1. Introduction

Let $X$ be a real Banach space whose dual space is denoted by $X^*$. Let $U = \{x \in X : \|x\| = 1\}$ denote the unit sphere of $X$. A Banach space $X$ is said to be uniformly convex if, for each $\epsilon \in (0, 2]$, there exists $\delta > 0$ such that, for all $x, y \in U$,

$$\|x - y\| \geq \epsilon \implies \frac{\|x + y\|}{2} \leq 1 - \delta.$$  (1)

It is known that a uniformly convex Banach space is reflexive and strictly convex. The normalized duality mapping $J : X \to 2^{X^*}$ is defined by

$$J(x) = \{x^* \in X^* : \langle x, x^* \rangle = \|x\|^2 = \|x^*\|^2\}, \quad \forall x \in X,$$  (2)

where $\langle \cdot, \cdot \rangle$ denotes the generalized duality pairing. It is an immediate consequence of the Hahn-Banach theorem that $J(x)$ is nonempty for each $x \in X$.

Let $C$ be a nonempty closed convex subset of a real Banach space $X$. A mapping $T : C \to C$ is said to be $L$-Lipschitzian if there exists a constant $L > 0$ such that $\|Tx - Ty\| \leq L\|x - y\|$ for all $x, y \in C$. In particular, if $L = 1$, then $T$ is said to be nonexpansive. The set of fixed points of $T$ is denoted by $\text{Fix}(T)$. We use the notation $\rightharpoonup$ to indicate the weak convergence and the one $\to$ to indicate the strong convergence. A mapping $A : C \to X$ is said to be

(i) accretive if, for each $x, y \in C$, there exists $j(x - y) \in J(x - y)$ such that

$$\langle Ax - Ay, j(x - y) \rangle \geq 0,$$  (3)

where $J$ is the normalized duality mapping of $X$,

(ii) $\alpha$-inverse-strongly accretive if, for each $x, y \in C$, there exists $j(x - y) \in J(x - y)$ such that

$$\langle Ax - Ay, j(x - y) \rangle \geq \alpha \|x - y\|^2,$$  (4)

for some $\alpha \in (0, 1)$,

(iii) pseudocontractive if, for each $x, y \in C$, there exists $j(x - y) \in J(x - y)$ such that

$$\langle Ax - Ay, j(x - y) \rangle \leq \|x - y\|^2,$$  (5)
(iv) $\beta$-strongly pseudocontractive if, for each $x, y \in C$, there exists $f(x - y) \in J(x - y)$ such that
\[
\langle Ax - Ay, j(x - y) \rangle \leq \beta \|x - y\|^2
\]
for some $\beta \in (0, 1)$.

(v) $\lambda$-strictly pseudocontractive if, for each $x, y \in C$, there exists $j(x - y) \in J(x - y)$ such that
\[
\langle Ax - Ay, j(x - y) \rangle \leq \|x - y\|^2 - \lambda\|x - y - (Ax - Ay)\|^2
\]
for some $\lambda \in (0, 1)$.

It is worth emphasizing that the definition of the inverse-strongly accretive mapping is based on that of the inverse-strongly monotone mapping, which was studied by so many authors; see, for example, [1–7].

A Banach space $X$ is said to be smooth if the limit
\[
\lim_{t \to 0} \frac{\|x + ty\| - \|x\|}{t} = 0
\]
even exists for all $x, y \in X$; in this case, $X$ is also said to have a Gateaux differentiable norm. Moreover, it is said to be uniformly smooth if this limit is attained uniformly for $x, y \in U$; in this case, $X$ is also said to have a uniformly Frechet differentiable norm. The norm of $X$ is said to be the Frechet differential if, for each $x \in U$, this limit is attained uniformly for $y \in U$. In the meantime, we define a function $\rho : [0, \infty) \to [0, \infty)$ called the modulus of smoothness of $X$ as follows:
\[
\rho(r) = \sup_{\|x\| = 1, \|y\| = r} \left\{ \frac{1}{2} (\|x + y\| + \|x - y\|) - 1 : x, y \in X, \right\}
\]
\[
\|x\| = 1, \|y\| = r \right\}
\]
It is known that $X$ is uniformly smooth if and only if $\lim_{r \to 0} \rho(r)/r = 0$. Let $q$ be a fixed real number with $1 < q \leq 2$. Then a Banach space $X$ is said to be $q$-uniformly smooth if there exists a constant $c > 0$ such that $\rho(r) \leq cr^q$, for all $r > 0$.

As pointed out in [8], no Banach space is $q$-uniformly smooth for $q > 2$. In addition, it is also known that $J$ is single-valued if and only if $X$ is smooth, whereas, if $X$ is uniformly smooth, then the mapping $J$ is norm-to-norm uniformly continuous on bounded subsets of $X$.

In a real smooth Banach space $X$, we say that an operator $A$ is strongly positive (see [9]), if there exists a constant $\overline{y} > 0$ with the property
\[
\langle Ax, J(x) \rangle \geq \overline{y}\|x\|^2,
\]
\[
\|aI - bA\| = \sup_{\|x\| \leq 1} \|((aI - bA)x, J(x))\|,
\]
\[
a \in [0, 1], \ b \in [-1, 1], \]
where $I$ is the identity mapping.

Proposition CB (see [9, Lemma 2.5]). Let $C$ be a nonempty closed convex subset of a uniformly smooth Banach space $X$. Let $T : C \to C$ be a continuous pseudocontractive mapping with $\text{Fix}(T) \neq \emptyset$ and let $f : C \to C$ be a fixed Lipschitzian strongly pseudocontractive mapping with pseudocontractive coefficient $\beta \in (0, 1)$ and Lipschitzian constant $L > 0$. Let $A : C \to C$ be a strongly positive linear bounded operator with coefficient $\overline{y} > 0$. Assume that $C \subset C \subset C$ and $0 < \beta < \overline{y}$. Let $\{x_t\}$ be defined by
\[
x_t = tf(x_t) + (I - tA)Tx_t.
\]
Then, as $t \to 0$, $\{x_t\}$ converges strongly to some fixed point of $T$ such that $p$ is the unique solution in $\text{Fix}(T)$ to the VIP:
\[
\langle (A - f)p, J(p - u) \rangle \leq 0, \quad \forall u \in \text{Fix}(T).
\]

On the other hand, Cai and Bu [10] considered the following general system of variational inequalities (GSVI) in a real smooth Banach space $X$, which involves finding $(x^*, y^*) \in C \times C$ such that
\[
\langle \mu_1B_1y^* + x^* - y^*, J(x - x^*) \rangle \geq 0, \quad \forall x \in C,
\]
\[
\langle \mu_2B_2x^* + y^* - x^*, J(x - y^*) \rangle \geq 0, \quad \forall x \in C,
\]
where $C$ is a nonempty, closed, and convex subset of $X$, $B_1, B_2 : C \to C$ are two nonlinear mappings, and $\mu_1$ and $\mu_2$ are two positive constants. Here the set of solutions of GSVI (13) is denoted by $\text{GSVI}(C)$.

For many authors, see, for example, [11], Lemma 1. Let $X$ be a 2-uniformly smooth Banach space. Then, there exists a best smooth constant $\kappa > 0$ such that
\[
\|x + y\|^2 \leq 2\langle y, J(x) \rangle + 2\|y\|^2, \quad \forall x, y \in X,
\]
where $J$ is the normalized duality mapping from $X$ into $X^*$.

The authors [10] have used the following inequality in a real smooth and uniform convex Banach space $X$.

Proposition 2 (see [12]). Let $X$ be a real smooth and uniform convex Banach space and let $r > 0$. Then, there exists a strictly increasing, continuous, and convex function $g : [0, 2r] \to \overline{R}$, $g(0) = 0$ such that
\[
g\left(\|x - y\|^2\right) \leq 2\langle x, J(y) \rangle + \|y\|^2, \quad \forall x, y \in B_r,
\]
where $B_r = \{x \in X : \|x\| \leq r\}$.

2. Preliminaries

We list some lemmas that will be used in the sequel. Lemma 3 can be found in [13]. Lemma 4 is an immediate consequence of the subdifferential inequality of the function $(1/2)\|\cdot\|^2$. 

Lemma 3. Let \( \{a_n\} \) be a sequence of nonnegative real numbers such that
\[
a_{n+1} \leq (1 - b_n) a_n + b_n c_n, \quad \forall n \geq 0, \tag{16}
\]
where \( \{b_n\} \) and \( \{c_n\} \) are sequences of real numbers satisfying the following conditions:
\begin{enumerate}
  \item \( \{b_n\} \subset [0, 1] \) and \( \sum_{n=0}^{\infty} b_n = \infty; \)
  \item either \( \lim \sup c_n < 0 \) or \( \sum_{n=0}^{\infty} |b_n c_n| < \infty. \)
\end{enumerate}
Then, \( \lim_{n \to \infty} a_n = 0. \)

Lemma 4. In a smooth Banach space \( X \), there holds the inequality
\[
\|x\|^2 + 2 \langle y, J(x) \rangle \leq \|x + y\|^2 \leq \|x\|^2 + 2 \langle y, J(x + y) \rangle, \quad \forall x, y \in X, \tag{17}
\]
where \( J \) is the normalized duality mapping of \( X \).

Let \( \mu \) be a mean if \( \mu \) is a continuous linear functional on \( l^\infty \) satisfying \( \|\mu\| = 1 = \mu(1) \). Then, we know that \( \mu \) is a mean on \( \mathbb{N} \) if and only if
\[
\inf \{a_n : n \in \mathbb{N}\} \leq \mu(a) \leq \sup \{a_n : n \in \mathbb{N}\} \tag{18}
\]
for every \( a = (a_1, a_2, \ldots) \in l^\infty \). According to time and circumstances, we use \( \mu_n(a_n) \) instead of \( \mu(a) \). A mean \( \mu \) on \( \mathbb{N} \) is called a Banach limit if and only if
\[
\mu_n(a_n) = \mu(a_{n+1}) \tag{19}
\]
for every \( a = (a_1, a_2, \ldots) \in l^\infty \). We know that, if \( \mu \) is a Banach limit, then
\[
\lim \inf a_n \leq \mu_n(a_n) \leq \lim \sup a_n \tag{20}
\]
for every \( a = (a_1, a_2, \ldots) \in l^\infty \). So, if \( a = (a_1, a_2, \ldots), b = (b_1, b_2, \ldots) \in l^\infty, \) and \( a_n \to c \) (resp., \( a_n - b_n \to 0 \)), as \( n \to \infty \), we have
\[
\mu_n(a_n) = \mu(a) = c \quad \text{(resp.,} \quad \mu_n(a_n) = \mu_n(b_n) \). \tag{21}
\]
Further, it is well known that there holds the following result.

