Making use of the operator $\mathcal{L}_v$ for functions of the form $f(z) = 1/z + \sum_{k=1}^{\infty} a_k z^{k-1}$, which are analytic in the punctured unit disc $\mathbb{U}^* = \{z : z \in \mathbb{C} \text{ and } 0 < |z| < 1\} = \mathbb{U} \setminus \{0\}$, we introduce two subclasses of meromorphic functions and investigate convolution properties, coefficient estimates, and containment properties for these subclasses.

1. Introduction

Let Σ denote the class of meromorphic functions of the form

$$f(z) = \frac{1}{z} + \sum_{k=1}^{\infty} a_k z^{k-1}, \quad (1)$$

which are analytic in the punctured unit disc $\mathbb{U}^* = \{z : z \in \mathbb{C} \text{ and } 0 < |z| < 1\} = \mathbb{U} \setminus \{0\}$. Let $g(z) \in \Sigma$ be given by

$$g(z) = \frac{1}{z} + \sum_{k=1}^{\infty} b_k z^{k-1}; \quad (2)$$

then, the Hadamard product (or convolution) of $f(z)$ and $g(z)$ is given by

$$(f * g)(z) = \frac{1}{z} + \sum_{k=1}^{\infty} a_k b_k z^{k-1} = (g * f)(z). \quad (3)$$

We recall some definitions which will be used in our paper.

Definition 1. For two functions $f(z)$ and $g(z)$, analytic in $\mathbb{U}$, we say that the function $f(z)$ is subordinate to $g(z)$ in $\mathbb{U}$ and written $f(z) < g(z)$, if there exists a Schwarz function $w(z)$, analytic in $\mathbb{U}$ with $w(0) = 0$ and $|w(z)| < 1$ such that $f(z) = g(w(z))$ ($z \in \mathbb{U}$). Furthermore, if the function $g(z)$ is

univalent in $\mathbb{U}$, then we have the following equivalence (see [1]):

$$\begin{aligned} f(z) < g(z) \\ \iff f(0) = g(0), \\ f(\mathbb{U}) \subset g(\mathbb{U}). \end{aligned} \quad (4)$$

Now, consider Bessel's function of the first kind of order v where v is an unrestricted (real or complex) number, defined by (see Watson [2, page 40]) (see also Baricz [3, page 7])

$$J_v(z) = \sum_{k=0}^{\infty} \frac{(-1)^k}{\Gamma(k+1)\Gamma(k+v+1)} \left(\frac{z}{2}\right)^{2k+v}, \quad (5)$$

which is a particular solution of the second order linear homogenous Bessel differential equation (see, e.g., Watson [2, page 38]) (see also Baricz [3, page 7])

$$z^2 w''(z) + zw'(z) + (z^2 - v^2)w(z) = 0. \quad (6)$$

Also, let us define

$$\begin{aligned} \mathcal{L}_v(z) &= \frac{2^v \Gamma(v+1)}{z^{v/2+1}} J_v(z^{1/2}) \\ &= \frac{1}{z} + \sum_{k=1}^{\infty} \frac{(-1)^k \Gamma(v+1)}{4^k \Gamma(k+1) \Gamma(k+v+1)} z^{k-1} \end{aligned} \quad (7)$$

$(z \in \mathbb{U}^*).$

The operator $\mathcal{L}_v$ is a modification of the operator introduced by Szász and Kupán [4] for analytic functions.

By using the Hadamard product (or convolution), we define the operator $\mathcal{L}_v$ as follows:

$$\begin{aligned} (\mathcal{L}_v f)(z) &= \mathcal{L}_v(z) * f(z) \\ &= \frac{1}{z} + \sum_{k=1}^{\infty} \frac{(-1)^k \Gamma(v+1)}{4^k \Gamma(k+1) \Gamma(k+v+1)} a_k z^{k-1}. \end{aligned} \quad (8)$$

It is easy to verify from (8) that

$$\begin{aligned} z((\mathcal{L}_{v+1} f)(z))' &= (v+1)(\mathcal{L}_v f)(z) \\ &\quad - (v+2)(\mathcal{L}_{v+1} f)(z). \end{aligned} \quad (9)$$

