The fundamental aim of this paper is to construct (h, q) -Genocchi numbers and polynomials with weight α . We shall obtain some interesting relations by using p -adic q -integral on $\mathbb{Z}_p$ in the sense of fermionic. Also, we shall derive the (h, q) -extensions of zeta type functions with weight α from the Mellin transformation of this generating function which interpolates the (h, q) -Genocchi numbers and polynomials with weight α at negative integers.

1. Introduction, Definitions, and Notations

Let p be a fixed odd prime number. Throughout this paper we use the following notations. $\mathbb{Z}_p$ denotes the ring of p -adic rational integers, $\mathbb{Q}$ denotes the field of rational numbers, $\mathbb{Q}_p$ denotes the field of p -adic rational numbers, and $\mathbb{C}_p$ denotes the completion of algebraic closure of $\mathbb{Q}_p$. Let $\mathbb{N}$ be the set of natural numbers and $\mathbb{N}^* = \mathbb{N} \cup \{0\}$. The p -adic absolute value is defined by $|p|_p = 1/p$. In this paper, we assume $|q - 1|_p < 1$ as an indeterminate. In [1–3], Kim defined the fermionic p -adic q -integral on $\mathbb{Z}_p$ as follows:

$$I_{-q}(f) = \int_{\mathbb{Z}_p} f(x) d\mu_{-q}(x) = \lim_{N \rightarrow \infty} \frac{1}{[p^N]_{-q}} \sum_{x=0}^{p^N-1} f(x) (-q)^x. \quad (1.1)$$

$[x]_q$ is a q -extension of x which is defined by

$$[x]_q = \frac{1 - q^x}{1 - q}, \quad (1.2)$$

see [1–15].

Note that $\lim_{q \rightarrow 1} [x]_q = x$.

Let $f_n(x) = f(x + n)$. By the definition (1.1) we easily get

$$\begin{aligned} -qI_{-q}(f_1) &= \lim_{N \rightarrow \infty} \frac{1}{[p^N]_{-q}} \sum_{x=0}^{p^N-1} f(x+1)(-q)^{x+1} \\ &= \lim_{N \rightarrow \infty} \frac{1}{[p^N]_{-q}} \sum_{x=0}^{p^N-1} f(x)(-q)^x - (1+q) \lim_{N \rightarrow \infty} \frac{f(p^N)q^{p^N} + f(0)}{1 + q^{p^N}} \\ &= I_{-q}(f) - [2]_q f(0). \end{aligned} \quad (1.3)$$

Continuing this process, we obtain easily the relation

$$q^n I_{-q}(f_n) + (-1)^{n-1} I_{-q}(f) = [2]_q \sum_{l=0}^{n-1} (-1)^{n-l-1} q^l f(l), \quad (1.4)$$

(h, q) -Genocchi numbers are defined as follows:

$$G_{0,q}^{(h)} = 0, \quad q^{h-2} \left(q G_q^{(h)} + 1 \right)^n + G_{n,q}^{(h)} = \begin{cases} [2]_q, & \text{if } n = 1, \\ 0, & \text{if } n > 1, \end{cases} \quad (1.5)$$

with the usual convention about replacing $(G_q^{(h)})^n$ by $G_{n,q}^{(h)}$ (see [6]).

In this paper, we constructed (h, q) -Genocchi numbers and polynomials with weight α . By using fermionic p -adic q -integral equations on $\mathbb{Z}_p$, we investigated some interesting identities and relations on the (h, q) -Genocchi numbers and polynomials with weight α . Furthermore, we derive the q -extensions of zeta type functions with weight α from the Mellin transformation of this generating function which interpolates the (h, q) -Genocchi polynomials with weight α .

2. On the Weighted (h, q) -Genocchi Numbers and Polynomials

In this section, by using fermionic p -adic q -integral equations on $\mathbb{Z}_p$, some interesting identities and relation on the (h, q) -Genocchi numbers and polynomials with weight α are shown.

