Using the suitable Trudinger-Moser inequality and the Mountain Pass Theorem, we prove the existence of multiple solutions for a class of N -Laplacian equations with critical growth and indefinite weight $-\operatorname{div}(|\nabla u|^{N-2}\nabla u) + V(x)|u|^{N-2}u = \lambda(|u|^{N-2}u/|x|^\beta) + (f(x, u)/|x|^\beta) + \varepsilon h(x)$, $x \in \mathbb{R}^N$, $u \neq 0$, $x \in \mathbb{R}^N$, where $0 < \beta < N$, $V(x)$ is an indefinite weight, $f: \mathbb{R}^N \times \mathbb{R} \rightarrow \mathbb{R}$ behaves like $\exp(\alpha|u|^{N/(N-1)})$ and does not satisfy the Ambrosetti-Rabinowitz condition, and $h \in (W^{1,N}(\mathbb{R}^N))^*$.

1. Introduction

In this paper, we consider the existence of multiple solutions for the N -Laplacian elliptic equations with critical growth and singular potentials

$$\begin{aligned} & -\operatorname{div}(|\nabla u|^{N-2}\nabla u) + V(x)|u|^{N-2}u \\ & = \lambda \frac{|u|^{N-2}u}{|x|^\beta} + \frac{f(x, u)}{|x|^\beta} + \varepsilon h(x), \quad x \in \mathbb{R}^N, \quad (1) \\ & u \neq 0, \quad x \in \mathbb{R}^N, \end{aligned}$$

where $N \geq 2$, $0 < \lambda < \lambda_1$, $\lambda_1 = \inf\{\int_{\mathbb{R}^N}(|\nabla u|^N + V(x)|u|^N)dx : u \in W^{1,N}(\mathbb{R}^N), \int_{\mathbb{R}^N}(|u|^N/|x|^\beta)dx = 1\}$, $0 < \beta < N$, $h \in (W^{1,N}(\mathbb{R}^N))^*$, $\Delta_N u = \operatorname{div}(|\nabla u|^{N-2}\nabla u)$ is the N -Laplacian, the indefinite weight $V(x) \in R(V_0)$, and $R(V_0)$ is the classes of rearrangement of V_0 ; V_0 satisfies the following conditions:

$$(H1) \quad V_0 \in L^q(\mathbb{R}^N), \quad \forall q \geq 1,$$

$$(H2) \quad \|V_0^-\|_{L^q(\mathbb{R}^N)} < S_{Nq'}, \text{ or } V_0 \geq -S_N + \delta, \text{ for some } \delta > 0,$$

$$(H3) \quad (1/V_0) \in L^1(\mathbb{R}^N),$$

where $1/q + 1/q' = 1$, $S_r(r = N, Nq')$ is the best constant

$$S_r \|u\|_{L^r(\mathbb{R}^N)}^N \leq \int_{\mathbb{R}^N} |\nabla u|^N dx, \quad \forall u \in W^{1,N}(\mathbb{R}^N); \quad (2)$$

that is,

$$S_r = \inf \left\{ \int_{\mathbb{R}^N} |\nabla u|^N dx : u \in W^{1,N}(\mathbb{R}^N), \|u\|_{L^r(\mathbb{R}^N)} = 1 \right\}. \quad (3)$$

Note that if V is a measurable function which satisfies (H2), there exists $\delta_0 > 0$ such that $\|V_0^-\|_{L^q(\mathbb{R}^N)} \leq (1 - \delta_0)S_{Nq'}$.

Recently, N -Laplacian equations had been studied by many authors. Marcos do Ó [1] studied the existence of nontrivial solutions for the following N -Laplacian equations with critical growth:

$$u \in W_0^{1,N}(\Omega), \quad u \geq 0, \quad -\Delta_N u = f(x, u), \quad x \in \Omega, \quad (4)$$

where Ω is bounded smooth domain in $\mathbb{R}^N$ ($N \geq 2$). Adimurthi and Sandeep [2] proved that the singular Trudinger-Moser inequality

$$\sup_{u \in W_0^{1,N}(\Omega)} \int_{\Omega} \frac{\exp(\alpha|u|^{N/(N-1)})}{|x|^\beta} dx < +\infty \quad (5)$$

holds if and only if $\alpha/\alpha_N + \beta/N \leq 1$, where $\alpha_N = Nw_{N-1}^{1/(N-1)}$, $\alpha > 0$, $0 \leq \beta < N$, and $\|\nabla u\|_{L^N(\Omega)} \leq 1$, and studied the corresponding critical exponent problem. For the unbounded domain, Li and Ruf [3] proved that, if we replace the L^N -norm of ∇u in the supremum by the standard Sobolev norm, the supremum can still be finite. Adimurthi and Yang [4] obtained the following Trudinger-Moser inequality

$$\int_{\mathbb{R}^N} \frac{\exp(\alpha|u|^{N/(N-1)} - S_{N-2}(\alpha, u))}{|x|^\beta} dx < +\infty, \quad (6)$$

where $\alpha > 0$, $0 \leq \beta < N$, $u \in W^{1,N}(\mathbb{R}^N)$, and $S_{N-2}(\alpha, u) = \sum_{k=0}^{N-2} (\alpha^k/k!) |u|^{Nk/(N-1)}$, and studied the existence of nontrivial solution for the corresponding N -Laplacian equations with critical growth. In particular, using inequality (6) and the Mountain Pass Theorem, Lam and Lu [5] studied the following nonuniformly elliptic equations of N -Laplacian type of the form

$$-\operatorname{div}(a(x, \nabla u)) + V(x)|u|^{N-2}u = \frac{f(x, u)}{|x|^\beta} + \varepsilon h(x), \quad (7)$$

$$x \in \mathbb{R}^N,$$

where $V(x) > V_0 > 0$, and obtained the existence and multiplicity results of problem (7).

On the other hand, some authors have studied the case for the nonlinear term which does not satisfy the Ambrosetti-Rabinowitz condition. Lam and Lu [6, 7] studied the existence of nontrivial solutions for the N -Laplacian equations and systems and polyharmonic equations without Ambrosetti-Rabinowitz conditions, respectively. Miyagaki and Souto [8] discussed a class of superlinear problems for the polynomial case without Ambrosetti-Rabinowitz conditions. Motivated by a suitable Trudinger-Moser inequality, we assume the following growth conditions on the nonlinearity $f(x, u)$:

(f1) the function $f: \mathbb{R}^N \times \mathbb{R} \rightarrow \mathbb{R}$ is continuous, for some constants $\alpha_0, b_1, b_2 > 0$ and for all $(x, s) \in \mathbb{R}^N \times \mathbb{R}$,

$$|f(x, s)| \leq b_1 |s|^{N-1} + b_2 [\exp(\alpha_0 |s|^{N/(N-1)}) - S_{N-2}(\alpha_0, s)]; \quad (8)$$

(f2) $H(x, t) \leq H(x, s)$, for all $0 < t < s$, $\forall x \in \mathbb{R}^N$, where

$$H(x, s) = sf(x, s) - NF(x, s),$$

$$F(x, s) = \int_0^s f(x, \tau) d\tau; \quad (9)$$

(f3) there exists $c > 0$ such that for all $(x, s) \in \mathbb{R}^N \times \mathbb{R}^+$, $0 < F(x, s) \leq c|s|^N + cf(x, s)$;

(f4) $\lim_{s \rightarrow \infty} (F(x, s)/|s|^N) = \infty$, uniformly on $x \in \mathbb{R}^N$.

We state our main result in this paper.

Theorem 1. Suppose that (H1)–(H3) and (f1)–(f4) are satisfied and $0 < \lambda < \lambda_1$. Furthermore, assume that

(f5) $\limsup_{s \rightarrow 0^+} (NF(x, s)/|s|^N) = 0$, uniformly on $x \in \mathbb{R}^N$,

and there exists $r > 0$ such that

$$(f6) \quad \lim_{s \rightarrow 0} sf(x, s) \exp(-\alpha_0 |s|^{N/(N-1)}) > \frac{2}{e^{(\alpha_N d(N-\beta)/N) + Cr^{N-\beta} - (r^{N-\beta}/(N-\beta))}} \times \left(\frac{N-\beta}{\alpha_0}\right)^{N-1}, \quad (10)$$

uniformly on compact subsets of $\mathbb{R}^N$, where d and C are defined in Section 3. Then there exists $\varepsilon_1 > 0$ such that, for each $0 < \varepsilon < \varepsilon_1$, problem (1) has at least two nontrivial weak solutions.

In this paper, as the function $V(x)$ is an indefinite weight, we establish a singular Trudinger-Moser inequality (see Lemma 8) and investigate the eigenvalue problem corresponding to problem (1). Using the singular Trudinger-Moser inequality, the eigenvalue problem and the Mountain Pass Theorem, we prove the multiplicity result for problem (1). Furthermore, condition (f2) is used by Lam and Lu [5], and it implies that the function $f(x, u)$ does not satisfy the Ambrosetti-Rabinowitz condition.

The paper is organized as follows. In Section 2, we recall some important lemmas and consider the eigenvalue problem corresponding to problem (1). Section 3 is devoted to prove Theorem 1.

2. Preliminary Results

2.1. Key Lemmas. Now, we define the following Sobolev space

$$E = \left\{ u \in W^{1,N}(\mathbb{R}^N) : \int_{\mathbb{R}^N} |\nabla u|^N dx + \int_{\mathbb{R}^N} V(x)|u|^N dx < +\infty \right\}, \quad (11)$$

and the corresponding norm,

$$\|u\|_E = \left(\int_{\mathbb{R}^N} (|\nabla u|^N + V(x)|u|^N) dx \right)^{1/N}. \quad (12)$$

From the Radial Lemma [9, 10], we have

$$|u(x)| \leq |x|^{-1} \left(\frac{N}{w_{N-1}} \right)^{1/N} \|u\|_{L^N(\mathbb{R}^N)}, \quad \forall x \neq 0, \quad (13)$$

for all $u \in W^{1,N}(\mathbb{R}^N)$ being radially symmetric, where w_{N-1} is the surface area of the unit sphere in $\mathbb{R}^N$. $V(x)$ is a rearrangement of V_0 if

$$\left| \{x \in \mathbb{R}^N : V(x) \geq \alpha\} \right| = \left| \{x \in \mathbb{R}^N : V_0(x) \geq \alpha\} \right|, \quad \forall \alpha \in \mathbb{R}^N, \quad (14)$$

where $|\cdot|$ denotes the Lebesgue measure.

