This paper is devoted to the study of a wave equation with a boundary condition of many-point type. The existence of weak solutions is proved by using the Galerkin method. Also, the uniqueness and the stability of solutions are established.

1. Introduction

Recently, initial-boundary value problems of wave equations have appeared more and more in mechanics, they have been deeply studied by many authors, and we can refer to the works [1–13]. In this paper, we consider the following nonlinear wave equation with a boundary condition of many-point type:

$$\begin{aligned} u_{tt} - \rho u_{xx} + f(x, u) &= 0, \quad 0 < x < 1, \quad 0 < t < T, \\ u(1, t) &= 0, \\ \rho u_x(0, t) &= \int_0^t k(t-s) h(u(\xi_0, s), u(\xi_1, s), \dots, u(\xi_N, s)) ds \\ &\quad + g(u(\xi_0, t)) + \sigma(t), \\ u(x, 0) &= u_0(x), \\ u_t(x, 0) &= u_1(x), \end{aligned}$$

where $f, g, h, k, \sigma, u_0, u_1$ are given real functions and $\rho, \xi_1, \xi_2, \dots, \xi_N$ are positive constants such that $0 = \xi_0 < \xi_1 < \dots < \xi_N < 1$.

Dang and Alain [4] studied the global existence of the following problem:

$$\begin{aligned} u_{tt} - u_{xx} + |u_t|^\alpha \operatorname{sign}(u_t) &= 0, \\ u(1, t) &= 0, \\ u_x(0, t) &= g(t), \\ u(x, 0) &= u_0(x), \\ u_t(x, 0) &= u_1(x), \end{aligned} \quad (2)$$

where $0 < \alpha < 1$ is a constant and g, u_0, u_1 are given functions.

In [11], Santos considered the following problem:

$$\begin{aligned} u_{tt} - \rho(t) u_{xx} &= 0, \\ u(0, t) &= 0, \\ u(1, t) + \int_0^t g(t-s) \rho(s) u_x(1, s) ds &= 0, \\ u(x, 0) &= u_0(x), \\ u_t(x, 0) &= u_1(x), \end{aligned} \quad (3)$$

in which g, ρ, u_0, u_1 are given functions. He studied the asymptotic behavior of the solutions of problem (3) with

respect to the time variable. In this case, problem (3) is a mathematical model for a linear one-dimensional motion of an elastic bar connected with a viscoelastic element at an end of the bar.

Applying the Mikusinski operational calculus, D. Takači and A. Takači [12] gave the formula for finding the exact solutions of the linear wave equation given by

$$\begin{aligned} u_{tt} - u_{xx} + Ku + \lambda u_t &= f(x, t), \\ u_x(0, t) &= v(t), \\ -u_x(1, t) &= \delta u(1, t) + \varepsilon u_t(1, t), \\ u(x, 0) &= u_0(x), \\ u_t(x, 0) &= u_1(x), \end{aligned} \quad (4)$$

where $K, \lambda, \delta, \varepsilon, h, \omega$ are given nonnegative constants and f, g, u_0, u_1 are given functions. Also, the unknown function $u(x, t)$ and the unknown boundary value $v(t)$ satisfy the following integral equation:

$$\begin{aligned} v(t) &= g(t) + hu(0, t) \\ &\quad - \omega h \int_0^t \sin(\omega(t-s)) u(0, s) ds. \end{aligned} \quad (5)$$

It is worth noting that the function $v(t)$ is deduced from a Cauchy problem for an ordinary differential equation at the boundary condition $t = 0$. Indeed, if $v(t)$ satisfies the following Cauchy problem

$$\begin{aligned} v''(t) + 2pv'(t) + p_0v(t) &= qu_{tt}(0, t) + q_0u_t(0, t) + q_1u(0, t), \\ v(0) &= v_0, \\ v'(0) &= v_1, \end{aligned} \quad (6)$$

where $p, p_0, q, q_0, q_1, v_0, v_1$ are constants such that $p_0 > p^2$, we can easily show that

$$v(t) = g(t) + hu(0, t) + \int_0^t k(t-s) u(0, s) ds, \quad (7)$$

where

$$\begin{aligned} g(t) &= \exp(-pt) \left[v_1 - pv_0 + pq u_0(0) - qu_1(0) \right] \frac{\sin \omega t}{\omega} \\ &\quad + \exp(-pt) \left\{ [v_0 - qu_0(0)] \cos \omega t - \frac{q_0}{\omega} u_0(0) \right\}, \\ k(t) &= \exp(-pt) \left\{ [q(p^2 - \omega^2) - pq_0 + q_1] \frac{\sin \omega t}{\omega} \right. \\ &\quad \left. + (q_0 - 2pq) \cos \omega t \right\}, \end{aligned} \quad (8)$$

with $\omega = \sqrt{p_0 - p^2}$, $h = q + q_0/\omega$. In the special case of $p = q_0 = q_1 = 0$, we obtain (5).

Besides, Nguyen and Giang Vo [8] obtained the asymptotic behavior of the weak solution of the following initial-boundary value problem as $\varepsilon \rightarrow 0_+$:

$$\begin{aligned} u_{tt} - u_{xx} + Ku + \lambda u_t &= f(x, t), \\ u(1, t) &= 0, \\ u_x(0, t) &= g(t) + hu(0, t) + \varepsilon u_t(0, t) \\ &\quad - \int_0^t k(t-s) u(0, s) ds, \\ u(x, 0) &= u_0(x), \\ u_t(x, 0) &= u_1(x), \end{aligned} \quad (9)$$

in which $K, \lambda, h \in \mathbb{R}$, $\varepsilon > 0$ are given constants and f, g, k, u_0, u_1 are given functions. Problem (9) is said to be a mathematical model describing a shock problem involving a linear viscoelastic bar.

The organization of this paper is as follows. First of all, we establish the global existence and uniqueness of weak solutions of problem (1). The proof is based on the Galerkin method associated with a priori estimates and the weak compact method. Finally, here we prove that this solution is stable in the sense of continuous dependence on the given data (f, g, h, k, σ) . This paper is a relative generalization of the works [4, 6, 11, 12].

2. Preliminaries

For convenience, we denote by $\langle \cdot, \cdot \rangle$ and $\| \cdot \|$, respectively, the scalar product and the norm in $L^2(0, 1)$. Also, we define a closed subspace of the Sobolev space $H^1(0, 1)$ as follows:

$$H = \{u \in H^1(0, 1) : u(1) = 0\}, \quad (10)$$

with the following scalar product and norm:

$$\begin{aligned} \langle u, v \rangle_H &= \langle u_x, v_x \rangle, \\ \|u\|_H &= \|u_x\|. \end{aligned} \quad (11)$$

Then it is easy to show the following.

Lemma 1. *The embedding $H \hookrightarrow C^0([0, 1])$ is compact and*

$$\|u\|_{C^0([0, 1])} \leq \|u\|_H \leq \|u\|_{H^1(0, 1)} \leq \sqrt{2} \|u\|_H, \quad \forall u \in H. \quad (12)$$

On the other hand, we also have the following result.

Lemma 2. *Let $\varepsilon > 0$. Then*

$$\begin{aligned} \|v\|_{C^0([0, 1])}^2 &\leq \varepsilon \|v_x\|^2 + \left(1 + \frac{1}{\varepsilon}\right) \|v\|^2, \\ &\quad \forall u \in H^1(0, 1). \end{aligned} \quad (13)$$

The proof of the lemma is straightforward; we omit the details.

Remark 3. Let $\varepsilon = 1$, we get

$$\|v\|_{C^0([0,1])} \leq (\|v_x\|^2 + 2\|v\|^2)^{1/2} \leq \sqrt{2}\|v\|_{H^1(0,1)}, \quad (14)$$

$$\forall u \in H^1(0,1).$$

Next, if W is a real Banach space with norm $\|\cdot\|_W$, $L^p(0,T;W)$ consists of equivalence classes of strongly measurable functions $u : (0,T) \rightarrow W$ such that $\|u\|_{L^p(0,T;W)} < \infty$, with

$$\|u\|_{L^p(0,T;W)} = \begin{cases} \left(\int_0^T \|u(t)\|_W^p dt \right)^{1/p}, & \text{if } 1 \leq p < \infty, \\ \text{ess sup}_{0 < t < T} \|u(t)\|_W, & \text{if } p = \infty. \end{cases} \quad (15)$$

It is not difficult to prove that $L^p(0,T;W)$ is a Banach space.

Let W_0 , W_1 , and W_2 be Banach spaces satisfying $W_0 \subset W_1 \subset W_2$. We further assume that W_0 and W_2 are reflexive, and the imbedding $W_0 \hookrightarrow W_1$ is compact. Set

$$W(0,T) = \{u : u \in L^p(0,T;W_0), u_t \in L^q(0,T;W_2)\}, \quad (16)$$

where $1 \leq p, q \leq \infty$. Then $W(0,T)$ is a Banach space with the norm

$$\|u\|_{W(0,T)} = \|u\|_{L^p(0,T;W_0)} + \|u_t\|_{L^q(0,T;W_2)}. \quad (17)$$

We also have the following lemma.

Lemma 4 (see [14]). *Let $1 < p, q < \infty$. The embedding $W(0,T) \hookrightarrow L^p(0,T;W_1)$ is compact.*

3. Global Existence and Uniqueness of Weak Solutions

To investigate the existence of a unique weak solution of problem (1), the following assumptions are needed:

$$(A_1) \quad u_0 \in H \text{ and } u_1 \in L^2(0,1).$$

$$(A_2) \quad \sigma \in H^1(0,T), \quad k \in W^{1,1}(0,T).$$

$$(A_3) \quad f, D_2 f \in C^0([0,1] \times \mathbb{R}) \text{ satisfy the following conditions:}$$

$$(i) \quad \text{There exist positive functions } \sigma_1, \sigma_2 \in L^1(0,1) \text{ such that}$$

$$\int_0^u f(x,s) ds \geq -\sigma_1(x)u^2 - \sigma_2(x), \quad (18)$$

$$\text{a.e. } x \in [0,1], \quad \forall u \in \mathbb{R}.$$

$$(ii) \quad \text{There exist positive functions } \hat{\sigma} \in L^2(0,1) \text{ and } \hat{f} \in C^0(\mathbb{R}) \text{ such that}$$

$$|D_2 f(x,u)| \leq \hat{\sigma}(x) \hat{f}(u), \quad \text{a.e. } x \in [0,1], \quad \forall u \in \mathbb{R}. \quad (19)$$

$$(A_4) \quad g \in C^2(\mathbb{R}); \text{ there exist constants } a, b > 0 \text{ such that}$$

$$\int_0^u g(s) ds \geq -au^2 - b, \quad \forall u \in \mathbb{R}. \quad (20)$$

$$(A_5) \quad h \in C^0(\mathbb{R}^{N+1}); \text{ there exist constants } c, d > 0 \text{ such that}$$

$$|h(u_0, u_1, \dots, u_N)| \leq c \sum_{i=0}^N |u_i| + d, \quad (21)$$

$$\forall u_i \in \mathbb{R}, \quad i = \overline{0, N}.$$

$$(A_6) \quad \text{For each } M > 0, \text{ there exists a constant } c_M > 0 \text{ such that}$$

$$|h(u_0, \dots, u_N) - h(v_0, \dots, v_N)| \leq c_M \sum_{i=0}^N |u_i - v_i| \quad (22)$$

$$\forall |u_i|, |v_i| \leq M, \quad i = \overline{0, N}.$$

With these assumptions, we have the following theorem.

