

## Special Issue on Osteogenic Biomaterials in Contemporary Dentistry

### Call for Papers

There have been developments and applications of osteogenic biomaterial substitutes in dentistry to replace missing dentition or to reinforce existing dentitions. The dentistry in practice has evolved into new treatment modality with the development and application of novel biocompatible materials. The examples are dental implants, bone graft materials, surgical plates, and any modification to increase biocompatibility and stability in dentition. These materials cover from replacing the missing teeth and/or degenerated supporting structures to the induction of new bone formation. Also, the osseointegrated materials further allowed orthopedic force application on these materials as skeletal anchorage to control tooth movements. Currently, modifications of the surface treatment or combination of osseoinductive materials to improve potential osseointegration are continuously endeavored.

Comprehension of recent advances in biomaterial of dentistry would lead to appropriate applications of these biomaterials and successful strategies to improve treatment outcomes to better serve patients.

We invite investigators to contribute with original research articles as well as review articles that will stimulate the continuing efforts to understand the development and application of osteogenic biomaterials in dentistry. We are particularly interested in articles describing properties of osteogenic biomaterials in dentistry and its clinical applications. Potential topics include, but are not limited to:

- Molecular mechanisms of osteogenic biomaterials
- The stability and safety of osteogenic substitutes
- Current knowledge in the osseointegration of metals and alloys used in dentistry
- Guided bone regeneration and tissue engineering approaches
- Clinical application of stem cells and the implications
- Clinical application of biocompatible materials and the implications (composites, bioabsorbable materials, etc.)
- Introduction of new surface treatments to increase the osseointegration in vivo or in vitro studies
- Histological identification of change in tissue adjacent to the biomaterials

- Nanoscale analysis of osseointegrated surfaces (i.e., nanotechnological approaches for porosity)
- Innovative advances in surgical procedure to improve osseointegration
- Modified dental implant as a gateway to the human body: implant mediated drug delivery system
- Smart module using implants: monitoring and control devices
- Contributing factors or precautions for successful placement and maintenance of biomaterials maintenance of biomaterials

Before submission authors should carefully read over the journal's Author Guidelines, which are located at <http://www.hindawi.com/journals/bmri/guidelines/>. Prospective authors should submit an electronic copy of their complete manuscript through the journal Manuscript Tracking System at <http://mts.hindawi.com/submit/journals/bmri/biomaterials/osteod/> according to the following timetable:

Manuscript Due	Friday, 25 July 2014
First Round of Reviews	Friday, 17 October 2014
Publication Date	Friday, 12 December 2014

### Lead Guest Editor

**Seong-Hun Kim**, Department of Orthodontics, School of Dentistry, Kyung Hee University, Seoul, Republic of Korea; [bravortho@khu.ac.kr](mailto:bravortho@khu.ac.kr)

### Guest Editors

**Jae-Pyung Ahn**, Korea Institute of Science and Technology (KIST), Seoul, Republic of Korea; [jpahn@kist.re.kr](mailto:jpahn@kist.re.kr)

**Homayoun H. Zadeh**, School of Dentistry, University of Southern California (USC), Los Angeles, CA, USA; [zadeh@usc.edu](mailto:zadeh@usc.edu)

**Eric Jein-Wein Liou**, Department of Orthodontic and Craniofacial Dentistry, Chang Gung University, Taipei, Taiwan; [lioueric@ms19.hinet.net](mailto:lioueric@ms19.hinet.net)
