{\alpha-\gamma-1,j}^1 t^{\alpha-\gamma-1} = t^{\alpha-\gamma-1}.
\]

The basic space used in this paper is $E = C([0,1]; \mathbb{R})$, where $\mathbb{R}$ is the set of real numbers. Obviously, the space $E$ is a Banach space if it is endowed with the norm as follows:
\[
\|y\| = \max_{t \in [0,1]} |y(t)|,
\]
for any $y \in E$. Let
\[
P = \left\{ y \in E : y(t) \geq \frac{1}{8} \sigma(t) \|y\| \right\},
\]
and then $P$ is a cone of $E$.

Now let $v(t) = D_t^{\alpha-\gamma} x(t)$; then the boundary value problem (1) is equivalent to the following boundary value problem:
\[
-D_t^{\alpha-\gamma} v(t) = \lambda f(t, I^{\gamma} \sigma(t), v(t)) \quad t \in (0,1),
\]
\[
v(0) = v'(0) = 0, \quad v(1) = \sum_{j=1}^{m-2} a_j y(\xi_j).
\]

Define a modified function $[\cdot]^*$ for any $\varphi \in C[0,1]$ by
\[
[\varphi(t)]^* = \begin{cases} 
\varphi(t), & \varphi(t) \geq 0, \\
0, & \varphi(t) < 0,
\end{cases}
\]
and consider
\[
-D_t^{\alpha-\gamma} y(t)
\]
\[
= \lambda \left[ f(t, I^{\gamma} [y(t) - w(t)]^*, [y(t) - w(t)]^*) + M \right],
\]
\[
t \in (0,1),
\]
\[
y(0) = y'(0) = 0, \quad y(1) = \sum_{j=1}^{m-2} a_j y(\xi_j).
\]

Lemma 7. The BVP (1) and the BVP (22) are equivalent. Moreover, if $y$ is a positive solution of the problem (22) and satisfies $y(t) \geq w(t)$, $t \in [0,1]$, then $I^{\gamma} [y(t) - w(t)]$ is a positive solution of the boundary value problem (1).

Proof. Since $y$ is a positive solution of the BVP (22) such that $y(t) \geq w(t)$ for any $t \in [0,1]$, we have
\[
-D_t^{\alpha-\gamma} y(t)
\]
\[
= \lambda \left[ f(t, I^{\gamma} [y(t) - w(t)]^*, [y(t) - w(t)]^*) + M \right],
\]
\[
t \in (0,1),
\]
\[
y(0) = y'(0) = 0, \quad y(1) = \sum_{j=1}^{m-2} a_j y(\xi_j).
\]

Let $v = y - w$, and then we have
\[
-D_t^{\alpha-\gamma} v(t) = \lambda \left[ f(t, I^{\gamma} [y(t) - w(t)]^*, [y(t) - w(t)]^*) + M \right],
\]
\[
w(0) = w'(0) = 0, \quad w(1) = \sum_{j=1}^{m-2} a_j w(\xi_j).
\]

Substitute (24) into (23), that is (20), which implies that $I^{\gamma} [y(t) - w(t)]$ is a positive solution of the BVP (1).

It follows from Lemma 4 that the BVP (22) is equivalent to the integral equation
\[
y(t) = \lambda \int_0^1 G(t, s) \left[ f(s, I^{\gamma} [y(s) - w(s)]^*, [y(s) - w(s)]^*) + M \right].
\]

Thus it is sufficient to find fixed points $y(t) \geq w(t)$, $t \in [0,1]$ for the mapping $T$ defined by
\[
(Ty)(t) = \lambda \int_0^1 G(t, s) \left[ f(s, I^{\gamma} [y(s) - w(s)]^*, [y(s) - w(s)]^*) + M \right].
\]

Lemma 8. $T : P \rightarrow P$ is a completely continuous operator.