Theorem 5. *Let assumptions (A_1) – (A_6) hold. Then problem (1) has a unique weak solution u such that*

$$u \in L^\infty(0,T;H),$$

$$u_t \in L^\infty(0,T;L^2(0,1)), \quad (23)$$

$$u(\xi_i, \cdot) \in H^1(0,T), \quad i = \overline{0, N}.$$

Remark 6. In the special case of $N = 0$ and $g'(t) > -1$, for all $t \in \mathbb{R}$, we have obtained the same results in the paper [6].

Proof of Theorem 5. The main tool of this proof is the Galerkin method. The procedure includes four steps as follows:

(i) Galerkin approximation.

(ii) A priori estimates.

(iii) Limiting process.

(iv) Uniqueness of the weak solutions.

Step 1 (Galerkin approximation). We use a special orthonormal base of H :

$$\varphi_k(x) = \sqrt{\frac{2}{(1+\mu_k^2)}} \cos(\mu_k x), \quad (24)$$

$$\mu_k = (2k-1) \frac{\pi}{2},$$

$$k = 1, 2, \dots$$

Now we are looking for the approximate solution of problem (1) in the form

$$u^m(x,t) = \sum_{k=1}^m \omega_{mk}(t) \varphi_k(x), \quad (25)$$

where the coefficient functions $\omega_{mk}(t)$ satisfy the following system of nonlinear differential equations

$$\begin{aligned} \langle u_{tt}^m(\cdot, t), \varphi_k \rangle + \rho \langle u^m(\cdot, t), \varphi_k \rangle_H + v_m(t) \varphi_k(0) \\ + \langle f(\cdot, u^m(\cdot, t)), \varphi_k \rangle = 0, \quad k = \overline{1, m}, \end{aligned} \quad (26)$$

with

$$\begin{aligned} v_m(t) = \int_0^t k(t-s) \\ \cdot h(u^m(\xi_0, s), u^m(\xi_1, s), \dots, u^m(\xi_N, s)) ds \\ + g(u^m(\xi_0, t)) + \sigma(t), \end{aligned} \quad (27)$$

$$u^m(\cdot, 0) \equiv u_0^m = \sum_{k=1}^m a_{mk} \varphi_k \longrightarrow u_0 \quad (28)$$

strongly in $H^1(0, 1)$,

$$u_t^m(\cdot, 0) \equiv u_1^m = \sum_{k=1}^m b_{mk} \varphi_k \longrightarrow u_1 \quad (29)$$

strongly in $L^2(0, 1)$.

By substituting $\rho_k = \sqrt{\rho} \mu_k$, we can rewrite the system of (26)–(29) as follows:

$$\begin{aligned} \omega_{mk}''(t) + \rho_k^2 \omega_{mk}(t) = -\frac{1}{\|\varphi_k\|^2} [v_m(t) \varphi_k(0) \\ + \langle f(\cdot, u^m(\cdot, t)), \varphi_k \rangle], \\ v_m(t) = \int_0^t k(t-s) \\ \cdot h(u^m(\xi_0, s), u^m(\xi_1, s), \dots, u^m(\xi_N, s)) ds \\ + g(u^m(\xi_0, t)) + \sigma(t), \end{aligned} \quad (30)$$

$$\omega_{mk}(0) = a_{mk},$$

$$\omega_{mk}'(0) = b_{mk},$$

$$k = \overline{1, m}.$$

Therefore, we obtain

$$\begin{aligned} \omega_{mk}(t) = a_{mk} \cos(\rho_k t) + b_{mk} \frac{\sin(\rho_k t)}{\rho_k} - \frac{2}{\varphi_k(0)} \int_0^t ds \\ \cdot \int_0^s \frac{\sin[\rho_k(t-s)]}{\rho_k} k(s-\tau) \\ \cdot h(u^m(\xi_0, \tau), \dots, u^m(\xi_N, \tau)) d\tau - \frac{2}{\varphi_k(0)} \end{aligned}$$

$$\begin{aligned} \cdot \int_0^t \frac{\sin[\rho_k(t-s)]}{\rho_k} [\sigma(s) + g(u^m(\xi_0, s))] ds \\ - \frac{2}{\varphi_k^2(0)} \int_0^t \frac{\sin[\rho_k(t-s)]}{\rho_k} \langle f(\cdot, u^m(s)), \varphi_k \rangle ds, \\ k = \overline{1, m}. \end{aligned} \quad (31)$$

Applying the Schauder fixed-point theorem, it is not difficult that system (31) has a solution $(\omega_{m1}, \omega_{m2}, \dots, \omega_{mm})$ on an interval $[0, T_m]$. This implies that in system (26)–(29) there exists a solution to $u^m(t)$ on $[0, T_m]$. Moreover, we can extend the approximate solution u^m to the whole interval $[0, T]$ (see [15]).

Step 2 (a priori estimates). In (26), we replace $\varphi_k(x)$ by $u_t^m(x, t)$. Then integrating from 0 to t , we have after some calculations

$$\begin{aligned} E_m(t) = E_m(0) + 2\sigma(0) u_0^m(0) + 2 \int_0^{u_0^m(0)} g(s) ds \\ + 2 \int_0^1 dx \int_0^{u_0^m(x)} f(x, s) ds - 2\sigma(t) u^m(0, t) \\ + 2 \int_0^t \sigma'(s) u^m(0, s) ds - 2 \int_0^{u^m(0, t)} g(s) ds \\ - 2 \int_0^1 \int_0^{u^m(x, t)} f(x, s) ds dx - 2 \int_0^t u_t^m(0, r) dr \\ \cdot \int_0^r k(r-s) h(u^m(\xi_0, s), \dots, u^m(\xi_N, s)) ds \\ \equiv E_m(0) + 2\sigma(0) u_0^m(0) + 2 \int_0^{u_0^m(0)} g(s) ds \\ + 2 \int_0^1 dx \int_0^{u_0^m(x)} f(x, s) ds + \sum_{k=1}^5 I_k(t), \end{aligned} \quad (32)$$

where

$$E_m(t) = \|u_t^m(\cdot, t)\|^2 + \rho \|u^m(\cdot, t)\|_H^2. \quad (33)$$

We will estimate, respectively, the following terms on the right-hand side of (32).

Estimating $I_1(t)$. Using (33) and Lemma 1, we infer that

$$\begin{aligned} |u^m(0, t)| \leq \|u^m(\cdot, t)\|_{C^0([0, 1])} \leq \|u^m(\cdot, t)\|_H \\ \leq \frac{1}{\sqrt{\rho}} \sqrt{E_m(t)}. \end{aligned} \quad (34)$$

Hence,

$$\begin{aligned} I_1(t) = -2\sigma(t) u^m(0, t) \leq \varepsilon |u^m(0, t)|^2 + \frac{1}{\varepsilon} \sigma^2(t) \\ \leq \varepsilon E_m(t) + \frac{1}{\varepsilon} \|\sigma\|_{L^\infty(0, T)}^2, \quad \forall \varepsilon > 0. \end{aligned} \quad (35)$$

Estimating $I_2(t)$. Using Lemma 1 and inequality (34), we arrive at

$$\begin{aligned} I_2(t) &= 2 \int_0^t \sigma'(s) u^m(0, s) ds \\ &\leq \frac{1}{\rho} \int_0^t |\sigma'(s)| ds + \rho \int_0^t |\sigma'(s)| |u^m(0, s)|^2 ds \\ &\leq \int_0^t |\sigma'(s)| E_m(s) ds + \frac{1}{\rho} \|\sigma'\|_{L^1(0, T)}. \end{aligned} \quad (36)$$

Estimating $I_3(t)$. From assumption (A_4) , we have

$$I_3(t) = -2 \int_0^{u^m(0, t)} g(s) ds \leq 2a |u^m(0, t)|^2 + 2b. \quad (37)$$

On the other hand, we see that

$$\begin{aligned} \|u^m(\cdot, t)\|^2 &= \|u_0^m + \int_0^t u_t^m(\cdot, s) ds\|^2 \\ &\leq 2 \|u_0^m\|^2 + 2t \int_0^t E_m(s) ds. \end{aligned} \quad (38)$$

It follows from (37), (38), and Lemma 2 that

$$\begin{aligned} I_3(t) &\leq 2\varepsilon \frac{a}{\rho} E_m(t) + 4at \left(1 + \frac{1}{\varepsilon}\right) \int_0^t E_m(s) ds \\ &\quad + 4a \left(1 + \frac{1}{\varepsilon}\right) \|u_0^m\|^2 + 2b. \end{aligned} \quad (39)$$

Estimating $I_4(t)$. Owing to assumption (A_3) -(i), (38), and Lemma 2, it is not difficult to show that

$$\begin{aligned} I_4(t) &= -2 \int_0^1 dx \int_0^{u^m(x, t)} f(x, s) ds \\ &\leq 2 \int_0^1 \sigma_1(x) |u^m(x, t)|^2 dx + 2 \|\sigma_2\|_{L^1(0, 1)} \\ &\leq \varepsilon \frac{2}{\rho} \|\sigma_1\|_{L^1(0, 1)} E_m(t) \\ &\quad + 4t \left(1 + \frac{1}{\varepsilon}\right) \|\sigma_1\|_{L^1(0, 1)} \int_0^t E_m(s) ds \\ &\quad + 4 \left(1 + \frac{1}{\varepsilon}\right) \|u_0^m\|^2 \|\sigma_1\|_{L^1(0, 1)} + 2 \|\sigma_2\|_{L^1(0, 1)}. \end{aligned} \quad (40)$$

