It is shown that the alternate passivity-based control schemes can be designed which explicitly exploit the passivity properties of the Timoshenko model. This approach has the advantage over the conventional methods in the respect that it allows one to deal directly with the system’s partial differential equations without resorting to approximations. Numerical results for the tracking control of a translational and rotational flexible Timoshenko arm are presented and compared. They verify that the proposed control schemes are effective at controlling flexible dynamical systems.

1. Introduction

In recent years, there has been a great deal of interest in the modeling and control of flexible arms [1–11]. This interest has been motivated by the prospect of fast, light, robot whose links, due to material characteristics, will flex under heavy loads. As a first step towards designing controllers for such robots, researchers have begun studying controllers for simple flexible links. These links, in most cases modeled as Euler-Bernoulli beams because of the small deflections involved, are often analyzed through an eigen-function series expansion of the solution to beam equation. The infinite term expansion is typically truncated after a finite number of terms and the controller designed using one of the various available linear control design techniques. Most practical controllers are designed based on models that are truncations of infinite-order transfer function models. There are several reasons for using the reduced-order models. First, these finite-order models agree very well with experimental results, assuming that an adequate number of modes have been retained. Second, there are no infinite-order transfer function models that coincide with experimental results past the first few modes. Finally, the use of a finite-order model greatly simplifies the controller design procedure. Most existing control design methods for flexible system, such as the Independent Modal Space Control, low-authority high-authority control design, frequency-weighted LQG, and positivity require modal truncation. One disadvantage of this kind of approach is that a controller, based on a truncated model, cannot guarantee stability of the closed loop system. This disadvantage arises because the model does not include the higher frequency terms. A second disadvantage is that the criteria for designing the controller for such a model are usually arbitrary and the design becomes more difficult as the truncated model order is increased.

In this paper, it is shown that the alternate passivity-based control schemes can be designed, which explicitly exploit the passivity properties of the Timoshenko model [12, 13]. From standard nonlinear control theory, the passivity theorem tells us that any strictly passive controller with finite gain will stabilize the system in an $L_2$ sense. This allows the design of very simple controllers for the systems. This approach has the advantage over the conventional methods in the respect that it allows one to deal directly with the system’s partial differential equations without resorting to approximations. Moreover, it is potentially applicable to the control of nonlinear flexible systems. Numerical results for the tracking control of a translational and rotational flexible Timoshenko
arm are presented and compared. They verify that the proposed control schemes are effective at controlling flexible dynamical systems.

2. Equation of Motions and Boundary Conditions

2.1. Translational Arm. Figure 1 shows a sketch of a translational Timoshenko arm. The equation of motions of the arm and mobile stage are

\[ \rho A \left( \frac{\partial^2 y}{\partial t^2} + \frac{\partial^3 W_b}{\partial t^2} \right) - \kappa G A \left( \frac{\partial^2 y}{\partial x^2} - \frac{\partial \phi}{\partial x} \right) = 0, \]

\[ \rho I \frac{\partial^2 \phi}{\partial t^2} - E I \frac{\partial^2 \phi}{\partial x^2} - \kappa G A \left( \frac{\partial y}{\partial x} - \phi \right) = 0, \]  

\[ M_p \frac{\partial^2 W_b}{\partial t^2} = -\kappa G A \left( \frac{\partial y(0,t)}{\partial x} - \phi(0,t) \right) + u, \]  

with boundary conditions:

\[ m \frac{\partial^2}{\partial t^2} \left( y(L,t) + W_b \right) + \kappa G A \left( \frac{\partial y(L,t)}{\partial x} - \phi(L,t) \right) = 0, \]

\[ I_c \frac{\partial^2 \phi(L,t)}{\partial t^2} + E I \frac{\partial \phi(L,t)}{\partial x} = 0, \]

\[ y(0,t) = 0, \]

\[ \phi(0,t) = 0. \]