Proof. For any fixed $y \in P$, there exists a constant $L > 0$ such that $\|y\| \leq L$, and
\[
0 \leq [y(s) - w(s)]^* \leq y(s) \leq \|y\| \leq L,
\]
\[
0 \leq I^{\gamma} [y(s) - w(s)]^* = \int_0^s (t - s)^{\gamma-1} (y(s) - w(s))^* \Gamma(\gamma) ds
\]
\[
\leq \frac{L}{\Gamma(\gamma)}.
\]

Take
\[
N = \max_{[0,1] \times [0,1] \times [0,1]} f(t, u, v),
\]

Proof. Since $y$ is a positive solution of the BVP (22) such that $y(t) \geq w(t)$ for any $t \in [0,1]$, we have
\[
-D_t^{\alpha-\gamma} y(t)
\]
\[
= \lambda \left[ f(t, I^{\gamma} [y(t) - w(t)]^*, [y(t) - w(t)]^*) + M \right],
\]
\[
t \in (0,1),
\]
\[
y(0) = y'(0) = 0, \quad y(1) = \sum_{j=1}^{m-2} a_j y(\xi_j).
\]
then
\[
(Ty)(t) = \lambda \int_0^1 G(t, s) \left[ f(s, I^\gamma[y(s) - w(s)])^*, [y(s) - w(s)]^* + M \right] \leq \lambda (M + N) \int_0^1 G(t, s) ds < \infty.
\]

(29)

This implies that the operator \( T : P \to E \) is bounded. Next for any \( y \in P \), by Lemma 5, we have
\[
\|Ty\| = \max_{0 \leq t \leq 1} \left\{ \lambda \int_0^1 G(t, s) \left[ f(s, I^\gamma[y(s) - w(s)])^*, [y(s) - w(s)]^* + M \right] \right\}
\]
\[
\leq \lambda (\alpha - \gamma - 1) \int_0^1 q(s) \left[ f(s, I^\gamma[y(s) - w(s)])^*, [y(s) - w(s)]^* + M \right] ds
\]
\[
+ \frac{\lambda}{1 - \sum_{j=1}^{m-2} a_j \xi_j^{\alpha-\gamma-1}} \times \sum_{j=1}^{m-2} a_j \int_0^1 g(\xi_j, s) \left[ f(s, I^\gamma[y(s) - w(s)])^*, [y(s) - w(s)]^* + M \right] ds
\]
\[
\leq 4\lambda \left\{ \int_0^1 q(s) \left[ f(s, I^\gamma[y(s) - w(s)])^*, [y(s) - w(s)]^* + M \right] ds \right\}
\]
\[
+ \frac{1}{1 - \sum_{j=1}^{m-2} a_j \xi_j^{\alpha-\gamma-1}} \times \sum_{j=1}^{m-2} a_j \int_0^1 g(\xi_j, s) \left[ f(s, I^\gamma[y(s) - w(s)])^*, [y(s) - w(s)]^* + M \right] ds
\]
\[
\leq \frac{4\lambda}{1 - \sum_{j=1}^{m-2} a_j \xi_j^{\alpha-\gamma-1}} \times \left( \int_0^1 q(s) \left[ f(s, I^\gamma[y(s) - w(s)])^*, [y(s) - w(s)]^* \right] + M \right) + \frac{\lambda}{1 - \sum_{j=1}^{m-2} a_j \xi_j^{\alpha-\gamma-1}} \times \sum_{j=1}^{m-2} a_j \int_0^1 g(\xi_j, s)
\]

On the other hand, it follows from Lemma 5, \( \Gamma(\alpha - \gamma) \geq 1 \), and \( \sigma(t) \leq t^{\alpha-\gamma-1} \) that
\[
(Ty)(t) \geq \lambda \Gamma(\alpha - \gamma) k(t)
\]
\[
\times \int_0^1 q(s) \left[ f(s, I^\gamma[y(s) - w(s)])^*, [y(s) - w(s)]^* + M \right] ds
\]
\[
+ \frac{\lambda t^{\alpha-\gamma-1}}{1 - \sum_{j=1}^{m-2} a_j \xi_j^{\alpha-\gamma-1}} \times \sum_{j=1}^{m-2} a_j \int_0^1 g(\xi_j, s) \left[ f(s, I^\gamma[y(s) - w(s)])^*, [y(s) - w(s)]^* + M \right] ds
\]
\[
\geq \frac{1}{2} \lambda k(t) \int_0^1 q(s) \left[ f(s, I^\gamma[y(s) - w(s)])^*, [y(s) - w(s)]^* + M \right] ds
\]
\[
+ \frac{\lambda t^{\alpha-\gamma-1}}{1 - \sum_{j=1}^{m-2} a_j \xi_j^{\alpha-\gamma-1}} \times \sum_{j=1}^{m-2} a_j \int_0^1 g(\xi_j, s) \left[ f(s, I^\gamma[y(s) - w(s)])^*, [y(s) - w(s)]^* + M \right] ds
\]
\[
= \frac{1}{2} \left\{ \lambda k(t) \int_0^1 q(s) \left[ f(s, I^\gamma[y(s) - w(s)])^*, [y(s) - w(s)]^* + M \right] ds + \frac{\lambda t^{\alpha-\gamma-1}}{1 - \sum_{j=1}^{m-2} a_j \xi_j^{\alpha-\gamma-1}} \times \sum_{j=1}^{m-2} a_j \int_0^1 g(\xi_j, s) \left[ f(s, I^\gamma[y(s) - w(s)])^*, [y(s) - w(s)]^* + M \right] ds \right\}.\]
Abstract and Applied Analysis