Lemma 2 (see [11]). *Let V_0 satisfy (H1) and (H2). Then there exists $\delta_0 > 0$ such that*

$$\delta_0 \int_{\mathbb{R}^N} |\nabla u|^N dx \leq \|u\|_E^N, \quad \forall u \in R(V_0). \quad (15)$$

Proof. Assume that $\|V_0^-\|_{L^N(\mathbb{R}^N)} < S_{Nq'}$. Since

$$\begin{aligned} \|u\|_E^N &\geq \int_{\mathbb{R}^N} (|\nabla u|^N + V^-(x) |u|^N) dx, \\ \int_{\mathbb{R}^N} V^-(x) |u|^N dx &\leq \|V^-(x)\|_{L^q(\mathbb{R}^N)} \|u\|_{L^{Nq'}(\mathbb{R}^N)}^N \\ &= \|V_0^-(x)\|_{L^q(\mathbb{R}^N)} \|u\|_{L^{Nq'}(\mathbb{R}^N)}^N. \end{aligned} \quad (16)$$

Then, by (H2), there exists δ_0 such that

$$\|V_0^-(x)\|_{L^q(\mathbb{R}^N)} \leq (1 - \delta_0) S_{Nq'}. \quad (17)$$

Therefore, we have

$$\|u\|_E^N \geq \delta_0 \int_{\mathbb{R}^N} |\nabla u|^N dx. \quad (18)$$

□

Remark 3. In this paper, we denote C as positive (possibly different) constants.

Remark 4. If $V \in R(V_0)$, then V satisfies (H1)–(H3).

Lemma 5. *If (H1)–(H3) are satisfied, then*

- (1) *the embedding $E \hookrightarrow W^{1,N}(\mathbb{R}^N) \hookrightarrow L^q(\mathbb{R}^N)$ is continuous, for all $1 \leq q < \infty$;*
- (2) *the embedding $E \hookrightarrow L^q(\mathbb{R}^N)$ is compact, for all $q \geq N$.*

Proof. (1) From Lemma 2 and Sobolev-Poincaré inequality, we obtain the conclusion.

(2) Let $\{u_k\} \subset E$ satisfy $\|u_k\|_E \leq C$ for all k , and we assume

$$\begin{aligned} u_k &\rightharpoonup u, \quad \text{weakly in } E, \\ u_k &\longrightarrow u, \quad \text{strongly in } L_{\text{loc}}^q(\mathbb{R}^N), \quad \forall q \geq 1, \\ u_k &\longrightarrow u, \quad \text{a.e. in } \mathbb{R}^N. \end{aligned} \quad (19)$$

In view of (H3), for every $\varepsilon \rightarrow 0$, there exists $R > 0$ such that

$$\left(\int_{|x|>R} \frac{1}{V_0^{1/(N-1)}} dx \right)^{1-1/N} < \varepsilon. \quad (20)$$

Hence, we have

$$\begin{aligned} \int_{|x|>R} |u_k - u| dx &= \int_{|x|>R} \frac{V_0^{1/N}}{V_0^{1/N}} |u_k - u| dx \\ &\leq \left(\int_{|x|>R} \frac{1}{V_0^{1/(N-1)}} dx \right)^{1-1/N} \\ &\quad \times \left(\int_{|x|>R} V_0 |u_k - u|^N dx \right)^{1/N} \\ &\leq \varepsilon \|u_k - u\|_E \leq C\varepsilon. \end{aligned} \quad (21)$$

From (19), we have $u_k \rightarrow u$ in $L^1(B_R(0))$ and $B_R(0) \subset \mathbb{R}^N$ is the ball centered at 0 with radius R . This together with (21) leads to $\limsup_{k \rightarrow +\infty} \int_{\mathbb{R}^N} |u_k - u| dx \leq C\varepsilon$. Since ε is arbitrary, we have

$$\lim_{k \rightarrow +\infty} \int_{\mathbb{R}^N} |u_k - u| dx = 0. \quad (22)$$

Hence, for every $q \geq N$, we have

$$\begin{aligned} \int_{\mathbb{R}^N} |u_k - u|^q dx &\leq \int_{\mathbb{R}^N} |u_k - u|^{1/2} |u_k - u|^{q-1/2} dx \\ &\leq \left(\int_{\mathbb{R}^N} |u_k - u| dx \right)^{1/2} \\ &\quad \times \left(\int_{\mathbb{R}^N} |u_k - u|^{2q-1} dx \right)^{1/2} \\ &\leq C \left(\int_{\mathbb{R}^N} |u_k - u| dx \right)^{1/2} \rightarrow 0. \end{aligned} \quad (23)$$

□

Lemma 6. *E is a reflexive Banach space.*

Proof. Suppose that $\forall u_1 \in E, \forall u_2 \in E$, we have

$$\|u_1\|_E \leq 1, \quad \|u_2\|_E \leq 1, \quad \|u_1 - u_2\|_E > \varepsilon, \quad (24)$$

and there exists $\delta = 1 - \sqrt[N]{1 - (\varepsilon/4)^N}$, using the following inequality

$$\left| \frac{a+b}{2} \right|^p + \left| \frac{a-b}{2} \right|^p \leq \frac{1}{2} (|a|^p + |b|^p), \quad (25)$$

$$\forall a, b, p \in \mathbb{R},$$

such that

$$\begin{aligned} &\left\| \frac{u_1 + u_2}{2} \right\|_E^N \\ &= \left\| \frac{u_1 + u_2}{2} \right\|_E^N - \left\| \frac{u_1 - u_2}{2} \right\|_E^N + \left\| \frac{u_1 - u_2}{2} \right\|_E^N \\ &\leq \frac{1}{2} \left(\int_{\mathbb{R}^N} |\nabla u_1|^N dx + \int_{\mathbb{R}^N} |\nabla u_2|^N dx \right) \\ &\quad + \frac{1}{2} \int_{\mathbb{R}^N} V(x) (|u_1|^N + |u_2|^N) dx - \left(\frac{\varepsilon}{2} \right)^N \\ &\leq 1 - \left(\frac{\varepsilon}{2} \right)^N < (1 - \delta)^N. \end{aligned} \quad (26)$$

Hence, E is uniformly convex. We obtain that E is a reflexive Banach space.

Now, we define the functional $I : E \rightarrow \mathbb{R}$

$$\begin{aligned} I(u) &= \frac{1}{N} \int_{\mathbb{R}^N} |\nabla u|^N dx + \frac{1}{N} \int_{\mathbb{R}^N} V(x) |u|^N dx \\ &\quad - \int_{\mathbb{R}^N} \frac{F(x, u)}{|x|^\beta} dx - \frac{\lambda}{N} \int_{\mathbb{R}^N} \frac{|u|^N}{|x|^\beta} dx - \varepsilon \int_{\mathbb{R}^N} hu dx; \end{aligned} \quad (27)$$

then the functional $I(u)$ is well defined by Lemma 5. Moreover, $I(u)$ is the C^1 functional on E and $\forall u, v \in E$; we have

$$\begin{aligned} DI(u)v &= \int_{\mathbb{R}^N} |\nabla u|^{N-2} \nabla u \nabla v \, dx + \int_{\mathbb{R}^N} V(x) |u|^{N-2} uv \, dx \\ &\quad - \int_{\mathbb{R}^N} \frac{f(x, u)v}{|x|^\beta} \, dx - \lambda \int_{\mathbb{R}^N} \frac{|u|^{N-2} uv}{|x|^\beta} \, dx \\ &\quad - \varepsilon \int_{\mathbb{R}^N} h v \, dx. \end{aligned} \quad (28)$$

Hence, the critical point of the functional $I(u)$ is the weak solution of problem (1). $\square$

Lemma 7. Let $0 < \alpha \leq (1 - \beta/N)\alpha_N$, $0 < \beta < N$, $u \in E$ and $\|u\|_E \leq 1$; then for some $q > N$ and $\alpha/\alpha_N + \beta/N + 1/q \leq 1$, one has

$$\int_{\mathbb{R}^N} \frac{[\exp(\alpha|u|^{N/(N-1)}) - S_{N-2}(\alpha, u)] |u|}{|x|^\beta} \, dx \leq C \|u\|_{L^q(\mathbb{R}^N)}. \quad (29)$$

Proof. Let $R(\alpha, u) = \exp(\alpha|u|^{N/(N-1)}) - S_{N-2}(\alpha, u)$; u^* is the Schwarz symmetrization of u ; we can conclude that

$$\int_{\mathbb{R}^N} \frac{R(\alpha, u) |u|}{|x|^\beta} \, dx = \int_{\mathbb{R}^N} \frac{R(\alpha, u^*) |u^*|}{|x|^\beta} \, dx. \quad (30)$$

Let $u' = u/\|u\|_E$. It is easy to obtain that $R(\alpha, u)$ is increasing with respect to $|u|$. If $\|u\|_E \leq 1$; then there holds

$$\begin{aligned} &\int_{\mathbb{R}^N} \frac{\exp(\alpha|u|^{N/(N-1)}) - S_{N-2}(\alpha, u)}{|x|^\beta} \, dx \\ &\leq \int_{\mathbb{R}^N} \frac{\exp(\alpha|u'|^{N/(N-1)}) - S_{N-2}(\alpha, u')}{|x|^\beta} \, dx. \end{aligned} \quad (31)$$

