We discuss a third-order multipoint boundary value problem under some appropriate resonance conditions. By using the coincidence degree theory, we establish the existence result of solutions. The emphasis here is that the dimension of the linear operator is equal to two. Our results supplement other results.

1. Introduction

In this paper, we are concerned with the following third-order ordinary differential equation:

$$x'''(t) = f(t, x(t), x'(t), x''(t)) + e(t), \quad t \in (0, 1), \quad (1)$$

with the boundary conditions

$$x(0) = \sum_{i=1}^{m-2} \alpha_i x(\xi_i), \quad x'(0) = 0, \quad x(1) = \beta x(\eta), \quad (2)$$

where $f: [0, 1] \times R^3 \rightarrow R$ is a Carathéodory function, $e \in L^1[0, 1]$, $0 < \xi_1 < \dots < \xi_{m-2} < 1$, $\alpha_i \in R$, $i = 1, \dots, m-2$, $\beta \geq 0$, and $\eta \in (0, 1)$.

In recent years, many authors have paid much attention to the existence of solutions for multipoint boundary value problems at resonance: we refer the readers to see [1–11]. If the linear equation $Lx = x'''(t) = 0$ with boundary conditions (2) has nontrivial solutions, that is, $\dim \text{Ker } L \geq 1$, the BVP (1)-(2) is called a resonance problem. In [5–11], the authors all discussed the case that $\dim \text{Ker } L = 1$. In [2, 3], the authors established the existence results for resonance boundary value problems with the case of $\dim \text{Ker } L = 2$. However, we will show that some conditions such as $\Lambda \neq 0$ assumed in [2, 3] are not necessary. We establish existence of some solutions for BVP (1)-(2) by using the coincidence degree theory of Mawhin [12] at resonance.

According to the constant β , the BVP (1)-(2) is divided into the following five resonance cases:

$$(C_1) \quad 0 < \beta < 1, \quad (1-\beta) \sum_{i=1}^{m-2} \alpha_i \xi_i^2 = (1 - \sum_{i=1}^{m-2} \alpha_i)(\beta\eta^2 - 1);$$

$$(C_2) \quad \beta = 1, \quad \sum_{i=1}^{m-2} \alpha_i \xi_i^2 = 0, \quad \sum_{i=1}^{m-2} \alpha_i = 1;$$

$$(C_3) \quad 1 < \beta < 1/\eta^2, \quad (1-\beta) \sum_{i=1}^{m-2} \alpha_i \xi_i^2 = (1 - \sum_{i=1}^{m-2} \alpha_i)(\beta\eta^2 - 1);$$

$$(C_4) \quad \beta = 1/\eta^2, \quad \sum_{i=1}^{m-2} \alpha_i \xi_i^2 = 0, \quad \sum_{i=1}^{m-2} \alpha_i = 1;$$

$$(C_5) \quad 1/\eta^2 < \beta, \quad (1-\beta) \sum_{i=1}^{m-2} \alpha_i \xi_i^2 = (1 - \sum_{i=1}^{m-2} \alpha_i)(\beta\eta^2 - 1).$$

Du et al. [1] studied the existence results of BVP (1)-(2) under the resonance conditions (C_2) and (C_4) , that is, $\dim \text{Ker } L = 1$, but they did not discuss the other three cases. In this paper, under the resonance conditions, (C_1) , (C_3) , or (C_5) , we could imply $\dim \text{Ker } L = 2$; thus we supplement the results in [1].

The layout of this paper is as follows. In Section 2, we briefly present some notations and an abstract existence result due to Mawhin. In Section 3, we study BVP (1)-(2) under the condition (C_1) and obtain some existence results. In Section 4, we give an example of the existence results in Section 3.

2. Preliminary

Now, we briefly recall some notations and an abstract existence result by Mawhin [12].

Let Y, Z be real Banach spaces and let $L : \text{dom } L \subset Y \rightarrow Z$ be a linear operator which is a Fredholm map of index zero and let $P : Y \rightarrow Y, Q : Z \rightarrow Z$ be continuous projectors such that $\text{Im } P = \text{Ker } L, \text{Ker } Q = \text{Im } L$ and $Y = \text{Ker } L \oplus \text{Ker } P, Z = \text{Im } L \oplus \text{Im } Q$. It follows that $L|_{\text{dom } L \cap \text{Ker } P} : \text{dom } L \cap \text{Ker } P \rightarrow \text{Im } L$ is invertible; we denote the inverse of that map by K_P . Let Ω be an open bounded subset of Y such that $\text{dom } L \cap \Omega \neq \emptyset$; the map $N : Y \rightarrow Z$ is said to be L -compact on $\overline{\Omega}$ if the map $QN(\overline{\Omega})$ is bounded and $K_P(I - Q)N : \overline{\Omega} \rightarrow Y$ is compact. For more details we refer the reader to the lecture of Mawhin [12].

