

383

384 **Figure S1: Expression of USP46 in human lung cancer cells was measured.** A & B. Relative mRNA and protein  
385 levels of USP46 in normal human bronchial epithelium (HBE) cells and indicated human lung cancer cells were  
386 measured by qRT-PCR (A) and WB (B) respectively, and the protein levels were quantified. Mean  $\pm$  SD, (n=3), \*\*\*  
387 means  $p < 0.001$ . C & D. Relative mRNA and protein levels of USP46 in indicated human lung cancer cells  
388 overexpressing USP46 were measured by RT-PCR (C) and WB (D) respectively, and the protein levels were  
389 quantified. USP46 mRNA level was normalized to beta-actin mRNA. Mean  $\pm$  SD, (n=3), \*\*\* means  $p < 0.001$ . E &  
390 F. Relative mRNA and protein levels of USP46 in H446 cells upon USP46 knock down were measured by qRT-PCR  
391 (E) and WB (F) respectively, and the protein levels were quantified. Mean  $\pm$  SD, (n=3), \*\*\* means  $p < 0.001$ .