Definition 2.1. Let $\alpha, n \in \mathbb{N}^*$ and $h \in \mathbb{N}$. Then the (h, q) -Genocchi numbers with weight α defined by as follows:

$$\frac{\tilde{G}_{n+1,q}^{(\alpha,h)}}{n+1} = [2]_q \sum_{m=0}^{\infty} (-1)^m q^{mh} [m]_{q^\alpha}^n. \quad (2.1)$$

If we take $h = 1$ to (2.1), then we have, $\tilde{G}_{n+1,q}^{(\alpha,1)} = \tilde{G}_{n+1,q}^{(\alpha)}$ (see [5]).

From (2.1), we obtain

$$\begin{aligned}
 \frac{\tilde{G}_{n+1,q}^{(\alpha,h)}}{n+1} &= \frac{[2]_q}{(1-q^\alpha)^n} \sum_{m=0}^{\infty} (-1)^m q^{mh} (1-q^{m\alpha})^n \\
 &= \frac{[2]_q}{(1-q^\alpha)^n} \left[\sum_{m=0}^{\infty} (-1)^m q^{mh} \sum_{l=0}^n \binom{n}{l} (-1)^l (q^{m\alpha})^l \right] \\
 &= \frac{[2]_q}{(1-q^\alpha)^n} \sum_{l=0}^n \binom{n}{l} (-1)^l \sum_{m=0}^{\infty} (-1)^m q^{mal+mh} \\
 &= \frac{[2]_q}{(1-q^\alpha)^n} \sum_{l=0}^n \binom{n}{l} (-1)^l \frac{1}{1+q^{\alpha l+h}}
 \end{aligned} \tag{2.2}$$

Therefore, we obtain the following theorem.

Theorem 2.2. For $\alpha, n \in \mathbb{N}^*$ and $h \in \mathbb{N}$. Then

$$\frac{\tilde{G}_{n+1,q}^{(\alpha,h)}}{n+1} = \frac{[2]_q}{(1-q^\alpha)^n} \sum_{l=0}^n \binom{n}{l} (-1)^l \frac{1}{1+q^{\alpha l+h}}. \tag{2.3}$$

In (1.1), one takes $f(x) = q^{(h-1)x} [x]_{q^\alpha}^n$,

$$\begin{aligned}
 \int_{\mathbb{Z}_p} q^{(h-1)x} [x]_{q^\alpha}^n d\mu_{-q}(x) &= \frac{1}{(1-q^\alpha)^n} \sum_{l=0}^n \binom{n}{l} (-1)^l \int_{\mathbb{Z}_p} q^{x(\alpha l+h-1)} d\mu_{-q}(x) \\
 &= \frac{1}{(1-q^\alpha)^n} \sum_{l=0}^n \binom{n}{l} (-1)^l \lim_{N \rightarrow \infty} \frac{1}{[p^N]_{-q}} \sum_{x=0}^{p^N-1} (-q^{\alpha l+h})^x \\
 &= \frac{1}{(1-q^\alpha)^n} \sum_{l=0}^n \binom{n}{l} (-1)^l \frac{(1+q)}{1+q^{\alpha l+h}} \lim_{N \rightarrow \infty} \frac{1+(q^{\alpha l+h})^{p^N}}{1+q^{p^N}} \\
 &= \frac{[2]_q}{(1-q^\alpha)^n} \sum_{l=0}^n \binom{n}{l} (-1)^l \frac{1}{1+q^{\alpha l+h}} \\
 &= \frac{\tilde{G}_{n+1,q}^{(\alpha,h)}}{n+1}.
 \end{aligned} \tag{2.4}$$

From [12], we obtain (h, q) -Genocchi numbers with weight α witt's type formula as follows.

Theorem 2.3. For $\alpha, n \in \mathbb{N}^*$ and $h \in \mathbb{N}$. Then

$$\frac{\tilde{G}_{n+1,q}^{(\alpha,h)}}{n+1} = \int_{\mathbb{Z}_p} q^{(h-1)x} [x]_{q^\alpha}^n d\mu_{-q}(x). \quad (2.5)$$

From (2.1), one easily gets

$$\int_{\mathbb{Z}_p} q^{(h-1)x} e^{t[x]_{q^\alpha}} d\mu_{-q}(x) = t[2]_q \sum_{m=0}^{\infty} (-1)^m q^{mh} e^{t[m]_{q^\alpha}}. \quad (2.6)$$

By (2.6), one has

$$\sum_{n=0}^{\infty} \tilde{G}_{n,q}^{(\alpha,h)} \frac{t^n}{n!} = t[2]_q \sum_{m=0}^{\infty} (-1)^m q^{mh} e^{t[m]_{q^\alpha}}. \quad (2.7)$$

Therefore, we obtain the following corollary.