\[ \times \sum_{j=1}^{m-2} a_j \int_0^1 g(\xi_j, s) \left[ f\left(s, I^\gamma [y(s) - w(s)]^*\right), \right. \]
\[ \left. \left[ y(s) - w(s) \right]^* + M \right] ds \]
\[ \geq \frac{1}{2} \lambda \left\{ k(t) \int_0^1 q(s) \left[ f\left(s, I^\gamma [y(s) - w(s)]^*\right), \right. \right.
\[ \left. \left. \left[ y(s) - w(s) \right]^* + M \right] ds \right\} ^{m-2} \sum_{j=1}^{m-2} a_j k(\xi_j) \]
\[ + \frac{\lambda^{\alpha-\gamma-1}}{2 \left( 1 - \sum_{j=1}^{m-2} a_j^{\alpha-\gamma-1} \right)} \]
\[ \times \sum_{j=1}^{m-2} a_j \int_0^1 g(\xi_j, s) \left[ f\left(s, I^\gamma [y(s) - w(s)]^*\right), \right. \]
\[ \left. \left[ y(s) - w(s) \right]^* + M \right] ds \]
\[ = \frac{\lambda \sigma(t)}{2 \left( 1 - \sum_{j=1}^{m-2} a_j^{\alpha-\gamma-1} \right)} \]
\[ \times \int_0^1 q(s) \left[ f\left(s, I^\gamma [y(s) - w(s)]^*\right), \right. \]
\[ \left. \left[ y(s) - w(s) \right]^* + M \right] ds \]
\[ + \frac{\lambda \sigma(t)}{2 \left( 1 - \sum_{j=1}^{m-2} a_j^{\alpha-\gamma-1} \right)} \]
\[ \times \left( \int_0^1 q(s) \left[ f\left(s, I^\gamma [y(s) - w(s)]^*\right), \right. \right.
\[ \left. \left. \left[ y(s) - w(s) \right]^* + M \right] ds \right) \right\} ^{m-2} \sum_{j=1}^{m-2} a_j \int_0^1 g(\xi_j, s) \left[ f\left(s, I^\gamma [y(s) - w(s)]^*\right), \right. \]
\[ \left. \left. \left[ y(s) - w(s) \right]^* + M \right] ds \right) \]

So, by (30) and (31), we have
\[ (Ty)(t) \geq \frac{1}{8} \|Ty\| \sigma(t), \quad t \in [0, 1], \quad (32) \]

which yields that \( T(P) \subset P \).

At the end, using standard arguments, according to the Ascoli-Arzela Theorem, one can show that \( T : P \to P \) is completely continuous. Thus \( T : P \to P \) is a completely continuous operator.

**Lemma 9** (see [25]). Let \( E \) be a real Banach space, and let \( P \subset E \) be a cone. Assume that \( \Omega_1, \Omega_2 \) are two bounded open subsets of \( E \) with \( \theta \in \Omega_1, \Omega_1 \subset \Omega_2, \) and let \( T : P \cap (\Omega_2 \setminus \Omega_1) \to P \) be a completely continuous operator such that either
\[ \begin{align*}
(1) & \quad \|Tx\| \leq \|x\|, \quad x \in P \cap \partial \Omega_1, \\
(2) & \quad \|Tx\| \geq \|x\|, \quad x \in P \cap \partial \Omega_2.
\end{align*} \]

Then \( T \) has a fixed point in \( P \cap (\Omega_2 \setminus \Omega_1) \).