Now, we prove that there exists a uniform constant C such that, for all radially decreasing symmetric functions $u \in W^{1,N}(\mathbb{R}^N)$ and $\|u\|_E = 1$,

$$\int_{\mathbb{R}^N} \frac{\exp(\alpha^*|u|^{N/(N-1)}) - S_{N-2}(\alpha^*, u)}{|x|^\beta} \, dx \leq C, \quad (32)$$

where $\alpha^* = (1 - \beta/N)\alpha_N$. In the following, assume that u is radially decreasing function in $\mathbb{R}^N$ and $\|u\|_E = 1$. Take r

sufficiently large; that is, $r > N^{1/N} u_{N-1}^{-1/N} \|u^*\|_{L^N(\mathbb{R}^N)}$. By the radial lemma, for all $|x| \geq r$, we have $u^*(x) < 1$ and

$$\begin{aligned} &\int_{|x| \geq r} \frac{R(\alpha^*, u)}{|x|^\beta} \, dx = \int_{|x| \geq r} \frac{R(\alpha^*, u^*)}{|x|^\beta} \, dx \\ &\leq \frac{1}{r^\beta} \int_{|x| > r} \left(\frac{(\alpha^*)^{N-1} |u^*|^N}{(N-1)!} \right. \\ &\quad \left. + \sum_{m=N}^{\infty} \frac{(\alpha^*)^m |u^*|^{mN/(N-1)}}{m!} \right) \, dx \\ &\leq \frac{\|u^*\|_{L^N(\mathbb{R}^N)}^N}{r^\beta} \left(\sum_{m=N-1}^{\infty} \frac{(\alpha^*)^m}{m!} \right) \leq C. \end{aligned} \quad (33)$$

Define the set $S = \{x \in \mathbb{B}_r(0) : |u(x) - u(r)| > 2|u(r)|\}$. Assume that S is nonempty; then for all $x \in S$ and $\varepsilon > 0$ we have

$$\begin{aligned} &|u(x)|^{N/(N-1)} \\ &= |u(x) - u(r) + u(r)|^{N/(N-1)} \\ &= |u(x) - u(r)|^{N/(N-1)} \left(1 + \frac{u(r)}{|u(x) - u(r)|} \right)^{N/(N-1)} \\ &\leq |u(x) - u(r)|^{N/(N-1)} + \frac{N}{N-1} \left(\frac{3}{2} \right)^{1/(N-1)} \\ &\quad \times |u(r)| |u(x) - u(r)|^{1/(N-1)} \\ &\leq (1 + \varepsilon) |u(x) - u(r)|^{N/(N-1)} \\ &\quad + \left(\frac{3}{2} \right)^{N/(N-1)^2} \left(\frac{|u(r)|^N}{(N-1)\varepsilon} \right)^{1/N-1}. \end{aligned} \quad (34)$$

Since

$$\|u\|_E^N = \|\nabla u\|_{L^N(\mathbb{R}^N)}^N + \int_{\mathbb{R}^N} V(x) |u|^N \, dx = 1, \quad (35)$$

so we have

$$\begin{aligned} &\|\nabla u\|_{L^N(\mathbb{R}^N)}^N = 1 - \int_{\mathbb{R}^N} V(x) |u|^N \, dx, \\ &\|\nabla u\|_{L^N(\mathbb{R}^N)}^{N/(N-1)} = \left(1 - \int_{\mathbb{R}^N} V(x) |u|^N \, dx \right)^{1/(N-1)}. \end{aligned} \quad (36)$$

Thus, we obtain

$$\frac{1}{\|\nabla u\|_{L^N(\mathbb{R}^N)}^{N/(N-1)}} = \left(\frac{1}{1 - \int_{\mathbb{R}^N} V(x) |u|^N \, dx} \right)^{1/(N-1)}. \quad (37)$$

From Hardy-Littlewood inequality, we have

$$\int_{\mathbb{R}^N} V(x) |u^*|^N \, dx \geq \int_{\mathbb{R}^N} V_0(x) |u|^N \, dx. \quad (38)$$

Since $V(x) \in R(V_0)$, we have $\int_{\mathbb{R}^N} V(x) |u^*|^N dx = \int_{\mathbb{R}^N} V(x) |u|^N dx$. Let

$$\begin{aligned} 1 + \varepsilon &= \frac{1}{\|\nabla u\|_{L^N(\mathbb{R}^N)}^{N/(N-1)}} \\ &= \left(\frac{1}{1 - \int_{\mathbb{R}^N} V(x) |u|^N dx} \right)^{1/(N-1)} \\ &\geq \left(\frac{1}{1 - \int_{\mathbb{R}^N} V_0(x) |u|^N dx} \right)^{1/(N-1)} \\ &\geq \left(\frac{1}{1 - (\delta - S_N) \int_{\mathbb{R}^N} |u|^N dx} \right)^{1/(N-1)}. \end{aligned} \quad (39)$$

Applying the mean value theorem to the function $\psi(t) = t^{1/(N-1)}$, we obtain that there exists ξ which satisfies

$$1 - (\delta - S_N) \|u\|_{L^N(\mathbb{R}^N)}^N \leq \xi \leq 1, \quad (40)$$

such that

$$\begin{aligned} 1 - \left[1 - (\delta - S_N) \|u\|_{L^N(\mathbb{R}^N)}^N \right]^{1/(N-1)} \\ = \frac{(\delta - S_N)}{N-1} \xi^{(2-N)/(N-1)} \|u\|_{L^N(\mathbb{R}^N)}^N. \end{aligned} \quad (41)$$

So we have

$$\begin{aligned} \varepsilon &= \frac{\|u\|_{L^N(\mathbb{R}^N)}^N}{(N-1) \xi^{(N-2)/(N-1)} \left(1 - (\delta - S_N) \|u\|_{L^N(\mathbb{R}^N)}^N \right)^{1/(N-1)}} \\ &\geq \frac{\|u\|_{L^N(\mathbb{R}^N)}^N}{N-1}. \end{aligned} \quad (42)$$

By $|u(r)| \leq (N/w_{N-1})^{1/N} \|u\|_{L^N(\mathbb{R}^N)}/r$, we have

$$\left(\frac{3}{2} \right)^{N/(N-1)^2} \left(\frac{|u(r)|^N}{(N-1)\varepsilon} \right)^{1/(N-1)} \leq C, \quad (43)$$

and $\forall x \in S$,

$$|u(x)|^{N/(N-1)} \leq \frac{|u(x) - u(r)|^{N/(N-1)}}{\left(\|\nabla u\|_{L^N(\mathbb{R}^N)}^N \right)^{1/(N-1)}} + C. \quad (44)$$

Obviously, $u - u(r) \in W^{1,N}(\mathbb{B}_r(0))$, and

$$\int_{\mathbb{B}_r(0)} |\nabla(u - u(r))|^N dx \leq \int_{\mathbb{B}_r(0)} |\nabla u|^N dx \leq 1. \quad (45)$$

Let $u' = (u(x) - u(r))/\|\nabla(u(x) - u(r))\|_{L^N(\mathbb{R}^N)}$; we obtain

$$\begin{aligned} &\int_{\mathbb{B}_r(0)} \frac{e^{\alpha^* |u|^{N/(N-1)}}}{|x|^\beta} dx \\ &= \int_S \frac{e^{\alpha^* |u|^{N/(N-1)}}}{|x|^\beta} dx + \int_{\mathbb{B}_r(0) \setminus S} \frac{e^{\alpha^* |u|^{N/(N-1)}}}{|x|^\beta} dx \\ &\leq C \int_{\mathbb{B}_r(0)} \frac{e^{\alpha^* |u'|^{N/(N-1)}}}{|x|^\beta} dx + C \leq C. \end{aligned} \quad (46)$$

Hence, we obtain that (32) holds. For $0 < \alpha \leq (1 - \beta/N)\alpha_N$, $\|u\|_E \leq 1$, we have

$$\int_{\mathbb{R}^N} \frac{\exp(\alpha |u|^{N/(N-1)}) - S_{N-2}(\alpha, u)}{|x|^\beta} dx \leq C. \quad (47)$$

Since $\alpha/\alpha_N + \beta/N + 1/q \leq 1$ and $1/q + 1/q' = 1$, $q > N$, that is, $\alpha q' < \alpha_N$, $\alpha q'/\alpha_N + \beta q'/N \leq 1$, we have

$$\begin{aligned} &\int_{\mathbb{R}^N} \frac{R(\alpha, u) |u|}{|x|^\beta} dx \\ &\leq \int_{\mathbb{R}^N} \frac{R(\alpha q', u)}{|x|^{\beta q'}} dx \|u\|_{L^q(\mathbb{R}^N)} \leq C \|u\|_{L^q(\mathbb{R}^N)}. \end{aligned} \quad (48)$$

□

As the proof of Lemma 7, we can obtain the following.

Lemma 8. For $0 < \alpha \leq (1 - \beta/N)\alpha_N$, $0 < \beta < N$, $u \in E$ and $\|u\|_E \leq 1$, $q > N$, and $\alpha/\alpha_N + \beta/N + 1/q \leq 1$, one has

$$\begin{aligned} &\int_{\mathbb{R}^N} \frac{[\exp(\alpha |u|^{N/(N-1)}) - S_{N-2}(\alpha, u)] |u|^q}{|x|^\beta} dx \\ &\leq C(N, \alpha) \|u\|_E^q. \end{aligned} \quad (49)$$

2.2. The Eigenvalue Problem. We consider the following eigenvalue problem:

$$-\operatorname{div}(|\nabla u|^{N-2} \nabla u) + V(x) |u|^{N-2} u = \lambda \frac{|u|^{N-2} u}{|x|^\beta}, \quad x \in \mathbb{R}^N,$$

$$u \neq 0, \quad x \in \mathbb{R}^N.$$

(50)

Now, we denote the set $M = \{u \in E : \int_{\mathbb{R}^N} (|u|^N/|x|^\beta) dx = 1\}$, and define

$$\lambda_1 = \inf_{0 \neq u \in M} \{I_N(u) : u \in E \setminus \{0\}\} > 0, \quad 0 < \beta < N, \quad (51)$$

where $I_N(u) = \int_{\mathbb{R}^N} (|\nabla u|^N + V(x) |u|^N) dx$.

Lemma 9 (see [12]). Let $u > 0$, $v > 0$ be two continuous functions in Ω differentiable a.e., and

$$L(u, v) = |\nabla u|^p + (p-1) \frac{u^p}{v^p} |\nabla v|^p - p \frac{u^{p-1}}{v^{p-1}} |\nabla v|^{p-2} \nabla v \nabla u,$$

$$R(u, v) = |\nabla u|^p - |\nabla v|^{p-2} \nabla \left(\frac{u^p}{v^{p-1}} \right) \nabla v. \quad (52)$$

Then (1) $L(u, v) = R(u, v) \geq 0$, (2) $L(u, v) = 0$ a.e. in Ω if and only if $u = kv$ for some $k > 0$.

Proposition 10. Assume that (H1)–(H3) hold; then $\lambda_1 > -\infty$ is the lowest eigenvalue of Problem (50) and λ_1 is principal.

