This paper is concerned with the optimal Kalman filtering problem for a class of discrete stochastic systems with multiplicative noises and random two-step sensor delays. Three Bernoulli distributed random variables with known conditional probabilities are introduced to characterize the phenomena of the random two-step sensor delays which may happen during the data transmission. By using the state augmentation approach and innovation analysis technique, an optimal Kalman filter is constructed for the augmented system in the sense of the minimum mean square error (MMSE). Subsequently, the optimal Kalman filtering is derived for corresponding augmented system in initial instants. Finally, a simulation example is provided to demonstrate the feasibility and effectiveness of the proposed filtering method.

1. Introduction

The filtering problem has been a mainstream research topic in the control theory due to its wide and important engineering applications such as signal processing, econometrics communication, guidance, navigation, and control of vehicles [1–4]. Kalman filtering, also known as linear optimal quadratic estimation, has attracted much research interests due to its good filtering performance and simple filtering structure [5, 6]. In [7], based on the minimum mean square error (MMSE) principle and the projection theory, the traditional Kalman filtering algorithm has been proposed for a class of linear discrete stochastic systems. Subsequently, the Kalman filtering problems have been widely investigated for different systems [8, 9]. For the nonlinear model, the theoretical results of the extended Kalman filter (EKF) have been proposed and applied in many practical engineering problems [10–13]. For example, in [14], the EKF algorithm has been employed to deal with the mobile robot localization problem with intermittent measurements, where the cases of missing measurements and uncertainties have been addressed. For

the microelectromechanical systems, a new terminal sliding-mode control scheme has been designed in [15] by using the EKF observer.

During the processes of signal measurement, transmission, and computation, the sensor delays are frequently encountered and are inevitable especially in the networked systems [16–21]. The existence of the sensor delays would deteriorate the filtering accuracy and even influence the control system performance [22–26]. Hence, it is not a surprise that a great number of results have been reported to handle the Kalman filtering problems with the sensor delays [8, 9, 27]. To mention a few, the optimal Kalman filtering problem has been investigated in [8] for linear discrete system with sensor delays, packet dropouts, and uncertain observations. It has been shown that a unified augmentation method has been proposed in [8] by applying the projection theory and recursive projection formula, which can reduce the amount of correlated parameters. Motivated by the method in [8], the optimal Kalman filtering algorithm has been given in [9] for the systems with *random* sensor delays. Based on the unbiasedness and MMSE of the optimal Kalman filtering,

the recursive optimal Kalman filtering approaches have been developed in [27, 28] for linear stochastic systems with random sensor delays. Compared with the methods in [27, 28], the developed approach in [9] can reduce the amount of correlated parameters when tackling the optimal filtering problem for systems with random sensor delays.

Note that a great deal of effort has been devoted to address the problems of optimal Kalman filtering with one-step sensor delay in the past years [29, 30]. Nevertheless, it should be pointed out that randomly occurring two-step sensor delays are also encountered in some networked systems [31]. Recently, the case of the noisy observation measurements with random one-step or two-step sample delays has been investigated and a novel unscented filtering algorithm has been given in [31] for a class of nonlinear discrete-time stochastic systems. On the other hand, it is necessary to deal with the multiplicative noises when designing the Kalman filtering [32–34]. The optimal nonfragile Kalman-type filtering problem has been investigated in [32] for a class of systems with multiplicative noises, finite-step autocorrelated measurement noises, and multiple packet dropouts, where the state-dependent multiplicative noises have been used to account for the stochastic uncertainties. In [33], a new nonlinear filter has been constructed to attenuate the effects from the multiplicative noises and the signal quantization. In [34], the linear minimum mean square estimator has been designed for linear discrete-time systems with state and measurement multiplicative noises and Markov jumps on the parameters. It is worth pointing out that, however, the optimal Kalman filtering problem has not been investigated for linear stochastic systems with multiplicative noises and random two-step sensor delays yet.

Motivated by the above discussions, in this paper, we aim to discuss the problem of optimal Kalman filtering for linear discrete stochastic system with multiplicative noises and random two-step sensor delays. The state-dependent multiplicative noises are considered to account for the stochastic uncertainties. The phenomena of two-step sensor delays may happen in data transmission and are described by using three Bernoulli distributed random variables with known conditional probabilities. Based on the MMSE estimation principle, the optimal Kalman filtering problem has been discussed for system with multiplicative noises and random two-step sensor delays. Firstly, we consider a general case for the original system where $k \geq 3$. By using the state augmentation approach and the projection theory, the optimal Kalman filtering algorithm has been given for augmented system. Then, the optimal Kalman filtering for the original system can be obtained easily. Secondly, we discuss the initial case when $k = 1$ ($k = 2$) and give some parameters to help algorithm developments. The main contributions of this paper can be highlighted as follows: (1) the system model is more general where the multiplicative noises and randomly occurring two-step sensor delays are considered simultaneously and (2) a new Kalman filter is designed to handle the addressed complex phenomena. Finally, an illustrative example is provided to verify the feasibility and effectiveness of the proposed result.

The rest of this paper is organized as follows. In Section 2, the problem addressed is formulated and some preliminaries are briefly introduced. In Section 3, a new Kalman filtering algorithm is proposed to deal with the systems with multiplicative noises and random two-step sensor delays and the explicit form of the filter gain is given. In Section 4, an illustrative example is used to show the effectiveness of the proposed filtering method. Finally, we provide the conclusions in Section 5.

Notations. The notations used throughout the paper are standard. $\mathcal{R}^n$ and $\mathcal{R}^{n \times m}$ denote the n -dimensional Euclidean space and the set of all $n \times m$ matrices, respectively. For a matrix P , the P^T and P^{-1} represent its transpose and inverse, respectively. $\mathbb{E}\{x\}$ stands for the expectation of a stochastic variable x . $\text{diag}\{P_1, P_2, \dots, P_n\}$ stands for a block-diagonal matrix with matrices $P_1, P_2, \dots, P_n$ on the diagonal. I and 0 represent the identity matrix and the zero matrix with appropriate dimensions, respectively. Matrices are assumed to be compatible with algebraic operations if their dimensions are not explicitly stated.