Lemma 5 (see [14]). Let \( C \) be a nonempty closed convex subset of a uniformly smooth Banach space \( X \). Let \( \{x_n\} \) be a bounded sequence of \( X \); let \( \mu \) be a mean on \( \mathbb{N} \) and let \( z \in C \). Then,
\[
\mu_n \|x_n - z\|^2 = \min_{y \in C} \|x_n - y\|^2 \tag{22}
\]
if and only if
\[
\mu_n \langle y - z, J(x_n - z) \rangle \leq 0, \quad \forall y \in C, \tag{23}
\]
where \( J \) is the normalized duality mapping of \( X \).

Lemma 6 (see [9, Lemma 2.6]). Let \( C \) be a nonempty closed convex subset of a real Banach space \( X \) which has uniformly Gateaux differentiable norm. Let \( T : C \to C \) be a continuous pseudocontractive mapping with Fix(\( T \)) \( \neq 0 \) and let \( f : C \to C \) be a fixed Lipschitzian strongly pseudocontractive mapping with pseudocontractive coefficient \( \beta \in (0, 1) \) and Lipschitzian constant \( L > 0 \). Let \( A : C \to C \) be a \( T \)-positive linear bounded operator with coefficient \( \gamma > 0 \). Assume that \( C \subseteq C \) and that \( \{x_n\} \) converges strongly to \( p \in \text{Fix}(T) \) as \( n \to 0 \), where \( x_n \) is defined by \( x_n = f(x_n) + (1 - \alpha)Tx_n \). Suppose that \( \{x_n\} \subseteq C \) is bounded and that \( \lim_{n \to \infty} \|x_n - Tx_n\| = 0 \). Then,
\[
\limsup_{n \to \infty} \| (f - A)p, J(x_n - p) \| \leq 0. \tag{24}
\]

Lemma 7. Let \( C \) be a nonempty closed convex subset of a real smooth Banach space \( X \). Let \( F : C \to X \) be an \( \alpha \)-strongly accretive and \( \lambda \)-strictly pseudocontractive with \( \alpha + \lambda \geq 1 \). Then, \( I - F \) is nonexpansive and \( F \) is Lipschitz continuous with constant \( (1 + \sqrt{(1 - \alpha)/\lambda}) \). Further, for any fixed \( \tau \in (0, 1) \), \( I - \tau F \) is contractive with coefficient \( 1 - \tau(1 - \sqrt{(1 - \alpha)/\lambda}) \).

Proof. From the \( \lambda \)-strictly pseudocontractivity and \( \alpha \)-strongly accretivity of \( F \), we have, for all \( x, y \in C \),
\[
\lambda \| (I - F)x - (I - F)y \|^2 \leq \|x - y\|^2 - \langle F(x) - F(y), J(x - y) \rangle \leq (1 - \alpha) \|x - y\|^2, \tag{24}
\]
which implies that
\[
\| (I - F)x - (I - F)y \| \leq \sqrt{\frac{1 - \alpha}{\lambda}} \|x - y\|. \tag{25}
\]

Because \( \alpha + \lambda \geq 1 \iff \sqrt{(1 - \alpha)/\lambda} \leq 1 \), we know that \( I - F \) is nonexpansive. Also note that
\[
\|F(x) - F(y)\| \leq \| (I - F)x - (I - F)y \| + \|x - y\| \leq \left( 1 + \sqrt{\frac{1 - \alpha}{\lambda}} \right) \|x - y\|. \tag{26}
\]

Now, take a fixed \( \tau \in (0, 1) \) arbitrarily. Observe that, for all \( x, y \in C \),
\[
\| (I - \tau F)x - (I - \tau F)y \| \leq \| (1 - \tau)(x - y) + \tau (I - F)x - (I - F)y \| \leq (1 - \tau) \|x - y\| + \tau \| (I - F)x - (I - F)y \| \leq (1 - \tau) \|x - y\| + \tau \sqrt{\frac{1 - \alpha}{\lambda}} \|x - y\| \leq (1 - \tau \left( 1 - \sqrt{\frac{1 - \alpha}{\lambda}} \right)) \|x - y\|. \tag{27}
\]

Because \( \alpha + \lambda > 1 \iff \sqrt{(1 - \alpha)/\lambda} < 1 \), we know that \( I - \tau F \) is contractive with coefficient \( 1 - \tau(1 - \sqrt{(1 - \alpha)/\lambda}) \). \( \square \)
Let $D$ be a subset of $C$ and let $\Pi$ be a mapping of $C$ into $D$. Then, $\Pi$ is said to be sunny if

$$
\Pi \left[ \Pi(x) + t(x - \Pi(x)) \right] = \Pi(x),
$$

whenever $\Pi(x) + t(x - \Pi(x)) \in C$ for $x \in C$ and $t \geq 0$. A mapping $\Pi$ of $C$ into itself is called a retraction if $\Pi^2 = \Pi$. If a mapping $\Pi$ of $C$ into itself is a retraction, then $\Pi(z) = z$ for every $z \in \Pi(C)$ where $\Pi$ is the range of $\Pi$. A subset $D$ of $C$ is called a sunny nonexpansive retract of $C$ if there exists a sunny nonexpansive retraction from $C$ onto $D$. The following lemma concerns the sunny nonexpansive retraction.

**Lemma 8 (see [15]).** Let $C$ be a nonempty closed convex subset of a smooth Banach space $X$. Let $D$ be a nonempty subset of $C$. Let $\Pi$ be a retraction of $C$ onto $D$. Then, the following are equivalent:

(i) $\Pi$ is sunny and nonexpansive;

(ii) $\|\Pi(x) - \Pi(y)\|^2 \leq \langle x - y, J(\Pi(x) - \Pi(y)) \rangle$, for all $x, y \in C$;

(iii) $\langle x - \Pi(x), J(y - \Pi(x)) \rangle \leq 0$, for all $x \in C$, $y \in D$.

It is well known that, if $X = H$ is a Hilbert space, then a sunny nonexpansive retraction $\Pi_C$ is coincident with the metric projection from $X$ onto $C$; that is, $\Pi_C = P_C$. If $C$ is a nonempty closed convex subset of a real Banach space and if $T : C \to C$ is a nonexpansive mapping with the fixed point set $\text{Fix}(T) \neq \emptyset$, then the set $\text{Fix}(T)$ is a sunny nonexpansive retract of $C$.

**Lemma 9.** Let $C$ be a nonempty closed convex subset of a smooth Banach space $X$. Let $\Pi_C$ be a sunny nonexpansive retraction from $X$ onto $C$ and let $B_1, B_2 : C \to X$ be nonlinear mappings. For given $x^*, y^* \in C$, $(x^*, y^*)$ is a solution of GSVI (13) if and only if $x^* = \Pi_C(y^* - \mu_i B_i y^*)$, where $y^* = \Pi_C(x^* - \mu_i B_i x^*)$.

**Proof.** We can rewrite GSVI (13) as

$$
\langle x^* - (y^* - \mu_i B_i y^*), J(x - x^*) \rangle \geq 0, \quad \forall x \in C,
$$

$$
\langle y^* - (x^* - \mu_i B_i x^*), J(y - y^*) \rangle \geq 0, \quad \forall y \in C,
$$

which is obviously equivalent to

$$
x^* = \Pi_C(y^* - \mu_i B_i y^*),
$$

$$
y^* = \Pi_C(x^* - \mu_i B_i x^*),
$$

because of Lemma 8. This completes the proof.

In terms of Lemma 9, define the mapping $G : C \to C$ as follows:

$$
G(x) := \Pi_C(I - \mu_i B_i) \Pi_C(I - \mu_i B_i) x, \quad \forall x \in C.
$$

Then, we observe that

$$
x^* = \Pi_C \left[ \Pi_C(x^* - \mu_i B_i x^*) - \mu_i B_i \Pi_C(x^* - \mu_i B_i x^*) \right],
$$

which implies that $x^*$ is a fixed point of the mapping $G$. Throughout this paper, the set of fixed points of the mapping $G$ is denoted by $\Omega$.

**Lemma 10 (see [16]).** Let $C$ be a nonempty closed convex subset of a strictly convex Banach space $X$. Let $\{T_n\}_{n=0}^\infty$ be a sequence of nonexpansive mappings on $C$. Suppose $\sum_{n=0}^\infty \text{Fix}(T_n)$ is nonempty. Let $\{\lambda_n\}$ be a sequence of positive numbers with $\sum_{n=0}^\infty \lambda_n = 1$. Then, a mapping $T$ on $C$ defined by $Tx = \sum_{n=0}^\infty \lambda_n T_n x$ for $x \in C$ is well-defined, nonexpansive and $\text{Fix}(T) = \bigcap_{n=0}^\infty \text{Fix}(T_n)$ holds.

**Lemma 11 (see [17]).** Let $C$ be a nonempty closed convex subset of a Banach space $X$. Let $S_1, S_2, \ldots$ be a sequence of mappings of $C$ into itself. Suppose that $\sum_{n=0}^\infty \sup \{|S_n x - S_{n+1} x| : x \in C\} < \infty$. Then, for each $y \in C$, $\{S_n y\}$ converges strongly to some point of $C$. Moreover, let $S$ be a mapping of $C$ into itself defined by $Sy = \lim_{n \to \infty} S_n y$, for all $y \in C$. Then, $\lim_{n \to \infty} \sup \{|S x - S_n x| : x \in C\} = 0$.

### 3. GSVI with Hierarchical Fixed Point Problem Constraint for a Nonexpansive Mapping

In this section, we introduce our hybrid implicit viscosity scheme for solving the GSVI (13) with hierarchical fixed point problem constraint for a nonexpansive mapping and show the strong convergence theorem. First, we list several useful and helpful lemmas.

**Lemma 12 (see [10, Lemma 2.8]).** Let $C$ be a nonempty closed convex subset of a real 2-uniformly smooth Banach space $X$. Let the mapping $B_i : C \to X$ be $\alpha_i$-inverse-strongly accretive. Then, one has

$$
\|(I - \mu_i B_i)x - (I - \mu_i B_i)y\| \leq \|(I - \mu_i B_i)y\| - \|x - y\| + 2\mu_i \alpha_i \|B_i x - B_i y\|,
$$

$$
\forall x, y \in C, \quad (33)
$$

for $i = 1, 2$, where $\mu_i > 0$. In particular, if $0 < \mu_i \leq \alpha_i/\kappa$ (where $\kappa$ is the best constant of $X$ as in Lemma 1), then $I - \mu_i B_i$ is nonexpansive for $i = 1, 2$.