Applying the Laplace transformation method with respect to \( t \) to equations (1) and (2) gives

\[ \rho As^2 (Y + W_b) - \kappa G A \left( \frac{\partial^2 Y}{\partial x^2} - \frac{\partial \Theta}{\partial x} \right) = 0, \]  

\[ \rho Is^2 \Phi - E I \frac{\partial^2 \Phi}{\partial x^2} - \kappa G A \left( \frac{\partial Y}{\partial x} - \Phi \right) = 0, \]  

\[ M_p s^2 W_b = -\kappa G A \left( \frac{\partial Y(0,t)}{\partial x} - \Phi(0,t) \right) + U, \]  

\[ ms^2 (Y(l,s) + W_b) + \kappa G A \left( \frac{\partial y(L,s)}{\partial x} - \Phi(L,s) \right) = 0, \]  

\[ I_c s^2 \Phi(L,s) + E I \frac{\partial \Phi(L,s)}{\partial x} = 0, \]

\[ Y(0,s) = 0, \]

\[ \Phi(0,s) = 0. \]  

2.2. Rotational Arm. The rotational Timoshenko arm depicted in Figure 2 of total length \( L \), area moment of inertia \( I \), cross-sectional area \( A \), density \( \rho \), Young’s modulus \( E \), shear modulus \( G \), and shear coefficient \( \kappa \), is attached at one end to a payload of mass \( m \) and inertia \( I_c \), and on the other end a hub of inertia \( I_h \), which in turn is connected to an actuator that supplies a torque \( u \). We obtain the following equations of motion with the boundary conditions.

\[ \rho A \left( \frac{\partial^2 y}{\partial t^2} + \kappa G A \frac{\partial^2 y}{\partial x^2} - \frac{\partial \phi}{\partial x} \right) = 0, \]  

\[ \rho I \left( \frac{\partial^2 \phi}{\partial t^2} + \frac{\partial^2 \theta}{\partial t^2} \right) - E I \frac{\partial^2 \phi}{\partial x^2} - \kappa G A \left( \frac{\partial y}{\partial x} - \phi \right) = 0, \]

\[ I_h \frac{\partial^2 \theta}{\partial t^2} = E I \frac{\partial \phi(t,0)}{\partial x} + u, \]  

\[ m \frac{\partial^2}{\partial t^2} \left( y(L,t) + L \theta \right) = -\kappa G A \left( \frac{\partial y(L,t)}{\partial x} - \phi(L,t) \right), \]

\[ I_c \frac{\partial^2 (\phi(L,t) + \theta)}{\partial t^2} = -E I \frac{\partial \phi(L,t)}{\partial x}, \] 

\[ \text{Figure 1: Translational Timoshenko arm.} \]

\[ \text{Figure 2: Rotational Timoshenko arm.} \]
The objective is to derive explicit expressions for feedback control $u$ for controlling the arm. The approach taken here is to consider the total energy of the arm at any time $t$ given by

$$V = \int_0^L \rho A \left( \frac{\partial y}{\partial t} + \frac{\partial w_b}{\partial t} \right)^2 + \rho I \left( \frac{\partial \phi}{\partial t} \right)^2 + \int_0^L \left[ EI \left( \frac{\partial \phi}{\partial x} \right)^2 + \kappa GA \left( \frac{\partial y}{\partial x} \right)^2 \right] dx,$$

that is positive definite with respect to $y = 0, dy/dt = 0$.

The Time derivative of (24) is given by

$$\frac{\partial V}{\partial t} = \int_0^L \rho A \left( \frac{\partial y}{\partial t} + \frac{\partial w_b}{\partial t} \right) \left( \frac{\partial \phi}{\partial t} \right) \left( \frac{\partial^2 \phi}{\partial t^2} \right) + \rho I \left( \frac{\partial^2 \phi}{\partial t^2} \right) + \int_0^L \left[ EI \left( \frac{\partial \phi}{\partial x} \right)^2 \frac{\partial \phi}{\partial x} \frac{\partial \phi}{\partial x} \right] dx$$

\[ + M_p \left( \frac{\partial w_b}{\partial t} \right) \left( \frac{\partial^2 \phi}{\partial t^2} \right) \]

\[ + \frac{1}{2} I_h \left( \frac{\partial \theta}{\partial t} \right)^2 + \frac{1}{2} L \left( \frac{\partial \phi}{\partial x} \right)^2 + \frac{1}{2} \int_0^L \left[ EI \left( \frac{\partial \phi}{\partial x} \right)^2 \frac{\partial \phi}{\partial x} \frac{\partial \phi}{\partial x} \right] dx. \]