Proof. From Lemma 2, we have $\lambda_1 > -\infty$. Furthermore, any minimizing sequence $\{u_n\}$ is bounded. Up to a subsequence, there exists $u \in E$ such that

$$\begin{aligned} u_n &\rightharpoonup u_0, \quad \text{in } E, \\ u_n &\longrightarrow u_0, \quad \text{in } L^{N'}(\mathbb{R}^N). \end{aligned} \quad (53)$$

Hence, we have

$$I_N(u_0) \leq \lim_{n \rightarrow +\infty} I_N(u_n) = \lambda_1, \quad u_0 \in M, \quad (54)$$

and consequently we have

$$I_N(u_0) = \lambda_1. \quad (55)$$

From Lemma 5, we obtain that M is weakly closed in E . By the Lagrange Multipliers rule, λ_1 is an eigenvalue of problem (50). Moreover $I_N(|u|) = I_N(u)$ for any u , so that λ_1 possesses a nonnegative eigenfunction. We conclude that the eigenvalue is principal from Harnack inequality in [13]. $\square$

Proposition 11. The eigenvalue λ_1 is isolated. That is, there exists $\varepsilon > 0$, such that there are no other eigenvalues of problem (50) in the interval $(\lambda_1, \lambda_1 + \varepsilon)$.

Proof. Assume by contradiction there exists a sequence of eigenvalue λ_m of problem (50) with $0 < \lambda_m \searrow \lambda_1$. Let $\{u_m\}$ be an eigenfunction associated with λ_m . Then $\{u_m\}$ satisfies

$$\begin{aligned} -\Delta_N u_m + V(x) |u_m|^{N-2} u_m &= \lambda_m \frac{|u_m|^{N-2} u_m}{|x|^\beta}, \\ \int_{\mathbb{R}^N} |\nabla u_m|^N dx + \int_{\mathbb{R}^N} V(x) |u_m|^N dx &= \lambda_m \int_{\mathbb{R}^N} \frac{|u_m|^N}{|x|^\beta} dx = 0. \end{aligned} \quad (56)$$

We define

$$v_m = \frac{u_m}{\left(\int_{\mathbb{R}^N} (|u_m|^N / |x|^\beta) dx \right)^{1/N}}. \quad (57)$$

The coercivity of the functional $I_N(u_m) = \int_{\mathbb{R}^N} |\nabla u_m|^N dx + \int_{\mathbb{R}^N} V(x) |u_m|^N dx$ implies that $\{u_m\}$ is a bounded sequence. Hence $\{v_m\}$ is bounded in E . So there exists a subsequence (still denoted) $\{v_m\}$ and $v \in E$ such that

$$\begin{aligned} v_m &\rightharpoonup v, \quad \text{weakly in } E, \\ v_m &\longrightarrow v, \quad \text{strongly in } L^N(\mathbb{R}^N), \end{aligned} \quad (58)$$

and $\int_{\mathbb{R}^N} (|u_m|^N / |x|^\beta) dx = 1$. On the other hand, we have

$$\begin{aligned} \int_{\mathbb{R}^N} |\nabla v|^N dx + \int_{\mathbb{R}^N} V(x) v^N dx \\ \leq \liminf_{n \rightarrow \infty} \left(\int_{\mathbb{R}^N} |\nabla v_n|^N dx + \int_{\mathbb{R}^N} V(x) v_n^N dx \right) = \lambda_1, \end{aligned} \quad (59)$$

and $\int_{\mathbb{R}^N} |\nabla v|^N dx + \int_{\mathbb{R}^N} V(x) v^N dx = \lambda_1 > 0$. So we conclude that v is an eigenfunction associated with λ_1 and $v > 0$. Then we conclude from the convergence in measure of the sequence $\{v_n\}$ towards v that

$$|\Omega_n^-| \longrightarrow 0, \quad (60)$$

where Ω_n^- denotes the negative set of v_n , which contradicts Proposition 11. $\square$

Proposition 12. The first eigenvalue λ_1 is simple, in the sense that the eigenfunctions associated with it are merely constant multiples of each other.

Proof. Let φ, ζ be two eigenfunctions associated with λ_1 . We assume without restriction that $\varphi > 0, \zeta > 0$; then φ satisfies $-\Delta\varphi + V(x)\varphi^{N-1} = \lambda_1(N)(\varphi^{N-1}/|x|^\beta)$. Testing it with function φ , we get

$$\int_{\mathbb{R}^N} |\nabla \varphi|^N dx - \int_{\mathbb{R}^N} \left[-V(x) + \frac{\lambda_1}{|x|^\beta} \right] \varphi^N dx = 0. \quad (61)$$

Let $\varepsilon \rightarrow 0$, from Lemma 9, we have

$$\begin{aligned} 0 &\leq \int_{\mathbb{R}^N} L(\varphi, \zeta + \varepsilon) dx \\ &= \int_{\mathbb{R}^N} R(\varphi, \zeta + \varepsilon) dx \\ &= \int_{\mathbb{R}^N} \left[-V(x) + \frac{\lambda_1}{|x|^\beta} \right] \varphi^N dx \\ &\quad - \int_{\mathbb{R}^N} |\nabla \zeta|^{N-2} \nabla \left(\frac{\varphi^N}{(\zeta + \varepsilon)^{N-1}} \right) \nabla \zeta dx. \end{aligned} \quad (62)$$

The function $\varphi^N / (\zeta + \varepsilon)^{N-1}$, where $\varepsilon > 0$, belongs to E and then it is admissible for the weak formulation of $-\Delta_N \zeta + V(x)|\zeta|^{N-2}\zeta = \lambda_1(|\zeta|^{N-2}\zeta/|x|^\beta)$, a.e., and

$$\begin{aligned} \int_{\mathbb{R}^N} |\nabla \zeta|^{N-2} \nabla \zeta \nabla \frac{\varphi^N}{(\zeta + \varepsilon)^{N-1}} dx \\ - \int_{\mathbb{R}^N} \left[-V(x) + \lambda \frac{1}{|x|^\beta} \right] \varphi^N \frac{\zeta^{N-1}}{(\zeta + \varepsilon)^{N-1}} dx = 0. \end{aligned} \quad (63)$$

It follows from (62) and (63) that we have

$$\begin{aligned} 0 &\leq L(\varphi, \zeta + \varepsilon) \\ &= \int_{\mathbb{R}^N} \lambda_1 \left[1 - \frac{\zeta^{N-1}}{(\zeta + \varepsilon)^{N-1}} \right] \frac{\varphi^N}{|x|^\beta} dx \\ &\quad - \int_{\mathbb{R}^N} V(x) \varphi^N \left[1 - \frac{\zeta^{N-1}}{(\zeta + \varepsilon)^{N-1}} \right] dx. \end{aligned} \quad (64)$$

Let $\varepsilon \rightarrow 0$; we have $L(\varphi, \zeta) = 0$. By Lemma 9, there exists $k > 0$ such that $\varphi = k\zeta$. $\square$

3. The Proof of Theorem 1

3.1. Palais-Smale Sequence. Now, we check that the functional I satisfies the geometric conditions of the Mountain Pass Theorem.

Lemma 13. Suppose that (H1)–(H3) and (f1)–(f5) hold. Then there exists ε_2 such that, for $0 < \varepsilon < \varepsilon_2$, there exists $\rho_\varepsilon > 0$ such that $I(u) > 0$ if $\|u\|_E = \rho_\varepsilon$. Furthermore, ρ_ε can be chosen such that $\rho_\varepsilon \rightarrow 0$, as $\varepsilon \rightarrow 0$.

Proof. From (f5), for every $\varepsilon > 0$, there exists $\sigma > 0$ such that $|u| \leq \sigma$ implies

$$F(x, u) \leq \frac{\varepsilon}{N} |u|^N, \quad \forall x \in \mathbb{R}^N. \quad (65)$$

Moreover, using (f1), for each $q > N$ and $k/\alpha_N + \beta/N + 1/q \leq 1$, we find a constant C such that

$$F(x, u) \leq C|u|^q \left[\exp(k|u|^{N/(N-1)}) - S_{N-2}(k, u) \right], \quad \forall |u| \geq \sigma, \quad x \in \mathbb{R}^N. \quad (66)$$

Combining (65) and (66), we have

$$\begin{aligned} F(x, u) &\leq \frac{\varepsilon}{N} |u|^N + C|u|^q \\ &\times \left[\exp(k|u|^{N/(N-1)}) - S_{N-2}(k, u) \right], \quad (67) \\ &\forall (x, u) \in \mathbb{R}^N \times \mathbb{R}. \end{aligned}$$

Since the embedding $E \hookrightarrow L^N(\mathbb{R}^N)$ is continuous, we obtain

$$\begin{aligned} I(u) &\geq \frac{1}{N} \|u\|_E^N - \frac{\varepsilon + \lambda}{N} \int_{\mathbb{R}^N} \frac{|u|^\beta}{|x|^\beta} dx \\ &\quad - C \|u\|_E^q - \varepsilon \|h\|_* \|u\|_E \\ &\geq \frac{1}{N} \left(1 - \frac{\lambda + \varepsilon}{\lambda_1} \right) \|u\|_E^N \\ &\quad - C \|u\|_E^q - \varepsilon \|h\|_* \|u\|_E. \end{aligned} \quad (68)$$

Thus, we have

$$I(u) \geq \|u\|_E \left[\frac{1}{N} \left(1 - \frac{\lambda + \varepsilon}{\lambda_1} \right) \|u\|_E^{N-1} - C \|u\|_E^{q-1} - \varepsilon \|h\|_* \right]. \quad (69)$$

Since $q > N$ and $0 < \lambda < \lambda_1$ and letting $\varepsilon < \lambda_1 - \lambda$, we choose $\rho > 0$ such that $(1/N)(1 - (\lambda + \varepsilon)/\lambda_1)\rho^{N-1} - C\rho^{q-1} - \varepsilon\|h\|_* > 0$. Thus, if ε is sufficiently small, we find some $\rho_\varepsilon > 0$ such that $I(u) > 0$ if $\|u\|_E = \rho_\varepsilon$ and even $\rho_\varepsilon \rightarrow 0$ as $\varepsilon \rightarrow 0$. $\square$

Lemma 14. If $0 < \lambda < \lambda_1$, there exists $e \in E$, with $\|e\|_E > \rho_\varepsilon$, such that $I(e) < \inf_{\|u\|_E = \rho_\varepsilon} I(u)$.