Estimating $I_5(t)$. Applying integration by parts, it follows that

$$\begin{aligned} I_5(t) &= -2 \int_0^t u_t^m(0, r) dr \\ &\quad \cdot \int_0^r k(r-s) h(u^m(\xi_0, s), \dots, u^m(\xi_N, s)) ds \\ &= -2u^m(0, t) \\ &\quad \cdot \int_0^t k(t-s) h(u^m(\xi_0, s), \dots, u^m(\xi_N, s)) ds \\ &\quad + 2k(0) \\ &\quad \cdot \int_0^t u^m(0, s) h(u^m(\xi_0, s), \dots, u^m(\xi_N, s)) ds \\ &\quad + 2 \int_0^t u^m(0, r) dr \\ &\quad \cdot \int_0^r k'(r-s) h(u^m(\xi_0, s), \dots, u^m(\xi_N, s)) ds \\ &\equiv J_1(t) + J_2(t) + J_3(t). \end{aligned} \quad (41)$$

We can estimate the integrals in the right-hand side of (41) as follows:

$$\begin{aligned} J_1(t) &= -2u^m(0, t) \\ &\quad \cdot \int_0^t k(t-s) h(u^m(\xi_0, s), \dots, u^m(\xi_N, s)) ds \\ &\leq 2c |u^m(0, t)| \sum_{i=0}^N \int_0^t |k(t-s)| |u^m(\xi_i, s)| ds \\ &\quad + 2d |u^m(0, t)| \int_0^t |k(t-s)| ds \leq 2(N+1) \frac{c}{\sqrt{\rho}} \\ &\quad \cdot \sqrt{E_m(t)} \int_0^t |k(t-s)| \sqrt{E_m(s)} ds + 2 \frac{d}{\sqrt{\rho}} \\ &\quad \cdot \sqrt{E_m(t)} \int_0^t |k(s)| ds \leq 2\varepsilon E_m(t) + (N+1)^2 \\ &\quad \cdot \frac{c^2}{\varepsilon \rho} \|k\|_{L^2(0, T)}^2 \int_0^t E_m(s) ds + \frac{d^2}{\varepsilon \rho} \|k\|_{L^1(0, T)}^2, \\ J_2(t) &= 2k(0) \\ &\quad \cdot \int_0^t u^m(0, s) h(u^m(\xi_0, s), \dots, u^m(\xi_N, s)) ds \\ &\leq 2(N+1) \frac{c}{\rho} |k(0)| \int_0^t E_m(s) ds + 2 \frac{d}{\sqrt{\rho}} |k(0)| \\ &\quad \cdot \int_0^t \sqrt{E_m(s)} ds \leq \left[1 + 2(N+1) \frac{c}{\rho} |k(0)|\right] \\ &\quad \cdot \int_0^t E_m(s) ds + \frac{d^2}{\rho} T k^2(0), \end{aligned} \quad (42)$$

$$\begin{aligned} J_3(t) &= 2k(0) \\ &\quad \cdot \int_0^t u^m(0, s) h(u^m(\xi_0, s), \dots, u^m(\xi_N, s)) ds \\ &\leq 2(N+1) \frac{c}{\rho} |k(0)| \int_0^t E_m(s) ds + 2 \frac{d}{\sqrt{\rho}} |k(0)| \\ &\quad \cdot \int_0^t \sqrt{E_m(s)} ds \leq \left[1 + 2(N+1) \frac{c}{\rho} |k(0)|\right] \\ &\quad \cdot \int_0^t E_m(s) ds + \frac{d^2}{\rho} T k^2(0), \end{aligned} \quad (43)$$

$$\begin{aligned}
J_3(t) &= 2 \int_0^t u^m(0, r) dr \\
&\cdot \int_0^r k'(r-s) h(u^m(\xi_0, s), \dots, u^m(\xi_N, s)) ds \\
&\leq 2(N+1) \frac{c}{\rho} \int_0^t \sqrt{E_m(r)} dr \\
&\cdot \int_0^r |k'(r-s)| \sqrt{E_m(s)} ds + 2 \frac{d}{\sqrt{\rho}} \int_0^t \sqrt{E_m(r)} dr \quad (44) \\
&\cdot \int_0^r |k'(r-s)| ds \leq 2(N+1) \frac{c}{\rho} \left[\int_0^t E_m(r) dr \right. \\
&\left. + \int_0^t \left(\int_0^r |k'(r-s)| \sqrt{E_m(s)} ds \right)^2 dr \right] \\
&+ \int_0^t E_m(r) dr + \frac{d^2 t}{\rho} \|k'\|_{L^1(0,T)}^2.
\end{aligned}$$

Going in for the Cauchy-Schwartz inequality, we arrive at

$$\begin{aligned}
&\left(\int_0^r |k'(r-s)| \sqrt{E_m(s)} ds \right)^2 \\
&\leq \int_0^r |k'(r-s)| ds \int_0^r |k'(r-s)| E_m(s) ds \quad (45) \\
&\leq \|k'\|_{L^1(0,T)} \int_0^r |k'(r-s)| E_m(s) ds.
\end{aligned}$$

Consequently,

$$\begin{aligned}
&\int_0^t \left(\int_0^r |k'(r-s)| \sqrt{E_m(s)} ds \right)^2 dr \\
&\leq \|k'\|_{L^1(0,T)} \int_0^t dr \int_0^r |k'(r-s)| E_m(s) ds \\
&= \|k'\|_{L^1(0,T)} \int_0^t E_m(s) ds \int_s^t |k'(r-s)| dr \quad (46) \\
&\leq \|k'\|_{L^1(0,T)}^2 \int_0^t E_m(s) ds.
\end{aligned}$$

It follows from (44) and (46) that

$$\begin{aligned}
J_3(t) &\leq \left[1 + 2(N+1) \frac{c}{\rho} \left(1 + \|k'\|_{L^1(0,T)}^2 \right) \right] \int_0^t E_m(r) dr \quad (47) \\
&+ \frac{d^2 T}{\rho} \|k'\|_{L^1(0,T)}^2.
\end{aligned}$$

We deduce from the estimates of $J_1(t)$, $J_2(t)$, $J_3(t)$ that

$$I_5(t) \leq 2\varepsilon E_m(t) + D_T^1 \int_0^t E_m(s) ds + D_T^2, \quad (48)$$

with

$$\begin{aligned}
D_T^1 &= (N+1)^2 \frac{c^2}{\varepsilon \rho} \|k\|_{L^2(0,T)}^2 \\
&+ 2(N+1) \frac{c}{\rho} \left(\|k'\|_{L^1(0,T)}^2 + |k(0)| + 1 \right) + 2, \quad (49)
\end{aligned}$$

$$D_T^2 = \frac{d^2}{\varepsilon \rho} \left[\varepsilon T \|k'\|_{L^1(0,T)}^2 + \|k\|_{L^2(0,T)}^2 + \varepsilon T k^2(0) \right].$$

On the other hand, by (28), (29), and assumptions (A_1) – (A_3) ,

$$\begin{aligned}
&E_m(0) + 2\sigma(0) u_0^m(0) + 2 \int_0^{u_0^m(0)} g(s) ds \\
&+ 2 \int_0^1 dx \int_0^{u_0^m(x)} f(x, s) ds \leq C, \quad (50)
\end{aligned}$$

where C is a positive constant depending only on u_0, u_1, f, g, σ .

Combining (32), (35), (36), (39), (40), (48), and (50), we obtain after some rearrangements

$$E_m(t) \leq \varepsilon D_T^3 E_m(t) + \int_0^t D_T^4(s) E_m(s) ds + D_T^5, \quad (51)$$

where

$$\begin{aligned}
D_T^3 &= \frac{2}{\rho} \|\sigma_1\|_{L^1(0,1)} + 2 \frac{a}{\rho} + 3, \\
D_T^4(s) &= |\sigma'(s)| + 4T \left(1 + \frac{1}{\varepsilon} \right) \left(\|\rho_1\|_{L^1(0,1)} + a \right) + D_T^1, \\
D_T^5 &= \frac{1}{\varepsilon} \|\sigma\|_{L^\infty(0,T)}^2 + \frac{1}{\rho} \|\sigma'\|_{L^1(0,T)} + 2 \|\sigma_2\|_{L^1(0,1)} \quad (52) \\
&+ 4 \left(1 + \frac{1}{\varepsilon} \right) \left(\|\sigma_1\|_{L^1(0,1)} + a \right) \|u_0^m\|^2 \\
&+ D_T^2 + C + 2b.
\end{aligned}$$

Choosing $\varepsilon D_T^3 = 1/2$, by Gronwall's inequality, we have

$$E_m(t) \leq 2D_T^5 \exp \left(2 \int_0^t D_T^4(s) ds \right) \leq D_T, \quad (53)$$

where D_T is a positive constant depending on T .

Next, we will require the following lemma.

Lemma 7. *There exists a positive constant C_T depending only on T such that*

$$\int_0^t |u_t^m(\xi_i, s)|^2 ds \leq C_T, \quad \forall t \in [0, T], \quad i = \overline{0, N}. \quad (54)$$

Proof of Lemma 7. We put

$$k_{mi}(t) = \sum_{k=1}^m \cos(\mu_k \xi_i) \frac{\sin(\rho_k t)}{\rho_k}, \quad (55)$$

$$\begin{aligned} g_{mi}(t) &= \sum_{k=1}^m \varphi_k(\xi_i) \left[a_{mk} \cos(\rho_k t) + b_{mk} \frac{\sin(\rho_k t)}{\rho_k} \right] \\ &\quad - 2 \sum_{k=1}^m \frac{\cos(\mu_k \xi_i)}{\varphi_k(0)} \\ &\quad \cdot \int_0^t \frac{\sin[\rho_k(t-s)]}{\rho_k} \langle f(\cdot, u^m(\cdot, s)), \varphi_k \rangle ds. \end{aligned} \quad (56)$$

In view of (25) and (31), $u^m(\xi_i, t)$ can be rewritten as follows:

$$u^m(\xi_i, t) = g_{mi}(t) - 2 \int_0^t k_{mi}(t-s) v_m(s) ds. \quad (57)$$

In connection with $g_{mi}(t)$, we have the following lemma.