**Lemma 13 (see [10, Lemma 2.9]).** Let $C$ be a nonempty closed convex subset of a real 2-uniformly smooth Banach space $X$. Let $\Pi_C$ be a sunny nonexpansive retraction from $X$ onto $C$. Let the mapping $B_i : C \to X$ be $\alpha_i$-inverse-strongly accretive for $i = 1, 2$. Let $G : C \to C$ be the mapping defined by

$$
Gx = \Pi_C \left[ \Pi_C(x - \mu_i B_i x) - \mu_i B_i \Pi_C(x - \mu_i B_i x) \right],
$$

$$
\forall x \in C. \quad (34)
$$

If $0 < \mu_i \leq \alpha_i/\kappa^2$, for $i = 1, 2$, then $G : C \to C$ is nonexpansive.

**Lemma 14 (see [18]).** Let $X$ be a Banach space, $C$ a nonempty closed and convex subset of $X$, and $T : C \to C$ a continuous
and strong pseudocontraction. Then, $T$ has a unique fixed point in $C$.

**Lemma 15** (see [19]). Assume that $A$ is a strongly positive linear bounded operator on a smooth Banach space $X$ with coefficient $\overline{\nu} > 0$ and $0 < \rho \leq \|A\|^{-1}$. Then, $\|I - \rho A\|^2 \leq 1 - \rho \overline{\nu}$.

We now state and prove our first result.

**Theorem 16.** Let $C$ be a nonempty closed convex subset of a uniformly convex and 2-uniformly smooth Banach space $X$ such that $C \subseteq C$. Let $\Pi_C$ be a sunny nonexpansive retraction from $X$ onto $C$. Let the mapping $B_i : C \to X$ be $\alpha_i$-inverse-strongly accretive for $i = 1, 2$. Let $T : C \to C$ be a nonexpansive mapping such that $\Lambda = \text{Fix}(T) \cap \Omega \neq \emptyset$ where $\Omega$ is the fixed point set of the mapping $G = \Pi_C(I - \mu_1B_1)\Pi_C(I - \mu_2B_2)$ with $0 < \mu_i < \alpha_i/\kappa^2$ for $i = 1, 2$. Let $f : C \to C$ be a fixed Lipschitzian strongly pseudocontractive mapping with pseudocontractive coefficient $\beta \in (0, 1)$ and Lipschitzian constant $L > 0$, let $F : C \to C$ be a strongly accretive and $\lambda$-strictly pseudocontractive with $\alpha > \lambda > 1$, and let $A : C \to C$ be a $\overline{\nu}$-strongly positive linear bounded operator with $0 < \overline{\nu} - \beta \leq 1$. Let $\{x_i\}$ be defined by

$$x_i = tf(x_i) + (I - tA)[G(Tx_i) - \theta_iFG(Tx_i)],$$

(35)

where $[\theta_i : t \in (0, 1)] \subseteq [0, 1]$ with $\lim_{t \to 0}\theta_i/t = 0$. Then, as $t \to 0$, $\{x_i\}$ converges strongly to a point $p \in \Lambda$, which is the unique solution in $\Lambda$ to the VIP,

$$\langle (A - f) p, I (p - u) \rangle \leq 0, \quad \forall u \in \Lambda.$$  

(36)

**Proof.** First, let us show that the net $\{x_i\}$ is defined well. As a matter of fact, define the mapping $S_i : C \to C$ as follows:

$$S_i x = tf(x) + (I - tA)[G(Tx) - \theta_iFG(Tx)], \quad \forall x \in C.$$  

(37)

We may assume, without loss of generality, that $t \leq \|A\|^{-1}$. Utilizing Lemmas 7, 13, and 15, we have

$$\langle S_i x - S_i y, J(x - y) \rangle = t \langle f(x) - f(y), J(x - y) \rangle + \langle (I - tA)[(I - \theta_1F)G(Tx) - (I - \theta_2F)G(Ty)], J(x - y) \rangle,$n

$$\leq t\|x - y\|^2 + (1 - t\overline{\nu}) \times \|G(Tx) - G(Ty)\| \times \|x - y\|,$n

$$\leq t\|x - y\|^2 + (1 - t\overline{\nu}) \times \|G(Tx) - G(Ty)\| \times \|x - y\|,$n

$$\leq t\|x - y\|^2 + (1 - t\overline{\nu}) \times \|G(Tx) - G(Ty)\| \times \|x - y\|,$n

$$\leq t\beta \|x - y\|^2 + (1 - t\overline{\nu}) \times \|G(Tx) - G(Ty)\| \times \|x - y\|,$n

$$\leq t\beta \|x - y\|^2 + (1 - t\overline{\nu}) \times \|G(Tx) - G(Ty)\| \times \|x - y\|.$$  

(38)

Hence, it is known that $S_i : C \to C$ is a continuous and strongly pseudocontractive mapping with pseudocontractive coefficient $1 - t(\overline{\nu} - \beta) \in (0, 1)$ Thus, by Lemma 14, we deduce that there exists a unique fixed point in $C$, denoted by $x_i$, which uniquely solves the fixed point equation

$$x_i = tf(x_i) + (I - tA)[G(Tx_i) - \theta_iFG(Tx_i)].$$

(39)

Let us show the uniqueness of the solution of VIP (36). Suppose that both $p_1 \in \Lambda$ and $p_2 \in \Lambda$ are solutions to VIP (36). Then, we have

$$\langle (A - f) p_1, J(p_1 - p_2) \rangle \leq 0,$n

and

$$\langle (A - f) p_2, J(p_2 - p_1) \rangle \leq 0.$$  

(40)

Adding up the above two inequalities, we obtain

$$\langle (A - f) p_1 - (A - f) p_2, J(p_1 - p_2) \rangle \leq 0.$$  

(41)

Note that

$$\langle (A - f) p_1 - (A - f) p_2, J(p_1 - p_2) \rangle = \langle A(p_1 - p_2) , J(p_1 - p_2) \rangle - \langle (f(p_1) - f(p_2)) , J(p_1 - p_2) \rangle,$n

$$\geq \overline{\nu} \|p_1 - p_2\|^2 - \beta \|p_1 - p_2\|^2,$n

$$= (\overline{\nu} - \beta) \|p_1 - p_2\|^2 \geq 0.$$  

Consequently, we have $p_1 = p_2$, and the uniqueness is proved.

Next, let us show that, for some $a \in (0, 1), \{x_i : t \in (0, a]\}$ is bounded. Indeed, since $[\theta_i : t \in (0, 1)] \subseteq [0, 1]$ with $\lim_{t \to 0}\theta_i/t = 0$, there exists some $a \in (0, 1)$ such that $0 \leq \theta_i/t < 1$ for all $t \in (0, a]$. Take a fixed $p \in \text{Fix}(A)$ arbitrarily. Utilizing Lemma 7, we have

$$\|x_i - p\|^2 = \langle t(f(x_i) - f(p)) + (I - tA)[G(Tx_i) - \theta_iFG(Tx_i) - p], J(x_i - p) \rangle,$n

$$- t(Ap - f(p)) , J(x_i - p) \rangle,$n

$$= t \langle f(x_i) - f(p), J(x_i - p) \rangle + \langle (I - tA)[G(Tx_i) - \theta_iFG(Tx_i) - p], J(x_i - p) \rangle,$n

$$- t \langle (A - f) p, J(x_i - p) \rangle.$$  

\[
\leq t\beta\|x_t - p\|^2 + (1 - t\gamma)\|G(Tx_t) - \theta_t F(Tx_t) - p\| \\
\times \|x_t - p\| + t\|(A - f)p\|\|x_t - p\| \\
\leq t\beta\|x_t - p\|^2 + (1 - t\gamma) \\
\times \|\|G(Tx_t) - (1 - \theta_t F)G(Tp)\| + \|G(Tx_t) - (1 - \theta_t F) G(Tp) - p\|\|x_t - p\| \\
+ t\|(A - f)p\|\|x_t - p\| \\
\leq t\beta\|x_t - p\|^2 + (1 - t\gamma)\left(1 - \theta_t \left(1 - \frac{1 - \alpha}{\lambda}\right)\right) \\
\times \|[G(Tx_t) - G(Tp)]\|\|x_t - p\| \\
+ (1 - t\gamma)\theta_t\|Fp\|\|x_t - p\| + t\|(A - f)p\|\|x_t - p\| \\
\leq t\beta\|x_t - p\|^2 + (1 - t\gamma)\left(1 - \theta_t \left(1 - \frac{1 - \alpha}{\lambda}\right)\right) \\
\times \|Tx_t - Tp\|\|x_t - p\| \\
+ \theta_t\|Fp\|\|x_t - p\| + t\|(A - f)p\|\|x_t - p\| \\
\leq t\beta\|x_t - p\|^2 + (1 - t\gamma)\left(1 - \theta_t \left(1 - \frac{1 - \alpha}{\lambda}\right)\right) \\
\times \|\|Tx_t - Tp\|\|x_t - p\| \\
+ \theta_t\|Fp\|\|x_t - p\| + t\|(A - f)p\|\|x_t - p\|
\]

(43)

and, hence, for all \(t \in (0, a]\),

\[
\|x_t - p\| \leq \frac{1}{\beta - \beta} \left(\|G(Tx_t) - Fp\| + \frac{\theta_t}{t}\|Fp\|\right) \\
\leq \frac{1}{\beta - \beta} \left(\|G(Tx_t) - Fp\| + \frac{\theta_t}{t}\|Fp\|\right).
\]

(44)

Thus, this implies that \(\{x_t : t \in (0, a]\}\) is bounded and so are \(\{f(x_t) : t \in (0, a]\}\), \(\{Tx_t : t \in (0, a]\}\), and \(\{G(Tx_t) : t \in (0, a]\}\).

Let us show that \(\|Tx_t - G(Tx_t)\| \to 0\) as \(t \to 0\).