Proof. Let $u \in E \setminus \{0\}$, $u > 0$ with compact support $\Omega = \text{supp}(u)$. By (f4), we obtain that for $p > N$, there exists a positive constant $C > 0$ such that for every $M > 0$,

$$\forall |u| > C, \quad \forall x \in \Omega, \quad F(x, u) \geq M|u|^N. \quad (70)$$

Then, we have

$$\begin{aligned} I(tu) &\leq \frac{t^N}{N} \|u\|_E^N - Mt^N \int_{\Omega} \frac{|u|^N}{|x|^\beta} dx \\ &\quad - \varepsilon t \int_{\Omega} hu \, dx - \frac{\lambda}{N} \int_{\Omega} \frac{|tu|^N}{|x|^\beta} dx \\ &\leq \frac{t^N}{N} \|u\|_E^N \\ &\quad - t^N \left(M + \frac{\lambda}{N} \right) \int_{\Omega} \frac{|u|^N}{|x|^\beta} dx - \varepsilon t \int_{\Omega} hu \, dx \\ &\leq t^N \left(\frac{\|u\|_E^N}{N} - \left(M + \frac{\lambda}{N} \right) \int_{|x| < R} \frac{|u|^N}{|x|^\beta} dx \right). \end{aligned} \quad (71)$$

Choose $R > 0$ and $B_R(0) \subset \bar{\Omega}$ and let

$$M > \frac{R^\beta \|u\|_E^N}{N \|u\|_{L^N(\mathbb{R}^N)}^N} - \frac{\lambda}{N} > \frac{R^\beta \|u\|_E^N}{N \|u\|_{L^N(\mathbb{R}^N)}^N} - \frac{\lambda_1}{N}; \quad (72)$$

we have $I(tu) \rightarrow -\infty$ as $t \rightarrow \infty$. Setting $e = tu$ with t being sufficient large, we obtain the conclusion. $\square$

It is well known that the failure of the (PS) compactness condition creates some difficulties in studying the class of elliptic problems involving critical growth. In Lemma 15, instead of (PS) sequence, we analyze the compactness of Cerami sequences of the functional I .

Lemma 15. Let $(u_n) \subset E$ be a Cerami sequence of I ; that is,

$$I(u_n) \rightarrow C_M, \quad (1 + \|u_n\|_E) \|DI(u_n)\|_{E'} \rightarrow 0, \quad \text{as } n \rightarrow \infty. \quad (73)$$

Then there exists a subsequence of (u_n) (still denoted by (u_n)) and $u \in E$ such that

$$\begin{aligned} \frac{f(x, u_n)}{|x|^\beta} &\rightarrow \frac{f(x, u)}{|x|^\beta}, \quad \text{in } L^1_{\text{loc}}(\mathbb{R}^N), \\ \nabla u_n &\rightarrow \nabla u, \quad \text{a.e. in } \mathbb{R}^N, \end{aligned}$$

$$\begin{aligned} |\nabla u_n|^{N-2} |\nabla u_n| &\rightarrow |\nabla u|^{N-2} |\nabla u|, \quad (L^{N/(N-1)}_{\text{loc}}(\mathbb{R}^N))^N, \\ u_n &\rightharpoonup u, \quad \text{in } E, \end{aligned} \quad (74)$$

where $C_M \in (0, (1/N)(1 - \beta/N)(\alpha_N/\alpha_0))$. Furthermore, u is a nontrivial weak solution of problem (1).

Proof. Let $u_n \in E$, $v \in E$, as $n \rightarrow \infty$; we have

$$\begin{aligned}
 & \frac{1}{N} \int_{\mathbb{R}^N} |\nabla u_n|^N dx + \frac{1}{N} \int_{\mathbb{R}^N} V(x) |u_n|^N dx \\
 & - \int_{\mathbb{R}^N} \frac{F(x, u_n)}{|x|^\beta} dx - \frac{\lambda}{N} \int_{\mathbb{R}^N} \frac{|u_n|^N}{|x|^\beta} dx \\
 & - \varepsilon \int_{\mathbb{R}^N} h u_n \rightarrow C_M, \\
 & |DI(u_n) v| \\
 & = \left| \int_{\mathbb{R}^N} |\nabla u_n|^{N-2} \nabla u_n \nabla v dx \right. \\
 & \quad + \int_{\mathbb{R}^N} V(x) |u_n|^{N-2} u_n v dx - \int_{\mathbb{R}^N} \frac{f(x, u_n) v}{|x|^\beta} dx \\
 & \quad \left. - \lambda \int_{\mathbb{R}^N} \frac{|u_n|^{N-2} u_n v}{|x|^\beta} dx - \varepsilon \int_{\mathbb{R}^N} h v dx \right| \\
 & \leq \frac{\tau_n \|v\|_E}{(1 + \|u_n\|_E)},
 \end{aligned} \tag{75}$$

where $\tau_n \rightarrow 0$ as $n \rightarrow \infty$. Let $v = u_n$ in (76); we have

$$\begin{aligned}
 & - \int_{\mathbb{R}^N} |\nabla u_n|^N dx - \int_{\mathbb{R}^N} V(x) |u_n|^N dx \\
 & + \int_{\mathbb{R}^N} \frac{f(x, u_n) u_n}{|x|^\beta} dx \\
 & + \lambda \int_{\mathbb{R}^N} \frac{|u_n|^N}{|x|^\beta} dx + \varepsilon \int_{\mathbb{R}^N} h u_n dx \\
 & \leq \frac{\tau_n \|u_n\|_E}{(1 + \|u_n\|_E)} \rightarrow 0, \quad \text{as } n \rightarrow \infty.
 \end{aligned} \tag{76}$$

Suppose that

$$\|u_n\|_E \rightarrow \infty. \tag{77}$$

Set

$$v_n = \frac{u_n}{\|u_n\|_E}; \tag{78}$$

we have $\|v_n\|_E = 1$. From [5], we have

$$\int_{\mathbb{R}^N} \liminf_{n \rightarrow \infty} \frac{F(x, u_n)}{|x|^\beta |u_n^+(x)|^N} |v_n^+|^N dx = +\infty. \tag{79}$$

However, since $\{u_n\}$ is the Cerami sequence at the level C_M , we have that

$$\begin{aligned}
 \|u_n\|_E^N &= NI(u_n) + N \int_{\mathbb{R}^N} \frac{F(x, u_n)}{|x|^\beta} dx \\
 &+ N\varepsilon \int_{\mathbb{R}^N} h u_n dx + \lambda \int_{\mathbb{R}^N} \frac{|u_n|^N}{|x|^\beta} dx + o(1).
 \end{aligned} \tag{80}$$

Then there exists some constant C such that

$$\begin{aligned}
 & \|u_n\|_E \left[1 - \frac{\lambda}{\lambda_1} - N\varepsilon \|h\|_* \right] \\
 & \leq NC_M + N \int_{\mathbb{R}^N} \frac{F(x, u_n)}{|x|^\beta} dx + o(1), \quad \text{as } \varepsilon \rightarrow 0,
 \end{aligned} \tag{81}$$

which implies that

$$\begin{aligned}
 & \int_{\mathbb{R}^N} \frac{F(x, u_n)}{|x|^\beta} dx \rightarrow \infty, \\
 & \liminf_{n \rightarrow \infty} \int_{\mathbb{R}^N} \frac{F(x, u_n)}{|x|^\beta |u_n^+|^N} |v_n^+|^N dx \\
 & = \liminf_{n \rightarrow \infty} \int_{\mathbb{R}^N} \frac{F(x, u_n)}{|x|^\beta \|u_n^+\|_E^N} dx.
 \end{aligned} \tag{82}$$

Let $\Psi = \int_{\mathbb{R}^N} (F(x, u_n)/|x|^\beta) dx$; then we have

$$\begin{aligned}
 & \liminf_{n \rightarrow \infty} \int_{\mathbb{R}^N} \frac{F(x, u_n)}{|x|^\beta |u_n^+|^N} |v_n^+|^N dx \\
 & \leq \liminf_{n \rightarrow \infty} \frac{\Psi}{NC_M + N\Psi + N\varepsilon \int_{\mathbb{R}^N} h u_n^+ dx + o(1)}.
 \end{aligned} \tag{83}$$

So we can conclude that

$$\begin{aligned}
 & \liminf_{n \rightarrow \infty} \int_{\mathbb{R}^N} \frac{F(x, u_n)}{|x|^\beta |u_n^+|^N} |v_n^+|^N dx \\
 & \leq \liminf_{n \rightarrow \infty} \frac{\Psi}{NC_M + N\Psi + N\varepsilon \int_{\mathbb{R}^N} h u_n^+ dx + o(1)} \\
 & = \frac{1}{N}.
 \end{aligned} \tag{84}$$

Note that $F(x, u_n) \geq 0$; by Fatou Lemma, (80), and (85), we get a contradiction. So $v \leq 0$ which means that $v_k^+ \rightarrow 0$ in E .