2. Problem Formulation and Preliminaries

In this paper, we consider the following class of discrete uncertain stochastic systems with multiplicative noises and random two-step sensor delays:

$$x_{k+1} = (A_k + A_{s,k}\xi_k)x_k + B_k\omega_k \quad (1)$$

$$z_k = (C_k + C_{s,k}\eta_k)x_k + \nu_k \quad (2)$$

$$y_k = \sum_{i=0}^{\min\{k-1,2\}} \gamma_k^i z_{k-i}, \quad (3)$$

where $x_k \in \mathcal{R}^n$ is the system state vector to be estimated, $z_k \in \mathcal{R}^m$ is measured output, and $y_k \in \mathcal{R}^m$ is measurement received by the sensor. $\omega_k \in \mathcal{R}^n$ and $\nu_k \in \mathcal{R}^m$ are uncorrelated white noises with zero means and variance matrices $Q_{\omega_k} \geq 0$ and $Q_{\nu_k} > 0$. ξ_k and η_k are multiplicative noises with zero means and unity covariances and are uncorrelated with other noise signals. A_k , $A_{s,k}$, B_k , C_k , and $C_{s,k}$ are known real time-varying matrices with appropriate dimensions.

The random variables γ_k^i obey the Bernoulli distribution and have the following statistical properties:

$$\text{Prob}\{\gamma_k^i = 1\} = \mathbb{E}\{\gamma_k^i\} = \alpha_i, \quad (4)$$

$$\text{Prob}\{\gamma_k^i = 0\} = 1 - \mathbb{E}\{\gamma_k^i\} = 1 - \alpha_i,$$

where $\alpha_i \in [0, 1]$ ($i = 0, 1, 2$) are known positive scalars. Assume that γ_k^i are mutually independent of other noise signals.

Remark 1. As in [31], for $k \geq 3$, if $\gamma_k^0 = 1$, $\gamma_k^1 = 0$, and $\gamma_k^2 = 0$ in model (3), one has $y_k = z_k$; that is, the sensor receives the data at the time instant k ; if $\gamma_k^0 = 0$, $\gamma_k^1 = 1$, and $\gamma_k^2 = 0$, one has $y_k = z_{k-1}$; that is, there exists the one-step time delay; if $\gamma_k^0 = 0$, $\gamma_k^1 = 0$, and $\gamma_k^2 = 1$, one has $y_k = z_{k-2}$; that is, there

exists the two-step time delays. For special cases, when $k = 1$, the sensor receives the signal on time, $y_1 = \gamma_1^0 z_1$ with $\gamma_1^0 = 1$. When $k = 2$, the sensor receives the signal on time or the one-step sensor delay occurs, $y_2 = \gamma_2^0 z_2 + \gamma_2^1 z_1$; here $\gamma_2^0 = 1, \gamma_2^1 = 0$ or $\gamma_2^0 = 0$, and $\gamma_2^1 = 1$; that is, $\gamma_2^0 + \gamma_2^1 = 1$. In other words, these Bernoulli distributed variables satisfy $\sum_{i=0}^{\min\{k-1, 2\}} \gamma_k^i = 1$ for all $k \geq 1$.

Assumption 2. The initial state x_0 is uncorrelated with other noise signals, and

$$\mathbb{E}\{x_0\} = \mu_0, \quad \mathbb{E}\{(x_0 - \mu_0)(x_0 - \mu_0)^T\} = P_0. \quad (5)$$

Without loss of generality, for $k \geq 3$, we can rewrite (3) as follows:

$$y_k = \gamma_k^0 z_k + \gamma_k^1 z_{k-1} + \gamma_k^2 z_{k-2}. \quad (6)$$

By defining $\tilde{x}_k = [x_k^T \ x_{k-1}^T \ x_{k-2}^T]^T$, the systems (1), (2), and (6) can be rewritten as the following compact form:

$$\tilde{x}_{k+1} = \tilde{\Phi}_k \tilde{x}_k + \tilde{B}_k \tilde{\omega}_k \quad (7)$$

$$\tilde{y}_k = \tilde{H}_k \tilde{x}_k + \tilde{\Lambda}_k \tilde{v}_k, \quad (8)$$

where

$$\tilde{y}_k = y_k, \quad \tilde{\omega}_k = \omega_k, \quad \tilde{v}_k = \begin{bmatrix} v_k \\ v_{k-1} \\ v_{k-2} \end{bmatrix},$$

$$\tilde{\Phi}_k = \tilde{A}_k + \xi_k \tilde{A}_{s,k}, \quad \tilde{A}_k = \begin{bmatrix} A_k & 0 & 0 \\ I & 0 & 0 \\ 0 & I & 0 \end{bmatrix},$$

$$\tilde{A}_{s,k} = \begin{bmatrix} A_{s,k} & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix}, \quad \tilde{B}_k = \begin{bmatrix} B_k \\ 0 \\ 0 \end{bmatrix},$$

$$\tilde{H}_k = \tilde{\Lambda}_k \tilde{C}_k + \tilde{\Lambda}_k \tilde{C}_{s,k} \tilde{\eta}_k, \quad \tilde{\Lambda}_k = \begin{bmatrix} \gamma_k^0 I \\ \gamma_k^1 I \\ \gamma_k^2 I \end{bmatrix}^T,$$

$$\tilde{C}_k = \begin{bmatrix} C_k & 0 & 0 \\ 0 & C_{k-1} & 0 \\ 0 & 0 & C_{k-2} \end{bmatrix}, \quad \tilde{C}_{s,k} = \begin{bmatrix} C_{s,k} & 0 & 0 \\ 0 & C_{s,k-1} & 0 \\ 0 & 0 & C_{s,k-2} \end{bmatrix},$$

$$\tilde{\eta}_k = \begin{bmatrix} \eta_k I & 0 & 0 \\ 0 & \eta_{k-1} I & 0 \\ 0 & 0 & \eta_{k-2} I \end{bmatrix}. \quad (9)$$