Definition 2. For $0 \leq \lambda < 1$, $-1 \leq B < A \leq 1$, and $b \in \mathbb{C}^* = \mathbb{C} \setminus \{0\}$, let $\Sigma \mathcal{S}_\lambda^*[b; A, B]$ be the subclass of Σ consisting of function $f(z)$ of the form (1) and satisfying the analytic criterion

$$1 + \frac{1}{b} \left[\frac{-zf'(z)}{(1-\lambda)f(z) - \lambda zf'(z)} - 1 \right] < \frac{1 + Az}{1 + Bz}. \quad (10)$$

Also, let $\Sigma \mathcal{K}_\lambda[b; A, B]$ be the subclass of Σ consisting of function $f(z)$ of the form (1) and satisfying the analytic criterion

$$\begin{aligned} 1 + \frac{1}{b} \left[\frac{-z(zf'(z))'}{(1-\lambda)zf'(z) - \lambda z(zf'(z))'} - 1 \right] \\ < \frac{1 + Az}{1 + Bz}. \end{aligned} \quad (11)$$

It is easy to verify from (10) and (11) that

$$\begin{aligned} f(z) &\in \Sigma \mathcal{K}_\lambda[b; A, B] \\ &\iff -zf'(z) \in \Sigma \mathcal{S}_\lambda^*[b; A, B]. \end{aligned} \quad (12)$$

We note that

- (i) $\Sigma \mathcal{S}_0^*[b; A, B] = \Sigma \mathcal{S}^*[b; A, B]$ and $\Sigma \mathcal{K}_0[b; A, B] = \Sigma \mathcal{K}[b; A, B]$ (see Bulboacă et al. [5]);
- (ii) $\Sigma \mathcal{S}_0^*[b; 1, -1] = \Sigma \mathcal{S}(b)$ and $\Sigma \mathcal{K}_0[b; 1, -1] = \Sigma \mathcal{K}(b)$ (see Aouf [6]);
- (iii) $\Sigma \mathcal{S}_0^*[(1-\alpha)e^{-i\mu}\cos\mu; 1, -1] = \Sigma \mathcal{S}^\mu(\alpha)$ and $\Sigma \mathcal{K}_0[(1-\alpha)e^{-i\mu}\cos\mu; 1, -1] = \Sigma \mathcal{K}^\mu(\alpha)$ ($\mu \in \mathbb{R}$, $|\mu| \leq \pi/2$, $0 \leq \alpha < 1$) (see Ravichandran et al. [7, with $p = 1$]).

Definition 3. For $0 \leq \lambda < 1$, $-1 \leq B < A \leq 1$, $b \in \mathbb{C}^*$ and v is an unrestricted (real or complex) number, let

$$\begin{aligned} \Sigma \mathcal{S}_{\lambda,v}^*[b; A, B] \\ &= \{f(z) \in \Sigma : (\mathcal{L}_v f)(z) \in \Sigma \mathcal{S}_\lambda^*[b; A, B]\}, \\ \Sigma \mathcal{K}_{\lambda,v}[b; A, B] \\ &= \{f(z) \in \Sigma : (\mathcal{L}_v f)(z) \in \Sigma \mathcal{K}_\lambda[b; A, B]\}. \end{aligned} \quad (13)$$

It is easy to show that

$$\begin{aligned} f(z) &\in \Sigma \mathcal{K}_{\lambda,v}[b; A, B] \\ &\iff -zf'(z) \in \Sigma \mathcal{S}_{\lambda,v}^*[b; A, B]. \end{aligned} \quad (14)$$

The object of the present paper is to investigate some convolution properties, coefficient estimates, and containment properties for the subclasses $\Sigma \mathcal{S}_{\lambda,v}^*[b; A, B]$ and $\Sigma \mathcal{K}_{\lambda,v}[b; A, B]$.

2. Main Results

Unless otherwise mentioned, we assume throughout this paper that $0 \leq \lambda < 1$, $-1 \leq B < A \leq 1$, $b \in \mathbb{C}^*$ and v is an unrestricted (real or complex) number.