Lemma 8. *There exists a positive constant $\widehat{C}_T$ depending only on T such that*

$$\int_0^t |g'_{mi}(s)|^2 ds \leq \widehat{C}_T, \quad \forall t \in [0, T], \quad i = \overline{0, N}. \quad (58)$$

Proof of Lemma 8. We define

$$g'_{mi}(t) = -p_{mi}(t) + q_{mi}(t) - r_{mi}(t) - s_{mi}(t), \quad (59)$$

with

$$p_{mi}(t) = \sum_{k=1}^m \varphi_k(0) \rho_k a_{mk} \cos(\mu_k \xi_i) \sin(\rho_k t), \quad (60)$$

$$q_{mi}(t) = \sum_{k=1}^m \varphi_k(0) b_{mk} \cos(\mu_k \xi_i) \cos(\rho_k t), \quad (61)$$

$$r_{mi}(t) = 2 \sum_{k=1}^m \frac{\cos(\mu_k \xi_i)}{\varphi_k(0)} \frac{\sin(\rho_k t)}{\rho_k} \langle f(\cdot, u_0^m), \varphi_k \rangle, \quad (62)$$

$$\begin{aligned} s_{mi}(t) &= 2 \sum_{k=1}^m \frac{\cos(\mu_k \xi_i)}{\varphi_k(0)} \\ &\quad \cdot \int_0^t \frac{\sin[\rho_k(t-s)]}{\rho_k} \langle D_2 f(\cdot, u^m(\cdot, s)) \\ &\quad \cdot u_t^m(\cdot, s), \varphi_k \rangle ds. \end{aligned} \quad (63)$$

On the other hand, use the inequality

$$(a+b+c+d)^2 \leq 4(a^2+b^2+c^2+d^2), \quad (64)$$

$$\forall a, b, c, d \in \mathbb{R}.$$

Hence,

$$\begin{aligned} \int_0^t |g'_{mi}(s)|^2 ds &\leq 4 \sum_{j \in \{p, q, r, s\}} \int_0^t |j_{mi}(s)|^2 ds \\ &\equiv K_1(t) + K_2(t) + K_3(t) + K_4(t). \end{aligned} \quad (65)$$

We will estimate each term on the right-hand side of this inequality.

Estimating $K_1(t) = 4 \int_0^t |p_{mi}(s)|^2 ds$. Thanks to (60) and (65),

$$\begin{aligned} K_1(t) &= \rho \int_0^t \left\{ \sum_{k=1}^m \varphi_k(0) \right. \\ &\quad \cdot \mu_k a_{mk} \left\{ \sin[\mu_k(\sqrt{\rho}s + \xi_i)] + \sin[\mu_k(\sqrt{\rho}s - \xi_i)] \right\} \left. \right\}^2 ds \\ &\leq 2\rho \int_0^t \left\{ \sum_{k=1}^m \varphi_k(0) \mu_k a_{mk} \sin[\mu_k(\sqrt{\rho}s + \xi_i)] \right\}^2 ds \\ &\quad + 2\rho \int_0^t \left\{ \sum_{k=1}^m \varphi_k(0) \mu_k a_{mk} \sin[\mu_k(\sqrt{\rho}s - \xi_i)] \right\}^2 ds \\ &= 2\sqrt{\rho} \int_{\xi_i}^{\sqrt{\rho}t + \xi_i} \left[\sum_{k=1}^m \varphi_k(0) \mu_k a_{mk} \sin(\mu_k s) \right]^2 ds \\ &\quad + 2\sqrt{\rho} \int_{-\xi_i}^{\sqrt{\rho}t - \xi_i} \left[\sum_{k=1}^m \varphi_k(0) \mu_k a_{mk} \sin(\mu_k s) \right]^2 ds. \end{aligned} \quad (66)$$

Now, we will need the following lemma.

Lemma 9. *Let $a, b \in \mathbb{R}$, $a < b$ and $c_k \in \mathbb{R}$, $k = \overline{1, m}$. Then*

$$\begin{aligned} &\int_a^b \left[\sum_{k=1}^m c_k \sin(\mu_k s) \right]^2 ds \\ &\leq 2(\max\{|a|, |b|\} + 2) \int_0^1 \left[\sum_{k=1}^m c_k \sin(\mu_k s) \right]^2 ds. \end{aligned} \quad (67)$$

The proof of this lemma is simple; we omit the details.

Applying Lemma 9, we deduce from (28), (66), and assumption (A_1) that

$$\begin{aligned} K_1(t) &\leq 8\sqrt{\rho}(\sqrt{\rho}T + \xi_i + 2) \\ &\quad \cdot \int_0^1 \left[\sum_{k=1}^m \varphi_k(0) \mu_k a_{mk} \sin(\mu_k s) \right]^2 ds \\ &\leq 8\sqrt{\rho}(\sqrt{\rho}T + \xi_i + 2) \|u_{0m}\|_H^2 \leq C_T, \end{aligned} \quad (68)$$

where C_T always indicates a constant depending on T .

Estimating $K_2(t) = 4 \int_0^t |q_{mi}(s)|^2 ds$. Similarly, we also obtain

$$K_2(t) \leq 8 \left(T + \frac{\xi_i + 2}{\sqrt{\rho}} \right) \|u_{1m}\|^2 \leq C_T. \quad (69)$$

Estimating $K_3(t) = 4 \int_0^t |r_{mi}(s)|^2 ds$. We see that

$$\begin{aligned} r_{mi}(s) &= \frac{2}{\sqrt{\rho}} \sum_{k=1}^m \frac{1}{\mu_k} \int_0^1 \sin(\mu_k \sqrt{\rho} s) \cos(\mu_k \xi_i) \cos(\mu_k x) \\ &\quad \cdot f(x, u_0^m(x)) dx = \frac{1}{2\sqrt{\rho}} \\ &\quad \cdot \int_0^1 \sum_{k=1}^m \frac{1}{\mu_k} \{ \sin[\mu_k(\sqrt{\rho} s + \xi_i + x)] \\ &\quad + \sin[\mu_k(\sqrt{\rho} s - \xi_i - x)] \} f(x, u_0^m(x)) dx \\ &\quad + \frac{1}{2\sqrt{\rho}} \int_0^1 \sum_{k=1}^m \frac{1}{\mu_k} \{ \sin[\mu_k(\sqrt{\rho} s + \xi_i - x)] \\ &\quad + \sin[\mu_k(\sqrt{\rho} s - \xi_i + x)] \} f(x, u_0^m(x)) dx. \end{aligned} \quad (70)$$

To estimate $K_3(t)$, we need the following lemma.

Lemma 10. *Let $m \in \mathbb{N}$. One always has*

$$S_m(z) = \left| \sum_{k=0}^m \frac{\sin \mu_k z}{\mu_k} \right| < 1 + \frac{4}{\pi}, \quad \forall z \in \mathbb{R}. \quad (71)$$

Proof of Lemma 10. First, we assume that $0 < z \leq 1$. Set $M = [z^{-1}]$ (which is an integer part of z^{-1}). We consider two cases of m .

Case 1 ($m > M + 1$). Then

$$\begin{aligned} S_m(z) &\leq \sum_{k=1}^M \left| \frac{\sin \mu_j z}{\mu_j} \right| + \left| \sum_{k=M+1}^m \frac{\sin \mu_k z}{\mu_k} \right| \\ &\equiv S_m^1(z) + S_m^2(z). \end{aligned} \quad (72)$$

Since $|\sin \phi| \leq |\phi|$, for all $\phi \in \mathbb{R}$, we get

$$S_m^1(z) = \sum_{k=1}^M \left| \frac{\sin \mu_k z}{\mu_k} \right| \leq \sum_{k=1}^M \frac{\mu_k z}{\mu_k} = Mz \leq 1. \quad (73)$$

Moreover, the function $\phi \mapsto (\sin \phi)/\phi$ is decreasing on $(0, \pi/2]$; hence, $\sin(\pi/2)\phi \geq \phi$; for all $\phi \in [0, 1]$, it follows that

$$\begin{aligned} &\left| \sum_{i=k}^m \sin \mu_i z \right| \\ &= \left| \frac{\sin((m+k-1)/2)\pi z \sin((m-k+1)/2)\pi z}{\sin(\pi z/2)} \right| \quad (74) \\ &\leq \frac{1}{\sin(\pi z/2)} \leq \frac{1}{z}, \quad k = \overline{1, m}. \end{aligned}$$

On the other hand, it is easy to verify the following equality by the induction:

$$\begin{aligned} &\sum_{k=M+1}^m \frac{\sin \mu_k z}{\mu_k} \\ &= \frac{1}{\mu_{M+1}} \sum_{k=M+1}^m \sin \mu_k z \\ &\quad + \sum_{k=M+1}^{m-1} \left[\left(\frac{1}{\mu_{k+1}} - \frac{1}{\mu_k} \right) \sum_{i=k+1}^m \sin \mu_i z \right]. \end{aligned} \quad (75)$$

Using (74) and (75), we arrive at

$$\begin{aligned} S_m^2(z) &= \left| \sum_{k=M+1}^m \frac{\sin \mu_k z}{\mu_k} \right| \\ &\leq \frac{1}{\mu_{M+1}} \left| \sum_{k=M+1}^m \sin \mu_k z \right| \\ &\quad + \sum_{k=M+1}^{m-1} \left[\left(\frac{1}{\mu_k} - \frac{1}{\mu_{k+1}} \right) \left| \sum_{i=k+1}^m \sin \mu_i z \right| \right] \quad (76) \\ &\leq \frac{1}{\mu_{M+1}} \frac{1}{z} + \sum_{k=M+1}^{m-1} \left(\frac{1}{\mu_k} - \frac{1}{\mu_{k+1}} \right) \frac{1}{z} \\ &= \left(\frac{2}{\mu_{M+1}} - \frac{1}{\mu_m} \right) \frac{1}{z} < \frac{4}{\pi}. \end{aligned}$$

Consequently, it follows from (72), (73), and (76) that

$$S_m(z) \leq S_m^1(z) + S_m^2(z) < 1 + \frac{4}{\pi}. \quad (77)$$

Case 2 ($1 \leq m \leq M + 1$). We have

$$\begin{aligned} S_m(z) &\leq \left| \sum_{k=1}^m \frac{\sin \mu_k z}{\mu_k} \right| \leq \sum_{k=1}^{M+1} \left| \frac{\sin \mu_k z}{\mu_k} \right| \leq \sum_{k=1}^{M+1} \frac{\mu_k z}{\mu_k} \\ &= (M+1)z < 1 + \frac{4}{\pi}. \end{aligned} \quad (78)$$

Combining (77) and (78), we conclude that

$$S_m(z) < 1 + \frac{4}{\pi}, \quad \forall m \in \mathbb{N}, \quad z \in (0, 1]. \quad (79)$$

Since $S_m(0) = 0$ and the function S_m is even, periodic with the period 2, thus inequality (79) holds for all $m \in \mathbb{N}$, $z \in \mathbb{R}$. The proof of Lemma 10 is complete.