For convenience of the subsequent developments, set

$$\begin{aligned} \bar{\Phi}_k &= \mathbb{E}\{\tilde{\Phi}_k\} = \tilde{A}_k, & \Delta\Phi_k &= \tilde{\Phi}_k - \bar{\Phi}_k = \xi_k \tilde{A}_{s,k}, \\ \bar{\Lambda}_k &= \gamma_k^0 \Lambda_0 + \gamma_k^1 \Lambda_1 + \gamma_k^2 \Lambda_2, \\ \bar{\Lambda}_k &= \mathbb{E}\{\tilde{\Lambda}_k\} = [\alpha_0 I \ \alpha_1 I \ \alpha_2 I], \\ \Lambda_0 &= [I \ 0 \ 0], & \Lambda_1 &= [0 \ I \ 0], \\ \Lambda_2 &= [0 \ 0 \ I], \end{aligned}$$

$$\Delta\Lambda_k = \tilde{\Lambda}_k - \bar{\Lambda}_k = \begin{bmatrix} (\gamma_k^0 - \alpha_0) I \\ (\gamma_k^1 - \alpha_1) I \\ (\gamma_k^2 - \alpha_2) I \end{bmatrix}^T$$

$$= (\gamma_k^0 - \alpha_0) \Lambda_0 + (\gamma_k^1 - \alpha_1) \Lambda_1 + (\gamma_k^2 - \alpha_2) \Lambda_2,$$

$$\bar{H}_k = \mathbb{E}\{\tilde{H}_k\} = \bar{\Lambda}_k \tilde{C}_k,$$

$$\Delta H_k = \tilde{H}_k - \bar{H}_k = (\tilde{\Lambda}_k - \bar{\Lambda}_k) \tilde{C}_k + \tilde{\Lambda}_k \tilde{C}_{s,k} \tilde{\eta}_k,$$

$$\tilde{\eta}_k = \eta_k N_0 + \eta_{k-1} N_1 + \eta_{k-2} N_2,$$

$$N_0 = \text{diag}\{I, 0, 0\}, \quad N_1 = \text{diag}\{0, I, 0\},$$

$$N_2 = \text{diag}\{0, 0, I\}.$$

(10)

Then, it is easy to obtain that

$$\mathbb{E}\{\Delta\Phi_k\} = 0, \quad \mathbb{E}\{\Delta H_k\} = 0, \quad \mathbb{E}\{\Delta\Lambda_k\} = 0. \quad (11)$$

The purpose of this paper is to design the optimal Kalman filter $\hat{x}_{k|k}$ for the addressed discrete uncertain stochastic systems (1)–(3) based on the observation sequence $\{y_1, y_2, \dots, y_{k-1}\}$. Noting the relationship between the original system and the augmented system, we know $\hat{x}_{k|k} = [I \ 0 \ 0] \hat{\tilde{x}}_{k|k}$.

3. Main Results

In this section, by using the projection theory, the recursion of the Kalman filtering is derived and the explicit expression of the filter gain is given.

To facilitate the subsequent developments, we introduce the following definition and lemmas.

Definition 3 (see [8]). Let $\Xi_k = \mathbb{E}\{\tilde{x}_k \tilde{x}_k^T\}$ be the state covariance matrix. Then, one has

$$\Delta_{\tilde{T}_k \tilde{U}_k}(\Xi_k) = \mathbb{E}\left\{\left[\tilde{T}_k - \mathbb{E}\{\tilde{T}_k\}\right] \tilde{x}_k \tilde{x}_k^T \left[\tilde{U}_k - \mathbb{E}\{\tilde{U}_k\}\right]^T\right\}, \quad (12)$$

where $\tilde{T}_k$ and $\tilde{U}_k$ are time-varying stochastic matrices.

Motivated by the excellent results in [8], we can obtain the following lemmas which would be helpful for the further calculation.

Lemma 4. According to the definition of the $\tilde{\Phi}_k$ and $\tilde{H}_k$, one has

$$\Delta_{\tilde{\Phi}_k \tilde{\Phi}_k}(\Xi_k) = \tilde{A}_{s,k} \Xi_k \tilde{A}_{s,k}^T \quad (13)$$

$$\begin{aligned} \Delta_{\tilde{H}_k \tilde{H}_k}(\Xi_k) &= \alpha_0 (1 - \alpha_0) \Lambda_0 \tilde{C}_k \Xi_k \tilde{C}_k^T \Lambda_0^T \\ &\quad + \alpha_1 (1 - \alpha_1) \Lambda_1 \tilde{C}_k \Xi_k \tilde{C}_k^T \Lambda_1^T \\ &\quad + \alpha_2 (1 - \alpha_2) \Lambda_2 \tilde{C}_k \Xi_k \tilde{C}_k^T \Lambda_2^T - \mathcal{A}_k - \mathcal{A}_k^T \\ &\quad + \sum_{i=0}^2 \sum_{j=0}^2 \alpha_i \Lambda_i \tilde{C}_{s,k} N_j \Xi_k N_j^T \tilde{C}_{s,k}^T \Lambda_i^T, \end{aligned} \quad (14)$$

where

$$\begin{aligned} \mathcal{A}_k = & \alpha_0 \alpha_1 \Lambda_0 \bar{C}_k \Xi_k \bar{C}_k^T \Lambda_1^T + \alpha_0 \alpha_2 \Lambda_0 \bar{C}_k \Xi_k \bar{C}_k^T \Lambda_2^T \\ & + \alpha_1 \alpha_2 \Lambda_1 \bar{C}_k \Xi_k \bar{C}_k^T \Lambda_2^T. \end{aligned} \quad (15)$$

Proof. By using Definition 3 and noting the expressions of $\bar{\Phi}_k$ and $\bar{H}_k$, one has