Indeed, for simplicity, we put \(q = \Pi_{C}(I - \mu B_2)p\), \(\bar{x}_t = Tx_t\), \(u_t = \Pi_{C}(I - \mu B_2)\bar{x}_t\), and \(v_t = \Pi_{C}(I - \mu B_1)u_t\). Then, it is clear that \(p = \Pi_{C}(I - \mu B_1)q\) and \(v_t = G(\bar{x}_t) = G(Tx_t)\). Hence, from (43), it follows that

\[
\|x_t - p\|^2 \leq t\beta\|x_t - p\|^2 + (1 - t\gamma)\left(1 - \theta_t \left(1 - \frac{1 - \alpha}{\lambda}\right)\right) \\
\times \|G(Tx_t) - G(Tp)\|\|x_t - p\| \\
+ (1 - t\gamma)\theta_t\|Fp\|\|x_t - p\| + t\|(A - f)p\|\|x_t - p\|
\]

(45)

From Lemma 12, we have

\[
\|u_t - q\|^2 = \|\Pi_{C}(\bar{x}_t - u_t, B_2)\| - \|\Pi_{C}(\mu B_2)\|^2 \\
\leq \|\bar{x}_t - p - \mu B_2\|^2 - 2\mu_1(\alpha_2 - \kappa^2\mu_2)\|B_2\|^2, \\
\|v_t - p\|^2 = \|\Pi_{C}(u_t - p, B_1)\| - \|\Pi_{C}(\mu B_1)\|^2 \\
\leq \|u_t - q - \mu B_1\|^2 - 2\mu_1(\alpha_1 - \kappa^2\mu_1)\|B_1\|^2.
\]

(46)

From the last two inequalities, we obtain

\[
\|v_t - p\|^2 \leq \|\bar{x}_t - p\|^2 - 2\mu_2(\alpha_2 - \kappa^2\mu_2) \\
\times \|B_2\|^2 - 2\mu_1(\alpha_1 - \kappa^2\mu_1) \\
\times \|B_1\|^2 \\
\leq \|x_t - p\|^2 - 2\mu_2(\alpha_2 - \kappa^2\mu_2)\|B_2\|^2 - 2\mu_1(\alpha_1 - \kappa^2\mu_1)\|B_1\|^2,
\]

(47)

which together with (45) implies that

\[
\|x_t - p\|^2 \leq t\beta\|x_t - p\|^2 + (1 - t\gamma)\|v_t - p\|\|x_t - p\| + \theta_t\|Fp\| \\
\times \|x_t - p\| + t\|(A - f)p\|\|x_t - p\| \\
\leq t\beta\|x_t - p\|^2 + (1 - t\gamma)\left(\|v_t - p\|^2 + \theta_t\|Fp\|\|x_t - p\| + (1 - t\gamma)\right) \\
\times \left(\|\|Tx_t - Tp\|\|x_t - p\| \\
+ \theta_t\|Fp\|\|x_t - p\| + t\|(A - f)p\|\|x_t - p\|\right) \\
\leq t\beta\|x_t - p\|^2 + t\|(A - f)p\|\|x_t - p\| \\
+ (1 - t\gamma)\frac{1}{2}\left(\|x_t - p\|^2 + \|v_t - p\|^2\right) \\
+ \theta_t\|Fp\|\|x_t - p\| \\
= (1 - t(\gamma - \beta))\|x_t - p\|^2 + t\|(A - f)p\|\|x_t - p\| \\
- (1 - t\gamma)\left[\mu_2(\alpha_2 - \kappa^2\mu_2)\|B_2\|^2 \\
- 2\mu_1(\alpha_1 - \kappa^2\mu_1)\|B_1\|^2\right].
\]
Abstract and Applied Analysis

+ $\theta_t \|Fp\| \|x_t - p\|
\leq \|x_t - p\|^2 + t \| (A - f) p \| \|x_t - p\| - (1 - t \gamma)
\times \left[ \mu_2 (\alpha_2 - \kappa^2 \mu_2) \|B_2 \tilde{x}_t - B_2 p\|^2
+ \mu_1 (\alpha_1 - \kappa^2 \mu_1) \|B_1 u_t - B_1 q\|^2 \right]
+ \theta_1 \|Fp\| \|x_t - p\|.

(48)

So, it immediately follows that

$$
(1 - t \gamma) \left[ \mu_2 (\alpha_2 - \kappa^2 \mu_2) \|B_2 \tilde{x}_t - B_2 p\|^2 + \mu_1 (\alpha_1 - \kappa^2 \mu_1) \right]
\times \|B_1 u_t - B_1 q\|^2
\leq t \| (A - f) p \| \|x_t - p\| + \theta_1 \|Fp\| \|x_t - p\|.
$$

(49)

Since $0 < \mu_i < \alpha_i/\kappa^2$, for $i = 1, 2$, we have

$$
\lim_{t \to 0} \|B_2 \tilde{x}_t - B_2 p\| = 0,
\lim_{t \to 0} \|B_1 u_t - B_1 q\| = 0.
$$

(50)

Utilizing Proposition 2 and Lemma 8, we have that there exists $g_1$ such that

$$
\|u_t - q\|^2 = \|\Pi_C (\tilde{x}_t - \mu_2 B_2 \tilde{x}_t) - \Pi_C (p - \mu_2 B_2 p)\|^2
\leq \langle \tilde{x}_t - \mu_2 B_2 \tilde{x}_t - (p - \mu_2 B_2 p), J (u_t - q) \rangle
$$

$$
= \langle \tilde{x}_t - p, J (u_t - q) \rangle + \mu_2 \|B_2 p - B_2 \tilde{x}_t, J (u_t - q) \rangle
\leq \frac{1}{2} \|\tilde{x}_t - p\|^2 + \|u_t - q\|^2
- g_1 (\|\tilde{x}_t - u_t - (p - q)\|)
+ \mu_2 \|B_2 p - B_2 \tilde{x}_t\| \|u_t - q\|,
$$

(51)

which implies that

$$
\|u_t - q\|^2 \leq \|\tilde{x}_t - p\|^2 - g_1 (\|\tilde{x}_t - u_t - (p - q)\|)
+ 2 \mu_2 \|B_2 p - B_2 \tilde{x}_t\| \|u_t - q\|.
$$

(52)

In the same way, we derive that there exists $g_2$:

$$
\|v_t - p\|^2 = \|\Pi_C (u_t - \mu_1 B_1 u_t) - \Pi_C (q - \mu_1 B_1 q)\|^2
\leq \langle u_t - \mu_1 B_1 u_t - (q - \mu_1 B_1 q), J (v_t - p) \rangle
$$

$$
= \langle u_t - q, J (v_t - p) \rangle + \mu_1 \langle B_1 q - B_1 u_t, J (v_t - p) \rangle
\leq \frac{1}{2} \|u_t - q\|^2 + \|v_t - p\|^2
- g_2 (\|u_t - v_t + (p - q)\|)
+ \mu_1 \|B_1 q - B_1 u_t\| \|v_t - p\|,
$$

(53)

which implies that

$$
\|v_t - p\|^2 \leq \|u_t - q\|^2 - g_2 (\|u_t - v_t + (p - q)\|)
+ 2 \mu_1 \|B_1 q - B_1 u_t\| \|v_t - p\|.
$$

(54)

Substituting (52) for (54), we get

$$
\|v_t - p\|^2 \leq \|\tilde{x}_t - p\|^2 - g_1 (\|\tilde{x}_t - u_t - (p - q)\|)
- g_2 (\|u_t - v_t + (p - q)\|)
$$

$$
+ 2 \mu_2 \|B_2 p - B_2 \tilde{x}_t\| \|u_t - q\|
+ 2 \mu_1 \|B_1 q - B_1 u_t\| \|v_t - p\|.
$$

(55)

which together with (45) implies that

$$
\|x_t - p\|^2
\leq t \beta \|x_t - p\|^2 + (1 - t \gamma) \|v_t - p\| \|x_t - p\| + \theta_1 \|Fp\|
\times \|x_t - p\| + t \| (A - f) p \| \|x_t - p\|
\leq t \beta \|x_t - p\|^2 + t \| (A - f) p \| \|x_t - p\| + (1 - t \gamma)
\times \frac{1}{2} \left( \|x_t - p\|^2 + \|v_t - p\|^2 \right)
+ \theta_1 \|Fp\| \|x_t - p\|
\leq t \beta \|x_t - p\|^2 + t \| (A - f) p \| \|x_t - p\| + (1 - t \gamma)
\times \frac{1}{2} \left( \|x_t - p\|^2 + \|x_t - p\|^2 \right)
- g_1 (\|\tilde{x}_t - u_t - (p - q)\|)
- g_2 (\|u_t - v_t + (p - q)\|)
+ 2 \mu_2 \|B_2 p - B_2 \tilde{x}_t\| \|u_t - q\|
+ 2 \mu_1 \|B_1 q - B_1 u_t\| \|v_t - p\|
+ \theta_1 \|Fp\| \|x_t - p\|.
$$
\[ + \theta \| Fp \| \| x_t - p \| \leq \| x_t - p \|^2 + t \| (A - f) p \| \| x_t - p \| - (1 - t \gamma) \]
\[ \times \left( \begin{array}{c}
\frac{1}{2} \left[ g_1 \left( \| x_t - u_t - (p - q) \| \right) \\
\| u_t - v_t + (p - q) \| \\
\| Bp - Bx_t \| \| u_t - q \|
\end{array} \right) + \mu \left[ Bq - Bx_t \| v_t - p \| + \theta \| Fp \| \| x_t - p \| \right. \]
\[ \left. + \mu \left[ Bq - Bx_t \| v_t - p \| + \theta \| Fp \| \| x_t - p \| \right. \]
\[ \leq \left( \begin{array}{c}
\| u_t - v_t + (p - q) \| \\
\| x_t - u_t - (p - q) \| \\
\| u_t - v_t + (p - q) \| \\
\| x_t - u_t - (p - q) \|
\end{array} \right) \to 0 \quad \text{as} \ t \to 0. \]

This together with (61) and (62) implies that
\[ \lim_{t \to 0} \| x_t - Tx_t \| = 0. \]  

Utilizing the nonexpansivity of G, we obtain
\[ \| x_t - Gx_t \| \leq \| x_t - G( Tx_t ) \| + \| G(Tx_t) - Gx_t \| \]
\[ \leq \| x_t - G( Tx_t ) \| + \| Tx_t - x_t \|, \]
which together with (62) and (64) implies that
\[ \lim_{t \to 0} \| x_t - Gx_t \| = 0. \]  

