R: Root samples; S: Substrate samples. Difference among groups of L, M, H groups were tested with one-way ANOVA and different characters indicate significant differences ($p < 0.05$). Difference between R and S samples in each group were tested with Student's t test and '*' or '**' indicate significant differences ($p < 0.05$). (means \pm SD, $n = 3$)

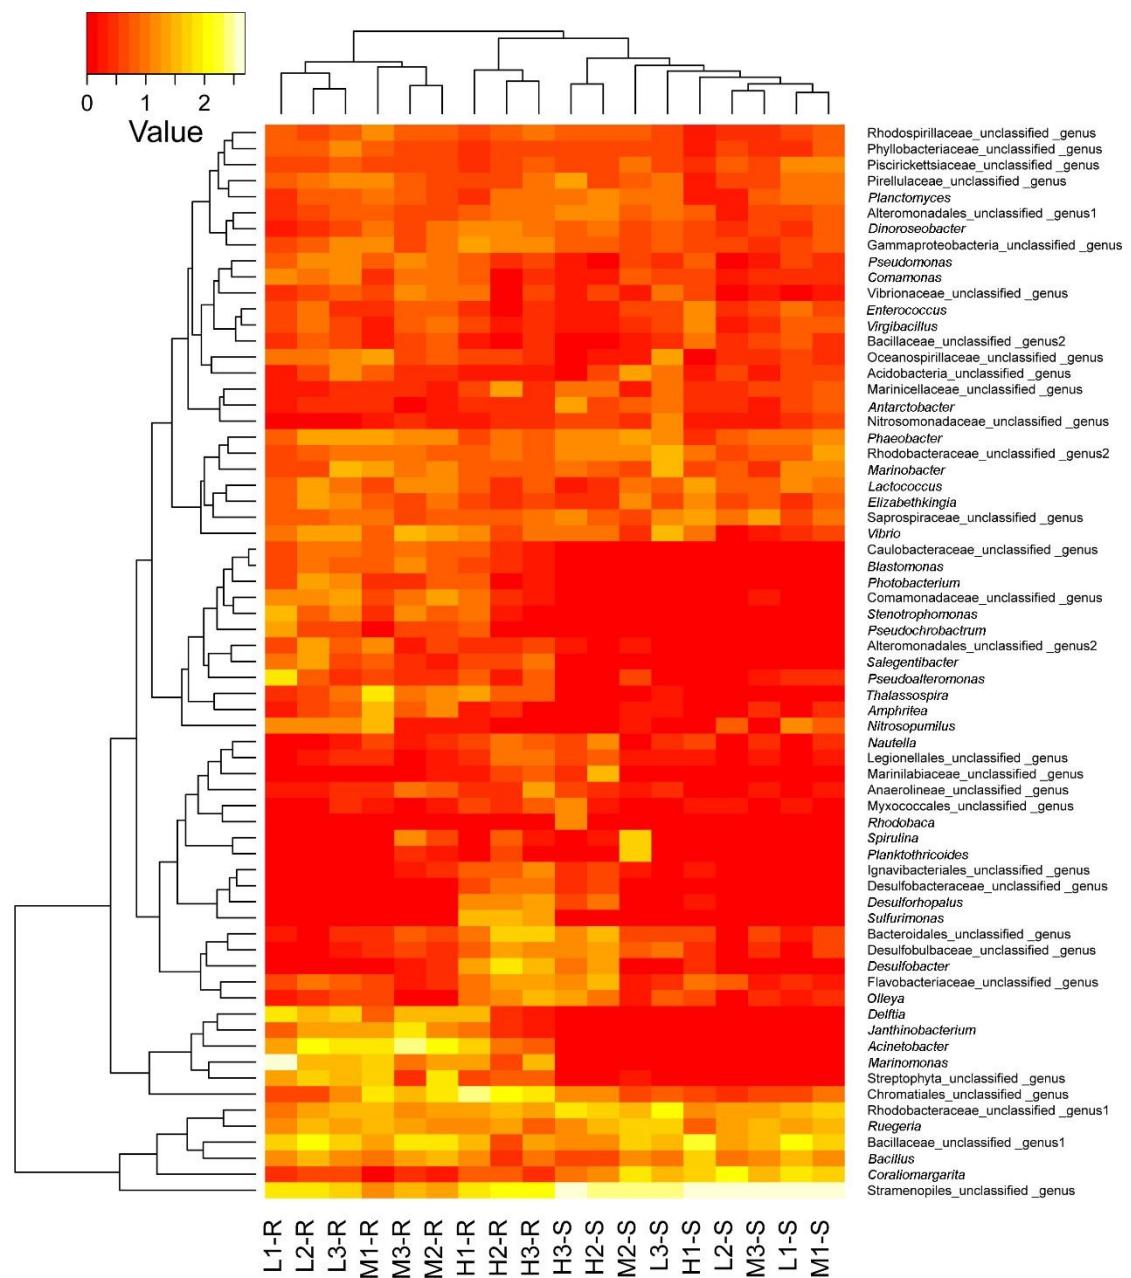

FIGURE S1: Heatmap of microbial genera of root and substrate samples treating mariculture wastewater of different TAN concentration. (dominant genus of relative abundance >1%).