$$\begin{aligned} \Delta_{\bar{\Phi}_k \bar{\Phi}_k}(\Xi_k) &= \mathbb{E} \left\{ \left[\bar{\Phi}_k - \mathbb{E} \{ \bar{\Phi}_k \} \right] \bar{x}_k \bar{x}_k^T \left[\bar{\Phi}_k - \mathbb{E} \{ \bar{\Phi}_k \} \right]^T \right\} \\ &= \mathbb{E} \left\{ \xi_k \bar{A}_{s,k} \bar{x}_k \bar{x}_k^T \bar{A}_{s,k}^T \xi_k \right\} \\ &= \bar{A}_{s,k} \Xi_k \bar{A}_{s,k}^T, \\ \Delta_{\bar{H}_k \bar{H}_k}(\Xi_k) &= \mathbb{E} \left\{ \left[\bar{H}_k - \bar{H}_k \right] \bar{x}_k \bar{x}_k^T \left[\bar{H}_k - \bar{H}_k \right]^T \right\} \\ &= \mathbb{E} \left\{ \left[(\bar{\Lambda}_k - \bar{\Lambda}_k) \bar{C}_k + \bar{\Lambda}_k \bar{C}_{s,k} \bar{\eta}_k \right] \bar{x}_k \bar{x}_k^T \right. \\ &\quad \cdot \left. \left[(\bar{\Lambda}_k - \bar{\Lambda}_k) \bar{C}_k + \bar{\Lambda}_k \bar{C}_{s,k} \bar{\eta}_k \right]^T \right\} \\ &= \mathbb{E} \left\{ (\bar{\Lambda}_k - \bar{\Lambda}_k) \bar{C}_k \bar{x}_k \bar{x}_k^T \bar{C}_k^T (\bar{\Lambda}_k - \bar{\Lambda}_k)^T \right. \\ &\quad + \bar{\Lambda}_k \bar{C}_{s,k} \bar{\eta}_k \bar{x}_k \bar{x}_k^T \bar{\eta}_k \bar{C}_{s,k}^T \bar{\Lambda}_k^T \\ &\quad + (\bar{\Lambda}_k - \bar{\Lambda}_k) \bar{C}_k \bar{x}_k \bar{x}_k^T \bar{\eta}_k \bar{C}_{s,k}^T \bar{\Lambda}_k^T \\ &\quad \left. + \bar{\Lambda}_k \bar{C}_{s,k} \bar{\eta}_k \bar{x}_k \bar{x}_k^T \bar{C}_k^T (\bar{\Lambda}_k - \bar{\Lambda}_k)^T \right\} \\ &= \alpha_0 (1 - \alpha_0) \Lambda_0 \bar{C}_k \Xi_k \bar{C}_k^T \Lambda_0^T \\ &\quad + \alpha_1 (1 - \alpha_1) \Lambda_1 \bar{C}_k \Xi_k \bar{C}_k^T \Lambda_1^T \\ &\quad + \alpha_2 (1 - \alpha_2) \Lambda_2 \bar{C}_k \Xi_k \bar{C}_k^T \Lambda_2^T - \mathcal{A}_k - \mathcal{A}_k^T \\ &\quad + \sum_{i=0}^2 \sum_{j=0}^2 \alpha_i \Lambda_i \bar{C}_{s,k} N_j \Xi_k N_j^T \bar{C}_{s,k}^T \Lambda_i^T, \end{aligned} \quad (16)$$

where $\mathcal{A}_k$ is defined in (15). Then, the proof of this lemma is complete. $\square$

Lemma 5. The state covariance matrix Ξ_k of system (7) satisfies the following recursion:

$$\Xi_k = \bar{\Phi}_{k-1} \Xi_{k-1} \bar{\Phi}_{k-1}^T + \Delta_{\bar{\Phi}_{k-1} \bar{\Phi}_{k-1}}(\Xi_{k-1}) + \bar{B}_{k-1} Q_{\omega_{k-1}} \bar{B}_{k-1}^T \quad (17)$$

with the initial value $\Xi_0 = \text{diag}\{P_0 + \mu_0 \mu_0^T, 0, 0\}$.

Proof. It follows from (7) that

$$\begin{aligned} \Xi_k &= \mathbb{E} \{ \bar{x}_k \bar{x}_k^T \} \\ &= \mathbb{E} \left\{ \left[\bar{\Phi}_{k-1} \bar{x}_{k-1} + \bar{B}_{k-1} \bar{\omega}_{k-1} \right] \right. \\ &\quad \cdot \left. \left[\bar{\Phi}_{k-1} \bar{x}_{k-1} + \bar{B}_{k-1} \bar{\omega}_{k-1} \right]^T \right\} \\ &= \bar{\Phi}_{k-1} \Xi_{k-1} \bar{\Phi}_{k-1}^T + \Delta_{\bar{\Phi}_{k-1} \bar{\Phi}_{k-1}}(\Xi_{k-1}) + \bar{B}_{k-1} Q_{\omega_{k-1}} \bar{B}_{k-1}^T. \end{aligned} \quad (18)$$

The proof of this lemma is complete. $\square$

Now, we are ready to design the optimal Kalman filter for system (7)-(8) based on the observation sequence $\{y_1, y_2, \dots, y_{k-1}\}$. By employing Lemmas 4 and 5, we have the following theorem.

Theorem 6. The optimal Kalman filtering for system (7)-(8) is given as follows:

$$\hat{x}_{k|k} = \hat{x}_{k|k-1} + K_k \varepsilon_k, \quad (19)$$

$$\hat{x}_{k|k-1} = \bar{\Phi}_{k-1} \hat{x}_{k-1|k-1}, \quad (20)$$

$$\varepsilon_k = y_k - \bar{H}_k \hat{x}_{k|k-1} - \bar{\Lambda}_k (F_{k-1} \varepsilon_{k-1} + G_{k-2} \varepsilon_{k-2}), \quad (21)$$

$$F_{k-1} = \left[\mathcal{S}_{k-1} - G_{k-2} \left(K_{k-2}^T \bar{\Phi}_{k-2}^T \bar{H}_{k-1}^T + F_{k-2}^T \bar{\Lambda}_{k-1}^T \right) \right] Q_{\varepsilon_{k-1}}^{-1}, \quad (22)$$

$$G_{k-2} = \mathcal{N}_{k-2} Q_{\varepsilon_{k-2}}^{-1}, \quad (23)$$

$$P_{k|k} = P_{k|k-1} - K_k Q_{\varepsilon_k} K_k^T, \quad (24)$$

$$\begin{aligned} P_{k|k-1} &= \bar{\Phi}_{k-1} P_{k-1|k-1} \bar{\Phi}_{k-1}^T + \Delta_{\bar{\Phi}_{k-1} \bar{\Phi}_{k-1}}(\Xi_{k-1}) \\ &\quad + \bar{B}_{k-1} Q_{\omega_{k-1}} \bar{B}_{k-1}^T, \end{aligned} \quad (25)$$

$$\begin{aligned} K_k &= \left[P_{k|k-1} \bar{H}_k^T - \bar{\Phi}_{k-1} L_{k-2} Q_{\varepsilon_{k-2}} G_{k-2}^T \bar{\Lambda}_k^T \right. \\ &\quad \left. - L_{k-1} Q_{\varepsilon_{k-1}} F_{k-1}^T \bar{\Lambda}_k^T \right] Q_{\varepsilon_k}^{-1}, \end{aligned} \quad (26)$$

$$\begin{aligned} L_{k-1} &= \left[\bar{\Phi}_{k-1} P_{k-1|k-2} \bar{H}_{k-1}^T \right. \\ &\quad - \bar{\Phi}_{k-1} L_{k-2} Q_{\varepsilon_{k-2}}^T F_{k-2}^T \bar{\Lambda}_{k-1}^T \\ &\quad \left. - \bar{\Phi}_{k-1} \bar{\Phi}_{k-2} L_{k-3} Q_{\varepsilon_{k-3}}^T G_{k-3}^T \bar{\Lambda}_{k-1}^T \right] Q_{\varepsilon_{k-1}}^{-1}, \end{aligned} \quad (27)$$