By (70) and Lemma 10, it leads to

$$\begin{aligned} |r_{mi}(s)| &\leq \frac{1}{2\sqrt{\rho}} \int_0^1 4 \left(1 + \frac{4}{\pi} \right) |f(x, u_0^m(x))| dx \\ &= \frac{2}{\sqrt{\rho}} \left(1 + \frac{4}{\pi} \right) \|f(\cdot, u_0^m)\|_{L^1(0,1)}. \end{aligned} \quad (80)$$

Hence, it follows from (28), (80), and assumptions (A_1) , (A_3) that

$$\begin{aligned} K_3(t) &= 4 \int_0^t |r_{mi}(s)|^2 ds \\ &\leq \frac{16T}{\rho} \left(1 + \frac{4}{\pi}\right)^2 \|f(\cdot, u_0^m)\|_{L^1(0,1)}^2 \leq C_T. \end{aligned} \quad (81)$$

Estimating $K_4(t) = 4 \int_0^t |s_{mi}(s)|^2 ds$. Proving in the same way as (81), we get

$$\begin{aligned} K_4(t) &= 4 \int_0^t |s_{mi}(s)|^2 ds \leq \frac{8T^2}{\rho} \left(1 + \frac{4}{\pi}\right)^2 \\ &\quad \cdot \int_0^t \|D_2 f(\cdot, u^m(\cdot, s)) u_t^m(\cdot, s)\|_{L^1(0,1)}^2 ds. \end{aligned} \quad (82)$$

On the other hand, using assumption (A_3) -(ii), then

$$|D_2 f(x, u^m(x, s))| \leq \widehat{\sigma}(x) \sup_{|z| \leq \widehat{D}_T} \widehat{f}(z) = \widehat{C}_T \widehat{\sigma}(x), \quad (83)$$

with $\widehat{D}_T = \sqrt{D_T/\rho}$.

Applying the Cauchy-Schwartz inequality, we clearly get

$$\begin{aligned} K_4(t) &\leq \frac{8T^2}{\rho} \left(1 + \frac{4}{\pi}\right)^2 \widehat{C}_T^2 \|\widehat{\sigma}\|^2 \int_0^t \|u_t^m(\cdot, s)\|^2 ds \\ &\leq C_T. \end{aligned} \quad (84)$$

Combining (65), (68), (69), (81), and (84), we obtain Lemma 8.

Remark 11. Lemma 3 in [4] is a special case of Lemma 8 with $g = h = 0$ and $\rho = 1$.

We now return to the proof of Lemma 7.

Note that it follows from (27) that

$$\begin{aligned} v_m'(t) &= \sigma'(t) + g'(u^m(\xi_0, t)) u_t^m(\xi_0, t) + k(0) \\ &\quad \cdot h(u^m(\xi_0, t), u^m(\xi_1, t), \dots, u^m(\xi_N, t)) \\ &\quad + \int_0^t k'(t-s) \\ &\quad \cdot h(u^m(\xi_0, s), u^m(\xi_1, s), \dots, u^m(\xi_N, s)) ds. \end{aligned} \quad (85)$$

On account of (53) and assumptions (A_2) , (A_4) , and (A_5) , we get

$$\begin{aligned} |v_m'(t)| &\leq |\sigma'(t)| + \sup_{|z| \leq \widehat{D}_T} |g'(z)| |u_t^m(\xi_0, t)| \\ &\quad + \left(|k(0)| + \|k'\|_{L^1(0,T)}\right) [(N+1) c \widehat{D}_T + d] \\ &\leq |\sigma'(t)| + C_T (|u_t^m(\xi_0, t)| + 1). \end{aligned} \quad (86)$$

Therefore, it is easy to see that

$$|v_m'(t)|^2 \leq 2 |\sigma'(t)|^2 + 4C_T^2 (|u_t^m(\xi_0, t)|^2 + 1). \quad (87)$$

Applying Lemma 10 and the imbedding $H^1(0, 1) \hookrightarrow C^0([0, 1])$, we deduce from (27) and (57) that

$$\begin{aligned} |u_t^m(\xi_i, t)| &= |g_{mi}'(t) - 2k_{mi}'(t) v_m(0) \\ &\quad - 2 \int_0^t k_{mi}(t-s) v_m'(s) ds| \leq |g_{mi}'(t)| + \frac{2}{\sqrt{\rho}} \left(1 + \frac{4}{\pi}\right) |v_m(0)| + \frac{2}{\sqrt{\rho}} \left(1 + \frac{4}{\pi}\right) \int_0^t |v_m'(s)| ds \\ &\leq |g_{mi}'(t)| + C_T \left(1 + \int_0^t |v_m'(s)| ds\right). \end{aligned} \quad (88)$$

Thus,

$$\begin{aligned} |u_t^m(\xi_i, t)|^2 &\leq 2 |g_{mi}'(t)|^2 \\ &\quad + 4C_T^2 \left(1 + t \int_0^t |v_m'(s)|^2 ds\right). \end{aligned} \quad (89)$$

Using the Cauchy-Schwartz inequality and Lemma 8, then we obtain from (87) and (89) that

$$\begin{aligned} \int_0^t |u_t^m(\xi_i, s)|^2 ds &\leq 4C_T^2 t + 2 \int_0^t |g_{mi}'(s)|^2 ds \\ &\quad + 4C_T^2 \int_0^t \tau d\tau \int_0^\tau |v_m'(s)|^2 ds \\ &\leq 4C_T^2 t + \frac{16}{3} C_T^4 t^3 + 4C_T^2 t \|\sigma'\|_{L^2(0,T)}^2 \\ &\quad + 2 \int_0^t |g_{mi}'(s)|^2 ds \\ &\quad + 16C_T^4 \int_0^t \tau d\tau \int_0^\tau |u_t^m(\xi_0, s)|^2 ds \\ &\leq C_T + C_T \int_0^t d\tau \int_0^\tau |u_t^m(\xi_0, s)|^2 ds. \end{aligned} \quad (90)$$

Hence,

$$\begin{aligned} \sum_{i=0}^N \int_0^t |u_t^m(\xi_i, s)|^2 ds &\leq (N+1) C_T \left[1 + \int_0^t \left(\sum_{i=0}^N \int_0^\tau |u_t^m(\xi_i, s)|^2 ds\right) d\tau\right]. \end{aligned} \quad (91)$$

By the Gronwall inequality, we get Lemma 7. This completes the proof of Lemma 7.

Step 3 (limiting process). Due to (53) and (54), applying the Banach-Alaoglu theorem, we can extract a subsequence of sequence $\{u^m\}$, still labeled by the same notations, such that

$$\begin{aligned} u^m &\rightharpoonup u \quad \text{weakly}^* \text{ in } L^\infty(0, T; H^1(0, 1)), \\ u_t^m &\rightharpoonup u_t \quad \text{weakly}^* \text{ in } L^\infty(0, T; L^2(0, 1)), \end{aligned} \quad (92)$$

$$u^m(\xi_i, \cdot) \rightharpoonup u(\xi_i, \cdot) \quad \text{weakly in } H^1(0, T).$$

Thanks to Lemma 4 and the compactness of the imbedding $H^1(0, T) \hookrightarrow C^0([0, T])$, they lead us to

$$u^m \rightarrow u$$

$$\text{strongly in } L^2((0, 1) \times (0, T)), \text{ a.e. in } (0, 1) \times (0, T), \quad (93)$$

$$u^m(\xi_i, \cdot) \rightarrow u(\xi_i, \cdot) \quad \text{strongly in } C^0([0, T]).$$

By (93)₂ and assumptions (A₂), (A₄), and (A₆), we have

$$\begin{aligned} v_m(t) &\rightarrow \int_0^t k(t-s) h(u(\xi_0, s), \dots, u(\xi_N, s)) ds \\ &\quad + g(u(\xi_0, t)) + \sigma(t) = v(t), \end{aligned} \quad (94)$$

strongly in $C^0([0, T])$.

Also, we apply the inequality

$$\begin{aligned} |f(x, u^m(x, t)) - f(x, u(x, t))| \\ \leq d_T |u^m(x, t) - u(x, t)|, \end{aligned} \quad (95)$$

where $d_T = \|D_2 f\|_{C^0([0, 1] \times [-\widehat{D}_T, \widehat{D}_T])}$. By (93)₁ and (95), we get

$$\begin{aligned} f(\cdot, u^m) &\rightarrow f(\cdot, u) \\ &\text{strongly in } L^2((0, 1) \times (0, T)). \end{aligned} \quad (96)$$

Passing to the limit in (26) by (92)_{1,2}, (94), and (96), we have u satisfying the equation

$$\begin{aligned} \frac{d}{dt} \langle u_t(\cdot, t), \varphi \rangle + \rho \langle u(\cdot, t), \varphi \rangle_H + v(t) \varphi(0) \\ + \langle f(\cdot, u(\cdot, t)), \varphi \rangle = 0, \end{aligned} \quad (97)$$

for all $\varphi \in H$, a.e. $t \in [0, T]$.

On the other hand, it is easy to show a similar way as in [4, p. 588]

$$\begin{aligned} u(x, 0) &= u_0(x), \\ u_t(x, 0) &= u_1(x). \end{aligned} \quad (98)$$

The existence of global solutions is proved.

Step 4 (uniqueness of the weak solutions). Let u_1 and u_2 be two weak solutions of problem (1). Then $u = u_1 - u_2$ is a weak solution of the following problem:

$$\begin{aligned} u_{tt} - \rho u_{xx} + f(\cdot, u_1) - f(\cdot, u_2) &= 0, \\ \rho u_x(0, t) &= v(t), \\ u(1, t) &= 0, \\ u(x, 0) &= u_t(x, 0) = 0, \end{aligned} \quad (99)$$

in which

$$\begin{aligned} v(t) &= \sum_{i=1}^2 (-1)^{i-1} g(u_i(\xi_0, t)) + \int_0^t k(t-s) \\ &\quad \cdot \sum_{i=1}^2 (-1)^{i-1} h(u_i(\xi_0, s), \dots, u_i(\xi_N, s)) ds. \end{aligned} \quad (100)$$

To prove $u_1 = u_2$, then the following lemma is needed.