Theorem 4. If $f(z) \in \Sigma$, then $f(z) \in \Sigma \mathcal{S}_\lambda^*[b; A, B]$ if and only if

$$\begin{aligned} z \left[f(z) * \frac{1 - [(\lambda - 1)M + (\lambda + 1)]z}{z(1 - z)^2} \right] &\neq 0 \\ &\text{for } z \in \mathbb{U}, \end{aligned} \quad (15)$$

where $M = M_\theta = (e^{-i\theta} + B)/(A - B)b$, $\theta \in [0, 2\pi)$, and also $M = 0$.

Proof. It is easy to verify that

$$\begin{aligned} f(z) * \frac{1}{z(1 - z)} &= f(z), \\ f(z) * \left[\frac{1}{z(1 - z)^2} - \frac{2}{(1 - z)^2} \right] &= -zf'(z) \\ &\quad \forall z \in \mathbb{U}^*; f \in \Sigma. \end{aligned} \quad (16)$$

(i) In view of (10), $f(z) \in \Sigma \mathcal{S}_\lambda^*[b; A, B]$ if and only if (10) holds. Since the function $(1 + [B + (A - B)b]z)/(1 + Bz)$ is analytic in $\mathbb{U}$, it follows that $(1 - \lambda)f(z) - \lambda zf'(z) \neq 0$ for $z \in \mathbb{U}^*$ or $z[(1 - \lambda)f(z) - \lambda zf'(z)] \neq 0$ for $z \in \mathbb{U}$; this is equivalent to (15) holding for $M = 0$. To prove (15) for all $M \neq 0$, we write (10) by using the principle of subordination as

$$\frac{-zf'(z)}{(1 - \lambda)f(z) - \lambda zf'(z)} = \frac{1 + [B + (A - B)b]w(z)}{1 + Bw(z)}, \quad (17)$$

where $w(z)$ is Schwarz function, analytic in $\mathbb{U}$ with $w(0) = 0$ and $|w(z)| < 1$; hence,

$$\begin{aligned} z \left[-zf'(z) (1 + Be^{i\theta}) - [(1 - \lambda)f(z) - \lambda zf'(z)] \right. \\ \left. \cdot [1 + [B + (A - B)b]e^{i\theta}] \right] &\neq 0 \\ &\text{for } z \in \mathbb{U}, \theta \in [0, 2\pi). \end{aligned} \quad (18)$$

Using (16), (18) may be written as

$$z \left[f(z) * \frac{1 - [(\lambda - 1)((e^{-i\theta} + B)/(A - B)b) + (\lambda + 1)]z}{z(1 - z)^2} \right] \neq 0 \quad \text{for } z \in \mathbb{U}. \quad (19)$$

Thus, the first part of Theorem 4 was proved.

(ii) Reversely, because assumption (15) holds for $M = 0$, it follows that $z[(1 - \lambda)f(z) - \lambda zf'(z)] \neq 0$ for $z \in \mathbb{U}$. This implies that $\varphi(z) = -zf'(z)/((1 - \lambda)f(z) - \lambda zf'(z))$ is analytic in $\mathbb{U}$ (i.e., it is regular in $z = 0$, with $\varphi(0) = 1$).

Since it was shown in the first part of the proof that assumption (18) is equivalent to (15), we obtain that

$$\frac{-zf'(z)}{(1 - \lambda)f(z) - \lambda zf'(z)} \neq \frac{1 + [B + (A - B)b]e^{i\theta}}{1 + Be^{i\theta}} \quad \text{for } z \in \mathbb{U}, \theta \in [0, 2\pi). \quad (20)$$

Assume that

$$\psi(z) = \frac{1 + [B + (A - B)b]e^{i\theta}}{1 + Be^{i\theta}}. \quad (21)$$

Relation (20) means that $\varphi(\mathbb{U}) \cap \psi(\partial\mathbb{U}) = \emptyset$. Thus, the simply connected domain is included in a connected component of $\mathbb{C} \setminus \psi(\partial\mathbb{U})$. From this, using the fact that $\varphi(0) = \psi(0)$ and the univalence of the function ψ , it follows that $\varphi(z) < \psi(z)$; this implies that $f(z) \in \Sigma\mathcal{S}_{\lambda, v}^*[b; A, B]$. Thus, the proof of Theorem 4 is completed. $\square$

Remark 5. (i) Putting $\lambda = 0$ in Theorem 4, we obtain the result obtained by Bulboacă et al. [5, Theorem 1].