$$\begin{aligned} Q_{\varepsilon_k} &= \Delta_{\bar{H}_k \bar{H}_k}(\Xi_k) + \bar{H}_k P_{k|k-1} \bar{H}_k^T \\ &\quad + \sum_{i=0}^2 \alpha_i \Lambda_i Q_k \Lambda_i^T + \bar{\Lambda}_k G_{k-2} Q_{\varepsilon_{k-2}} G_{k-2}^T \bar{\Lambda}_k^T \\ &\quad + \bar{\Lambda}_k F_{k-1} Q_{\varepsilon_{k-1}} F_{k-1}^T \bar{\Lambda}_k^T + \mathcal{B}_k + \mathcal{B}_k^T, \end{aligned} \quad (28)$$

where

$$\begin{aligned} Q_k &= \text{diag} \{ Q_{v_k}, Q_{v_{k-1}}, Q_{v_{k-2}} \}, \\ \mathcal{S}_{k-1} &= [0 \quad \alpha_0 Q_{v_{k-1}} \quad \alpha_1 Q_{v_{k-2}}]^T, \\ \mathcal{N}_{k-2} &= [0 \quad 0 \quad \alpha_0 Q_{v_{k-2}}]^T, \end{aligned} \quad (29)$$

$$\begin{aligned} \mathcal{B}_k &= \bar{H}_k \left(\bar{\Phi}_{k-1} \bar{\Phi}_{k-2} K_{k-2} G_{k-2}^T + \bar{\Phi}_{k-1} K_{k-1} F_{k-1}^T \right) \bar{\Lambda}_k^T \\ &\quad - \bar{\Lambda}_k G_{k-2} G_{k-2}^T \bar{\Lambda}_k^T - \bar{\Lambda}_k F_{k-1} F_{k-1}^T \bar{\Lambda}_k^T. \end{aligned}$$

Proof. According to the projection theory, it is easy to obtain (19). Moreover, the filter gain matrix K_k is calculated by

$$K_k = \mathbb{E} \{ \bar{x}_k \varepsilon_k^T \} \left[\mathbb{E} \{ \varepsilon_k \varepsilon_k^T \} \right]^{-1}. \quad (30)$$

Taking projection on both sides of (7) onto the linear space spanned by $\{\bar{y}_1, \bar{y}_2, \dots, \bar{y}_{k-1}\}$, we have

$$\hat{x}_{k|k-1} = \bar{\Phi}_{k-1} \hat{x}_{k-1|k-1} + \bar{B}_{k-1} \hat{\omega}_{k-1|k-1}. \quad (31)$$

From the projection theory, we have $\hat{\omega}_{k-1|k-1} = 0$. Then, (20) can be obtained directly.

Set the innovation

$$\varepsilon_k = \vec{y}_k - \hat{\vec{y}}_{k|k-1}. \quad (32)$$

Taking projection on both sides of (8) onto the linear space spanned by $\{\vec{y}_1, \vec{y}_2, \dots, \vec{y}_{k-1}\}$, we have

$$\hat{\vec{y}}_{k|k-1} = \bar{H}_k \hat{\vec{x}}_{k|k-1} + \bar{\Lambda}_k \hat{\vec{v}}_{k|k-1}, \quad (33)$$

where the one-step prediction $\hat{\vec{v}}_{k|k-1}$ of the measurement noise is calculated by

$$\hat{\vec{v}}_{k|k-1} = \hat{\vec{v}}_{k|k-2} + F_{k-1} \varepsilon_{k-1}. \quad (34)$$

Here, the one-step prediction gain F_{k-1} of the measurement noise is defined by

$$F_{k-1} = \mathbb{E} \left\{ \vec{v}_k \varepsilon_{k-1}^T \right\} \left[\mathbb{E} \left\{ \varepsilon_{k-1} \varepsilon_{k-1}^T \right\} \right]^{-1}. \quad (35)$$

Moreover, the two-step prediction $\hat{\vec{v}}_{k|k-2}$ of the measurement noise in (34) is computed by

$$\hat{\vec{v}}_{k|k-2} = \hat{\vec{v}}_{k|k-3} + G_{k-2} \varepsilon_{k-2}, \quad (36)$$

where the two-step prediction gain of the measurement noise is defined by

$$G_{k-2} = \mathbb{E} \left\{ \vec{v}_k \varepsilon_{k-2}^T \right\} \left[\mathbb{E} \left\{ \varepsilon_{k-2} \varepsilon_{k-2}^T \right\} \right]^{-1}. \quad (37)$$

From the projection theory, $\hat{\vec{v}}_k \perp \mathcal{L}\{\vec{y}_1, \vec{y}_2, \dots, \vec{y}_{k-3}\}$, where the symbol $\perp$ denotes the orthogonality. Then, it is not difficult to see that $\hat{\vec{v}}_{k|k-3} = 0$. Subsequently, substituting (34) and (36) into (33) yields

$$\hat{\vec{y}}_{k|k-1} = \bar{H}_k \hat{\vec{x}}_{k|k-1} + \bar{\Lambda}_k (F_{k-1} \varepsilon_{k-1} + G_{k-2} \varepsilon_{k-2}). \quad (38)$$

Then, it follows from (32) and (38) that (21) is true.