Lemma 12. *Let u be the weak solution of the following problem:*

$$\begin{aligned} u_{tt} - \rho u_{xx} + F &= 0, \quad 0 < x < 1, \quad 0 < t < T, \\ u(1, t) &= 0, \\ \rho u_x(0, t) &= v(t), \\ u(x, 0) &= u_0(x), \\ u_t(x, 0) &= u_1(x), \\ u &\in L^\infty(0, T; H), \\ u_t &\in L^\infty(0, T; L^2(0, 1)), \\ u(0, \cdot) &\in H^1(0, T), \\ v &\in L^2(0, T), \\ F &\in L^1(0, T; L^2(0, 1)). \end{aligned} \quad (101)$$

Then we have

$$\begin{aligned} \|u_t(\cdot, t)\|^2 + \rho \|u(\cdot, t)\|_H^2 + 2 \int_0^t v(s) u_t(0, s) ds \\ + 2 \int_0^t \langle F(\cdot, s), u_t(\cdot, s) \rangle ds \geq \|u_1\|^2 + \rho \|u_0\|_H^2, \end{aligned} \quad (102)$$

a.e. $t \in [0, T]$.

Equality holds in case of $u_0 = u_1 = 0$.

The proof of Lemma 12 is the same as Lemma 2.1 in [16].

Applying Lemma 12 with $u_0 = u_1 = 0$, $F = f(\cdot, u_1) - f(\cdot, u_2)$, we get

$$\begin{aligned} E(t) &= -2 \int_0^t \langle f(\cdot, u_1) - f(\cdot, u_2), u'(\cdot, s) \rangle ds \\ &\quad - 2 \int_0^t u_t(0, s) \sum_{i=1}^2 (-1)^{i-1} g(u_i(\xi_0, s)) ds \\ &\quad - 2 \rho u(0, t) \int_0^t k(t-s) \sum_{i=1}^2 (-1)^{i-1} \\ &\quad \cdot h(u_i(\xi_0, s), \dots, u_i(\xi_N, s)) ds + 2 \rho k(0) \\ &\quad \cdot \int_0^t u(0, s) \sum_{i=1}^2 (-1)^{i-1} \\ &\quad \cdot h(u_i(\xi_0, s), \dots, u_i(\xi_N, s)) ds \end{aligned}$$

$$\begin{aligned}
& + 2\rho \int_0^t u(0, r) dr \int_0^r k'(r-s) \sum_{i=1}^2 (-1)^{i-1} \\
& \cdot h(u_i(\xi_0, s), \dots, u_i(\xi_N, s)) ds \equiv J_1(t) + J_2(t) \\
& + J_3(t) + J_4(t) + J_5(t),
\end{aligned} \tag{103}$$

with $E(t) = \|u_t(\cdot, t)\|^2 + \rho \|u(\cdot, t)\|_H^2$.

Now we can estimate the integrals in the right-hand side of (103) as follows.

First term $J_1(t)$: using assumption (A_3) , it follows from Lemma 1 and (103) that

$$\begin{aligned}
J_1(t) &= -2 \int_0^t \langle f(\cdot, u_1(\cdot, s)) - f(\cdot, u_2(\cdot, s)), u_t(\cdot, s) \rangle ds \\
&\leq \frac{d_{M1}}{\sqrt{\rho}} \int_0^t (\|u_t(\cdot, s)\|^2 + \rho \|u(\cdot, s)\|^2) ds \\
&\leq \frac{d_{M1}}{\sqrt{\rho}} \int_0^t E(s) ds,
\end{aligned} \tag{104}$$

where

$$\begin{aligned}
d_{M1} &= \|D_2 f\|_{C^0([0,1] \times [-M, M])}, \\
M &= \sum_{i=1}^2 \|u_i\|_{L^\infty(0, T; H)}.
\end{aligned} \tag{105}$$

Second term $J_2(t)$: set $d_{M2} = \|g\|_{C^2([-M, M])}$. Integrating by parts, then we arrive at

$$\begin{aligned}
J_2(t) &= -2 \int_0^t u_t(0, s) \sum_{i=1}^2 (-1)^{i-1} g(u_i(\xi_0, s)) ds \\
&= -2 \int_0^t u_t(0, s) ds \\
&\cdot \int_0^1 \frac{d}{d\theta} g(u_2(\xi_0, s) + \theta u(\xi_0, s)) d\theta \\
&= -u^2(0, t) \int_0^1 g'(u_2(\xi_0, t) + \theta u(\xi_0, t)) d\theta \\
&+ \int_0^t u^2(0, s) ds \int_0^1 g''(u_2(\xi_0, s) + \theta u(\xi_0, s)) \\
&\cdot (u'_2(\xi_0, s) + \theta u'(\xi_0, s)) d\theta \leq d_{M2} \left[u^2(0, t) \right. \\
&\left. + \int_0^t (|u'_1(\xi_0, s)| + |u'_2(\xi_0, s)|) u^2(0, s) ds \right].
\end{aligned} \tag{106}$$

On the other hand, we easily show that

$$\|u(\cdot, t)\|^2 \leq t \int_0^t \|u_t(\cdot, s)\|^2 ds \leq T \int_0^t E(s) ds. \tag{107}$$

Applying Lemma 2, we deduce from (107) that

$$\begin{aligned}
u^2(0, t) &\leq \|u(\cdot, t)\|_{C^0([0,1])}^2 \\
&\leq \varepsilon \|u(\cdot, t)\|_H^2 + \left(1 + \frac{1}{\varepsilon}\right) \|u(\cdot, t)\|^2 \\
&\leq \frac{\varepsilon}{\rho} E(t) + T \left(1 + \frac{1}{\varepsilon}\right) \int_0^t E(s) ds, \quad \forall \varepsilon > 0.
\end{aligned} \tag{108}$$

Thus, it follows from (106) and (108) that

$$J_2(t) \leq \varepsilon \frac{d_{M2}}{\rho} E(t) + \int_0^t d(s) E(s) ds, \tag{109}$$

in which

$$\begin{aligned}
d(s) &= \frac{\varepsilon}{\rho} d_{M2} (|u'_1(\xi_0, s)| + |u'_2(\xi_0, s)|) + \left(1 + \frac{1}{\varepsilon}\right) \\
&\cdot T d_{M2} (\|u'_1(\xi_0, \cdot)\|_{L^1(0, T)} + \|u'_2(\xi_0, \cdot)\|_{L^1(0, T)} + 1).
\end{aligned} \tag{110}$$

Third term $J_3(t)$: using the Cauchy-Schwartz inequality, we have from (103), (A_2) , and (A_6) that

$$\begin{aligned}
J_3(t) &= -2\rho u(0, t) \int_0^t k(t-s) \sum_{i=1}^2 (-1)^{i-1} \\
&\cdot h(u_i(\xi_0, s), \dots, u_i(\xi_N, s)) ds \\
&\leq 2\sqrt{E(t)} \int_0^t |k(t-s)| \sum_{i=0}^N c_{Mi} \sqrt{E(s)} ds \leq \frac{1}{4} E(t) \\
&+ 4(N+1)^2 c_M^2 T \|k\|_{L^\infty(0, T)}^2 \int_0^t E(s) ds.
\end{aligned} \tag{111}$$

In addition, we can similarly prove as in (111) for the fourth and fifth terms as follows:

$$\begin{aligned}
J_4(t) &= 2\rho k(0) \int_0^t u(0, s) \sum_{i=1}^2 (-1)^{i-1} \\
&\cdot h(u_i(\xi_0, s), \dots, u_i(\xi_N, s)) ds \leq 2\rho |k(0)| \\
&\cdot \int_0^t \frac{1}{\sqrt{\rho}} \sqrt{E(s)} (N+1) c_M \frac{1}{\sqrt{\rho}} \sqrt{E(s)} ds = 2(N \\
&+ 1) c_M |k(0)| \int_0^t E(s) ds, \\
J_5(t) &= 2\rho \int_0^t u(0, r) dr \int_0^r k'(r-s) \sum_{i=1}^2 (-1)^{i-1} \\
&\cdot h(u_i(\xi_0, s), \dots, u_i(\xi_N, s)) ds \\
&\leq 2 \int_0^t \sqrt{E(r)} \int_0^r |k'(r-s)| (N+1) \\
&\cdot c_M \sqrt{E(s)} ds dr \leq (N+1) c_M (\|k'\|_{L^1(0, T)}^2 + 1) \\
&\cdot \int_0^t E(s) ds.
\end{aligned} \tag{112}$$

Choosing $4\epsilon d_{M2} \leq \rho$, the combination of (103), (104), (109), and (111)-(112) shows that

$$E(t) \leq \int_0^t \widehat{d}(s) E(s) ds, \quad (113)$$

where

$$\begin{aligned} \widehat{d}(s) = & 2d(s) + 8(N+1)^2 c_M^2 T \|k\|_{L^\infty(0,T)}^2 \\ & + 2(N+1) c_M \left(\|k'\|_{L^1(0,T)}^2 + 2|k(0)| + 1 \right) \\ & + 2 \frac{d_{M1}}{\sqrt{\rho}}. \end{aligned} \quad (114)$$

By the Gronwall inequality, we see that $E(t) \equiv 0$; that is, $u_1 \equiv u_2$.

This completes the proof of Theorem 5.

4. Stability of the Weak Solutions

In this section, let $(u_0, u_1) \in H^1(0,1) \times L^2(0,1)$ be fixed functions. Also, we assume that $\sigma_1, \sigma_2 \in L^1(0,1)$, $\widehat{\sigma} \in L^2(0,1)$, $\widehat{f} \in C^0(\mathbb{R})$, and a, b, d, c, c_M are fixed functions,

constants satisfying assumptions (A_3) – (A_6) (independent of f, g , and h). Applying Theorem 5, then problem (1) has a unique weak solution u depending on σ, k, f, g, h . We denote

$$u = u(\sigma, k, f, g, h), \quad (115)$$

where σ, k, f, g, h satisfy assumptions (A_2) – (A_6) .

Then the stability of the solutions of problem (1) is given as follows.