(ii) Putting $\lambda = 0$, $b = 1$, and $e^{i\theta} = x$ in Theorem 4, we obtain the result obtained by Ponnusamy [8, Theorem 2.1].

(iii) Putting $\lambda = 0$, $b = (1 - \alpha)e^{-i\mu}\cos\mu$ ($\mu \in \mathbb{R}$, $|\mu| \leq \pi/2$, $0 \leq \alpha < 1$), $A = 1$, $B = -1$, and $e^{i\theta} = x$ in Theorem 4, we obtain the result obtained by Ravichandran et al. [7, Theorem 1.2 with $p = 1$].

Theorem 6. If $f(z) \in \Sigma$, then $f(z) \in \Sigma\mathcal{K}_{\lambda}[b; A, B]$ if and only if

$$z \left[f(z) * \frac{1 - 3z + 2[(\lambda - 1)M + (\lambda + 1)]z^2}{z(1 - z)^3} \right] \neq 0 \quad \text{for } z \in \mathbb{U}, \quad (22)$$

where $M = M_{\theta} = (e^{-i\theta} + B)/(A - B)b$, $\theta \in [0, 2\pi)$, and also $M = 0$.

Proof. Putting

$$g(z) = \frac{1 - [(\lambda - 1)M + (\lambda + 1)]z}{z(1 - z)^2}, \quad (23)$$

then

$$-zg'(z) = \frac{1 - 3z + 2[(\lambda - 1)M + (\lambda + 1)]z^2}{z(1 - z)^3}. \quad (24)$$

From (12) and using the identity

$$[-zf'(z)] * g(z) = f(z) * [-zg'(z)], \quad (25)$$

we obtain the required result from Theorem 4. $\square$

Remark 7. (i) Putting $\lambda = 0$ in Theorem 6, we obtain the result obtained by Bulboacă et al. [5, Theorem 2].

(ii) Putting $\lambda = 0$, $b = 1$, and $e^{i\theta} = x$ in Theorem 4, we obtain the result obtained by Ponnusamy [8, Theorem 2.2].

Theorem 8. If $f(z) \in \Sigma$, then $f(z) \in \Sigma\mathcal{S}_{\lambda, v}^*[b; A, B]$ if and only if

$$1 + \sum_{k=1}^{\infty} \frac{(-1)^k (1 - k\lambda) \Gamma(v + 1)}{4^k \Gamma(k + 1) \Gamma(k + v + 1)} a_k z^k \neq 0, \quad (26)$$

$$1 + \sum_{k=1}^{\infty} (-1)^k \Gamma(v + 1) \cdot \left[\frac{(1 - k\lambda)(A - B)b}{4^k (A - B)b \Gamma(k + 1) \Gamma(k + v + 1)} - \frac{-k(\lambda - 1)(e^{-i\theta} + B)}{4^k (A - B)b \Gamma(k + 1) \Gamma(k + v + 1)} \right] a_k z^k \neq 0, \quad (27)$$

for all $\theta \in [0, 2\pi)$.