Now, let \{t_k\} be a sequence in (0, a] that converges to 0 as \( k \to \infty \), and define a function \( g \) on \( C \) by
\[ g(x) = \mu_k \frac{1}{2} \| x_{t_k} - x \|^2, \quad \forall x \in C, \]
where \( \mu \) is a Banach limit. Define the set
\[ K := \{ w \in C : g(w) = \min \{ g(y) : y \in C \} \} \]
a nd the mapping
\[ Wx = (1 - \theta)Tx + \theta Gx, \quad \forall x \in C, \]
where \( \theta \) is a constant in \( (0, 1) \). Then, by Lemma 10, we know that \( \text{Fix}(W) = \text{Fix}(T) \cap \text{Fix}(G) = \Lambda \). We observe that
\[ \| x_t - Wx_t \| = \| (1 - \theta) (x_t - Tx_t) + \theta (x_t - Gx_t) \|
\[ \leq (1 - \theta) \| x_t - Tx_t \| + \| x_t - Gx_t \|. \]

So, from (64) and (66), we obtain
\[ \lim_{n \to \infty} \| x_t - Wx_t \| = 0. \]

Since \( X \) is a uniformly smooth Banach space, \( K \) is a nonempty bounded closed convex subset of \( C \); for more details, see [14]. We claim that \( K \) is also invariant under the nonexpansive mapping \( W \). Indeed, noticing (71), we have, for \( w \in K \),
\[ g(Ww) = \mu_k \frac{1}{2} \| x_{t_k} - Ww \|^2 = \mu_k \frac{1}{2} \| Wx_{t_k} - Ww \|^2 \]
\[ \leq \mu_k \frac{1}{2} \| x_{t_k} - w \|^2 = g(w). \]

Since every nonempty closed bounded convex subset of a uniformly smooth Banach space \( X \) has the fixed point property for nonexpansive mappings and \( W \) is a nonexpansive mapping of \( K \), \( W \) has a fixed point in \( K \), say \( p \). Utilizing Lemma 5, we get
\[ \mu_k \left( x - p, J(x_{t_k} - p) \right) \leq 0, \quad \forall x \in C. \]

Putting \( x = (f - A)p + p \in C \), we have
\[ \mu_k \left( (f - A)p, J(x_{t_k} - p) \right) \leq 0, \quad \forall x \in C. \]
Since $x_{t_k} - p = t_k (f(x_{t_k}) - f(p)) + (I - t_k A) [G(Tx_{t_k}) - \theta t_k FG(Tx_{t_k}) - p] - t_k (A - f) p$, we get

$$
\|x_{t_k} - p\|^2 \\
= t_k \left\langle f(x_{t_k}) - f(p), J(x_{t_k} - p) \right\rangle \\
+ \left\langle (I - t_k A) (G(Tx_{t_k}) - p), J(x_{t_k} - p) \right\rangle \\
- \theta t_k \left\langle (I - t_k A) FG(Tx_{t_k}), J(x_{t_k} - p) \right\rangle \\
- t_k \left\langle (A - f) p, J(x_{t_k} - p) \right\rangle \\
\leq t_k \beta \|x_{t_k} - p\|^2 + t_k \left\langle (f - A) p, J(x_{t_k} - p) \right\rangle \\
+ (1 - t_k \beta) \|G(Tx_{t_k}) - p\| \|x_{t_k} - p\| \\
+ (1 - t_k \beta) \theta t_k \|FG(Tx_{t_k})\| \|x_{t_k} - p\| \\
\leq t_k \beta \|x_{t_k} - p\|^2 + t_k \left\langle (f - A) p, J(x_{t_k} - p) \right\rangle \\
+ (1 - t_k \beta) \|x_{t_k} - p\|^2 + \theta t_k \|FG(Tx_{t_k})\| \|x_{t_k} - p\|.
$$

(75)

It follows that

$$
\|x_{t_k} - p\|^2 \leq \frac{1}{\alpha - \beta} \left\langle (f - A) p, J(x_{t_k} - p) \right\rangle \\
+ \frac{\theta t_k}{t_k} \|FG(Tx_{t_k})\| \|x_{t_k} - p\|.
$$

(76)

Since $\lim_{k \to \infty} (\alpha t_k / t_k) = 0$, from (74) and the boundedness of sequences $\{FG(Tx_{t_k})\}, \{x_{t_k}\}$, it follows that

$$
\mu_k \|x_{t_k} - p\|^2 \leq \frac{1}{\alpha - \beta} \mu_k \left\langle (f - A) p, J(x_{t_k} - p) \right\rangle \\
+ \frac{\theta t_k}{t_k} \|FG(Tx_{t_k})\| \|x_{t_k} - p\| \\
= \frac{1}{\alpha - \beta} \left[ \mu_k \left\langle (f - A) p, J(x_{t_k} - p) \right\rangle \\
+ \mu_k \left( \frac{\theta t_k}{t_k} \|FG(Tx_{t_k})\| \|x_{t_k} - p\| \right) \right] \leq 0.
$$

(77)

Indeed, from (35), it follows that for all $u \in \Lambda = \text{Fix}(T) \cap \Omega$

$$
\|x_t - u\|^2 \\
= t \left\langle f(x_t) - f(u), J(x_t - u) \right\rangle \\
+ \langle (I - tA) [G(Tx_t) - \theta, FG(Tx_t) - u], J(x_t - u) \rangle \\
- t \langle (A - f) u, J(x_t - u) \rangle \\
= \langle (I - t\beta) [(I - \theta t) G(Tx_t) - (I - \theta t) F u] \\
+ (I - \theta t) F u, J(x_t - u) \rangle \\
+ t \langle f(x_t) - f(u), J(x_t - u) \rangle - t \langle (A - f) u, J(x_t - u) \rangle \\
\leq (1 - t\beta) \| (I - \theta t) G(Tx_t) - (I - \theta t) F u \| \\
+ \| (I - \theta t) F u - u \| \\
\times \| x_t - u \| + t\beta \| x_t - u \|^2 - t \langle (A - f) u, J(x_t - u) \rangle \\
\leq (1 - t\beta) \left[ \left( 1 - \theta t \left( 1 - \frac{1 - \alpha}{\alpha} \right) \right) \| x_t - u \| + \theta t \| Fu \| \right] \\
\times \| x_t - u \| + t\beta \| x_t - u \|^2 - t \langle (A - f) u, J(x_t - u) \rangle \\
\leq (1 - t\beta) \| x_t - u \|^2 + \theta t \| Fu \| \| x_t - u \| \\
+ t\beta \| x_t - u \|^2 - t \langle (A - f) u, J(x_t - u) \rangle \\
\leq \| x_t - u \|^2 + \theta t \| Fu \| \| x_t - u \| - t \langle (A - f) u, J(x_t - u) \rangle,
$$

(78)

which hence implies that

$$
\langle (A - f) u, J(x_t - u) \rangle \leq \frac{\theta t}{t} \| Fu \| \| x_t - u \|, \quad \forall u \in \Lambda.
$$

(79)

Since $x_{t_k} \to p$ as $t_k \to 0$ and $\lim_{t \to 0} (\theta t / t) = 0$, we obtain from the last inequality that

$$
\langle (A - f) u, J(p - u) \rangle \leq 0, \quad \forall u \in \Lambda.
$$

(80)

Utilizing the well-known Minty-type Lemma, we get

$$
\langle (A - f) p, J(p - u) \rangle \leq 0, \quad \forall u \in \Lambda.
$$

(81)

So, $p$ is a solution in $\Lambda$ to the VIP (36).

In order to prove that the net $\{x_t : t \in (0, a]\}$ converges strongly to $p$ as $t \to 0$, suppose that there exists another subsequence $\{x_{s_k}\} \subset \{x_t\}$ such that $x_{s_k} \to q$ as $s_k \to 0$; then we also have $q \in \text{Fix}(W) = \text{Fix}(T) \cap \Omega =: \Lambda$ due to (71). Repeating the same argument as above, we know that $q$ is another solution in $\Lambda$ to the VIP (36). In terms of the uniqueness of solutions in $\Lambda$ to the VIP (36), we immediately get $p = q$. This completes the proof. \qed
Remark 17. It is worth emphasizing that, in the assertion of Theorem 16, “as \( t \to 0 \), \( \{x_t\} \) converges strongly to a point \( p \in \Lambda \),” this \( p \) depends on no one of the mappings \( f, A, \) and \( F \). Indeed, although \( x_t \) is defined by
\[
x_t = tf(x_t) + (1-tA) \left[ G(Tx_t) - \theta F(Tx_t) \right], \quad \forall t \in (0,1),
\]
in the proof of Theorem 16, it can be readily seen that \( p \) is first found out as a fixed point of the nonexpansive self-mapping \( W \) of \( K \). This shows that \( p \) depends on no one of the mappings \( f, A, \) and \( F \).

Remark 18. Theorem 16 improves, extends, supplements, and develops Cai and Bu [9, Lemma 2.5] in the following aspects.

(i) The GSVI (13) with hierarchical fixed point problem constraint for a nonexpansive mapping is more general and more subtle than the problem in Cai and Bu [9, Lemma 2.5] because our problem is to find a point \( p \in \Lambda = \text{Fix}(T) \cap \Omega \), which is the unique solution in \( \Lambda \) to the VIP:
\[
\langle (A-f)p, J(p-u) \rangle \leq 0, \quad \forall u \in \Lambda.
\]

(ii) The iterative scheme in [9, Lemma 2.5] is extended to develop the iterative scheme in Theorem 16 by virtue of hybrid steepest-descent method. The iterative scheme in Theorem 16 is more advantageous and more flexible than the iterative scheme of [9, Lemma 2.5] because our iterative scheme involves solving two problems: the GSVI (13) and the fixed point problem of a nonexpansive mapping \( T \).

(iii) The iterative scheme in Theorem 16 is very different from the iterative scheme in [9, Lemma 2.5] because our iterative scheme involves hybrid steepest-descent method (namely, we add a strongly accretive and strictly pseudocontractive mapping \( F \) in our iterative scheme) and because the mapping \( T \) in [9, Lemma 2.5] is replaced by the composite mapping \( G \circ T \) in the iterative scheme of Theorem 16.

(iv) The argument techniques of Theorem 16 are very different from Cai and Bu's ones of [9, Lemma 2.5]. Because the composite mapping \( G \circ T \) appears in the iterative scheme of Theorem 16, the proof of Theorem 16 depends on the argument techniques in [18], the inequality in 2-uniformly smooth Banach spaces (see Lemma 1), the inequality in smooth and uniform convex Banach spaces (see Proposition 2), and the properties of the strongly positive linear bounded operator (see Lemmas 15), the Banach limit (see Lemma 5), and the strongly accretive and strictly pseudocontractive mapping (see Lemma 7).

4. GSVI with Hierarchical Fixed Point Problem Constraint for a Countable Family of Nonexpansive mappings

In this section, we propose our hybrid explicit viscosity scheme for solving the GSVI (13) with hierarchical fixed point problem constraint for a countable family of nonexpansive mappings and show the strong convergence theorem.