The innovation ε_k can be rewritten as follows:

$$\begin{aligned} \varepsilon_k &= \vec{H}_k \vec{x}_k + \vec{\Lambda}_k \vec{v}_k - \bar{H}_k \hat{\vec{x}}_{k|k-1} \\ &\quad - \bar{\Lambda}_k (F_{k-1} \varepsilon_{k-1} + G_{k-2} \varepsilon_{k-2}) \\ &= \bar{H}_k \tilde{\vec{x}}_{k|k-1} + \Delta H_k \vec{x}_k + \vec{\Lambda}_k \vec{v}_k \\ &\quad - \bar{\Lambda}_k (F_{k-1} \varepsilon_{k-1} + G_{k-2} \varepsilon_{k-2}), \end{aligned} \quad (39)$$

where $\tilde{\vec{x}}_{k|k-1} = \vec{x}_k - \hat{\vec{x}}_{k|k-1}$ is the one-step prediction error. Substitute (39) with $k = k - 1$ into (35). Noting

$$\begin{aligned} \tilde{\vec{x}}_{k-1|k-2} &= \vec{x}_{k-1} - \hat{\vec{x}}_{k-1|k-2} \\ &= \bar{\Phi}_{k-2} \tilde{\vec{x}}_{k-2|k-2} + \Delta \Phi_{k-2} \vec{x}_{k-2} + \vec{B}_{k-2} \vec{\omega}_{k-2}, \end{aligned} \quad (40)$$

$$\tilde{\vec{x}}_{k-2|k-2} = \tilde{\vec{x}}_{k-2|k-3} - K_{k-2} \varepsilon_{k-2},$$

the one-step prediction gain F_{k-1} of the measurement noise can be calculated

$$\begin{aligned} F_{k-1} &= \mathbb{E} \left\{ \vec{v}_k \varepsilon_{k-1}^T \right\} \left[\mathbb{E} \left\{ \varepsilon_{k-1} \varepsilon_{k-1}^T \right\} \right]^{-1} \\ &= \mathbb{E} \left\{ \vec{v}_k \left[\bar{H}_{k-1} \tilde{\vec{x}}_{k-1|k-2} + \Delta H_{k-1} \vec{x}_{k-1} + \bar{\Lambda}_{k-1} \vec{v}_{k-1} \right. \right. \\ &\quad \left. \left. - \bar{\Lambda}_{k-1} (F_{k-2} \varepsilon_{k-2} + G_{k-3} \varepsilon_{k-3}) \right]^T \right\} \\ &\quad \cdot \left[\mathbb{E} \left\{ \varepsilon_{k-1} \varepsilon_{k-1}^T \right\} \right]^{-1}. \end{aligned} \quad (41)$$

When deriving (41), we have used the fact that $\vec{v}_k \perp \varepsilon_{k-3}$ and $\mathbb{E}\{\Delta H_{k-1}\} = 0$. Then, we have (22). Similarly, substituting (39) with $k = k - 2$ into (37), one has (23).

Subsequently, we are in a position to obtain the filtering error covariance matrix $P_{k|k}$ and the prediction error covariance matrix $P_{k|k-1}$. Subtracting (19) from $\tilde{\vec{x}}_{k|k}$, the filtering error equation can be obtained:

$$\tilde{\vec{x}}_{k|k} = \vec{x}_k - \hat{\vec{x}}_{k|k} = \tilde{\vec{x}}_{k|k-1} - K_k \varepsilon_k. \quad (42)$$

Then, we have

$$\tilde{\vec{x}}_{k|k} + K_k \varepsilon_k = \tilde{\vec{x}}_{k|k-1}. \quad (43)$$

Notice that $\tilde{\vec{x}}_{k|k} \perp \varepsilon_k$, $\mathbb{E}\{\Delta \Phi_{k-1}\} = 0$, $\vec{x}_{k-1}$, and $\tilde{\vec{x}}_{k-1|k-1}$ are all uncorrelated with $\vec{\omega}_{k-1}$, we have

$$\begin{aligned} P_{k|k} &= \mathbb{E} \left\{ \tilde{\vec{x}}_{k|k} \tilde{\vec{x}}_{k|k}^T \right\} \\ &= \mathbb{E} \left\{ \left[\tilde{\vec{x}}_{k|k} + K_k \varepsilon_k - K_k \varepsilon_k \right] \left[\tilde{\vec{x}}_{k|k} + K_k \varepsilon_k - K_k \varepsilon_k \right]^T \right\} \\ &= P_{k|k-1} - K_k Q_{\varepsilon_k} K_k^T. \end{aligned} \quad (44)$$

Thus, (24) is obtained.

Similarly, the one-step prediction error equation can be obtained as follows:

$$\begin{aligned} \tilde{\vec{x}}_{k|k-1} &= \vec{x}_k - \hat{\vec{x}}_{k|k-1} \\ &= \vec{\Phi}_{k-1} \vec{x}_{k-1} + \vec{B}_{k-1} \vec{\omega}_{k-1} - \bar{\Phi}_{k-1} \hat{\vec{x}}_{k-1|k-1} \\ &= (\bar{\Phi}_{k-1} + \Delta \Phi_{k-1}) \vec{x}_{k-1} + \vec{B}_{k-1} \vec{\omega}_{k-1} \\ &\quad - \bar{\Phi}_{k-1} \hat{\vec{x}}_{k-1|k-1} \\ &= \bar{\Phi}_{k-1} \tilde{\vec{x}}_{k-1|k-1} + \Delta \Phi_{k-1} \vec{x}_{k-1} + \vec{B}_{k-1} \vec{\omega}_{k-1}. \end{aligned} \quad (45)$$

According to (45), we have the following equation:

$$\begin{aligned} P_{k|k-1} &= \mathbb{E} \left\{ \tilde{\vec{x}}_{k|k-1} \tilde{\vec{x}}_{k|k-1}^T \right\} \\ &= \bar{\Phi}_{k-1} P_{k-1|k-1} \bar{\Phi}_{k-1}^T \\ &\quad + \Delta \bar{\Phi}_{k-1} \bar{\Phi}_{k-1} (\Xi_{k-1}) + \vec{B}_{k-1} Q_{\omega_{k-1}} \vec{B}_{k-1}^T \\ &\quad + \mathcal{C}_{k-1} + \mathcal{C}_{k-1}^T, \end{aligned} \quad (46)$$

where

$$\begin{aligned}\mathcal{C}_{k-1} &= \bar{\Phi}_{k-1} \mathbb{E} \left\{ \tilde{\mathbf{x}}_{k-1|k-1} \tilde{\mathbf{x}}_{k-1}^T \Delta \Phi_{k-1}^T \right\} \\ &\quad + \bar{\Phi}_{k-1} \mathbb{E} \left\{ \tilde{\mathbf{x}}_{k-1|k-1} \tilde{\omega}_{k-1}^T \right\} \bar{\mathbf{B}}_{k-1}^T \\ &\quad + \mathbb{E} \left\{ \Delta \Phi_{k-1} \tilde{\mathbf{x}}_{k-1} \tilde{\omega}_{k-1}^T \right\} \bar{\mathbf{B}}_{k-1}^T.\end{aligned}\quad (47)$$

Noting $\mathcal{C}_{k-1} = 0$, we have

$$\begin{aligned}P_{k|k-1} &= \bar{\Phi}_{k-1} P_{k-1|k-1} \bar{\Phi}_{k-1}^T \\ &\quad + \Delta \bar{\Phi}_{k-1} \bar{\Phi}_{k-1} (\Xi_{k-1}) + \bar{\mathbf{B}}_{k-1} Q_{\omega_{k-1}} \bar{\mathbf{B}}_{k-1}^T.\end{aligned}\quad (48)$$

Then, it is concluded that (25) holds.