**3. Main Result**

Define
\[ f^\infty = \limsup_{|x|+|y| \to \infty} \max_{t \in [0,1]} f(t, x, y) \left| x \right| + \left\| y \right\|, \quad f_\infty = \liminf_{|x|+|y| \to \infty} \min_{t \in [1/4,3/4]} f(t, x, y) \left| x \right| + \left\| y \right\|. \]

**Theorem 10.** Suppose that \( f_\infty = \infty \).

Then there exists a constant \( \Lambda > 0 \) such that, for any \( \lambda \in (0, \Lambda) \), the BVP (1) has at least one positive solution.

**Proof.** Choosing \( y \in P \) with \( \|y\| = 1 \), then
\[ 0 \leq \left[ y(s) - w(s) \right]^* \leq y(s) \leq \|y\| \leq 1, \]
\[ 0 \leq \|x\| \leq \|y\| \leq 1, \]
\[ 0 \leq \|I^\gamma [y(s) - w(s)]^*\| \leq \frac{1}{\Gamma(y)} \int_0^1 (t-s)^{\gamma-1} \left[ y(s) - w(s) \right]^* ds \leq \frac{1}{\Gamma(y)}. \]

Let
\[ N = \max_{(t,x,y) \in [0,1] \times [0,\Lambda] \times [0,1]} f(t, x, y), \]
\[ \begin{align*}
\Lambda &= \min \left\{ \frac{1 - \sum_{j=1}^{m-2} a_j^{\alpha-\gamma-1}}{34M}, \frac{1 - \sum_{j=1}^{m-2} a_j^{\alpha-\gamma-1}}{4 \sum_{j=1}^{m-2} a_j (M + N)} \right\}. \end{align*} \]
For any \( y \in \partial B_1, B_1 = \{ y \in P : \| y \| \leq 1 \} \), and \( \lambda > 0 \) sufficiently small such that \( \lambda \in (0, \Lambda \] \), we have

\[
\| Ty \| = \max_{0 \leq t \leq 1} \left\{ \lambda \int_0^1 G(t, s) \left[ f(s, I^\alpha_y y(s) - w(s))^* + M \right] ds \right\} \\
\leq \lambda (\alpha - \gamma - 1) \\
\times \int_0^1 q(s) \left[ f(s, I^\alpha_y y(s) - w(s))^* + M \right] ds \\
\leq \frac{4 \lambda \sum_{j=1}^{m-2} a_j (M + N)}{1 - \sum_{j=1}^{m-2} a_j \alpha^{\gamma-1}} \leq 1 = \| y \|.
\]

(37)

Therefore,

\[
\| Ty \| \leq \| y \|, \quad y \in \partial B_1.
\]

(38)

On the other hand, take

\[
e = \left( 1 - \sum_{j=1}^{m-2} a_j \alpha^{\gamma-1} \right) \left( \frac{1}{4} \right)^{\alpha-\gamma},
\]

(39)

and choose a large enough \( L > 0 \) such that

\[
\frac{\lambda L e}{64} \left( \frac{1}{4} \right)^{\alpha-\gamma} \int_{1/4}^{3/4} q(s) ds > 1.
\]

(40)

By (33), we know that \( f \) is an unbounded continuous function. Therefore, for any \( t \in [1/4, 3/4] \), there exists a constant \( K > 0 \) such that

\[
f(t, x, y) \geq L (|x| + |y|), \quad \text{if } |x| + |y| > K.
\]

(41)

Choosing

\[
R > \max \left\{ \frac{64 \lambda M}{1 - \sum_{j=1}^{m-2} a_j \alpha^{\gamma-1}}, 1 + K, \frac{16K}{e} \right\},
\]

(42)

then \( R > K > 1 \). Let \( B_R = \{ y \in P : \| y \| \leq R \} \). Then for any \( y \in \partial B_R \) and for any \( t \in [1/4, 3/4] \), we have

\[
y(t) - w(t) \geq y(t) - \frac{4 \lambda M \sigma (t)}{1 - \sum_{j=1}^{m-2} a_j \alpha^{\gamma-1}} \\
\geq y(t) - \frac{32 \lambda M y(t)}{1 - \sum_{j=1}^{m-2} a_j \alpha^{\gamma-1}} R \\
\geq \frac{1}{2} y(t) \geq \frac{\sigma(t) R}{16} \geq \frac{eR}{16} \geq K > 0.
\]