**Theorem 19.** Let \( C \) be a nonempty closed convex subset of a uniformly convex and 2-uniformly smooth Banach space \( X \) such that \( C \cap C \subset C \). Let \( \Pi_C \) be a sunny nonexpansive retraction from \( X \) onto \( C \). Let the mapping \( B_i : C \to X \) be \( \alpha_i \)-inverse-strongly accretive for \( i = 1, 2 \). Let \( \{S_n\}_{n=0}^{\infty} \) be an infinite family of nonexpansive mappings of \( C \) into itself such that \( \Delta = \bigcap_{n=0}^{\infty} \text{Fix}(S_n) \cap \Omega \neq \emptyset \), where \( \Omega \) is the fixed point set of the mapping \( G = \Pi_C(I - \mu_1 B_1)\Pi_C(I - \mu_2 B_2) \) with
\[
0 < \mu_i < \alpha_i / \kappa \text{ for } i = 1, 2.
\]
Let \( f : C \to C \) be a fixed contractive map with coefficient \( \beta \in (0,1) \), let \( F : C \to C \) be \( \alpha \)-strongly accretive and \( \lambda \)-strictly pseudocontractive with \( \alpha + \lambda > 1 \), and let \( A : C \to C \) be a \( \overline{\gamma} \)-strongly positive linear bounded operator with \( 0 < \overline{\gamma} - \beta \leq 1 \). Given sequences \( \{\lambda_n\}_{n=0}^{\infty}, \{\mu_n\}_{n=0}^{\infty} \) in \([0,1]\) and \( \{\beta_n\}_{n=0}^{\infty} \subset (0,1] \), suppose that there hold the following conditions:

(i) \( \lim_{n \to \infty} \lambda_n \beta_n = 0 \) and \( \sup_{n \geq 0} \beta_n = \infty \);

(ii) \( \lim_{n \to \infty} (\lambda_n \beta_n) / \beta_n = 0 \);

(iii) \( \{\lambda_n\} \subset [a,b] \) for some \( a, b \in (0,1) \);

(iv) \( \sum_{n=0}^{\infty} (|\alpha_n - \alpha_{n+1}| + |\beta_n - \beta_{n+1}| + |\lambda_n - \lambda_{n+1}| + |\mu_n - \mu_{n+1}|) < \infty \).

Assume that \( \sum_{n=0}^{\infty} \sup_{x \in D} \|S_n x - x \| < \infty \) for any bounded subset \( D \) of \( C \) and let \( S \) be a mapping of \( C \) into itself defined by \( Sx = \lim_{n \to \infty} S_n x \) for all \( x \in C \) and suppose that \( \text{Fix}(S) = \bigcap_{n=0}^{\infty} \text{Fix}(S_n) \). Then, for any given point \( x_0 \in C \), the sequence \( \{x_n\} \) generated by
\[
\begin{align*}
y_n &= \alpha_n x_n + (1 - \alpha_n) G(S_n x_n), \\
x_{n+1} &= \beta_n f(x_n) + (1 - \beta_n) A \left[ G(S_n y_n) - \frac{\lambda_n}{\mu_n} F(S_n y_n) \right],
\end{align*}
\]
converges strongly to \( p \in \Delta \), which is the unique solution in \( \Delta \) to the VIP:
\[
\langle (A-f)p, J(p-u) \rangle \leq 0, \quad \forall u \in \Delta.
\]

**Proof.** First, let us show that \( \{x_n\} \) is bounded. Indeed, taking a fixed \( u \in \Delta \) arbitrarily, we have
\[
\begin{align*}
\|y_n - u\| &= \|\alpha_n x_n + (1 - \alpha_n) G(S_n x_n) - u\| \\
&\leq \alpha_n \|x_n - u\| + (1 - \alpha_n) \|G(S_n x_n) - u\|
\end{align*}
\]
\[
\begin{align*}
&\leq \alpha_n \|x_n - u\| + (1 - \alpha_n) \|S_n x_n - u\| \\
&\leq \alpha_n \|x_n - u\| + (1 - \alpha_n) \|x_n - u\| = \|x_n - u\|.
\end{align*}
\]
So, \( \|y_n - u\| \leq \|x_n - u\| \) for all \( n \geq 0 \). Taking into account \( \lim_{n \to \infty} (\lambda_n \mu_n) / \beta_n = 0 \), we may assume, without loss of
Abstract and Applied Analysis

generality, that \( \lambda_n \mu_n \leq \beta_n \leq \|A\|^{-1} \) for all \( n \geq 0 \). Thus, by Lemma 7 (ii), we have

\[
\|x_{n+1} - u\| \\
= \|\beta_n (f(x_n) - f(u)) + (I - \beta_n A) \times [G(S_n y_n) - \lambda_n \mu_n FG(S_n y_n) - u] - \beta_n (A - f) u\| \\
\leq \beta_n \|f(x_n) - f(u)\| \\
+ \|I - \beta_n A \| \|G(S_n y_n) - \lambda_n \mu_n FG(S_n y_n) - u\| \\
+ \beta_n \|(A - f) u\| \\
\leq \beta_n \beta \|x_n - u\| + (1 - \beta_n \overline{\gamma}) \times \left(1 - \lambda_n \mu_n \left(1 - \frac{1 - \alpha}{\lambda}\right)\right) \|G(S_n y_n) - G(S_n u)\| \\
+ (1 - \beta_n \overline{\gamma}) \lambda_n \mu_n \|Fu\| + \beta_n \|(A - f) u\| \\
\leq \beta_n \beta \|x_n - u\| + (1 - \beta_n \overline{\gamma}) \left(1 - \lambda_n \mu_n \left(1 - \frac{1 - \alpha}{\lambda}\right)\right) \times \|S_n y_n - S_n u\| + \lambda_n \mu_n \|Fu\| + \beta_n \|(A - f) u\| \\
\leq \beta_n \beta \|x_n - u\| + (1 - \beta_n \overline{\gamma}) \left(1 - \lambda_n \mu_n \left(1 - \frac{1 - \alpha}{\lambda}\right)\right) \times \|y_n - u\| \\
+ \lambda_n \mu_n \|Fu\| + \beta_n \|(A - f) u\| \\
\leq \beta_n \beta \|x_n - u\| + (1 - \beta_n \overline{\gamma}) \left(1 - \lambda_n \mu_n \left(1 - \frac{1 - \alpha}{\lambda}\right)\right) \times (1 - \|\lambda_n \mu_n \| Fu\| + \beta_n \|(A - f) u\| \\
= (1 - \beta_n (\overline{\gamma} - \beta)) \|x_n - u\| \\
+ \beta_n (\overline{\gamma} - \beta) \left\{ \|(A - f) u\| + \|Fu\| \right\} \right) / (\overline{\gamma} - \beta) \\
\leq \max \left\{ \|x_n - u\|, \frac{\|(A - f) u\| + \|Fu\|}{\overline{\gamma} - \beta} \right\} ,
\]

(87)

By induction,

\[
\|x_n - u\| \leq \max \left\{ \|x_0 - u\|, \frac{\|(A - f) u\| + \|Fu\|}{\overline{\gamma} - \beta} \right\}, \quad \forall n \geq 0.
\]

(88)

Thus, \( \{x_n\} \) is bounded and so is \( \{y_n\} \). Because \( G \) and \( S_n \) are nonexpansive for all \( n \geq 0 \), \( f \) is contractive, and \( F \) is Lipschitzian, \( \{S_n x_0\}, \{S_n y_n\}, \{G(S_n x_n)\}, \{G(S_n y_n)\}, \{f(x_n)\}, \) and \( \{FG(S_n y_n)\} \) are bounded. From conditions (i) and (ii) we have

\[
\|x_{n+1} - G(S_n y_n)\| \\
= \beta_n \|G(S_n y_n) - AG(S_n y_n)\| + (I - \beta_n A) \times (G(S_n y_n) - \lambda_n \mu_n FG(S_n y_n) - G(S_n y_n)) \\
\leq \beta_n \|f(x_n) - AG(S_n y_n)\| \\
+ (1 - \beta_n \overline{\gamma}) \lambda_n \mu_n \|FG(S_n y_n)\| \\
\leq \beta_n \|f(x_n) - AG(S_n y_n)\| \\
+ (1 - \beta_n \overline{\gamma}) \lambda_n \mu_n \|FG(S_n y_n)\| \\
\rightarrow 0 \quad \text{as} \quad n \rightarrow \infty.
\]

(89)

Now, we claim that

\[
\|x_{n+1} - x_n\| \rightarrow 0 \quad \text{as} \quad n \rightarrow \infty.
\]

(90)

In order to prove (90), we estimate \( \|x_{n+1} - x_n\| \) first. From (84), we have

\[
y_n = \alpha_n x_n + (1 - \alpha_n) G(S_n x_n),
\]

\[
y_{n-1} = \alpha_{n-1} x_{n-1} + (1 - \alpha_{n-1}) G(S_{n-1} x_{n-1}).
\]

(91)

Simple calculations show that

\[
y_n - y_{n-1} = (1 - \alpha_n) (G(S_n x_n) - G(S_{n-1} x_{n-1})) \\
\quad + \alpha_n (x_n - x_{n-1}) + (x_{n-1} - G(S_{n-1} x_{n-1})) \\
\times (\alpha_n - \alpha_{n-1}).
\]

(92)

It follows that

\[
\|y_n - y_{n-1}\| \\
\leq (1 - \alpha_n) \|G(S_n x_n) - G(S_{n-1} x_{n-1})\| + \alpha_n \|x_n - x_{n-1}\| \\
\quad + \|x_{n-1} - G(S_{n-1} x_{n-1})\| \|\alpha_n - \alpha_{n-1}\| \\
\leq (1 - \alpha_n) \|S_n x_n - S_{n-1} x_{n-1}\| + \alpha_n \|x_n - x_{n-1}\| \\
\quad + \|x_{n-1} - G(S_{n-1} x_{n-1})\| \|\alpha_n - \alpha_{n-1}\| \\
\leq (1 - \alpha_n) \|S_n x_n - S_{n-1} x_{n-1}\| + \alpha_n \|x_n - x_{n-1}\| + \|x_{n-1} - G(S_{n-1} x_{n-1})\| \|\alpha_n - \alpha_{n-1}\| \\
\leq \|x_n - x_{n-1}\| + \|x_{n-1} - G(S_{n-1} x_{n-1})\| \|\alpha_n - \alpha_{n-1}\| \\
\quad + \|S_n x_{n-1} - S_{n-1} x_{n-1}\|.
\]