The theorem we use in this paper is Theorem IV.13 of [12].

Theorem 1. *Let L be a Fredholm map of index zero and let N be L -compact on $\overline{\Omega}$. Assume that the following conditions are satisfied.*

- (i) $Lx \neq Nx$ for every $(x, \lambda) \in [(\text{dom } L \setminus \text{Ker } L) \cap \partial\Omega] \times (0, 1)$.
- (ii) $Nx \notin \text{Im } L$ for every $x \in \text{Ker } L \cap \partial\Omega$.
- (iii) $\deg(QN|_{\text{Ker } L}, \Omega \cap \text{Ker } L, 0) \neq 0$, where $Q : Z \rightarrow Z$ is a continuous projector as above with $\text{Im } L = \text{Ker } Q$.

Then the abstract equation $Lx = Nx$ has at least one solution in $\text{dom } L \cap \overline{\Omega}$.

In the following, we will use the classical spaces $C[0, 1], C^1[0, 1], C^2[0, 1]$, and $L^1[0, 1]$. For $x \in C^2[0, 1]$, we use the norms $\|x\|_\infty = \max_{t \in [0, 1]} |x(t)|$ and $\|x\| = \max\{\|x\|_\infty, \|x'\|_\infty, \|x''\|_\infty\}$, denote the norm in $L^1[0, 1]$ by $\|\cdot\|_1$, and define the Sobolev space $W^{3,1}(0, 1)$ as

$$W^{3,1}(0, 1) = \{x : [0, 1] \rightarrow \mathbb{R} \mid x, x', x'' \text{ are absolutely continuous on } [0, 1] \text{ with } x''' \in L^1[0, 1]\}. \quad (3)$$

Let $Y = C^2[0, 1], Z = L^1[0, 1]$, and define the linear operator $L : \text{dom } L \subset Y \rightarrow Z$ as $Lx = x'''$, $x \in \text{dom } L$, where

$$\text{dom } L = \{x \in W^{3,1}(0, 1) : x \text{ satisfies boundary conditions (2)}\}. \quad (4)$$

We define $N : Y \rightarrow Z$ as

$$Nx = f(t, x(t), x'(t), x''(t)), \quad t \in (0, 1). \quad (5)$$

Then BVP (1)-(2) can be written as $Lx = Nx$.

3. Existence Results

Lemma 2. *If the condition (C_1) holds, then there exist $p \in \{1, 2, \dots, m-2\}, q \in N^+, q \geq p+1$, such that*

$$\Lambda(p, q) = \sum_{i=1}^{m-2} \alpha_i \xi_i^{q+2} (1 - \beta \eta^{p+2}) - \sum_{i=1}^{m-2} \alpha_i \xi_i^{p+2} (1 - \beta \eta^{q+2}) \neq 0, \quad (6)$$

where $N^+ = \{1, 2, \dots\}$.

Proof. We prove that, for any $l \in N$, there exists $k_l \in \{l(m-2) + 1, \dots, (l+1)(m-2)\}$, such that $\sum_{i=1}^{m-2} \alpha_i \xi_i^{k_l+2} \neq 0$.

If else, one has $\sum_{i=1}^{m-2} \alpha_i \xi_i^{k_l+2} = 0$, any $k_l \in \{l(m-2) + 1, l(m-2) + 2, \dots, (l+1)(m-2)\}$; that is,

$$\begin{pmatrix} \xi_1^{l(m-2)+3} & \dots & \xi_{m-2}^{l(m-2)+3} \\ \vdots & \ddots & \vdots \\ \xi_1^{(l+1)(m-2)+2} & \dots & \xi_{m-2}^{(l+1)(m-2)+2} \end{pmatrix} \begin{pmatrix} \alpha_1 \\ \vdots \\ \alpha_{m-2} \end{pmatrix} = \begin{pmatrix} 0 \\ \vdots \\ 0 \end{pmatrix}. \quad (7)$$

Since

$$\begin{aligned} & \begin{vmatrix} \xi_1^{l(m-2)+3} & \dots & \xi_{m-2}^{l(m-2)+3} \\ \vdots & \ddots & \vdots \\ \xi_1^{(l+1)(m-2)+2} & \dots & \xi_{m-2}^{(l+1)(m-2)+2} \end{vmatrix} \\ &= \prod_{j=1}^{m-2} \xi_j^{l(m-2)+3} \begin{vmatrix} 1 & \dots & 1 \\ \xi_1 & \dots & \xi_{m-2} \\ \vdots & \ddots & \vdots \\ \xi_1^{m-3} & \dots & \xi_{m-2}^{m-3} \end{vmatrix} \\ &= \prod_{j=1}^{m-2} \xi_j^{l(m-2)+3} \prod_{1 \leq i < j \leq m-2} (\xi_j - \xi_i) \neq 0, \end{aligned} \quad (8)$$

thus $\alpha_i = 0, i = 1, 2, \dots, m-2$.