Proof. If $f(z) \in \Sigma$, from Theorem 4, we have $f(z) \in \Sigma\mathcal{S}_{\lambda, v}^*[b; A, B]$ if and only if

$$z \left[(\mathcal{L}_v f)(z) * \frac{1 - [(\lambda - 1)M + (\lambda + 1)]z}{z(1 - z)^2} \right] \neq 0 \quad \text{for } z \in \mathbb{U}, \quad (28)$$

where $M = M_{\theta} = (e^{-i\theta} + B)/(A - B)b$, $\theta \in [0, 2\pi)$, and also $M = 0$. Since

$$\frac{1 - (\lambda + 1)z}{z(1 - z)^2} = \frac{1}{z} + \sum_{k=1}^{\infty} (1 - k\lambda) z^{k-1}, \quad z \in \mathbb{U}^*, \quad (29)$$

it is easy to show that (28) holds for $M = 0$ if and only if (26) holds. Also,

$$\begin{aligned} & \frac{1 - [(\lambda - 1)M + (\lambda + 1)]z}{z(1 - z)^2} \\ &= \frac{1}{z} + \sum_{k=1}^{\infty} [(1 - k\lambda) - k(\lambda - 1)M] z^{k-1}, \quad z \in \mathbb{U}^*; \end{aligned} \quad (30)$$

we may easily check that (28) is equivalent to (27). This completes the proof of Theorem 8. $\square$

Theorem 9. If $f(z) \in \Sigma$, then $f(z) \in \Sigma \mathcal{K}_{\lambda, \nu}[b; A, B]$ if and only if

$$1 + \sum_{k=1}^{\infty} \frac{(-1)^k (k\lambda - 1) (k-1) \Gamma(\nu+1)}{4^k \Gamma(k+1) \Gamma(k+\nu+1)} a_k z^k \neq 0, \quad (31)$$

$$1 + \sum_{k=1}^{\infty} (-1)^k (k-1) \Gamma(\nu+1) \cdot \left[\frac{(k\lambda - 1) (A - B) b}{4^k (A - B) b \Gamma(k+1) \Gamma(k+\nu+1)} + \frac{k(\lambda - 1) (e^{-i\theta} + B)}{4^k (A - B) b \Gamma(k+1) \Gamma(k+\nu+1)} \right] a_k z^k \neq 0, \quad (32)$$

for all $\theta \in [0, 2\pi)$.

Proof. If $f(z) \in \Sigma$, from Theorem 6, we have $f(z) \in \Sigma \mathcal{K}_{\lambda, \nu}[b; A, B]$ if and only if

$$z \left[(\mathcal{L}_\nu f)(z) * \frac{1 - 3z + 2[(\lambda - 1)M + (\lambda + 1)]z^2}{z(1 - z)^3} \right] \neq 0 \quad \text{for } z \in \mathbb{U}, \quad (33)$$

where $M = M_\theta = (e^{-i\theta} + B)/(A - B)b$, $\theta \in [0, 2\pi)$, and also $M = 0$. Since

$$\frac{1 - 3z + 2(\lambda + 1)z^2}{z(1 - z)^3} = \frac{1}{z} + \sum_{k=1}^{\infty} (k\lambda - 1)(k-1)z^{k-1}, \quad (34)$$

$z \in \mathbb{U}^*$,

it is easy to show that (33) holds for $M = 0$ if and only if (31) holds. Also,

$$\begin{aligned} & \frac{1 - 3z + 2[(\lambda - 1)M + (\lambda + 1)]z^2}{z(1 - z)^3} \\ &= \frac{1}{z} + \sum_{k=1}^{\infty} (k-1)[k(\lambda - 1)M + (k\lambda - 1)]z^{k-1}; \end{aligned} \quad (35)$$

for $z \in \mathbb{U}^*$, we may easily check that (33) is equivalent to (32). This completes the proof of Theorem 9. $\square$

Unless otherwise mentioned, we assume throughout the remainder of this section that ν is a real number ($\nu > -1$).

Theorem 10. If $f(z) \in \Sigma$ satisfies inequalities

$$\sum_{k=1}^{\infty} |k\lambda - 1| \frac{\Gamma(\nu+1)}{4^k \Gamma(k+1) \Gamma(k+\nu+1)} |a_k| < 1, \quad (36)$$

$$\begin{aligned} & \sum_{k=1}^{\infty} \frac{[(1 - k\lambda)(A - B)|b| + k(1 - \lambda)(1 + |B|)] \Gamma(\nu+1)}{4^k \Gamma(k+1) \Gamma(k+\nu+1)} |a_k| \\ & < (A - B)|b|, \end{aligned} \quad (37)$$

then $f(z) \in \Sigma \mathcal{S}_{\lambda, \nu}^*[b; A, B]$.