Consequently, for \( s \in [1/4, 3/4] \), it follows from (43) that

\[
\left| I^\alpha_y [y(s) - w(s)]^* \right| + \left| y(s) - w(s) \right|^* > K,
\]

(44)

and then by (41) and (44), for \( s \in [1/4, 3/4] \), we get

\[
f(s, I^\alpha_y [y(s) - w(s)]^*, [y(s) - w(s)]^*) \\
\geq L \left( \left| I^\alpha_y [y(s) - w(s)]^* \right| + \left| y(s) - w(s) \right|^* \right) \\
\geq L \left| y(s) - w(s) \right| \geq \frac{1}{64} L e R.
\]

So for any \( y \in \partial B_R \) and \( t \in [0, 1] \), by (45), we have

\[
\| Ty \| \\
\geq \lambda \int_0^1 G\left( \frac{1}{4}, s \right) \left[ f\left( s, I^\alpha_y [y(s) - w(s)]^*, [y(s) - w(s)]^* \right) + M \right] ds \\
\geq \lambda \int_0^1 g\left( \frac{1}{4}, s \right) f\left( s, I^\alpha_y [y(s) - w(s)]^*, [y(s) - w(s)]^* \right) ds \\
\geq \lambda \left( \frac{1}{4} \right)^{\alpha-\gamma} \int_{1/4}^{3/4} q(s) f\left( s, I^\alpha_y [y(s) - w(s)]^*, [y(s) - w(s)]^* \right) ds \\
\geq \lambda \left( \frac{1}{4} \right)^{\alpha-\gamma} \int_{1/4}^{3/4} q(s) \left( \frac{1}{64} L e R ds \right) = R = \| y \|.
\]

(46)
Thus, we have
\[ \| Ty \| \geq \| y \|, \quad y \in \partial B_R. \] (47)

By Lemma 9, \( T \) has a fixed point \( y \) such that \( 1 \leq \| y \| \leq R \).

From
\[ \lambda \leq \Lambda \leq \frac{1 - \sum_{j=1}^{m-2} a_j \xi_j}{32M}, \] (48)
we have
\[ \frac{32 \lambda M}{1 - \sum_{j=1}^{m-2} a_j \xi_j} \leq 1. \] (49)

Thus
\[ y(t) \geq \frac{1}{8} \sigma(t) \| y \| \geq \frac{1}{8} \sigma(t) \] (50)
\[ \geq \frac{4 \lambda M \sigma(t)}{1 - \sum_{j=1}^{m-2} a_j \xi_j} \geq w(t). \]

By Lemma 7 and (50), the boundary value problem (1) has at least one positive solution. The proof of Theorem 10 is completed.

**Theorem 11.** Suppose that
\[ f(\infty) = 0, \] (51)
and there exist constants \( \kappa \geq 0 \) and \( \theta > 0 \) such that
\[ f(t, x, y) \geq \kappa (|x| + |y|), \]
\[ (t, x, y) \in \left[ \frac{1}{4}, \frac{3}{4} \right] \times \left[ \frac{\theta}{4 \Gamma(y + 1)}, \infty \right) \times [\theta, \infty). \] (52)

Then there exists a constant \( \Lambda > 0 \) such that, for any \( \Lambda \in [\Lambda, +\infty) \), the BVP (1) has at least one positive solution.

**Proof.** Choosing
\[ \Lambda_1 = \left[ \frac{\kappa e}{4^{\alpha-\gamma+2}} \left( 1 + \frac{1}{4 \Gamma(y + 1)} \right) \right]^{\frac{3/4}{1/4}} q(s) ds \]
\[ = \| y \|, \] (53)
let \( B_{R_1} = \{ y \in P : \| y \| \leq R_1 \} \). Then for any \( \Lambda \in [\Lambda, \infty) \), \( y \in \partial B_{R_1} \), and \( t \in [1/4, 3/4] \), we have
\[ y(t) \geq \frac{1}{8} \sigma(t) \| y \| \geq \frac{1}{8} \sigma(t) \geq \frac{4 \lambda M \sigma(t)}{1 - \sum_{j=1}^{m-2} a_j \xi_j} \geq w(t). \]
(57)
According to (51), it is clear that
\[
\begin{align*}
\limsup_{|x|+|y| \to \infty} f(t, x, y) &= \max_{|x|+|y| \to \infty} \frac{f(t, x, y)}{|x|+|y|} \\
&= \limsup_{|x|+|y| \to \infty} \frac{f(t, x, y) + M}{|x|+|y|} = 0.
\end{align*}
\] (58)