It is clear that

$$\begin{aligned} (1 - \beta) \sum_{i=1}^{m-2} \alpha_i \xi_i^2 &= 0, \\ \left(1 - \sum_{i=1}^{m-2} \alpha_i\right) (\beta \eta^2 - 1) &= \beta \eta^2 - 1 < 0, \end{aligned} \quad (9)$$

which is a contradiction to the condition (C_1) .

Set

$$S = \left\{ k_l \in N^+ : 1 - \beta \eta^{p+2} = \frac{\sum_{i=1}^{m-2} \alpha_i \xi_i^{p+2} (1 - \beta \eta^{k_l+2})}{\sum_{i=1}^{m-2} \alpha_i \xi_i^{k_l+2}} \right\}. \quad (10)$$

Then S is a finite set.

If else, there exists a monotone sequence $\{k_{l_r}\}, r = 1, 2, \dots, k_{l_r} < k_{l_{r+1}}$, such that

$$1 - \beta \eta^{p+2} = \frac{\sum_{i=1}^{m-2} \alpha_i \xi_i^{p+2} (1 - \beta \eta^{k_{l_r}+2})}{\sum_{i=1}^{m-2} \alpha_i \xi_i^{k_{l_r}+2}}. \quad (11)$$

From $0 < \beta \eta^{p+2} < 1$, we get

$$\sum_{i=1}^{m-2} \alpha_i \xi_i^{p+2} \neq 0. \quad (12)$$

Thus

$$1 - \beta \eta^{p+2} = \lim_{k_{l_r} \rightarrow \infty} \frac{\sum_{i=1}^{m-2} \alpha_i \xi_i^{p+2} (1 - \beta \eta^{k_{l_r}+2})}{\sum_{i=1}^{m-2} \alpha_i \xi_i^{k_{l_r}+2}} = \infty. \quad (13)$$

So it is a contradiction. Thus the Lemma is proved. $\square$

Lemma 3. Let (C_1) hold and $\Lambda(p, q) \neq 0$; then $L: \text{dom } L \subset Y \rightarrow Z$ is a Fredholm map of index zero. Furthermore, the linear continuous projector operator $Q: Z \rightarrow Z$ can be defined by

$$Qy(t) = (T_1y)t^{p-1} + (T_2y)t^{q-1}, \quad (14)$$

where

$$\begin{aligned} T_1y &= \frac{p(p+1)(p+2)}{\Lambda(p, q)} \\ &\times \left[(\beta\eta^{q+2} - 1)Q_1y + \sum_{i=1}^{m-2} \alpha_i \xi_i^{q+2} Q_2y \right], \\ T_2y &= -\frac{q(q+1)(q+2)}{\Lambda(p, q)} \\ &\times \left[(\beta\eta^{p+2} - 1)Q_1y + \sum_{i=1}^{m-2} \alpha_i \xi_i^{p+2} Q_2y \right], \quad (15) \\ Q_1y &= \sum_{i=1}^{m-2} \alpha_i \int_0^{\xi_i} \int_0^s \int_0^\tau y(v) dv d\tau ds, \\ Q_2y &= \int_0^1 \int_0^s \int_0^\tau y(v) dv d\tau ds \\ &\quad - \beta \int_0^\eta \int_0^s \int_0^\tau y(v) dv d\tau ds. \end{aligned}$$

And the linear operator $K_P: \text{Im } L \rightarrow \text{dom } L \cap \text{Ker } P$ can be written by

$$K_Py(t) = \int_0^t \int_0^s \int_0^\tau y(v) dv d\tau ds, \quad y \in \text{Im } L. \quad (16)$$

Furthermore

$$\|K_Py\| \leq \|y\|_1, \quad y \in \text{Im } L. \quad (17)$$

Proof. It is clear that $\text{Ker } L = \{x \in \text{dom } L : x = a + ct^2, a = ((\beta\eta^2 - 1)/(1 - \beta))c, c \in R\}$.

Now we show that

$$\text{Im } L = \{y \in Z : Q_1y = Q_2y = 0\}. \quad (18)$$

The equation

$$x''' = y, \quad (19)$$

has a solution $x(t)$ satisfying (2) if and only if

$$Q_1y = Q_2y = 0. \quad (20)$$

In fact, if (19) has a solution $x(t)$ such that (2), then from (19) we have

$$x(t) = \frac{\beta\eta^2 - 1}{1 - \beta}c + ct^2 + \int_0^t \int_0^s \int_0^\tau y(v) dv d\tau ds. \quad (21)$$

According to the condition (C_1) , we obtain

$$Q_1y = Q_2y = 0. \quad (22)$$

On the other hand, if (20) holds, let

$$x(t) = \frac{\beta\eta^2 - 1}{1 - \beta}c + ct^2 + \int_0^t \int_0^s \int_0^\tau y(v) dv d\tau ds, \quad (23)$$

where c is an arbitrary constant; then $x(t)$ is a solution of (19) and (2). Hence (18) holds.