Proof. We have

$$\begin{aligned} & \left| 1 - \sum_{k=1}^{\infty} \frac{(-1)^k (k\lambda - 1) \Gamma(\nu+1)}{4^k \Gamma(k+1) \Gamma(k+\nu+1)} a_k z^k \right| \\ & \geq 1 - \left| \sum_{k=1}^{\infty} \frac{(-1)^k (k\lambda - 1) \Gamma(\nu+1)}{4^k \Gamma(k+1) \Gamma(k+\nu+1)} a_k z^k \right| \\ & \geq 1 - \sum_{k=1}^{\infty} |k\lambda - 1| \frac{\Gamma(\nu+1)}{4^k \Gamma(k+1) \Gamma(k+\nu+1)} |a_k| |z^k| \quad (38) \\ & \geq 1 - \sum_{k=1}^{\infty} |k\lambda - 1| \frac{\Gamma(\nu+1)}{4^k \Gamma(k+1) \Gamma(k+\nu+1)} |a_k| \\ & > 0, \quad \text{for } z \in \mathbb{U}, \end{aligned}$$

which implies inequality (36). Also,

$$\begin{aligned} & \left| 1 + \sum_{k=1}^{\infty} (-1)^k \Gamma(\nu+1) \cdot \left[\frac{(1 - k\lambda)(A - B)b}{4^k (A - B)b \Gamma(k+1) \Gamma(k+\nu+1)} - \frac{k(\lambda - 1)(e^{-i\theta} + B)}{4^k (A - B)b \Gamma(k+1) \Gamma(k+\nu+1)} \right] a_k z^k \right| \geq 1 \\ & - \left| \sum_{k=1}^{\infty} (-1)^k \Gamma(\nu+1) \cdot \left[\frac{(1 - k\lambda)(A - B)b}{4^k (A - B)b \Gamma(k+1) \Gamma(k+\nu+1)} - \frac{k(\lambda - 1)(e^{-i\theta} + B)}{4^k (A - B)b \Gamma(k+1) \Gamma(k+\nu+1)} \right] a_k z^k \right| \geq 1 \quad (39) \\ & - \sum_{k=1}^{\infty} \Gamma(\nu+1) \cdot \left[\frac{|1 - k\lambda|(A - B)|b|}{4^k (A - B)|b| \Gamma(k+1) \Gamma(k+\nu+1)} + \frac{k(1 - \lambda)(1 + |B|)}{4^k (A - B)|b| \Gamma(k+1) \Gamma(k+\nu+1)} \right] |a_k| |z^k| \\ & \geq 1 - \sum_{k=1}^{\infty} \Gamma(\nu+1) \cdot \left[\frac{|1 - k\lambda|(A - B)|b|}{4^k (A - B)|b| \Gamma(k+1) \Gamma(k+\nu+1)} + \frac{k(1 - \lambda)(1 + |B|)}{4^k (A - B)|b| \Gamma(k+1) \Gamma(k+\nu+1)} \right] |a_k| > 0, \end{aligned}$$

for $z \in \mathbb{U}$,

which implies inequality (37). Thus, the proof of Theorem 10 is completed. $\square$

Using similar arguments to those in the proof of Theorem 10, we obtain the following theorem.

Theorem 11. *If $f(z) \in \Sigma$ satisfies inequalities*

$$\sum_{k=1}^{\infty} |k\lambda - 1| \frac{(k-1)\Gamma(v+1)}{4^k \Gamma(k+1)\Gamma(k+v+1)} |a_k| < 1, \quad (40)$$

$$\sum_{k=1}^{\infty} (k-1)\Gamma(v+1) \left[\frac{(|k\lambda - 1|)(A-B)|b|}{4^k \Gamma(k+1)\Gamma(k+v+1)} + \frac{k(1-\lambda)(1+|B|)}{4^k \Gamma(k+1)\Gamma(k+v+1)} \right] |a_k| < (A-B)|b|,$$

then $f(z) \in \Sigma \mathcal{K}_{\lambda,v}[b; A, B]$.