Corollary 2.4. If $\tilde{G}_{0,q}^{(\alpha,h)} = 0$. Let $D_q^{(\alpha,h)}(t) = \sum_{n=0}^{\infty} \tilde{G}_{n,q}^{(\alpha,h)} (t^n/n!)$. Then

$$D_q^{(\alpha,h)}(t) = t[2]_q \sum_{m=0}^{\infty} (-1)^m q^{mh} e^{t[m]_{q^\alpha}}. \quad (2.8)$$

Now, one considers the (h, q) -Genocchi polynomials with weight α as follows:

$$\frac{\tilde{G}_{n+1,q}^{(\alpha,h)}(x)}{n+1} = \int_{\mathbb{Z}_p} q^{(h-1)y} [x+y]_{q^\alpha}^n d\mu_{-q}(y), \quad n \in \mathbb{N}, \alpha \in \mathbb{N}^*. \quad (2.9)$$

From (2.9), one sees that

$$\frac{\tilde{G}_{n+1,q}^{(\alpha,h)}(x)}{n+1} = \frac{[2]_q}{(1-q^\alpha)^n} \sum_{l=0}^n \binom{n}{l} (-1)^l q^{\alpha l x} \frac{1}{1+q^{\alpha l+h}} = [2]_q \sum_{m=0}^{\infty} (-1)^m q^{mh} [m+x]_{q^\alpha}^n. \quad (2.10)$$

Let $D_q^{(\alpha,h)}(t, x) = \sum_{n=0}^{\infty} \tilde{G}_{n,q}^{(\alpha,h)}(x) (t^n/n!)$. Then, one has

$$D_q^{(\alpha,h)}(t, x) = t[2]_q \sum_{m=0}^{\infty} (-1)^m q^{mh} e^{t[m+x]_{q^\alpha}} = \sum_{n=0}^{\infty} \tilde{G}_{n,q}^{(\alpha,h)}(x) \frac{t^n}{n!}. \quad (2.11)$$

By (1.4), one sees that

$$q^{hn} \frac{\tilde{G}_{m+1,q}^{(\alpha,h)}(n)}{m+1} + (-1)^{n-1} \frac{\tilde{G}_{m+1,q}^{(\alpha,h)}}{m+1} = [2]_q \sum_{l=0}^{n-1} (-1)^{n-l-1} q^{hl} [l]_{q^\alpha}^m. \quad (2.12)$$

Therefore, we obtain the following theorem.

Theorem 2.5. For $m, h \in \mathbb{N}$, and $\alpha, n \in \mathbb{N}^*$, one has

$$q^{hn} \frac{\tilde{G}_{m+1,q}^{(\alpha,h)}(n)}{m+1} + (-1)^{n-1} \frac{\tilde{G}_{m+1,q}^{(\alpha,h)}}{m+1} = [2]_q \sum_{l=0}^{n-1} (-1)^{n-l-1} q^{hl} [l]_{q^\alpha}^m. \quad (2.13)$$

In (1.3), it is known that

$$qI_{-q}(f_1) + I_{-q}(f) = [2]_q f(0). \quad (2.14)$$

If we take $f(x) = q^{(h-1)x} e^{t[x]_{q^\alpha}}$, then one has

$$\begin{aligned} [2]_q &= q \int_{\mathbb{Z}_p} q^{(h-1)(x+1)} e^{t[x+1]_{q^\alpha}} d\mu_{-q}(x) + \int_{\mathbb{Z}_p} q^{(h-1)x} e^{t[x]_{q^\alpha}} d\mu_{-q}(x) \\ &= \sum_{m=0}^{\infty} \left(q^h \frac{\tilde{G}_{m+1,q}^{(\alpha,h)}(1)}{m+1} + \frac{\tilde{G}_{m+1,q}^{(\alpha,h)}}{m+1} \right) \frac{t^m}{m!}. \end{aligned} \quad (2.15)$$

Therefore, by (2.15), we obtain the following theorem.