Set

$$\begin{aligned} T_1y &= \frac{p(p+1)(p+2)}{\Lambda(p, q)} \\ &\times \left[(\beta\eta^{q+2} - 1)Q_1y + \sum_{i=1}^{m-2} \alpha_i \xi_i^{q+2} Q_2y \right], \\ T_2y &= -\frac{q(q+1)(q+2)}{\Lambda(p, q)} \\ &\times \left[(\beta\eta^{p+2} - 1)Q_1y + \sum_{i=1}^{m-2} \alpha_i \xi_i^{p+2} Q_2y \right]. \end{aligned} \quad (24)$$

Then we define

$$Qy(t) = (T_1y)t^{p-1} + (T_2y)t^{q-1}. \quad (25)$$

It is clear that $\dim \text{Im } Q = 2$.

Again from

$$\begin{aligned} T_1((T_1y)t^{p-1}) &= \frac{p(p+1)(p+2)}{\Lambda(p, q)} \\ &\times \left[(\beta\eta^{q+2} - 1)Q_1((T_1y)t^{p-1}) \right. \\ &\quad \left. + \sum_{i=1}^{m-2} \alpha_i \xi_i^{q+2} Q_2((T_1y)t^{p-1}) \right] \\ &= \frac{1}{\Lambda(p, q)} \left[(\beta\eta^{q+2} - 1)p(p+1) \right. \\ &\quad \times (p+2)Q_1(t^{p-1}) \\ &\quad \left. + p(p+1)(p+2) \right. \\ &\quad \left. \times \sum_{i=1}^{m-2} \alpha_i \xi_i^{q+2} Q_2(t^{p-1}) \right] \end{aligned}$$

$$\times (T_1y) = T_1y,$$

$$\begin{aligned}
T_1((T_2 y) t^{q-1}) &= \frac{p(p+1)(p+2)}{\Lambda(p, q)} \\
&\times \left[(\beta \eta^{q+2} - 1) Q_1((T_2 y) t^{q-1}) \right. \\
&\quad \left. + \sum_{i=1}^{m-2} \alpha_i \xi_i^{q+2} Q_2((T_2 y) t^{q-1}) \right] \\
&= \frac{1}{\Lambda(p, q)} \left[(\beta \eta^{q+2} - 1) p(p+1) \right. \\
&\quad \times (p+2) Q_1(t^{q-1}) \\
&\quad + p(p+1)(p+2) \\
&\quad \times \left. \sum_{i=1}^{m-2} \alpha_i \xi_i^{q+2} Q_2(t^{q-1}) \right] \\
&\times (T_2 y) = 0, \\
T_2((T_1 y) t^{p-1}) &= -\frac{q(q+1)(q+2)}{\Lambda(p, q)} \\
&\times \left[(\beta \eta^{p+2} - 1) Q_1((T_1 y) t^{p-1}) \right. \\
&\quad \left. + \sum_{i=1}^{m-2} \alpha_i \xi_i^{p+2} Q_2((T_1 y) t^{p-1}) \right] \\
&= -\frac{q(q+1)(q+2)}{\Lambda(p, q)} \\
&\times \left[(\beta \eta^{p+2} - 1) Q_1(t^{p-1}) \right. \\
&\quad \left. + \sum_{i=1}^{m-2} \alpha_i \xi_i^{p+2} Q_2(t^{p-1}) \right] \\
&\times (T_1 y) = 0, \\
T_2((T_2 y) t^{q-1}) &= -\frac{q(q+1)(q+2)}{\Lambda(p, q)} \\
&\times \left[(\beta \eta^{p+2} - 1) Q_1((T_2 y) t^{q-1}) \right. \\
&\quad \left. + \sum_{i=1}^{m-2} \alpha_i \xi_i^{p+2} Q_2((T_2 y) t^{q-1}) \right] \\
&= T_2 y.
\end{aligned} \tag{26}$$

One has

$$\begin{aligned}
Q^2 y &= Q((T_1 y) t^{p-1} + (T_2 y) t^{q-1}) \\
&= T_1((T_1 y) t^{p-1} + (T_2 y) t^{q-1}) t^{p-1}
\end{aligned}$$

$$\begin{aligned}
&+ T_2((T_1 y) t^{p-1} + (T_2 y) t^{q-1}) t^{q-1} \\
&= T_1((T_1 y) t^{p-1}) t^{p-1} + T_1((T_2 y) t^{q-1}) t^{p-1} \\
&\quad + T_2((T_1 y) t^{p-1}) t^{q-1} + T_2((T_2 y) t^{q-1}) t^{q-1} \\
&= (T_1 y) t^{p-1} + (T_2 y) t^{q-1} \\
&= Qy.
\end{aligned} \tag{27}$$

Thus the operator Q is a projector.