Theorem 13. *Let (A_1) – (A_6) hold. Then the solutions of problem (1) are stable with respect to the data (σ, k, f, g, h) in the following sense.*

If $(\sigma^j, k^j, f^j, g^j, h^j)$ and (σ, k, f, g, h) satisfy the assumptions (A_2) – (A_6) such that

$$(\sigma^j, k^j) \rightarrow (\sigma, k) \quad \text{strongly in } [W^{1,1}(0, T)]^2, \quad (116)$$

$$(f^j, g^j, h^j) \rightarrow (f, g, h)$$

strongly in $C^0([0, 1] \times [-M, M]) \times C^1([-M, M]) \times C^0([-M, M]^{N+1})$, as $j \rightarrow \infty$, for all $M > 0$.

Then

$$(u^j, u_t^j) \rightarrow (u, u_t) \quad \text{strongly in } L^\infty(0, T; H^1(0, 1)) L^\infty(0, T; L^2(0, 1)), \quad \text{as } j \rightarrow \infty, \quad (117)$$

where $u^j = u(\sigma^j, k^j, f^j, g^j, h^j)$, $u = u(\sigma, k, f, g, h)$.

Proof of Theorem 13. Firstly, we assume that

$$\begin{aligned} \|\sigma^j\|_{W^{1,1}(0,T)} + \|\sigma\|_{W^{1,1}(0,T)} &\leq \sigma_*, \\ \|k^j\|_{W^{1,1}(0,T)} + \|k\|_{W^{1,1}(0,T)} &\leq k_*, \end{aligned} \quad (118)$$

where σ_*, k_* are fixed positive constants.

On the other hand, by the proof of Theorem 5, the a priori estimates of the sequence $\{u^m\}$ satisfy

$$\begin{aligned} \|u_t^m(\cdot, t)\|^2 + \rho \|u^m(\cdot, t)\|_H^2 + \sum_{i=0}^N \int_0^t |u_t^m(\xi_i, s)|^2 ds \\ \leq C_T, \quad \forall t \in [0, T], \end{aligned} \quad (119)$$

where C_T is a constant depending only on $u_0, u_1, \sigma_1, \sigma_2, \widehat{\sigma}, f, \widehat{f}, \sigma_*, k_*, a, b, d, c, \rho, T$.

Due to (119) and (92), we conclude that

$$\begin{aligned} C_T \geq \liminf_{m \rightarrow \infty} \left(\|u_t^m(\cdot, t)\|^2 + \rho \|u^m(\cdot, t)\|_H^2 \right. \\ \left. + \sum_{i=0}^N \int_0^t |u_t^m(\xi_i, s)|^2 ds \right) \geq \liminf_{m \rightarrow \infty} \|u_t^m(\cdot, t)\|^2 + \rho \end{aligned}$$

$$\begin{aligned} \cdot \liminf_{m \rightarrow \infty} \|u^m(\cdot, t)\|_H^2 + \sum_{i=0}^N \liminf_{m \rightarrow \infty} \int_0^t |u_t^m(\xi_i, s)|^2 ds \\ \geq \|u_t(\cdot, t)\|^2 + \rho \|u(\cdot, t)\|_H^2 + \sum_{i=1}^N \int_0^t |u_t(\xi_i, s)|^2 ds. \end{aligned} \quad (120)$$

In addition, we can prove in a similar way above that the solution u^j of problem (1) corresponding to the data $(\sigma^j, k^j, f^j, g^j, h^j)$ also satisfies

$$\begin{aligned} \|u_t^j(\cdot, t)\|^2 + \rho \|u^j(\cdot, t)\|_H^2 + \sum_{i=0}^N \int_0^t |u_t^j(\xi_i, s)|^2 ds \\ \leq \widehat{C}_T, \quad \forall t \in [0, T], \end{aligned} \quad (121)$$

with $\widehat{C}_T$ being a constant depending only on $u_0, u_1, \sigma_1, \sigma_2, \widehat{\sigma}, f, \widehat{f}, \sigma_*, k_*, a, b, d, c, \rho, T$.

We set

$$\begin{aligned} \widehat{f}_j &= f^j - f, \\ \widehat{g}_j &= g^j - g, \\ \widehat{h}_j &= h^j - h, \\ \widehat{k}_j &= k^j - k, \\ \widehat{\sigma}_j &= \sigma^j - \sigma, \\ v^j &= u^j - u. \end{aligned} \quad (122)$$

Then v^j satisfies the following problem:

$$\begin{aligned} v_{tt}^j - \rho v_{xx}^j + F^j &= 0, \quad 0 < x < 1, \quad 0 < t < T, \\ v^j(1, t) &= 0, \\ v_t^j(0, t) &= w^j(t), \\ v^j(x, 0) = v_t^j(x, 0) &= 0, \end{aligned} \quad (123)$$

where

$$F^j(x, t) = \widehat{f}_j(x, u^j) + f(x, u^j) - f(x, u),$$

$$w^j(t)$$

$$\begin{aligned} &= \widehat{\sigma}_j(t) + \widehat{g}_j(u^j(\xi_0, t)) + g(u^j(\xi_0, t)) \\ &\quad - g(u(\xi_0, t)) \\ &\quad + \int_0^t k^j(t-s) \widehat{h}_j(u^j(\xi_0, s), \dots, u^j(\xi_N, s)) ds \\ &\quad + \int_0^t \widehat{k}_j(t-s) h(u^j(\xi_0, s), \dots, u^j(\xi_N, s)) ds \\ &\quad + \int_0^t k(t-s) h(u^j(\xi_0, s), \dots, u^j(\xi_N, s)) ds \\ &\quad - \int_0^t k(t-s) h(u(\xi_0, s), \dots, u(\xi_N, s)) ds. \end{aligned} \quad (124)$$

Applying Lemma 12 with $u_0 = u_1 = 0$, we see that

$$\begin{aligned} E_j(t) &= -2 \int_0^t \langle f(\cdot, u^j) - f(\cdot, u), v_t^j(\cdot, s) \rangle ds \\ &\quad - 2 \int_0^t \langle \widehat{f}_j(\cdot, u^j), v_t^j(\cdot, s) \rangle ds - 2 \int_0^t \widehat{\sigma}_j(s) \\ &\quad \cdot v_t^j(0, s) ds - 2 \int_0^t \widehat{g}_j(u^j(\xi_0, s)) v_t^j(0, s) ds \\ &\quad - 2 \int_0^t [g(u^j(\xi_0, t)) - g(u(\xi_0, t))] v_t^j(0, s) ds \\ &\quad - 2 \int_0^t v_t^j(0, r) dr \int_0^r k^j(r-s) \\ &\quad \cdot \widehat{h}_j(u^j(\xi_0, s), \dots, u^j(\xi_N, s)) ds \\ &\quad - 2 \int_0^t v_t^j(0, r) dr \int_0^r \widehat{k}_j(r-s) \\ &\quad \cdot h(u^j(\xi_0, s), \dots, u^j(\xi_N, s)) ds \end{aligned}$$

$$\begin{aligned} &- 2 \left[\int_0^t v_t^j(0, r) dr \right. \\ &\quad \cdot \int_0^r k(r-s) h(u^j(\xi_0, s), \dots, u^j(\xi_N, s)) ds \\ &\quad - \int_0^t v_t^j(0, r) dr \\ &\quad \cdot \left. \int_0^r k(r-s) h(u(\xi_0, s), \dots, u(\xi_N, s)) ds \right] \\ &\equiv K_1(t) + K_2(t) + \dots + K_8(t), \end{aligned} \quad (125)$$

where

$$E_j(t) = \|v_t^j(\cdot, t)\|^2 + \rho \|v^j(\cdot, t)\|_H^2. \quad (126)$$

Let $M = (\sqrt{C_T} + \sqrt{\widehat{C}_T})/\sqrt{\rho}$. Now we can estimate eight integrals in the right-hand side of (125) as follows.

Estimating $K_1(t)$. From assumption (A_3) , it yields

$$\begin{aligned} K_1(t) &= -2 \int_0^t \langle f(\cdot, u^j(\cdot, s)) - f(\cdot, u(\cdot, s)), v_t^j(\cdot, s) \rangle ds \\ &\leq \frac{d_M}{\sqrt{\rho}} \int_0^t E_j(s) ds, \end{aligned} \quad (127)$$

with $d_M = \|D_2 f\|_{C^0([0,1] \times [-M, M])}$.

Estimating $K_2(t)$. It is easy to show that

$$\begin{aligned} K_2(t) &= -2 \int_0^t \langle \widehat{f}_j(\cdot, u^j), v_t^j(\cdot, s) \rangle ds \\ &\leq T \|\widehat{f}_j\|_{C^0([0,1] \times [-M, M])}^2 + \int_0^t E_j(s) ds. \end{aligned} \quad (128)$$

Estimating $K_3(t)$. Since $\rho v_j^2(0, t) \leq E_j(t)$, by Cauchy-Schwartz inequality, then

$$\begin{aligned} K_3(t) &= -2 \int_0^t \widehat{\sigma}_j(s) v_t^j(0, s) ds \\ &\leq \varepsilon E_j(t) + \frac{1}{\rho} \|\widehat{\sigma}_j'\|_{L^1(0, T)} + \frac{1}{\varepsilon \rho} |\widehat{\sigma}_j(t)|^2 \\ &\quad + \int_0^t |\widehat{\sigma}_j'(s)| E_j(s) ds. \end{aligned} \quad (129)$$

Moreover, using the imbedding $W^{1,1}(0, T) \hookrightarrow C^0([0, T])$, there exists a positive constant k_T such that

$$\|v\|_{C^0([0, T])} \leq k_T \|v\|_{W^{1,1}(0, T)}, \quad \forall v \in W^{1,1}(0, T). \quad (130)$$

Thus,

$$K_3(t) \leq \varepsilon E_j(t) + \frac{1}{\rho} \|\widehat{\sigma}_j\|_{W^{1,1}(0,T)} + \frac{k_T^2}{\varepsilon \rho} \|\widehat{\sigma}_j\|_{W^{1,1}(0,T)}^2 + \int_0^t |\widehat{\sigma}_j'(s)| E_j(s) ds. \quad (131)$$

Estimating $K_4(t)$. By help of assumption (A_4) and (121), we get

$$\begin{aligned} K_4(t) &= -2 \int_0^t \widehat{g}_j(u^j(\xi_0, s)) v_t^j(0, s) ds \\ &\leq \varepsilon E(t) + \frac{1}{\rho} \int_0^t E_j(s) ds + \frac{1}{\varepsilon \rho} \|\widehat{g}_j\|_{C^0([-M, M])}^2 \\ &\quad + \|\widehat{g}_j'\|_{C^0([-M, M])}^2 \int_0^t |u_t^j(\xi_0, s)|^2 ds \\ &\leq \varepsilon E(t) + \frac{1}{\rho} \int_0^t E_j(s) ds \\ &\quad + \left(\widehat{C}_T + \frac{1}{\varepsilon \rho} \right) \|\widehat{g}_j\|_{C^1([-M, M])}^2, \quad \forall \varepsilon > 0. \end{aligned} \quad (132)$$