Theorem 2.6. For $\alpha \in \mathbb{N}^*$ and $m, h \in \mathbb{N}$, one has

$$\tilde{G}_{0,q}^{(\alpha,h)} = 0, \quad q^h \frac{\tilde{G}_{m+1,q}^{(\alpha,h)}(1)}{m+1} + \frac{\tilde{G}_{m+1,q}^{(\alpha,h)}}{m+1} = \begin{cases} [2]_q, & \text{if } m = 0, \\ 0, & \text{if } m \neq 0. \end{cases} \quad (2.16)$$

From (2.9), one can easily derive the following:

$$\begin{aligned} \int_{\mathbb{Z}_p} q^{(h-1)y} [x+y]_{q^\alpha}^n d\mu_{-q}(y) &= \frac{[d]_{q^\alpha}^n}{[d]_{-q}} \sum_{a=0}^{d-1} (-1)^a q^{ha} \int_{\mathbb{Z}_p} q^{dy(h-1)} \left[\frac{x+a}{d} + y \right]_{q^{da}}^n d\mu_{(-q)^d}(y) \\ &= \frac{[d]_{q^\alpha}^n}{[d]_{-q}} \sum_{a=0}^{d-1} (-1)^a q^{ha} \frac{\tilde{G}_{n+1,q^d}^{(\alpha,h)}((x+a)/d)}{n+1}. \end{aligned} \quad (2.17)$$

Therefore, by (2.17), we obtain the following theorem.

Theorem 2.7. For $d \equiv 1 \pmod{2}$, $n \in \mathbb{N}^*$ and $\alpha, h \in \mathbb{N}$

$$\tilde{G}_{n+1,q}^{(\alpha,h)}(x) = \frac{[d]_{q^\alpha}^n}{[d]_{-q}} \sum_{a=0}^{d-1} (-1)^a q^{ha} \tilde{G}_{n+1,q^d}^{(\alpha,h)}\left(\frac{x+a}{d}\right). \quad (2.18)$$

3. Interpolation Function of the Polynomials $\tilde{G}_{n,q}^{(\alpha,h)}(x)$

In this section, we give interpolation function of the generating functions of (h, q) -Genocchi polynomials with weight α . For $s \in \mathbb{C}$ and $h \in \mathbb{N}$, by applying the Mellin transformation to (2.11), we obtain

$$\mathfrak{J}_q^{(\alpha,h)}(s, x) = \frac{1}{\Gamma(s)} \int_0^\infty t^{s-2} \left(-D_q^{(\alpha,h)}(-t, x) \right) dt = [2]_q \sum_{m=0}^\infty (-1)^m q^{mh} \frac{1}{\Gamma(s)} \int_0^\infty t^{s-1} e^{-t[m+x]_{q^\alpha}} dt, \quad (3.1)$$

so we have

$$\mathfrak{J}_q^{(\alpha,h)}(s, x) = [2]_q \sum_{m=0}^\infty \frac{(-1)^m q^{mh}}{[m+x]_{q^\alpha}^s}. \quad (3.2)$$

We define q -extension zeta type function as follows.

Theorem 3.1. For $s \in \mathbb{C}$, $h \in \mathbb{N}$, and $\alpha \in \mathbb{N}^*$. One has

$$\mathfrak{J}_q^{(\alpha,h)}(s, x) = [2]_q \sum_{m=0}^\infty \frac{(-1)^m q^{mh}}{[m+x]_{q^\alpha}^s}. \quad (3.3)$$

$\mathfrak{J}_q^{(\alpha,h)}(s, x)$ can be continued analytically to an entire function.

By substituting $s = -n$ into (3.3) one easily gets

$$\mathfrak{J}_q^{(\alpha,h)}(-n, x) = \frac{\tilde{G}_{n+1,q}^{(\alpha,h)}(x)}{n+1}. \quad (3.4)$$

We obtain the following theorem.

Theorem 3.2. For $h \in \mathbb{N}$ and $q, s \in \mathbb{C}$, $|q| < 1$. Then one defines

$$\mathfrak{J}_q^{(\alpha,h)}(-n, x) = \frac{\tilde{G}_{n+1,q}^{(\alpha,h)}(x)}{n+1}. \quad (3.5)$$