Now we show that $\text{Ker } Q = \text{Im } L$. If $y \in \text{Ker } Q$, from $Qy = 0$, we have

$$\begin{aligned}
&\sum_{i=1}^{m-2} \alpha_i \xi_i^{q+2} Q_2 y + (\beta \eta^{q+2} - 1) Q_1 y = 0, \\
&\sum_{i=1}^{m-2} \alpha_i \xi_i^{p+2} Q_2 y + (\beta \eta^{p+2} - 1) Q_1 y = 0.
\end{aligned} \tag{28}$$

Because of

$$\begin{vmatrix} \sum_{i=1}^{m-2} \alpha_i \xi_i^{q+2} & \beta \eta^{q+2} - 1 \\ \sum_{i=1}^{m-2} \alpha_i \xi_i^{p+2} & \beta \eta^{p+2} - 1 \end{vmatrix} = -\Lambda(p, q) \neq 0, \tag{29}$$

$Q_1 y = Q_2 y = 0$, which yields $y \in \text{Im } L$. On the other hand, if $y \in \text{Im } L$, from $Q_1 y = Q_2 y = 0$ and the definition of Q , so $Qy = 0$; thus $y \in \text{Ker } Q$. Hence, $\text{Ker } Q = \text{Im } L$.

For $y \in Z$, from $y = (y - Qy) + Qy$, $(y - Qy) \in \text{Ker } Q = \text{Im } L$, $Qy \in \text{Im } Q$, we have $Z = \text{Im } L + \text{Im } Q$. And if $y \in \text{Im } L \cap \text{Im } Q$, from $y \in \text{Im } Q$, there exist constants $a, b \in \mathbb{R}$, such that $y(t) = at^{p-1} + bt^{q-1}$.

From $y \in \text{Im } L$, we obtain

$$\begin{aligned}
&aq(q+1)(q+2) \\
&\times \sum_{i=1}^{m-2} \alpha_i \xi_i^{p+2} + bp(p+1)(p+2) \sum_{i=1}^{m-2} \alpha_i \xi_i^{q+2} = 0, \\
&aq(q+1)(q+2)(1 - \beta \eta^{p+2}) \\
&+ bp(p+1)(p+2)(1 - \beta \eta^{q+2}) = 0.
\end{aligned} \tag{30}$$

In view of

$$\begin{vmatrix} q(q+1)(q+2) \sum_{i=1}^{m-2} \alpha_i \xi_i^{p+2} & p(p+1)(p+2) \sum_{i=1}^{m-2} \alpha_i \xi_i^{q+2} \\ q(q+1)(q+2)(1 - \beta \eta^{p+2}) & p(p+1)(p+2)(1 - \beta \eta^{q+2}) \end{vmatrix} \\
= -q(q+1)(q+2)p(p+1)(p+2)\Lambda(p, q) \\
\neq 0,
\end{aligned} \tag{31}$$

therefore (30) has a unique solution $a = b = 0$, which implies $\text{Im } L \cap \text{Im } Q = \{0\}$. So we have $Z = \text{Im } L \oplus \text{Im } Q$. Since

$\dim \text{Ker } L = \dim \text{Im } Q = \text{codim Im } L = 2$, thus L is a Fredholm map of index zero.

Let $P : Y \rightarrow Y$ be defined by

$$Px(t) = x(0) + \frac{1}{2}x''(0)t^2, \quad t \in [0, 1]. \quad (32)$$

Then, the generalized inverse $K_P : \text{Im } L \rightarrow \text{dom } L \cap \text{Ker } P$ can be written by

$$K_P y(t) = \int_0^t \int_0^s \int_0^\tau y(v) dv d\tau ds, \quad y \in \text{Im } L. \quad (33)$$

In fact, for $y \in \text{Im } L$, we have

$$(LK_P)y(t) = (K_P y)''' = y(t), \quad (34)$$

and for $x \in \text{dom } L \cap \text{Ker } P$, we know

$$\begin{aligned} (K_P L)x(t) &= (K_P)x'''(t) \\ &= \int_0^t \int_0^s \int_0^\tau x'''(v) dv d\tau ds \\ &= x(t) - \left[x(0) + \frac{1}{2}x''(0)t^2 \right] \\ &= x(t) - Px(t). \end{aligned} \quad (35)$$

Taking note that $x \in \text{dom } L \cap \text{Ker } P$, $Px(t) = 0$, thus $(K_P L)x(t) = x(t)$.

It is clear that $\|K_P y\| \leq \|y\|_1$. $\square$

Theorem 4. Let the condition (C_1) hold and $\Lambda(p, q) \neq 0$. Assume the following.