(93)
In the meantime, it follows from (84) that
\[
x_{n+1} = \beta_n f(x_n) + (I - \beta_n A) \left[ G(S_{n,y_n}) - \lambda_n \mu_n FG(S_{n,y_n}) \right],
\]
\[
x_n = \beta_{n-1} f(x_{n-1}) + (I - \beta_{n-1} A) \times \left[ G(S_{n-1,y_{n-1}}) - \lambda_{n-1} \mu_{n-1} FG(S_{n-1,y_{n-1}}) \right].
\]
(94)

Simple calculations show that
\[
x_{n+1} - x_n
\]
\[
= (\beta_n - \beta_{n-1}) f(x_n) + \beta_n (f(x_n) - f(x_{n-1}))
\]
\[
+ (\beta_{n-1} - \beta_n) A (I - \lambda_{n-1} \mu_{n-1} F) G(S_{n-1,y_{n-1}})
\]
\[
+ (I - \beta_n A) \left[ (I - \lambda_n \mu_n F) G(S_{n,y_n})
\]
\[
- (I - \lambda_n \mu_n F) G(S_{n-1,y_{n-1}})
\]
\[
+ (\lambda_n \mu_n) FG(S_{n-1,y_{n-1}}) \right].
\]
(95)

It follows from Lemma 7 (ii) and (93) that
\[
\|x_{n+1} - x_n\|
\]
\[
\leq |\beta_n - \beta_{n-1}| \|f(x_{n-1})\| + |\beta_n| \|f(x_n) - f(x_{n-1})\|
\]
\[
+ |\beta_{n-1} - \beta_n| \|A (I - \lambda_{n-1} \mu_{n-1} F) G(S_{n-1,y_{n-1}})\|
\]
\[
+ (1 - \beta_n \bar{\rho}) \left[ (I - \lambda_n \mu_n F) G(S_{n,y_n})
\]
\[
- (I - \lambda_n \mu_n F) G(S_{n-1,y_{n-1}})
\]
\[
+ (\lambda_n \mu_n) FG(S_{n-1,y_{n-1}}) \right].
\]
(96)
Abstract and Applied Analysis

where \( \sup_{n \geq 0} \{ \| f(x_n) \| + \| A(I - \lambda_n \mu_n F)G(S_n y_n) \| + \| G(S_n x_n) \| \} \leq M_0 \) for some \( M_0 > 0 \). Since it follows from conditions (i) and (iv) that \( \sum_{n=0}^{\infty} \beta_n (\gamma - \beta) = \infty \) and

\[
\sum_{n=0}^{\infty} M_0 (|\alpha_n - \alpha_{n-1}| + |\beta_n - \beta_{n-1}| + |\lambda_n - \lambda_{n-1}| + |\mu_n - \mu_{n-1}|) < \infty,
\]

applying Lemma 3 to (96), we obtain from the assumption on \( \{S_n\} \) that

\[
\lim_{n \to \infty} \| x_{n+1} - x_n \| = 0.
\] (98)

By condition (iii) and (84), we have

\[
\| y_n - x_n \| = (1 - \alpha_n) \| G(S_n x_n) - x_n \| 
\leq (1 - \alpha_n) \left( \| G(S_n x_n) - G(S_n y_n) \| + \| G(S_n y_n) - x_{n+1} \| + \| x_{n+1} - x_n \| \right)
\leq (1 - \alpha_n) \left( \| x_n - y_n \| + \| G(S_n y_n) - x_{n+1} \| + \| x_{n+1} - x_n \| \right),
\] (99)

which implies that

\[
\| y_n - x_n \| \leq \frac{1 - a}{a} \left( \| G(S_n y_n) - x_{n+1} \| + \| x_{n+1} - x_n \| \right).
\] (100)

This together with (89)-(100) implies that

\[
\lim_{n \to \infty} \| x_n - y_n \| = 0.
\] (101)

So, we obtain

\[
\| x_n - G(S_n x_n) \| \leq \| x_n - y_n \| + \| y_n - G(S_n x_n) \|
\leq \| x_n - y_n \| + \alpha_n \| x_n - G(S_n x_n) \|
\leq \| x_n - y_n \| + b \| x_n - G(S_n x_n) \|,
\] (102)

which implies that

\[
\| x_n - G(S_n x_n) \| \leq \frac{1}{1 - b} \| x_n - y_n \|,
\] (103)

and hence

\[
\lim_{n \to \infty} \| x_n - G(S_n x_n) \| = 0.
\] (104)

Let \( u \in \Delta \). Now, we show that \( \lim_{n \to \infty} \| x_n - S_n x_n \| = 0 \) and \( \lim_{n \to \infty} \| x_n - G x_n \| = 0 \).

Indeed, for simplicity, put \( v = \Pi_C (u - \mu_2 B_2 u), \tilde{x}_n = S_n x_n, \) \( u_n = \Pi_C (\tilde{x}_n - \mu_2 B_2 \tilde{x}_n), \) and \( v_n = \Pi_C (u_n - \mu_1 B_1 u_n) \). Then, \( u = \Pi_C (v - \mu_1 B_1 v) \) and \( v_n = G \tilde{x}_n = G(S_n x_n) \) for all \( n \geq 0 \). It is clear from (84) that

\[
\| y_n - u \| \leq \alpha_n \| x_n - u \| + (1 - \alpha_n) \| G(S_n x_n) - u \|
\leq \alpha_n \| x_n - u \| + (1 - \alpha_n) \| v_n - u \|.
\] (105)

Utilizing Lemma 12, we have

\[
\| u_n - v \|^2 = \Pi_C (\tilde{x}_n - \mu_2 B_2 \tilde{x}_n - \Pi_C (u - \mu_2 B_2 u))^2
\leq \| \tilde{x}_n - u - \mu_2 (B_2 \tilde{x}_n - B_2 u) \|^2
\leq \| \tilde{x}_n - u \|^2 - 2 \mu_2 (\alpha_2 - \kappa^2 \mu_2) \| B_2 \tilde{x}_n - B_2 u \|^2,
\] (106)

\[
\| v_n - u \|^2 = \Pi_C (u_n - \mu_1 B_1 u_n - \Pi_C (v - \mu_1 B_1 v))^2
\leq \| u_n - v - \mu_1 (B_1 u_n - B_1 v) \|^2
\leq \| u_n - v \|^2 - 2 \mu_1 (\alpha_1 - \kappa^2 \mu_1) \| B_1 u_n - B_1 v \|^2.
\] (107)

Substituting (106) for (107), we obtain

\[
\| v_n - u \| \leq \| \tilde{x}_n - u \| - 2 \mu_2 (\alpha_2 - \kappa^2 \mu_2)
\times \| B_2 \tilde{x}_n - B_2 u \|^2 - 2 \mu_1 (\alpha_1 - \kappa^2 \mu_1)
\times \| B_1 u_n - B_1 v \|^2
\] (108)

which together with (105) implies that

\[
\| y_n - u \| \leq \alpha_n \| x_n - u \| + (1 - \alpha_n) \| v_n - u \|
\leq \alpha_n \| x_n - u \|^2 + (1 - \alpha_n) \times \| \tilde{x}_n - u \|^2
\leq \alpha_n \| x_n - u \|^2 + (1 - \alpha_n) \times \| \tilde{x}_n - u \|^2 - 2 \mu_2 (\alpha_2 - \kappa^2 \mu_2)
\times \| B_2 \tilde{x}_n - B_2 u \|^2
\leq \| x_n - u \|^2 - 2 (1 - \alpha_n) \times \| \mu_2 (\alpha_2 - \kappa^2 \mu_2) B_2 \tilde{x}_n - B_2 u \|^2
\leq \| x_n - u \|^2 + \mu_1 (\alpha_1 - \kappa^2 \mu_1) \| B_1 u_n - B_1 v \|^2.
\] (109)