By substituting (1) reduces to

$$\frac{\partial V}{\partial t} = \int_0^L \left[ \frac{\partial^2 \phi}{\partial x^2} - \frac{\partial \phi}{\partial x} \right] \left( \frac{\partial \phi}{\partial t} \right) + \rho I \left( \frac{\partial \phi}{\partial t} \right)^2 + \int_0^L \left[ EI \left( \frac{\partial \phi}{\partial x} \right)^2 \frac{\partial \phi}{\partial x} \frac{\partial \phi}{\partial x} \right] dx.$$
The time rate-of-change of $V$ is given by
\[
\frac{\partial V}{\partial t} = \int_0^L \left[ \rho A \left( \frac{\partial y}{\partial t} + x \frac{\partial \theta}{\partial t} \right) \left( \frac{\partial^2 y}{\partial t^2} + x \frac{\partial^2 \theta}{\partial t^2} \right) \right] dx + \rho I \left( \frac{\partial \phi}{\partial t} + \frac{\partial \theta}{\partial t} \right) \left( \frac{\partial^2 \phi}{\partial x^2} + \frac{\partial^2 \theta}{\partial t^2} \right) dx + I_k \left( \frac{\partial \theta}{\partial t} \right) \left( \frac{\partial^2 \theta}{\partial t^2} \right) dx
\]
\[
+ \int_0^L \left[ EI \left( \frac{\partial \phi}{\partial x} \right) \left( \frac{\partial^2 \phi}{\partial x^2} \right) \right] dx + \kappa GA \left( \phi \frac{\partial y}{\partial x} \right) \left( \frac{\partial \phi}{\partial t} - \frac{\partial^2 y}{\partial x \partial t} \right) dx.
\]
(31)

By substituting (10)-(11) reduces to
\[
\frac{\partial V}{\partial t} = \int_0^L \left[ \frac{\partial y}{\partial t} + x \frac{\partial \theta}{\partial t} \right] \left( \kappa GA \left( \frac{\partial^2 y}{\partial x^2} - \frac{\partial \phi}{\partial x} \right) \right) dx + \left( \frac{\partial \phi}{\partial t} + \frac{\partial \theta}{\partial t} \right) \left( EI \left( \frac{\partial \phi}{\partial x} \right) - \kappa GA \left( \phi - \frac{\partial y}{\partial x} \right) \right) dx \]
\[
+ \frac{\partial \theta}{\partial t} \left( EI \left( \frac{\partial \phi}{\partial x} \right) + u \right) + \int_0^L \left[ EI \left( \frac{\partial \phi}{\partial x} \right) \left( \frac{\partial^2 \phi}{\partial x^2} \right) \right] dx + \kappa GA \left( \phi - \frac{\partial y}{\partial x} \right) \left( \frac{\partial \phi}{\partial t} - \frac{\partial^2 y}{\partial x \partial t} \right) dx.
\]
(32)

The equation (32) is then integrated by parts and boundary conditions, (12)–(16) are substituted into the resulting equation. The result is
\[
\frac{\partial V}{\partial t} = \frac{\partial \theta}{\partial t} u.
\]
(33)

Taking into consideration of the fact that there is a feedback control law which gives nonpositive $\partial V/\partial t$ is
\[
u = -\frac{\gamma}{\kappa} \frac{\partial \theta}{\partial t} (y > 0).
\]
(34)

Substituting (34) into (33) leads to
\[
\frac{\partial V}{\partial t} = -\gamma \left( \frac{\partial \theta}{\partial t} \right)^2 \leq 0,
\]
(35)

which is negative semidefinite. This implies that the closed-loop system is energy dissipative and, hence, stable.