Now, using the method due to Ahuja [9], we will prove the containment relations for the subclasses $\Sigma \mathcal{S}_{\lambda,v}^*[b; A, B]$ and $\Sigma \mathcal{K}_{\lambda,v}[b; A, B]$.

Theorem 12. *For $v > -1$, we have $\Sigma \mathcal{S}_{\lambda,v+1}^*[b; A, B] \subset \Sigma \mathcal{S}_{\lambda,v}^*[b; A, B]$.*

Proof. Since $f(z) \in \Sigma \mathcal{S}_{\lambda,v+1}^*[b; A, B]$, we see from Theorem 8 that

$$1 + \sum_{k=1}^{\infty} \frac{(-1)^k (1-k\lambda)\Gamma(v+2)}{4^k \Gamma(k+1)\Gamma(k+v+2)} a_k z^k \neq 0, \quad (41)$$

$$1 + \sum_{k=1}^{\infty} (-1)^k \Gamma(v+2) \cdot \left[\frac{(1-k\lambda)(A-B)b}{4^k (A-B)b\Gamma(k+1)\Gamma(k+v+2)} - \frac{k(\lambda-1)(e^{-i\theta} + B)}{4^k (A-B)b\Gamma(k+1)\Gamma(k+v+2)} \right] a_k z^k \neq 0.$$

We can write (41) as

$$\left[1 + \sum_{k=1}^{\infty} \frac{v+1}{k+v+1} z^k \right] * \left[1 + \sum_{k=1}^{\infty} \frac{(-1)^k (1-k\lambda)\Gamma(v+1)}{4^k \Gamma(k+1)\Gamma(k+v+1)} a_k z^k \right] \neq 0, \quad (42)$$

$$\left[1 + \sum_{k=1}^{\infty} \frac{v+1}{k+v+1} z^k \right] * \left[1 + \sum_{k=1}^{\infty} (-1)^k \Gamma(v+1) \cdot \left[\frac{(1-k\lambda)(A-B)b}{4^k (A-B)b\Gamma(k+1)\Gamma(k+v+1)} - \frac{k(\lambda-1)(e^{-i\theta} + B)}{4^k (A-B)b\Gamma(k+1)\Gamma(k+v+1)} \right] a_k z^k \right] \neq 0,$$

since

$$\left[1 + \sum_{k=1}^{\infty} \frac{v+1}{k+v+1} z^k \right] * \left[1 + \sum_{k=1}^{\infty} \frac{k+v+1}{v+1} z^k \right] = 1 + \sum_{k=1}^{\infty} z^k. \quad (43)$$

By using the property, if $f \neq 0$ and $g * h \neq 0$, then $f * (g * h) \neq 0$; (42) can be written as

$$1 + \sum_{k=1}^{\infty} \frac{(-1)^k (1-k\lambda)\Gamma(v+1)}{4^k \Gamma(k+1)\Gamma(k+v+1)} a_k z^k \neq 0, \quad (44)$$

$$1 + \sum_{k=1}^{\infty} (-1)^k \Gamma(v+1) \cdot \left[\frac{(1-k\lambda)(A-B)b}{4^k (A-B)b\Gamma(k+1)\Gamma(k+v+1)} - \frac{k(\lambda-1)(e^{-i\theta} + B)}{4^k (A-B)b\Gamma(k+1)\Gamma(k+v+1)} \right] a_k z^k \neq 0,$$

which means that $f(z) \in \Sigma \mathcal{S}_{\lambda,v}^*[b; A, B]$. This completes the proof of Theorem 12. $\square$

Using the same arguments as in the proof of Theorem 12, we obtain the following theorem.

Theorem 13. *For $v > -1$, we have $\Sigma \mathcal{K}_{\lambda,v+1}[b; A, B] \subset \Sigma \mathcal{K}_{\lambda,v}[b; A, B]$.*

Conflict of Interests

The authors declare that there is no conflict of interests regarding the publication of this paper.