Next, we aim to derive the filter gain K_k . Firstly, substitute (39) into (30). Secondly, by using $\mathbb{E}\{\Delta H_k\} = 0$ and $\tilde{\mathbf{x}}_k = \hat{\mathbf{x}}_{k|k-1} + \tilde{\mathbf{x}}_{k|k-1}$, we obtain

$$\begin{aligned}K_k &= \mathbb{E} \left\{ \tilde{\mathbf{x}}_k \varepsilon_k^T \right\} Q_{\varepsilon_k}^{-1} \\ &= \mathbb{E} \left\{ \tilde{\mathbf{x}}_k \left[\Delta H_k \tilde{\mathbf{x}}_k + \bar{H}_k \tilde{\mathbf{x}}_{k|k-1} + \bar{\Lambda}_k \tilde{\mathbf{y}}_k \right. \right. \\ &\quad \left. \left. - \bar{\Lambda}_k (F_{k-1} \varepsilon_{k-1} + G_{k-2} \varepsilon_{k-2}) \right] \right\} Q_{\varepsilon_k}^{-1} \\ &= \left\{ P_{k|k-1} \bar{H}_k^T + \mathbb{E} \left\{ \tilde{\mathbf{x}}_k \tilde{\mathbf{y}}_k^T \bar{\Lambda}_k^T \right\} - \mathcal{M}_k \right\} Q_{\varepsilon_k}^{-1},\end{aligned}\quad (49)$$

where $\mathcal{M}_k = \mathbb{E} \left\{ \tilde{\mathbf{x}}_k (F_{k-1} \varepsilon_{k-1} + G_{k-2} \varepsilon_{k-2})^T \bar{\Lambda}_k^T \right\}$. When deriving (49), we have used the fact that $\tilde{\mathbf{x}}_k$ is uncorrelated with $\tilde{\mathbf{y}}_k$. Setting

$$\mathbb{E} \left\{ \tilde{\mathbf{x}}_k \varepsilon_{k-1}^T \right\} Q_{\varepsilon_{k-1}}^{-1} = L_{k-1}, \quad (50)$$

we have $\mathbb{E} \left\{ \tilde{\mathbf{x}}_k \varepsilon_{k-1}^T \right\} = L_{k-1} Q_{\varepsilon_{k-1}}$. By using (7) and noting $\tilde{\omega}_{k-1} \perp \varepsilon_{k-2}$, the term $\mathcal{M}_k$ can be obtained as follows:

$$\begin{aligned}\mathcal{M}_k &= \mathbb{E} \left\{ \tilde{\mathbf{x}}_k \varepsilon_{k-1}^T \right\} F_{k-1}^T \bar{\Lambda}_k^T + \mathbb{E} \left\{ \tilde{\mathbf{x}}_k \varepsilon_{k-2}^T \right\} G_{k-2}^T \bar{\Lambda}_k^T \\ &= \mathbb{E} \left\{ \tilde{\mathbf{x}}_k \varepsilon_{k-1}^T \right\} F_{k-1}^T \bar{\Lambda}_k^T \\ &\quad + \mathbb{E} \left\{ \left(\bar{\Phi}_{k-1} \tilde{\mathbf{x}}_{k-1} + \bar{\mathbf{B}}_{k-1} \tilde{\omega}_{k-1} \right) \varepsilon_{k-2}^T \right\} G_{k-2}^T \bar{\Lambda}_k^T \\ &= L_{k-1} Q_{\varepsilon_{k-1}} F_{k-1}^T \bar{\Lambda}_k^T + \bar{\Phi}_{k-1} L_{k-2} Q_{\varepsilon_{k-2}} G_{k-2}^T \bar{\Lambda}_k^T.\end{aligned}\quad (51)$$

Substituting (51) into (49) and noting $\mathbb{E} \left\{ \tilde{\mathbf{x}}_k \tilde{\mathbf{y}}_k^T \bar{\Lambda}_k^T \right\} = 0$, we have (26).

Furthermore, it follows from $\tilde{\mathbf{x}}_{k-1} = \hat{\mathbf{x}}_{k-1|k-2} + \tilde{\mathbf{x}}_{k-1|k-2}$ that

$$\begin{aligned}\mathbb{E} \left\{ \tilde{\mathbf{x}}_k \varepsilon_{k-1}^T \right\} &= \mathbb{E} \left\{ \tilde{\mathbf{x}}_k \left[\bar{H}_{k-1} \tilde{\mathbf{x}}_{k-1|k-2} + \Delta H_{k-1} \tilde{\mathbf{x}}_{k-1} + \bar{\Lambda}_{k-1} \tilde{\mathbf{y}}_{k-1} \right. \right. \\ &\quad \left. \left. - \bar{\Lambda}_{k-1} (F_{k-2} \varepsilon_{k-2} + G_{k-3} \varepsilon_{k-3}) \right] \right\} \\ &= \bar{\Phi}_{k-1} P_{k-1|k-2} \bar{H}_{k-1}^T - \bar{\Phi}_{k-1} L_{k-2} Q_{\varepsilon_{k-2}}^T F_{k-2}^T \bar{\Lambda}_{k-1}^T \\ &\quad - \bar{\Phi}_{k-1} \bar{\Phi}_{k-2} L_{k-3} Q_{\varepsilon_{k-3}}^T G_{k-3}^T \bar{\Lambda}_{k-1}^T.\end{aligned}\quad (52)$$

Substituting (52) into (50), we can see that (27) is true.