(H_1) There exist functions $\alpha, \beta, \gamma, \theta \in L^1[0, 1]$, such that

$$\begin{aligned} |f(t, x_1, x_2, x_3) + e(t)| \\ \leq \alpha(t)|x_1| + \beta(t)|x_2| + \gamma(t)|x_3| + \theta(t), \quad (36) \\ \|\alpha\|_1 + \|\beta\|_1 + \|\gamma\|_1 < 1, \end{aligned}$$

where $\forall (x_1, x_2, x_3) \in R^3, t \in [0, 1]$.

(H_2) There exists a constant $A > 0$ such that for $x \in \text{dom } L$, if $|x(t)| > A$ or $|x''(t)| > A$ for all $t \in [0, 1]$, then

$$Q_1 N(x(t)) \neq 0 \quad \text{or} \quad Q_2 N(x(t)) \neq 0. \quad (37)$$

(H_3) There exists a constant $B > 0$ such that for $a, c \in R$, if $|a| > B$ or $|c| > B$, then either

$$Q_1 N(a + ct^2) + Q_2 N(a + ct^2) > 0 \quad (38)$$

or

$$Q_1 N(a + ct^2) + Q_2 N(a + ct^2) < 0. \quad (39)$$

Then BVP (1)-(2) has at least one solution in $C^2[0, 1]$.

Proof. We divide the proof into the following steps.

Step 1. The set $\Omega_1 = \{x \in \text{dom } L \setminus \text{Ker } L : Lx = \lambda Nx \text{ for some } \lambda \in [0, 1]\}$ is bounded.

For $x \in \Omega_1$, since $Lx = \lambda Nx$, so $\lambda \neq 0$, $Nx \in \text{Im } L$; hence

$$Q_1 N(x(t)) = 0, \quad Q_2 N(x(t)) = 0. \quad (40)$$

From (H_2) , there exist $t_0, t_1 \in [0, 1]$ such that $|x(t_0)| \leq A$, $|x''(t_1)| \leq A$. x, x' , and x'' are absolutely continuous for all $t \in [0, 1]$, and

$$\begin{aligned} x(t) &= x(t_0) + \int_{t_0}^t x'(s) ds, \quad x'(t) = x'(0) + \int_0^t x''(s) ds \\ x''(t) &= x''(t_1) + \int_{t_1}^t x'''(s) ds, \end{aligned} \quad (41)$$

which imply

$$\begin{aligned} \|x\|_\infty &\leq A + \|x'\|_\infty, \quad \|x'\|_\infty \leq A + \|x''\|_1, \\ \|x''\|_\infty &\leq A + \|x'''\|_1. \end{aligned} \quad (42)$$

From (H_1) , we obtain

$$\begin{aligned} \|x'''\|_1 &= \|Lx\|_1 \leq \|Nx\|_1 \\ &\leq \|\alpha\|_1 \|x\|_\infty + \|\beta\|_1 \|x'\|_\infty \\ &\quad + \|\gamma\|_1 \|x''\|_\infty + \|\theta\|_1 \\ &\leq (\|\alpha\|_1 + \|\beta\|_1 + \|\gamma\|_1) \|x'''\|_1 \\ &\quad + A(2\|\alpha\|_1 + \|\beta\|_1 + \|\gamma\|_1) + \|\theta\|_1, \\ \|x'''\|_1 &\leq \frac{1}{1 - (\|\alpha\|_1 + \|\beta\|_1 + \|\gamma\|_1)} \\ &\quad \times [A(2\|\alpha\|_1 + \|\beta\|_1 + \|\gamma\|_1) + \|\theta\|_1]. \end{aligned} \quad (43)$$

So there exists a constant $M_1 > 0$ such that $\|x\| \leq M_1$; that is, the set Ω_1 is bounded.

Step 2. The set $\Omega_2 = \{x \in \text{Ker } L : Nx \in \text{Im } L\}$ is bounded.

For $x \in \Omega_2$, $x \in \text{Ker } L$ implies that $x = a + ct^2$, $a = ((\beta\eta^2 - 1)/(1 - \beta))c$, $t \in [0, 1]$, $c \in R$. From $QNx = 0$, we get $Q_1 N(a + ct^2) = Q_2 N(a + ct^2) = 0$. From (H_3) , then $\|x\| \leq |a| + |c| \leq 2B$; that is, the set Ω_2 is bounded.

Step 3. The set $\Omega_3 = \{x \in \text{Ker } L : \lambda Jx + (1 - \lambda)QNx = 0, \lambda \in [0, 1]\}$ is bounded.