### 4. Passivity of Timoshenko Arm

Taking the time derivative of the total energy, and then integrating from 0 to $t$, we get the following restatement of energy balance principle:

\[
\frac{\partial V}{\partial t} = \int_0^t \frac{\partial w_b}{\partial t} \, dt = V(t) - V(0) \geq -V(0) = -\gamma_0^2 t^2,
\]
(36)

\[
\int_0^t \frac{\partial V}{\partial t} \, dt = V(t) - V(0) \geq -V(0) = -\gamma_0^2 t,
\]
(37)

where the left-hand side is the supplied energy and right-hand side is the energy at time $t$ minus the initial energy. Passivity of the operator $u$ relative to the function $V$ follows from the equation above and positivity of the total energy.

### 5. Simulation Results

Numerical inversion of Laplace transform is used to obtain the results in the time domain. The computation of the inverse Laplace transform is based on the paper of Hosono [14]. Numerical solutions are obtained by the Bromwich integrating the system corresponding to (A.1) and so forth. In the computer simulation study, we consider a typical arm whose parameters are given in the Table 1. Figures 3–6 show the step response of the arm-tip displacement with feedback gains variations. Figures 3 and 5 show the step response of the translational Euler arm. Figures 4 and 6 show the results of the Euler-Bernoulli beam equations.

### 6. Conclusion

In this paper, the passivity-based control of rotational and translational Timoshenko arms is studied. This approach has
Advances in Acoustics and Vibration

the advantage over the conventional methods in the respect that it allows one to deal directly with the system’s partial differential equations without resorting to approximations. Numerical results for the control of a translational and rotational flexible Timoshenko arm are presented and compared in graphical plots. They verify that the proposed control schemes are effective at controlling flexible dynamical systems and vibration control of mechanical systems.

Appendix

In the case of the translational Timoshenko arm, the resulting solution to (3), (4), and (5) is given by

\[ Y(x, z) = \frac{\Delta k_1}{\Delta} e^{k_1 x} + \frac{\Delta k_2}{\Delta} e^{k_2 x} - \frac{\Delta k_3}{\Delta} e^{-\lambda_1 x} - \frac{\Delta k_4}{\Delta} e^{-\lambda_2 x} - W_b, \]

(A.1)

where

\[ a_{11} = \left\{ m s^2 + \frac{\rho A s^2}{\lambda_1} \right\} e^{k_1 L}, \]
\[ a_{12} = \left\{ m s^2 + \frac{\rho A s^2}{\lambda_2} \right\} e^{k_2 L}, \]
\[ a_{13} = \left\{ m s^2 - \frac{\rho A s^2}{\lambda_1} \right\} e^{-\lambda_1 L}, \]
\[ a_{14} = \left\{ m s^2 - \frac{\rho A s^2}{\lambda_2} \right\} e^{-\lambda_2 L}, \]

\[ a_{21} = \left( \lambda_1 - \frac{\rho s^2}{\kappa G l_1} \right) (I s^2 + EI (1 + C s) \lambda_1) e^{k_1 L}, \]
\[ a_{22} = \left( \lambda_2 - \frac{\rho s^2}{\kappa G l_2} \right) (I s^2 + EI (1 + C s) \lambda_2) e^{k_2 L}, \]
\[ a_{23} = -\left( \lambda_1 - \frac{\rho s^2}{\kappa G l_1} \right) (I s^2 - EI (1 + C s) \lambda_1) e^{-\lambda_1 L}, \]
\[ a_{24} = -\left( \lambda_2 - \frac{\rho s^2}{\kappa G l_2} \right) (I s^2 - EI (1 + C s) \lambda_2) e^{-\lambda_2 L}, \]
\[ a_{31} = \left( \lambda_1 - \frac{\rho s^2}{\kappa G l_1} \right), \]
\[ a_{32} = \left( \lambda_2 - \frac{\rho s^2}{\kappa G l_2} \right), \]
\[ a_{33} = -\left( \lambda_1 - \frac{\rho s^2}{\kappa G l_1} \right), \]
\[ a_{34} = -\left( \lambda_2 - \frac{\rho s^2}{\kappa G l_2} \right), \]