Let $t_n \in [0, 1]$, such that

$$I(t_n u_n) = \max_{t \in [0, 1]} I(t u_n). \tag{85}$$

For any given $R \in (0, (1 - \beta/N)\alpha_N/\alpha_0)^{(N-1)/N}$, let $\varepsilon = (1 - \beta/N)\alpha_N/R^{N/(N-1)} - \alpha_0 > 0$, by (f1); there exists $C = C(R) > 0$ such that

$$\begin{aligned}
 F(x, u_n) &\leq C |u_n|^N + \left| \frac{(1 - \beta/N)\alpha_N}{R^{N/(N-1)}} - \alpha_0 \right| R(\alpha_0 + \varepsilon, u_n), \\
 &\quad \forall (x, u_n) \in \bar{\Omega} \times \mathbb{R}^N.
 \end{aligned} \tag{86}$$

Since $\|u_n\|_E \rightarrow \infty$, we have

$$I(t_n u_n) \geq I\left(\frac{R u_n}{\|u_n\|_E}\right) = I(R v_n), \tag{87}$$

and by (f3), $\|v_n\|_E = 1$, and $\int_{\mathbb{R}^N} (F(x, v_n^+)/|x|^\beta) dx = \int_{\mathbb{R}^N} (F(x, v_n)/|x|^\beta) dx$, we have

$$\begin{aligned}
 & NI(Rv_n) \\
 & \geq R^N - (NCR^N + \lambda R^N) \int_{\mathbb{R}^N} \frac{|v_n^+|^N}{|x|^\beta} dx \\
 & \quad - N \left| \frac{(1-\beta/N)\alpha_N}{R^{N/(N-1)}} - \alpha_0 \right| \int_{\mathbb{R}^N} \frac{R(\alpha_0 + \varepsilon, R|v_n^+|)}{|x|^\beta} dx \\
 & \quad - NR \left| \frac{(1-\beta/N)\alpha_N}{R^{N/(N-1)}} - \alpha_0 \right| \int_{\mathbb{R}^N} h|v_n^+| dx \\
 & \geq R^N - (NCR^N + \lambda R^N) \int_{\mathbb{R}^N} \frac{|v_n^+|^N}{|x|^\beta} dx \\
 & \quad - N \left| \frac{(1-\beta/N)\alpha_N}{R^{N/(N-1)}} - \alpha_0 \right| \\
 & \quad \times \int_{\mathbb{R}^N} \frac{R((\alpha_0 + \varepsilon)R^{N/(N-1)}, |v_n^+|)}{|x|^\beta} dx \\
 & \quad - NR \left| \frac{(1-\beta/N)\alpha_N}{R^{N/(N-1)}} - \alpha_0 \right| \int_{\mathbb{R}^N} h|v_n^+| dx \\
 & \geq R^N - (NCR^N + \lambda R^N) \int_{\mathbb{R}^N} \frac{|v_n^+|^N}{|x|^\beta} dx \\
 & \quad - N \left| \frac{(1-\beta/N)\alpha_N}{R^{N/(N-1)}} - \alpha_0 \right| \\
 & \quad \times \int_{\mathbb{R}^N} \frac{R((1-\beta/N)\alpha_N, |v_n^+|)}{|x|^\beta} dx \\
 & \quad - NR \left| \frac{(1-\beta/N)\alpha_N}{R^{N/(N-1)}} - \alpha_0 \right| \int_{\mathbb{R}^N} h|v_n^+| dx.
 \end{aligned} \tag{89}$$

Since $v_n^+ \rightarrow 0$ in E and the embedding $E \hookrightarrow L^N(\mathbb{R}^N)$ is compact from and the Hölder inequality, we have $\int_{\mathbb{R}^N} (|v_n^+|^N/|x|^\beta) dx \rightarrow 0$ ($n \rightarrow \infty$). By Lemma 7, we have $\int_{\mathbb{R}^N} (R((1-\beta/N)\alpha_N, |v_n^+|)/|x|^\beta) dx \leq C$.

Let $n \rightarrow \infty$ in (89) and $R \rightarrow [(1-\beta/N)\alpha_N/\alpha_0]^{(N-1)/N}$; we get

$$\liminf_{n \rightarrow \infty} I(t_n u_n) \geq \frac{1}{N} \left[\frac{(1-\beta/N)\alpha_N}{\alpha_0} \right]^{N-1} > C_M. \tag{90}$$

Note that $I(0) = 0$ and $I(u_n) \rightarrow C_M$; we suppose that $t_n \in (0, 1)$. Since $DI(t_n u_n) t_n u_n = 0$, we have

$$\begin{aligned}
 t_n^N \|u_n\|_E^N &= \int_{\mathbb{R}^N} \frac{f(x, t_n u_n) t_n u_n}{|x|^\beta} dx \\
 &+ \varepsilon t_n \int_{\mathbb{R}^N} h u_n dx + \lambda t_n^N \int_{\mathbb{R}^N} \frac{|u_n|^N}{|x|^\beta} dx.
 \end{aligned} \tag{91}$$

By (f2) and $\varepsilon_n \rightarrow 0$, we have

$$\begin{aligned}
 NI(t_n u_n) &= \int_{\mathbb{R}^N} \frac{f(x, t_n u_n) t_n u_n}{|x|^\beta} dx \\
 &- N \int_{\mathbb{R}^N} \frac{F(x, t_n u_n)}{|x|^\beta} dx + o(1).
 \end{aligned} \tag{92}$$

Moreover, we have

$$\begin{aligned}
 & \int_{\mathbb{R}^N} \frac{f(x, u_n) u_n}{|x|^\beta} dx - N \int_{\mathbb{R}^N} \frac{F(x, u_n)}{|x|^\beta} dx \\
 &= \|u_n\|_E^N + NC_M - \|u_n\|_E^N + o(1),
 \end{aligned} \tag{93}$$

which is a contraction to (75); this proves that $\{u_n\}$ is bounded in E . Thus, we have

$$\int_{\mathbb{R}^N} \frac{f(x, u_n) u_n}{|x|^\beta} dx \leq C, \quad \int_{\mathbb{R}^N} \frac{F(x, u_n)}{|x|^\beta} dx \leq C. \tag{94}$$

From Lemma 5, the embedding $E \hookrightarrow L^q(\mathbb{R}^N)$ is compact for all $q \geq N$. If $\{u_n\} \in E$, we get

$$\begin{aligned}
 & u_n \rightharpoonup u, \quad \text{in } E, \\
 & u_n \rightarrow u, \quad \text{in } L_{\text{loc}}^q(\mathbb{R}^N), \\
 & u_n \rightarrow u, \quad \text{a.e. in } \mathbb{R}^N,
 \end{aligned} \tag{95}$$

From (f1), the Trudinger-Moser inequality, and the Hölder inequality, we have $f(x, u_n)/|x|^\beta \in L_{\text{loc}}^1(\mathbb{R}^N)$. From Lemma 2.1 in [14], we have

$$\frac{f(x, u_n)}{|x|^\beta} \rightarrow \frac{f(x, u)}{|x|^\beta}, \quad \text{in } L_{\text{loc}}^1(\mathbb{R}^N). \tag{96}$$

For any fixed $\delta > 0$, set

$$\Sigma_\delta = \left\{ x \in \mathbb{R}^N : \lim_{r \rightarrow 0} \lim_{n \rightarrow \infty} \int_{B_r(x)} (|\nabla u_n|^N + |u_n|^N) dx \geq \delta \right\}. \tag{97}$$

Because $\{u_n\}$ is bounded, Σ_δ is a finite set. From Lemma 4.4 in ([4]), for any compact set $K \subset \mathbb{R}^N \setminus \Sigma_\delta$, we have

$$\lim_{n \rightarrow \infty} \int_K \frac{|f(x, u_n) u_n - f(x, u) u|}{|x|^\beta} dx = 0. \tag{98}$$

Now, we prove that

$$\lim_{n \rightarrow \infty} \int_K |\nabla u_n - \nabla u|^N dx = 0. \tag{99}$$

It is enough to prove that for any $x' \in \mathbb{R}^N \setminus \Sigma_\delta$ and $B_r(x') \subset \mathbb{R}^N \setminus \Sigma_\delta$ there holds

$$\lim_{n \rightarrow \infty} \int_{B_{r/2}(x')} |\nabla u_n - \nabla u|^N dx = 0. \tag{100}$$

We take $\phi \in C_0^\infty(B_r(x'))$ with $0 \leq \phi \leq 1$ and $\phi = 1$ on $\mathbb{B}_{r/2}(x')$. Then $\{\phi u_n\}$ is a bounded sequence. Choosing $v_n = \phi u_n$ and $v = \phi u$ in (76), we have

$$\begin{aligned} & \int_{B_r(x')} \phi (|\nabla u_n|^{N-2} \nabla u_n - |\nabla u|^{N-2} \nabla u) (\nabla u_n - \nabla u) dx \\ & \leq \int_{B_r(x')} |\nabla u_n|^{N-2} \nabla u_n \nabla \phi (u - u_n) dx \\ & \quad + \int_{B_r(x')} \phi |\nabla u|^{N-2} \nabla u (\nabla u - \nabla u_n) dx \\ & \quad + \int_{B_r(x')} \phi (u_n - u) \frac{f(x, u_n)}{|x|^\beta} dx \\ & \quad + \tau_n \|\phi u_n\|_E + \tau_n \|\phi u\|_E + \varepsilon \int_{B_r(x')} \phi h(u_n - u) dx \\ & \quad + \lambda \int_{B_r(x')} \frac{|u_n| u_n \phi}{|x|^\beta} (u_n - u) dx. \end{aligned} \quad (101)$$

Adapting an argument similar to [4], we have

$$\lim_{n \rightarrow \infty} \int_K |\nabla u_n - \nabla u|^N dx = 0. \quad (102)$$

Since Σ_δ is finite, it follows that $\nabla u_n \rightarrow \nabla u$ a.e. This implies, up to a subsequence that $|\nabla u_n|^{N-2} \nabla u_n \rightarrow |\nabla u|^{N-2} \nabla u$ in $(L_{\text{loc}}^{N/(N-1)}(\mathbb{R}^N))^N$. Let $n \rightarrow \infty$ in (76), and $f(x, u_n)/|x|^\beta \rightarrow f(x, u)/|x|^\beta$ in $L_{\text{loc}}^1(\mathbb{R}^N)$; we obtain

$$\langle DI(u), v \rangle = 0, \quad \forall v \in C_0^\infty(\mathbb{R}^N). \quad (103)$$

□

Remark 16. The idea and proof of Lemma 15 follow as in Lemma 4.1 in [5].