For any $a, c \in R$, we define the linear isomorphism $J : \text{Ker } L \rightarrow \text{Im } Q$ by

$$J(a + ct^2) = \frac{a't^{p-1} + b't^{q-1}}{\Lambda(p, q)}, \quad (44)$$

where

$$\begin{aligned} a' &= p(p+1)(p+2) \left[(\beta\eta^{q+2} - 1)|a| + \sum_{i=1}^{m-2} \alpha_i \xi_i^{q+2} |c| \right], \\ b' &= -q(q+1)(q+2) \left[(\beta\eta^{p+2} - 1)|a| + \sum_{i=1}^{m-2} \alpha_i \xi_i^{p+2} |c| \right]. \end{aligned} \quad (45)$$

Set

$$\begin{aligned} \mu &= \frac{p(p+1)(p+2)}{\Lambda(p,q)} (\beta\eta^{q+2} - 1), \\ \nu &= \frac{p(p+1)(p+2)}{\Lambda(p,q)} \sum_{i=1}^{m-2} \alpha_i \xi_i^{q+2}, \\ \rho &= -\frac{q(q+1)(q+2)}{\Lambda(p,q)} (\beta\eta^{p+2} - 1), \\ \omega &= -\frac{q(q+1)(q+2)}{\Lambda(p,q)} \sum_{i=1}^{m-2} \alpha_i \xi_i^{p+2}. \end{aligned} \quad (46)$$

For any $x(t) = a + ct^2 \in \Omega_3$, we obtain

$$\begin{aligned} &\mu [\lambda |a| + (1-\lambda) Q_1 N(a + ct^2)] \\ &\quad + \nu [\lambda |c| + (1-\lambda) Q_2 N(a + ct^2)] = 0, \\ &\rho [\lambda |a| + (1-\lambda) Q_1 N(a + ct^2)] \\ &\quad + \omega [\lambda |c| + (1-\lambda) Q_2 N(a + ct^2)] = 0. \end{aligned} \quad (47)$$

On account of

$$\begin{vmatrix} \mu & \nu \\ \rho & \omega \end{vmatrix} = -\frac{p(p+1)(p+2)q(q+1)(q+2)}{\Lambda(p,q)} \neq 0, \quad (48)$$

therefore, we have

$$\begin{aligned} \lambda |a| + (1-\lambda) Q_1 N(a + ct^2) &= 0, \\ \lambda |c| + (1-\lambda) Q_2 N(a + ct^2) &= 0. \end{aligned} \quad (49)$$

If $\lambda = 1$, then $a = c = 0$. If $\lambda \neq 1$ and $|a| > B$ or $|c| > B$, from the above equality and (38), one has

$$\begin{aligned} \lambda (|a| + |c|) &= -(1-\lambda) \\ &\quad \times [Q_1 N(a + ct^2) + Q_2 N(a + ct^2)] < 0, \end{aligned} \quad (50)$$

which contradicts $\lambda(|a| + |c|) \geq 0$; thus $\|x\| \leq |a| + |c| \leq 2B$. So the set Ω_3 is bounded.

Step 4. If (39) holds, similar to the above argument, we can prove that the set

$$\Omega_3 = \{x \in \text{Ker } L : -\lambda Jx + (1-\lambda) QNx = 0, \lambda \in [0, 1]\} \quad (51)$$

is bounded too, where J is defined in (44).

Now, we will prove that all conditions of Theorem 1 are satisfied.

Let Ω be an open bounded subset of Y such that $\cup_{i=1}^3 \bar{\Omega}_i \subset \Omega$. By the Arzelà-Ascoli theorem, we can prove that $K_p(I - Q)N : \bar{\Omega} \rightarrow Y$ is compact, so N is L -compact on $\bar{\Omega}$.

Then by the above argument, we have

- (i) $Lx \neq Nx$ for every $(x, \lambda) \in [(\text{dom } L \setminus \text{Ker } L) \cap \partial\Omega] \times (0, 1)$;
- (ii) $Nx \notin \text{Im } L$ for every $x \in \text{Ker } L \cap \partial\Omega$
- (iii) let $H(x, \lambda) = \pm \lambda Jx + (1-\lambda) QNx$.

According to the above argument in Steps 3 and 4, we know $H(x, \lambda) \neq 0$ for every $x \in \partial\Omega \cap \text{Ker } L$. Thus, by using the homotopy property of degree, we have

$$\begin{aligned} \deg(QN|_{\text{Ker } L}, \Omega \cap \text{Ker } L, 0) &= \deg(H(\cdot, 0), \Omega \cap \text{Ker } L, 0) \\ &= \deg(H(\cdot, 1), \Omega \cap \text{Ker } L, 0) \\ &= \deg(\pm J, \Omega \cap \text{Ker } L, 0) \\ &= \pm 1 \\ &\neq 0. \end{aligned} \quad (52)$$

Then by Theorem 1, $Lx = Nx$ has at least one solution in $\text{dom } L \cap \bar{\Omega}$; that is, BVP (1)-(2) has at least one solution in $C^2[0, 1]$. $\square$

4. Example

Example 1. We consider the following boundary value problem:

$$\begin{aligned} x'''(t) &= t^2 + 4 + \frac{3}{8}x \left(1 + \frac{1}{2} \sin x'\right) \\ &\quad + \frac{1}{4}t \cos(x'')^2, \quad t \in (0, 1), \end{aligned} \quad (53)$$

$$x(0) = \frac{68}{59}x\left(\frac{1}{2}\right), \quad x'(0) = 0, \quad x(1) = \frac{1}{2}x\left(\frac{1}{3}\right).$$

Let

$$\begin{aligned} f(t, x(t), x'(t), x''(t)) &= 4 + \frac{3}{8}x \left(1 + \frac{1}{2} \sin x'\right) + \frac{1}{4}t \cos(x'')^2, \quad e(t) = t^2, \\ m = 3, \quad \alpha_1 &= \frac{68}{59}, \quad \beta = \frac{1}{2}, \quad \xi_1 = \frac{1}{2}, \quad \eta = \frac{1}{3}. \end{aligned} \quad (54)$$

Then the condition (C_1) holds.