It immediately follows that

\[
2 (1 - \alpha_n) \times \| \mu_2 (\alpha_2 - \kappa^2 \mu_2) B_2 \tilde{x}_n - B_2 u \|^2
\leq \| x_n - u \|^2 - \| y_n - u \|^2
\leq (\| x_n - u \| + \| y_n - u \|) \| x_n - y_n \|.
\] (110)
Since \( \{x_n\} \) and \( \{y_n\} \) are bounded and \( 0 < \mu_i < \alpha_i/\kappa^2 \) for \( i = 1, 2 \), we deduce from (101) and condition (iii) that
\[
\lim_{n \to \infty} \|B_2\hat{x}_n - B_1u\| = 0, \quad \lim_{n \to \infty} \|B_1u_n - B_1v\| = 0. \tag{111}
\]
Utilizing Proposition 2 and Lemma 8, we have that there exists \( g_1 \) such that
\[
\|u_n - v\|^2 = \|\Pi_C(\hat{x}_n - \mu_2 B_2\hat{x}_n) - \Pi_C(u - \mu_2 B_2u)\|^2 \\
\leq \langle \hat{x}_n - \mu_2 B_2\hat{x}_n - (u - \mu_2 B_2u), J(u_n - v) \rangle \\
= \langle \hat{x}_n - u, J(u_n - v) \rangle \\
+ \mu_2 \langle B_2u - B_2\hat{x}_n, J(u_n - v) \rangle \tag{112}
\]
which implies that
\[
\|u_n - v\|^2 \leq \|\hat{x}_n - u\|^2 - g_1(\|\hat{x}_n - u_n - (u - v)\|) \\
+ 2\mu_2 \|B_2u - B_2\hat{x}_n\| \|u_n - v\|, \tag{113}
\]
In the same way, we derive that there exists \( g_2 \) such that
\[
\|v_n - u\|^2 = \|\Pi_C(u_n - \mu_1 B_1u_n) - \Pi_C(v - \mu_1 B_1v)\|^2 \\
\leq \langle u_n - \mu_1 B_1u_n - (v - \mu_1 B_1v), J(v_n - u) \rangle \\
= \langle u_n - v, J(v_n - u) \rangle + \mu_1 \langle B_1v - B_1u_n, J(v_n - u) \rangle \\
\leq \frac{1}{2} \|u_n - v\|^2 + \|v_n - u\|^2 \\
- g_2(\|u_n - v + (u - v)\|) \\
+ \mu_1 \|B_1v - B_1u_n\| \|v_n - u\|, \tag{114}
\]
which implies that
\[
\|v_n - u\|^2 \leq \|u_n - v\|^2 - g_2(\|u_n - v + (u - v)\|) \\
+ 2\mu_1 \|B_1v - B_1u_n\| \|v_n - u\|. \tag{115}
\]
Substituting (113) for (115), we get
\[
\|v_n - u\|^2 \leq \|\hat{x}_n - u\|^2 - g_1(\|\hat{x}_n - u_n - (u - v)\|) \\
- g_2(\|u_n - v_n + (u - v)\|) \\
+ 2\mu_2 \|B_2u - B_2\hat{x}_n\| \|u_n - v\| \\
+ 2\mu_1 \|B_1v - B_1u_n\| \|v_n - u\|, \tag{116}
\]
which together with (105) implies that
\[
\|y_n - u\|^2 \leq \|\hat{x}_n - u\|^2 + (1 - \alpha_n) \|v_n - u\|^2 \\
\leq \|\hat{x}_n - u\|^2 + (1 - \alpha_n) \\
\times \left[ \|x_n - u\|^2 - g_1(\|\hat{x}_n - u_n - (u - v)\|) \\
- g_2(\|u_n - v_n + (u - v)\|) \\
+ 2\mu_2 \|B_2u - B_2\hat{x}_n\| \|u_n - v\| \\
+ 2\mu_1 \|B_1v - B_1u_n\| \|v_n - u\| \right], \tag{117}
\]
It immediately follows that
\[
(1 - \alpha_n) \left[ g_1(\|\hat{x}_n - u_n - (u - v)\|) \\
+ g_2(\|u_n - v_n + (u - v)\|) \right] \\
\leq \|x_n - u\|^2 - \|y_n - u\|^2 + 2(1 - \alpha_n) \\
\times \left( \mu_2 \|B_2u - B_2\hat{x}_n\| \|u_n - v\| \\
+ \mu_1 \|B_1v - B_1u_n\| \|v_n - u\| \right), \tag{118}
\]
Since \( \{x_n\}, \{y_n\}, \{u_n\}, \) and \( \{V_n\} \) are bounded, we deduce from (101), (III), and condition (iii) that
\[
\lim_{n \to \infty} g_1 \left( \|\bar{x}_n - u_n - (u - v)\| \right) = 0, \\
\lim_{n \to \infty} g_2 \left( \|u_n - v_n + (u - v)\| \right) = 0.
\]
Utilizing the properties of \( g_1 \) and \( g_2 \), we get
\[
\lim_{n \to \infty} \|\bar{x}_n - u_n - (u - v)\| = 0, \\
\lim_{n \to \infty} \|u_n - v_n + (u - v)\| = 0,
\]
which hence yields
\[
\|\bar{x}_n - v_n\| \leq \|\bar{x}_n - u_n - (u - v)\| + \|u_n - v_n + (u - v)\| \longrightarrow 0 \\
as \ n \to \infty.
\]
That is,
\[
\lim_{n \to \infty} \|S_n x_n - G(S_n x_n)\| = \lim_{n \to \infty} \|\bar{x}_n - v_n\| = 0.
\]
Note that
\[
\|x_n - S_n x_n\| \leq \|x_n - G(S_n x_n)\| + \|G(S_n x_n) - S_n x_n\|.
\]
So, from (104) and (122), we have
\[
\lim_{n \to \infty} \|x_n - S_n x_n\| = 0,
\]
which together with (104) and the assumption on \( \{S_n\} \) implies that
\[
\|x_n - S_n x_n\| \leq \|x_n - S_n x_n\| + \|S_n x_n - S_n x_n\| \longrightarrow 0 \\
as \ n \to \infty,
\]
\[
\|x_n - G x_n\| \leq \|x_n - G(S_n x_n)\| + \|G(S_n x_n) - G x_n\| \\
\leq \|x_n - G(S_n x_n)\| + \|S_n x_n - x_n\| \longrightarrow 0 \\
as \ n \to \infty.
\]
That is,
\[
\lim_{n \to \infty} \|x_n - S_n x_n\| = 0, \quad \lim_{n \to \infty} \|x_n - G x_n\| = 0.
\]
Define a mapping
\[
W x = (1 - \theta) S x + \theta G x, \quad \forall x \in C,
\]
where \( \theta \) is a constant in \( (0, 1) \). Then, by Lemma 10, we know that \( \text{Fix}(W) = \text{Fix}(S) \cap \text{Fix}(G) = \Delta \). We observe that
\[
\|x_n - W x_n\| = \|(1 - \theta) (x_n - S_n x_n) + \theta (x_n - G x_n)\| \\
\leq (1 - \theta) \|x_n - S_n x_n\| + \|\theta x_n - G x_n\|.
\]
So, from (126), we get
\[
\lim_{n \to \infty} \|x_n - W x_n\| = 0,
\]
where \( p \) is defined below. Now, we claim that
\[
\lim_{n \to \infty} \langle (f - A) p, I (x_n - p) \rangle \leq 0. \tag{130}
\]
Indeed, let \( \{x_n\} \) be defined by
\[
x_n = tf(x_n) + (I - tA)W x_n.
\]
Then, as \( t \to 0, \{x_n\} \) converges strongly to \( p \in \text{Fix}(W) = \Delta \), which by Proposition CB is the unique solution in \( \Delta \) to the VIP:
\[
\langle (A - f) p, I (p - u) \rangle \leq 0, \quad \forall u \in \Delta. \tag{132}
\]
In terms of Lemma 6, we conclude from (129) that (130) holds. It is clear that
\[
\lim_{n \to \infty} \langle (f - A) p, I (x_{n+1} - p) \rangle \leq 0. \tag{133}
\]
Finally, let us show that \( x_n \to p \) as \( n \to \infty \). We observe that
\[
\|y_n - p\|^2 \leq \alpha_n \|x_n - p\|^2 + (1 - \alpha_n) \|G(S_n y_n) - p\|^2 \\
\leq \alpha_n \|x_n - p\|^2 + (1 - \alpha_n) \|x_n - p\|^2 = \|x_n - p\|^2,
\]
and hence
\[
\|x_{n+1} - p\|^2 = \|\beta_n (f(x_n) - f(p)) + (I - \beta_n A) \\
\times [G(S_n y_n) - \lambda_n \mu_n FG(S_n y_n) - p] + \beta_n (f - A) p\|^2 \\
\leq \|\beta_n (f(x_n) - f(p)) + (I - \beta_n A) \\
\times [G(S_n y_n) - \lambda_n \mu_n FG(S_n y_n) - p]\|^2 \\
+ 2\beta_n \langle (f - A) p, I (x_{n+1} - p) \rangle \\
\leq \|\beta_n (f(x_n) - f(p)) + (1 - \beta_n \theta) \\
\times [G(S_n y_n) - \lambda_n \mu_n FG(S_n y_n) - p]\|^2 \\
+ 2\beta_n \langle (f - A) p, I (x_{n+1} - p) \rangle \\
= \|\beta_n \lambda_n \mu_n FG(S_n y_n) \\
- (I - \lambda_n \mu_n F) p - \lambda_n \mu_n F p\|^2 \\
+ 2\beta_n \langle (f - A) p, I (x_{n+1} - p) \rangle \\
\leq \|\beta_n \lambda_n \mu_n F p\|^2 + 2\beta_n \langle (f - A) p, I (x_{n+1} - p) \rangle \\
+ \lambda_n \mu_n \|F p\|^2 + 2\beta_n \langle (f - A) p, I (x_{n+1} - p) \rangle \\
+ \lambda_n \mu_n \|F p\|^2 + 2\beta_n \langle (f - A) p, I (x_{n+1} - p) \rangle.
\]
\[
\gamma - \beta \leq 1
\]

because our problem is to find a point \( p \in \Delta = \bigcap_n \text{Fix}(S_n) \cap \Omega \), which is the unique solution in \( \Delta \) to the VIP:

\[
\langle (A - f)p, J(p - u) \rangle \leq 0, \quad \forall u \in \Delta.
\] (139)

(ii) The iterative scheme in [10, Theorem 3.1] is extended to develop the iterative schemes in Theorems 19 and 21 by virtue of hybrid steepest-descent method. The iterative schemes in Theorems 19 and 21 are more advantageous and more flexible than the iterative scheme of [9, Theorem 3.1] because the iterative scheme of [9, Theorem 3.1] is implicit and our iterative schemes involve solving two problems: the GSVI (13) and the fixed point problem of a countable family of nonexpansive mappings \( \{S_n\} \).

(iii) The iterative schemes in Theorems 19 and 21 are very different from everyone in both [10, Theorem 3.1] and [9, Theorem 3.1] because our iterative schemes involve hybrid steepest-descent method (namely, we add a strongly accretive and strictly pseudocontractive mapping \( F \) in our iterative schemes) and because the mappings \( G \) and \( S_n \) in [10, Theorem 3.1] and the mapping \( S_n \) in [9, Theorem 3.1] are replaced by the same composite mapping \( G \circ S_n \) in the iterative schemes of Theorems 19 and 21.

(iv) Cai and Bu’s proof in [10, Theorem 3.1] depends on the argument techniques in [20], the inequality in 2-uniformly smooth Banach spaces (see Lemma 1), and the inequality in smooth and uniform convex Banach spaces (see Proposition 2). Because the composite mapping \( G \circ S_n \) appears in the iterative schemes in Theorems 19 and 21, the proof of Theorems 19 and 21 depends on the argument techniques in [20], the inequality in 2-uniformly smooth Banach spaces (see Lemma 1), the inequality in smooth and uniform convex Banach spaces (see Proposition 2), and the properties of the strongly positive linear bounded operator (see Lemmas 15), the Banach limit (see Lemma 5), and the strongly accretive and strictly pseudocontractive mapping (see Lemma 7).

Remark 23. Theorems 19 and 21 extend and improve Theorem 16 of Yao et al. [21] to a great extent in the following aspects:

(i) the \( u \) is replaced by a fixed contractive mapping;

(ii) one continuous pseudocontractive mapping (including nonexpansive mapping) is replaced by a countable family of nonexpansive mappings;

(iii) we add a strongly positive linear bounded operator \( A \) and a strongly accretive and strictly pseudocontractive mapping \( F \) in our iterative algorithms.

Conflict of Interests

The authors declare that there is no conflict of interests regarding the publication of this paper.

Acknowledgment

This article was funded by the Deanship of Scientific Research (DSR), King Abdulaziz University, Jeddah. The authors, therefore, acknowledge with thanks DSR for the technical and financial support. This research was partially supported to first author by the National Science Foundation of China (11071169), Innovation Program of Shanghai Municipal Education Commission (09ZZ133), and Ph.D. Program Foundation of Ministry of Education of China (2012312710002).