3.2. Min-Max Value. In order to get a more precise information about the minimax level obtained by the Mountain Pass Theorem, we consider the following sequence of scale which is called the Moser function:

$$\widetilde{M}_l(x, r) = \frac{1}{w_{N-1}^{1/N}} \begin{cases} (\log l)^{(N-1)/N}, & \text{if } |x| \leq \frac{r}{l}, \\ \frac{\log(r/|x|)}{(\log l)^{1/N}}, & \text{if } \frac{r}{l} \leq |x| \leq r, \\ 0, & \text{if } |x| \geq r. \end{cases} \quad (104)$$

Hence, we have $\widetilde{M}_l(x, r) \in W^{1,N}(\mathbb{R}^N)$, the support of $\widetilde{M}_l(x, r)$ is the ball $B_r(0)$, and

$$\begin{aligned} & \int_{\mathbb{R}^N} |\nabla \widetilde{M}_l(x, r)|^N dx = 1, \\ & \int_{\mathbb{R}^N} |\widetilde{M}_l(x, r)|^N dx = o\left(\frac{1}{\log l}\right). \end{aligned} \quad (105)$$

Let $M_l(x, r) = \widetilde{M}_l(x, r) / \|\widetilde{M}_l(x, r)\|_E^N$; we have

$$M_l^{N/(N-1)}(x, r) = w_{N-1}^{-1/(N-1)} \log l + d_l, \quad \text{for } |x| \leq \frac{r}{l}, \quad (106)$$

where

$$d_l = w_{N-1}^{-1/(N-1)} \log l \left(\|\widetilde{M}_l(x, r)\|_E^{-1/(N-1)} - 1 \right). \quad (107)$$

From (105), we conclude that $\|M_l(x, r)\|_E \rightarrow 1$, as $l \rightarrow \infty$. Consequently, we have

$$\frac{d_l}{\log l} \rightarrow 0, \quad \text{as } l \rightarrow \infty. \quad (108)$$

Lemma 17. Suppose that (H1)–(H3) and (f1)–(f6) hold. Then there exists $k \in \mathbb{N}$ such that

$$\begin{aligned} & \max_{t \geq 0} \left\{ \frac{t^N}{N} - \int_{\mathbb{R}^N} \frac{F(x, tM_k)}{|x|^\beta} dx - \frac{\lambda}{N} \int_{\mathbb{R}^N} \frac{|tM_k|^N}{|x|^\beta} dx \right\} \\ & < \frac{1}{N} \left(\frac{N-\beta}{N} \frac{\alpha_N}{\alpha_0} \right)^{N-1}. \end{aligned} \quad (109)$$

Proof. Choose $r > 0$ as in (f6) and $\beta_0 > 0$ such that

$$\begin{aligned} & \lim_{s \rightarrow \infty} s f(x, s) \exp(-\alpha_0 |s|^{N/(N-1)}) \\ & \geq \beta_0 > \frac{2}{e^{(\alpha_N d(N-\beta)/N)} + C r^{N-\beta} + r^{N-\beta}/(N-\beta)} \\ & \quad \times \left(\frac{N-\beta}{\alpha_0} \right)^{N-1}, \end{aligned} \quad (110)$$

where

$$\begin{aligned} C &= \lim_{k \rightarrow \infty} \xi_k \log k \int_0^{\xi_k} \exp[(N-\beta) \\ & \quad \times \log k (s^{N/(N-1)} - \xi_k s)] ds > 0, \\ \xi_k &= \|\widetilde{M}_k\|_E, \quad C \geq \frac{1 - e^{-(N-\beta) \log n}}{N-\beta}. \end{aligned} \quad (111)$$

Suppose, by contradiction, that, for all k , we get

$$\begin{aligned} & \max_{t \geq 0} \left\{ \frac{t^N}{N} - \int_{\mathbb{R}^N} \frac{F(x, tM_k)}{|x|^\beta} dx - \frac{\lambda}{N} \int_{\mathbb{R}^N} \frac{|tM_k|^N}{|x|^\beta} dx \right\} \\ & \geq \frac{1}{N} \left(\frac{(N-\beta) \alpha_N}{N \alpha_0} \right)^{N-1}, \end{aligned} \quad (112)$$

where $M_k(x) = M_k(x, r)$. For each k , there exists $t_k > 0$ such that

$$\begin{aligned} & \frac{t_k^N}{N} - \int_{\mathbb{R}^N} \frac{F(x, t_k M_k)}{|x|^\beta} dx - \frac{\lambda}{N} \int_{\mathbb{R}^N} \frac{|t_k M_k|^N}{|x|^\beta} dx \\ & = \max_{t \geq 0} \left\{ \frac{t^N}{N} - \int_{\mathbb{R}^N} \frac{F(x, tM_k)}{|x|^\beta} dx \right. \\ & \quad \left. - \frac{\lambda}{N} \int_{\mathbb{R}^N} \frac{|tM_k|^N}{|x|^\beta} dx \right\}. \end{aligned} \quad (113)$$

Thus, we have

$$\begin{aligned} \frac{t_k^N}{N} - \int_{\mathbb{R}^N} \frac{F(x, t_k M_k)}{|x|^\beta} dx - \frac{\lambda}{N} \int_{\mathbb{R}^N} \frac{|t_k M_k|^N}{|x|^\beta} dx \\ \geq \frac{1}{N} \left(\frac{(N-\beta) \alpha_N}{N \alpha_0} \right)^{N-1}. \end{aligned} \quad (114)$$

From $F(x, u) \geq 0$, $0 < \lambda < \lambda_1$, we obtain

$$t_k^N \geq \left(\frac{(N-\beta) \alpha_N}{N \alpha_0} \right)^{N-1}. \quad (115)$$

Let $t = t_k$, we have

$$\begin{aligned} t_k^N &= \frac{\int_{\mathbb{R}^N} (t_k M_k f(x, t_k M_k) / |x|^\beta) dx}{\left(1 - \lambda \int_{|x| \leq r} (|M_k|^N / |x|^\beta) dx \right)} \\ &\geq \frac{\int_{|x| \leq r} (t_k M_k f(x, t_k M_k) / |x|^\beta) dx}{1 + \lambda / \lambda_1}. \end{aligned} \quad (116)$$

By (f6), given that $\tau > 0$, there exist $R_\tau > 0$ and $|x| \leq r$; we have

$$uf(x, u) \geq (\beta_0 - \tau) \exp(\alpha_0 |u|^{N/(N-1)}). \quad (117)$$

From (116) and (117), for large k , we obtain

$$\begin{aligned} t_k^N &\geq \frac{\lambda_1 (\beta_0 - \tau) \int_{|x| \leq r/k} (\exp(\alpha_0 |t_k M_k|^{N/(N-1)}) / |x|^\beta) dx}{(\lambda_1 + \lambda)} \\ &\geq \frac{(\beta_0 - \tau) k^{-N+\beta} w_{N-1} r^{N-\beta}}{2(N-\beta)} \\ &\quad \times \exp(\alpha_0 t_k^{N/(N-1)} w_{N-1}^{-1/(N-1)} \log k + \alpha_0 t_k^{N/(N-1)} d_k). \end{aligned} \quad (118)$$

Let

$$L_k = \frac{\alpha_0 N \log k}{\alpha_N} t_k^{N/(N-1)} + \alpha_0 t_k^{N/(N-1)} d_k - (N-\beta) \log k; \quad (119)$$

we have

$$1 \geq \frac{(\beta_0 - \tau) r^{N-\beta} w_{N-1}}{2(N-\beta)} \exp L(k). \quad (120)$$

Hence, the sequence $\{t_k\}$ is bounded. Otherwise, up to subsequences, we have $\lim_{k \rightarrow \infty} L(k) = \infty$, which leads to a contradiction. From (108) and (115) and

$$\begin{aligned} t_k^N &\geq \frac{(\beta_0 - \tau) r^{N-\beta} w_{N-1}}{2(N-\beta)} \\ &\quad \times \exp \left[\left(\frac{\alpha_0 t_k^{N/(N-1)}}{N \alpha_N} - (N-\beta) \right) \log k \right. \\ &\quad \left. + \alpha_0 t_k^{N/(N-1)} d_k \right], \end{aligned} \quad (121)$$

it follows that

$$t_k^N \rightarrow \left(\frac{(N-\beta) \alpha_N}{N \alpha_0} \right)^{N-1}. \quad (122)$$

From [4], we have

$$\begin{aligned} &\int_{|x| \leq r} \frac{\exp(\alpha_0 |t_k M_k|^{N/(N-1)})}{|x|^\beta} dx \\ &\geq \int_{|x| \leq r/k} \frac{\exp(\alpha_N |M_k|^{N/(N-1)} (N-\beta)/N)}{|x|^\beta} dx \\ &\quad + \int_{r/k \leq |x| \leq r} \frac{\exp(\alpha_N |M_k|^{N/(N-1)} (N-\beta)/N)}{|x|^\beta} dx, \\ &\int_{|x| \leq r/k} \frac{\exp(\alpha_N |M_k|^{N/(N-1)} (N-\beta)/N)}{|x|^\beta} dx \\ &= \frac{w_{N-1}}{N-\beta} r^{N-\beta} k^{[N-\beta+(d_k \alpha_N / \log k)(N-\beta)/N]}. \end{aligned} \quad (123)$$

Now, using the change of variable

$$s = \frac{\log(r/|x|)}{\zeta_k \log k} \quad \text{with } \zeta_k = \|M_k\|_E, \quad (124)$$

by straight forward computation, we have

$$\begin{aligned} &\int_{r/k \leq |x| \leq r} \frac{\exp(\alpha_N |M_k|^{N/(N-1)} (N-\beta)/N)}{|x|^\beta} dx \\ &= w_{N-1} r^{N-\beta} \zeta_k \log k \\ &\quad \times \int_0^{\zeta_k^{-1}} \exp[(N-\beta) \log k (s^{N/(N-1)} - \zeta_k s)] ds, \end{aligned} \quad (125)$$

which converges to $C w_{N-1} r^{N-\beta}$ as $k \rightarrow \infty$, where

$$\begin{aligned} C &= \lim_{k \rightarrow \infty} \zeta_k \log k \int_0^{\xi_k} \exp[(N-\beta) \\ &\quad \times \log k (s^{N/(N-1)} - \xi_k s)] ds > 0. \end{aligned} \quad (126)$$

Finally, let $k \rightarrow \infty$ in (118); from (108) and (115), we have

$$\begin{aligned} \left(\frac{(N-\beta) \alpha_N}{N \alpha_0} \right)^{N-1} &\geq \frac{(\beta_0 - \tau)}{2} \\ &\quad \times \left[\frac{r^{N-\beta} w_{N-1}}{(N-\beta)} e^{(\alpha_N d(N-\beta)/N)}, \right. \\ &\quad \left. + C r^{N-\beta} w_{N-1} - \frac{r^{N-\beta} w_{N-1}}{N-\beta} \right] \end{aligned} \quad (127)$$

which implies that

$$\beta_0 \leq \frac{2}{e^{(\alpha_N d(N-\beta)/N)} + Cr^{N-\beta} - r^{N-\beta}/(N-\beta)} \times \left(\frac{N-\beta}{\alpha_0} \right)^{N-1}. \quad (128)$$

□

Remark 18. The idea and the proof of Lemma 17 come from Lemma 3.6 in [5].