From Lemma 2, one has $\Lambda(1, 2) = -697/9558 \neq 0$. By Lemma 3, we define

$$\begin{aligned} Q_1 y &= \frac{68}{59} \int_0^{1/2} \int_0^s \int_0^\tau y(v) dv d\tau ds, \\ Q_2 y &= \int_0^1 \int_0^s \int_0^\tau y(v) dv d\tau ds \\ &\quad - \frac{1}{2} \int_0^{1/3} \int_0^s \int_0^\tau y(v) dv d\tau ds, \\ T_1 y &= -\frac{57348}{697} \left(-\frac{1}{162} Q_1 y + \frac{17}{236} Q_2 y \right), \\ T_2 y &= \frac{229392}{697} \left(-\frac{53}{54} Q_1 y + \frac{17}{118} Q_2 y \right), \\ K_P y(t) &= \int_0^t \int_0^s \int_0^\tau y(v) dv d\tau ds, \quad y \in \text{Im } L. \\ Qy(t) &= (T_1 y)t^{1-1} + (T_2 y)t^{2-1} = T_1 y + (T_2 y)t. \end{aligned} \quad (55)$$

Since $|f(t, x(t), x'(t), x''(t)) + e(t)| \leq (9/16)|x(t)| + t^2 + (1/4)t + 4$, then $\alpha(t) = 9/16, \beta(t) = \gamma(t) = 0, \theta(t) = t^2 + (1/4)t + 4$.

If $x(t) > 1 = A, |x''(t)| > 1 = A$, and $B = 1$, one has

$$\begin{aligned} Q_1 Nx &= \frac{68}{59} \int_0^{1/2} \int_0^s \int_0^\tau \left(v^2 + 4 + \frac{3}{8}x \left(1 + \frac{1}{2} \sin x' \right) \right. \\ &\quad \left. + \frac{1}{4}v \cos(x'')^2 \right) dv d\tau ds \\ &\geq \frac{68}{59} \int_0^{1/2} \int_0^s \int_0^\tau \left(v^2 + 4 + \frac{3}{16} - \frac{1}{4}v \right) dv d\tau ds \\ &= \frac{68}{59} \int_0^{1/2} \int_0^s \int_0^\tau \left[\left(v - \frac{1}{8} \right)^2 + \frac{267}{64} \right] dv d\tau ds \\ &> 0, \\ Q_2 Nx &= \int_0^1 \int_0^s \int_0^\tau \left(v^2 + 4 + \frac{3}{8}x \left(1 + \frac{1}{2} \sin x' \right) \right. \\ &\quad \left. + \frac{1}{4}v \cos(x'')^2 \right) dv d\tau ds \\ &\quad - \frac{1}{2} \int_0^{1/3} \int_0^s \int_0^\tau \left(v^2 + 4 + \frac{3}{8}x \left(1 + \frac{1}{2} \sin x' \right) \right. \\ &\quad \left. + \frac{1}{4}v \cos(x'')^2 \right) dv d\tau ds \\ &\geq \frac{1}{2} \int_0^{1/3} \int_0^s \int_0^\tau \left(v^2 + 4 + \frac{3}{8}x \left(1 + \frac{1}{2} \sin x' \right) \right. \\ &\quad \left. + \frac{1}{4}v \cos(x'')^2 \right) dv d\tau ds \end{aligned}$$

$$\begin{aligned} &\geq \frac{1}{2} \int_0^{1/3} \int_0^s \int_0^\tau \left(v^2 + 4 + \frac{3}{16} - \frac{1}{4}v \right) dv d\tau ds \\ &= \frac{1}{2} \int_0^{1/3} \int_0^s \int_0^\tau \left[\left(v - \frac{1}{8} \right)^2 + \frac{267}{64} \right] dv d\tau ds \\ &> 0, \end{aligned}$$

$$Q_1 N(2 + t^2) + Q_2 N(2 + t^2) > 0.$$

(56)

Then BVP (53) satisfies Theorem 4. So it has at least one solution in $C^2[0, 1]$.

Remark 2. By using a similar method as employed in the above proof, we could obtain some similar results under the condition (C_3) or (C_5) , then we omit them.