Estimating $K_5(t)$. Proving in a similar way to (109), we also obtain

$$\begin{aligned} K_5(t) &= -2 \int_0^t [g(u^j(\xi_0, s)) - g(u(\xi_0, s))] v_t^j(0, s) ds \\ &\leq \frac{\varepsilon}{\rho} E_j(t) \|g\|_{C^2([-M, M])} + \int_0^t d_j(s) E(s) ds, \end{aligned} \quad (133)$$

where

$$\begin{aligned} d_j(s) &= \|g\|_{C^2([-M, M])} \left[\frac{\varepsilon}{\rho} (|u_t^j(\xi_0, s)| + |u_t(\xi_0, s)|) \right. \\ &\quad + \left(1 + \frac{1}{\varepsilon} \right) \\ &\quad \cdot T \left(\|u_t^j(\xi_0, \cdot)\|_{L^1(0, T)} + \|u_t(\xi_0, \cdot)\|_{L^1(0, T)} + 1 \right) \Big]. \end{aligned} \quad (134)$$

On the other hand, we have

$$\|v\|_{L^1(0, T)} \leq \sqrt{T} \|v\|_{L^2(0, T)}, \quad \forall v \in L^2(0, T). \quad (135)$$

Therefore,

$$\begin{aligned} d_j(s) &\leq \frac{\varepsilon}{\rho} \|g\|_{C^2([-M, M])} (|u_t^j(\xi_0, s)| + |u_t(\xi_0, s)|) \\ &\quad + T^{3/2} \left(1 + \frac{1}{\varepsilon} \right) \left(1 + \sqrt{C_T} + \sqrt{\widehat{C}_T} \right) \|g\|_{C^2([-M, M])} \\ &= \widehat{d}_j(s). \end{aligned} \quad (136)$$

It implies

$$K_5(t) \leq \frac{\varepsilon}{\rho} E_j(t) \|g\|_{C^2([-M, M])} + \int_0^t \widehat{d}_j(s) E(s) ds. \quad (137)$$

Estimating $K_6(t)$. By reusing the inequalities (121) and (135) and assumption (A_2) , then

$$\begin{aligned} K_6(t) &= -2 \int_0^t v_t^j(0, r) dr \\ &\quad \cdot \int_0^r k^j(r-s) \widehat{h}_j(u^j(\xi_0, s), \dots, u^j(\xi_N, s)) ds \\ &\leq \varepsilon E_j(t) + \frac{2}{\rho} \int_0^t E_j(s) ds + \left(1 + Tk_T^2 + \frac{1}{\varepsilon \rho} \right) \\ &\quad \cdot \|k^j\|_{W^{1,1}(0, T)}^2 \|\widehat{h}_j\|_{C^0([-M, M]^{N+1})}^2 \leq \varepsilon E_j(t) + \frac{2}{\rho} \\ &\quad \cdot \int_0^t E_j(s) ds + k_*^2 \left(1 + Tk_T^2 + \frac{1}{\varepsilon \rho} \right) \\ &\quad \cdot \|\widehat{h}_j\|_{C^0([-M, M]^{N+1})}^2. \end{aligned} \quad (138)$$

Estimating $K_7(t)$. Similarly, from assumption (A_5) , we also obtain

$$\begin{aligned} K_7(t) &= -2 \int_0^t v_t^j(0, r) dr \\ &\quad \cdot \int_0^r \widehat{k}_j(r-s) h(u^j(\xi_0, s), \dots, u^j(\xi_N, s)) ds \\ &\leq \varepsilon E_j(t) + \frac{2}{\rho} \int_0^t E_j(s) ds + \left(1 + Tk_T^2 + \frac{1}{\varepsilon \rho} \right) \\ &\quad \cdot \|\widehat{k}_j\|_{W^{1,1}(0, T)}^2 \|h\|_{C^0([-M, M]^{N+1})}^2 \equiv \varepsilon E_j(t) + \frac{2}{\rho} \\ &\quad \cdot \int_0^t E_j(s) ds + \left(1 + Tk_T^2 + \frac{1}{\varepsilon \rho} \right) \widehat{d}_M \|\widehat{k}_j\|_{W^{1,1}(0, T)}^2. \end{aligned} \quad (139)$$

Estimating $K_8(t)$. Due to assumptions (A_2) and (A_6) , we get

$$\begin{aligned} K_8(t) &= -2 \int_0^t v_t^j(0, r) dr \\ &\quad \cdot \int_0^r k(r-s) h(u^j(\xi_0, s), \dots, u^j(\xi_N, s)) ds \\ &\quad + 2 \int_0^t v_t^j(0, r) dr \\ &\quad \cdot \int_0^r k(r-s) h(u(\xi_0, s), \dots, u(\xi_N, s)) ds \\ &\leq \varepsilon E_j(t) + M_T^1 \int_0^t E_j(s) ds, \end{aligned} \quad (140)$$

where

$$M_T^1 = \frac{1}{\rho} \left[(N+1)^2 c_M^2 \left(\|k'\|_{L^1(0,T)}^2 + \frac{1}{\varepsilon \rho} \|k\|_{L^2(0,T)}^2 \right) + 2(N+1) c_M |k(0)| + 1 \right]. \quad (141)$$

Thus, combining (125)–(128), (131), (132), and (137)–(140),

$$\begin{aligned} E_j(t) &\leq \varepsilon M_T^2 E_j(t) + M_T^3 \left(\|\widehat{f}_j\|_{C^0([0,1] \times [-M,M])}^2 \right. \\ &\quad + \|\widehat{g}_j\|_{C^1([-M,M])}^2 + \|\widehat{h}_j\|_{C^0([-M,M]^{N+1})}^2 \\ &\quad + \|\widehat{k}_j\|_{W^{1,1}(0,T)}^2 + \|\widehat{\sigma}_j\|_{W^{1,1}(0,T)}^2 + \|\widehat{\sigma}_j\|_{W^{1,1}(0,T)}^2 \Big) \\ &\quad + \int_0^t \left[\frac{\varepsilon}{\rho} \|g\|_{C^2([-M,M])} \left(|u_t^j(\xi_0, s)| + |u_t(\xi_0, s)| \right) \right. \\ &\quad \left. + |\widehat{\sigma}_j'(s)| + M_T^4 \right] E_j(s) ds, \end{aligned} \quad (142)$$

in which

$$\begin{aligned} M_T^2 &= \frac{1}{\rho} \|g\|_{C^2([-M,M])} + 5, \\ M_T^3 &= (k_*^2 + \widehat{d}_M) \left(1 + T k_T^2 + \frac{1}{\varepsilon \rho} \right) + \frac{1 + k_T^2 + \varepsilon}{\varepsilon \rho} + T \\ &\quad + \widehat{C}_T, \\ M_T^4 &= T^{3/2} \left(1 + \frac{1}{\varepsilon} \right) \left(1 + \sqrt{C_T} + \sqrt{\widehat{C}_T} \right) \|g\|_{C^2([-M,M])} \\ &\quad + \frac{d_M}{\sqrt{\rho}} + M_T^1 + \frac{5}{\rho} + 1. \end{aligned} \quad (143)$$

Choosing $\varepsilon M_T^2 = 1/2$ and applying the Gronwall inequality, we deduce from (120), (121), and (142) that

$$\begin{aligned} E_j(t) &\leq 2M_T^3 \exp \left[2TM_T^4 \right. \\ &\quad + 2\sqrt{T} \frac{\varepsilon}{\rho} \left(\sqrt{C_T} + \sqrt{\widehat{C}_T} \right) \|g\|_{C^2([-M,M])} + 2\sigma_* \Big] \\ &\quad \cdot \left(\|\widehat{f}_j\|_{C^0([0,1] \times [-M,M])}^2 + \|\widehat{g}_j\|_{C^1([-M,M])}^2 \right. \\ &\quad + \|\widehat{h}_j\|_{C^0([-M,M]^{N+1})}^2 + \|\widehat{k}_j\|_{W^{1,1}(0,T)}^2 + \|\widehat{\sigma}_j\|_{W^{1,1}(0,T)}^2 \\ &\quad \left. + \|\widehat{\sigma}_j\|_{W^{1,1}(0,T)}^2 \right). \end{aligned} \quad (144)$$

This shows that

$$\begin{aligned} &\|v_t^j\|_{L^\infty(0,T;L^2(0,1))}^2 + \|v^j\|_{L^\infty(0,T;H^1(0,1))}^2 \\ &\leq M_T \left(\|\widehat{f}_j\|_{C^0([0,1] \times [-M,M])}^2 + \|\widehat{g}_j\|_{C^1([-M,M])}^2 \right. \\ &\quad + \|\widehat{h}_j\|_{C^0([-M,M]^{N+1})}^2 + \|\widehat{k}_j\|_{W^{1,1}(0,T)}^2 + \|\widehat{\sigma}_j\|_{W^{1,1}(0,T)}^2 \\ &\quad \left. + \|\widehat{\sigma}_j\|_{W^{1,1}(0,T)}^2 \right), \end{aligned} \quad (145)$$

with M_T being a constant depending only on $u_0, u_1, \sigma_1, \sigma_2, \widehat{\sigma}, f, \widehat{f}, \sigma_*, k_*, a, b, d, c, \rho, T$.

This completes the proof of Theorem 13. $\square$

Remark 14. If we use the inequality $\rho v_j^2(\xi_i, t) \leq E_j(t)$, $i = \overline{0, N}$, then, with regard to (126) and (145), conclusion (117) in Theorem 13 can be extended as follows:

$$\begin{aligned} &(u^j, u_t^j, u^j(\xi_0, \cdot), u^j(\xi_1, \cdot), \dots, u^j(\xi_N, \cdot)) \\ &\longrightarrow (u, u_t, u(\xi_0, \cdot), u(\xi_1, \cdot), \dots, u(\xi_N, \cdot)), \end{aligned} \quad (146)$$

strongly in $L^\infty(0, T; H^1(0, 1)) \times L^\infty(0, T; L^2(0, 1)) \times [C^0([0, T])]^{N+1}$, as $j \rightarrow \infty$.

Conflict of Interests

The author declares that there is no conflict of interests regarding the publication of this paper.