Lemma 19. There exist $\tau > 0$ and $v \in E$ with $\|v\|_E = 1$ such that $I(tv) < 0$ for all $0 < t < \varsigma$. In particular, $\inf_{\|v\|_E \leq \varsigma} I(u) < 0$.

Proof. See Lemma 3.3 in [10]. □

Corollary 20. Under the conditions (H1)–(H3) and (f1)–(f4), if $\varepsilon \rightarrow 0$, then one has

$$\max_{t \geq 0} I(tM_k) < \frac{1}{N} \left(\frac{(N-\beta)\alpha_N}{N\alpha_0} \right)^{N-1}. \quad (129)$$

From Lemmas 13 and 19, we conclude that

$$\infty < C_0 = \inf_{\|v\|_E \leq \varsigma} I(u) < 0. \quad (130)$$

Corollary 21. There exist $\varepsilon_2 \in (0, \varepsilon_1]$ and $u \in W^{1,N}(\mathbb{R}^N)$ with compact support such that, for all $0 < \varepsilon < \varepsilon_2$,

$$I(tu) < C_0 + \frac{1}{N} \left(\frac{(N-\beta)\alpha_N}{N\alpha_0} \right)^{N-1}, \quad \forall t \geq 0. \quad (131)$$

Lemma 22. If $\{u_k\}$ is a Cerami sequence for $I(u)$ at any level with

$$\liminf_{n \rightarrow \infty} \|u_k\|_E < \left(\frac{(N-\beta)\alpha_N}{N\alpha_0} \right)^{N-1}, \quad (132)$$

then $\{u_k\}$ possesses a subsequence which converges strongly to a solution u_0 of problem (1).

Proof. See Lemma 4.6 in [4].

In conclusion, we have

$$0 < C_M < C_0 + \frac{1}{N} \left(\frac{(N-\beta)\alpha_N}{N\alpha_0} \right)^{N-1}. \quad (133)$$

□

3.3. Multiplicity Results. In order to prove the existence of the second solution of problem (1) follows by the minimum argument and Ekeland's Variational Principle.

Proposition 23. Under the conditions (H1)–(H3) and (f1)–(f6), there exists $\varepsilon_1 > 0$ such that, for each ε with $0 < \varepsilon < \varepsilon_1$, problem (1) has a solution u_M via Mountain Pass Theorem.

Proof. See Proposition 4.1 in [5]. □

Proposition 24. There exists $\varepsilon_2 > 0$ such that, for each ε with $0 < \varepsilon < \varepsilon_2$, (1) has a minimum type solution u_0 with $I(u_0) = C_0 < 0$, where C_0 is defined in (130).

Proof. See Proposition 5.1 in [5]. □

Proposition 25. If $\varepsilon_2 > 0$ is sufficiently small, then the solutions of problem (1) obtained in Propositions 23 and 24 are distinct.

Proof. By Propositions 23 and 24, there exist sequences $\{u_n\}, \{v_n\}$ in E such that

$$\begin{aligned} u_n &\rightarrow u_0, & I(u_n) &\rightarrow C_0, & DI(u_n)u_n &\rightarrow 0, \\ v_n &\rightarrow u_M, & I(v_n) &\rightarrow C_M > 0, \\ DI(v_n)v_n &\rightarrow 0, & \nabla v_n &\rightarrow \nabla u_M \text{ a.e. in } \mathbb{R}^N. \end{aligned} \quad (134)$$

Suppose by contradiction that $u_0 = u_M$. As in the proof of Lemma 15, we have

$$\frac{f(x, v_n)}{|x|^\beta} \rightarrow \frac{f(x, u_0)}{|x|^\beta} \quad \text{in } L^1_{\text{loc}}(\mathbb{R}^N), \text{ as } n \rightarrow \infty. \quad (135)$$

Hence, by (f2) and (f3) and Generalized Lebesgue's Dominated Convergence Theorem, we obtain that there exists $R > 0$ such that

$$\frac{F(x, v_n)}{|x|^\beta} \rightarrow \frac{F(x, u_0)}{|x|^\beta} \quad \text{in } L^1_{\text{loc}}(B_R), \text{ as } n \rightarrow \infty. \quad (136)$$

Claim 1. $\int_{\mathbb{R}^N} (F(x, v_n)/|x|^\beta) dx \rightarrow \int_{\mathbb{R}^N} (F(x, u_0)/|x|^\beta) dx$, as $n \rightarrow \infty$. Indeed, by (f2) and (f3), we have

$$F(x, s) \leq C|s|^N + Cf(x, s) \leq C|s|^N + CR(\alpha_0, s)s,$$

$$\int_{\mathbb{R}^N} \frac{f(x, v_n)v_n}{|x|^\beta} dx \leq C, \quad \int_{\mathbb{R}^N} \frac{F(x, v_n)}{|x|^\beta} dx \leq C. \quad (137)$$

Hence, on the domain $\{|x| > R \text{ and } |v_n| > A\}$, we have

$$\begin{aligned} &\int_{\{|x| > R, |v_n| > A\}} \frac{F(x, v_n)}{|x|^\beta} dx \\ &\leq C \int_{|x| > R} \frac{|v_n|^N}{|x|^\beta} dx + C \int_{\{|x| > R, |v_n| > A\}} \frac{f(x, v_n)}{|x|^\beta} dx \\ &\leq \frac{C}{R^\beta} \|v_n\|_E^N + \frac{C}{A} \int_{\mathbb{R}^N} \frac{f(x, v_n)v_n}{|x|^\beta} dx. \end{aligned} \quad (138)$$

Since $\|v_n\|_E^N$ is bounded, and using (137), we have

$$\int_{\{|x| > R, |v_n| > A\}} \frac{F(x, v_n)}{|x|^\beta} dx \leq 2\delta. \quad (139)$$

For $|s| \leq A$, we have

$$\begin{aligned} |F(x, s)| &\leq C|s|^N + CR(\alpha_0, s)s \\ &\leq |s|^N \left[C + C \sum_{j=N-1}^{\infty} \frac{\alpha_0^j}{j!} A^{(Nj/(N-1)+1-N)} \right] \\ &\leq C(\alpha_0, A) |s|^N. \end{aligned} \quad (140)$$

Since $\|v_n\|_E^N$ is bounded, we have

$$\int_{\{|x|>R, |v_n|\leq A\}} \frac{F(x, v_n)}{|x|^\beta} dx \leq \delta. \quad (141)$$

Combining (139) and (141), we have

$$\int_{|x|>R} \frac{F(x, v_n)}{|x|^\beta} dx \leq 3\delta. \quad (142)$$

Similarly, we also have

$$\int_{|x|>R} \frac{F(x, u_0)}{|x|^\beta} dx \leq 3\delta. \quad (143)$$

Combining (136), (142), and (143), we obtain

$$\begin{aligned} &\left| \int_{\mathbb{R}^N} \frac{F(x, v_n)}{|x|^\beta} dx - \int_{\mathbb{R}^N} \frac{F(x, u_0)}{|x|^\beta} dx \right| \\ &\leq \left| \int_{B_R} \frac{F(x, v_n)}{|x|^\beta} dx - \int_{B_R} \frac{F(x, u_0)}{|x|^\beta} dx \right| \\ &\quad + \left| \int_{|x|>R} \frac{F(x, v_n)}{|x|^\beta} dx - \int_{|x|>R} \frac{F(x, u_0)}{|x|^\beta} dx \right| \leq C\delta. \end{aligned} \quad (144)$$

Hence, the claim is proved.

Claim 2. $I(v_n) \rightarrow I(u_0) = C_0 < 0$. Indeed, we have

$$\begin{aligned} &\lim_{n \rightarrow \infty} \|\nabla v_n\|_{L^N(\mathbb{R}^N)}^N \\ &= NC_M - \lim_{n \rightarrow \infty} \int_{\mathbb{R}^N} V(x) |v_n|^N dx \\ &\quad + N \int_{\mathbb{R}^N} \frac{F(x, u_0)}{|x|^\beta} dx + \lambda \int_{\mathbb{R}^N} \frac{|v_n|^N}{|x|^\beta} dx. \end{aligned} \quad (145)$$

From [10], we have

$$\begin{aligned} &\left| \int_{\mathbb{R}^N} \frac{f(x, v_n)(v_n - u_0)}{|x|^\beta} dx \right| \rightarrow 0, \\ &\int_{\mathbb{R}^N} |\nabla v_n|^{N-2} \nabla v_n (\nabla v_n - \nabla u_0) dx \\ &\quad + \int_{\mathbb{R}^N} V(x) |v_n|^{N-2} v_n (v_n - u_0) dx \rightarrow 0. \end{aligned} \quad (146)$$

On the other hand, since $v_n \rightarrow u_0$, we have

$$\begin{aligned} &\int_{\mathbb{R}^N} |\nabla u_0|^{N-2} \nabla u_0 (\nabla v_n - \nabla u_0) dx \rightarrow 0, \\ &\int_{\mathbb{R}^N} V(x) |u_0|^{N-2} u_0 (v_n - u_0) dx \rightarrow 0. \end{aligned} \quad (147)$$

By the inequality $(|x|^{N-2}x - |y|^{N-2}y)(x - y) \geq 2^{2-N}|x - y|^N$, we have

$$\begin{aligned} &\int_{\mathbb{R}^N} |\nabla v_n - \nabla u_0|^N dx + \int_{\mathbb{R}^N} V(x) |v_n - u_0|^N dx \\ &\leq C_1 \int_{\mathbb{R}^N} (|\nabla v_n|^{N-2} \nabla v_n - |\nabla u_0|^{N-2} \nabla u_0) (v_n - u_0) dx \\ &\quad + C_1 \int_{\mathbb{R}^N} V(x) (|v_n|^{N-2} v_n - |u_0|^{N-2} u_0) (v_n - u_0) dx. \end{aligned} \quad (148)$$

Hence, we have $v_n \rightarrow u_0$ in E and $I(v_n) \rightarrow I(u_0) = C_0 < 0$. It is a contradiction. The proof is complete. $\square$

Conflict of Interests

The authors declare that there is no conflict of interests regarding the publication of this paper.