Let us choose \( \varepsilon > 0 \) such that
\[
4\lambda \left( \Gamma(y+1) + 1 \right) \varepsilon \frac{1}{\Gamma(y+1)} < 1.
\] (59)

Then there exists a large enough \( K > R_1 \) such that
\[
f(t, x, y) + M \leq \varepsilon (|x| + |y|),
\] for any \( t \in [0, 1], \ |x| + |y| > K. \) (60)

Thus, by (60), if
\[
\left| \mathcal{T} y(s) - w(s) \right|^* + \left| \left( y(s) - w(s) \right)^* \right| > K,
\] then
\[
f(t, \mathcal{T} y(s) - w(s)) + M \leq \varepsilon \left( \left| \mathcal{T} y(s) - w(s) \right|^* + \left| \left( y(s) - w(s) \right)^* \right| \right) \leq \varepsilon \left( \frac{1}{\Gamma(y)} \int_0^t (t-s)^{y-1} ds + 1 \right) \|y\| \leq \frac{\Gamma(y+1) + 1}{\Gamma(y+1)} \varepsilon \|y\|, \]
for any \( t \in [0, 1], \ |x| + |y| > K. \) (62)

Now denote that
\[
D = \max_{t \in [0, 1], |x| + |y| \leq K} f(t, x, y),
\] and choose
\[
R_2 = \frac{4\lambda (D + M)}{1 - 4\lambda (\Gamma(y+1) + 1) \varepsilon/\Gamma(y+1)} + K. \] (64)

Then \( R_2 > K > R_1. \)

Next let \( B_R = \{ y \in P : \|y\| \leq R \}. \) Then for any \( y \in \partial B_R, \) and for any \( t \in [0, 1], \) we have
\[
\|T y\| = \max_{t \in [0, 1]} (T y)(t) = \lambda \max_{t \in [0, 1]} \int_0^1 G(t, s) \left[ y(s) - w(s) \right]^* + M \right] ds \leq \lambda (\alpha - y - 1) \int_0^1 q(s) \left[ f(s, y(s) - w(s))^* + M \right] ds
\]
\[
\leq \lambda \left( \alpha - y - 1 \right) \left( \frac{1}{\Gamma(y+1)} \int_0^1 q(s) ds \right) \leq 4\lambda \left( D + M \right) \int_0^1 q(s) ds
\]
\[
+ 4\lambda \left( \frac{1}{\Gamma(y+1)} + 1 \right) \varepsilon \int_0^1 q(s) ds R_2
\]
\[
\leq 4\lambda (D + M) + 4\lambda \left( \frac{1}{\Gamma(y+1)} + 1 \right) \varepsilon R_2.
\]

which implies that
\[
\|T y\| \leq \|y\|, \ y \in \partial B_{R_2}.
\] (66)

By Lemma 9, \( T \) has at least a fixed points \( y \in (P \cap \overline{B_{R_2}}) \setminus \overline{B_{R_1}} \) such that \( R_1 \leq \|y\| \leq R_2. \)

It follows from \( R_1 \geq 64\lambda M/(1 - \sum_{j=1}^{m-2} a_j^{\alpha-\gamma-1}) \) that
\[
y(t) - w(t)
\]
\[
\geq y(t) - \frac{4\lambda M \sigma(t)}{1 - \sum_{j=1}^{m-2} a_j^{\alpha-\gamma-1}} \geq y(t) - \frac{32\lambda M y(t)}{1 - \sum_{j=1}^{m-2} a_j^{\alpha-\gamma-1}} R_1
\]
\[
\geq \frac{1}{16}(y(t) - \sigma(t) R_1) \geq 0.
\] (67)

By Lemma 7 and (67), the boundary value problem (1) has at least one positive solution. The proof of Theorem II is completed.