Finally, we will derive the term Q_{ε_k} in (28). According to (39), we have

$$\begin{aligned}Q_{\varepsilon_k} &= \mathbb{E} \left\{ \varepsilon_k \varepsilon_k^T \right\} \\ &= \mathbb{E} \left\{ \left[\Delta H_k \tilde{\mathbf{x}}_k + \bar{H}_k \tilde{\mathbf{x}}_{k|k-1} + \bar{\Lambda}_k \tilde{\mathbf{y}}_k \right. \right. \\ &\quad \left. \left. - \bar{\Lambda}_k (F_{k-1} \varepsilon_{k-1} + G_{k-2} \varepsilon_{k-2}) \right] \right. \\ &\quad \left. \times \left[\Delta H_k \tilde{\mathbf{x}}_k + \bar{H}_k \tilde{\mathbf{x}}_{k|k-1} + \bar{\Lambda}_k \tilde{\mathbf{y}}_k \right. \right. \\ &\quad \left. \left. - \bar{\Lambda}_k (F_{k-1} \varepsilon_{k-1} + G_{k-2} \varepsilon_{k-2}) \right]^T \right\} \\ &= \mathbb{E} \left\{ \Delta H_k \tilde{\mathbf{x}}_k \tilde{\mathbf{x}}_k^T \Delta H_k^T \right\} \\ &\quad + \mathbb{E} \left\{ \bar{H}_k \tilde{\mathbf{x}}_{k|k-1} \tilde{\mathbf{x}}_{k|k-1}^T \bar{H}_k^T \right\} + \mathbb{E} \left\{ \bar{\Lambda}_k \tilde{\mathbf{y}}_k \tilde{\mathbf{y}}_k^T \bar{\Lambda}_k^T \right\} \\ &\quad + \mathbb{E} \left\{ \bar{\Lambda}_k \left[F_{k-1} \varepsilon_{k-1} + G_{k-2} \varepsilon_{k-2} \right] \right. \\ &\quad \left. \cdot \left[F_{k-1} \varepsilon_{k-1} + G_{k-2} \varepsilon_{k-2} \right]^T \bar{\Lambda}_k^T \right\} + \mathcal{D}_k + \mathcal{D}_k^T \\ &= \Delta_{\bar{H}_k \bar{H}_k} (\Xi_k) + \bar{H}_k P_{k|k-1} \bar{H}_k^T \\ &\quad + \sum_{i=0}^2 \alpha_i \Lambda_i Q_k \Lambda_i^T + \bar{\Lambda}_k G_{k-2} Q_{\varepsilon_{k-2}} G_{k-2}^T \bar{\Lambda}_k^T \\ &\quad + \bar{\Lambda}_k F_{k-1} Q_{\varepsilon_{k-1}} F_{k-1}^T \bar{\Lambda}_k^T + \mathcal{B}_k + \mathcal{B}_k^T,\end{aligned}\quad (53)$$

where

$$\begin{aligned}\mathcal{D}_k &= \mathbb{E} \left\{ \Delta H_k \tilde{\mathbf{x}}_k \tilde{\mathbf{x}}_{k|k-1}^T \bar{H}_k^T + \Delta H_k \tilde{\mathbf{x}}_k \tilde{\mathbf{y}}_{k-1}^T \bar{\Lambda}_k^T \right. \\ &\quad \left. - \Delta H_k \tilde{\mathbf{x}}_k \left[F_{k-1} \varepsilon_{k-1} + G_{k-2} \varepsilon_{k-2} \right]^T \bar{\Lambda}_k^T \right. \\ &\quad \left. + \bar{H}_k \tilde{\mathbf{x}}_{k|k-1} \tilde{\mathbf{y}}_k^T \bar{\Lambda}_k^T \right. \\ &\quad \left. - \bar{H}_k \tilde{\mathbf{x}}_{k|k-1} \left[F_{k-1} \varepsilon_{k-1} + G_{k-2} \varepsilon_{k-2} \right]^T \bar{\Lambda}_{k-1}^T \right. \\ &\quad \left. - \bar{\Lambda}_k \tilde{\mathbf{y}}_{k-1} \left[F_{k-1} \varepsilon_{k-1} + G_{k-2} \varepsilon_{k-2} \right]^T \bar{\Lambda}_k^T \right\},\end{aligned}\quad (54)$$

Q_k and $\mathcal{B}_k$ are defined in (29). When deriving (53), we have used the fact that $\mathbb{E}\{\Delta H_k\} = 0$, $\mathbb{E}\{\tilde{\mathbf{x}}_k \tilde{\mathbf{y}}_k^T\} = 0$, and ΔH_k is uncorrelated with $\tilde{\mathbf{x}}_k \tilde{\mathbf{x}}_{k|k-1}^T$. Up to now, the proof of Theorem 6 is complete. $\square$

So far, we have derived the Kalman filtering for the addressed linear stochastic systems with multiplicative noises and random two-step sensor delays. In the following, let us discuss the initial time instant.

Particularly, when $k = 1$, (3) becomes $y_1 = z_1$. In the augmented system (7)-(8), letting $\gamma_k^2 = \gamma_k^1 = 0$, we have

$$\begin{aligned}\bar{\Lambda}_1 &= [I \ 0 \ 0], \\ \Delta_{\bar{H}_1 \bar{H}_1} (\Xi_1) &= \sum_{j=0}^2 \Lambda_0 \bar{C}_{s,1} N_j \Xi_1 N_j^T \bar{C}_{s,1}^T \Lambda_0^T, \\ F_0 &= \left\{ \mathcal{S}_0 - G_{-1} \left(K_{-1}^T \bar{\Phi}_{-1}^T \bar{H}_0^T + F_{-1}^T \bar{\Lambda}_0^T \right) \right\} Q_{\varepsilon_0}^{-1}, \\ G_{-1} &= \mathcal{N}_{-1} Q_{\varepsilon_{-1}}^{-1},\end{aligned}$$

$$Q_{\varepsilon_1} = \Delta_{\bar{H}_1 \bar{H}_1} (\Xi_1) + \bar{H}_1 P_{1|0} \bar{H}_1^T + \Lambda_0 Q_1 \Lambda_0^T + \bar{\Lambda}_1 G_{-1} Q_{\varepsilon_{-1}} G_{-1}^T \bar{\Lambda}_1^T + \bar{\Lambda}_1 F_0 Q_{\varepsilon_0} F_0^T \bar{\Lambda}_1^T + \mathcal{B}_1 + \mathcal{B}_1^T, \quad (55)$$

where

$$\mathcal{S}_0 = [0 \ 0 \ 0]^T, \quad \mathcal{N}_{-1} = [0 \ 0 \ 0]^T, \quad (56)$$

and $\mathcal{B}_1$ is defined in (29).

Similarly, when $k = 2$, (3) becomes $y_2 = \gamma_2^0 z_2 + \gamma_2^1 z_1$. In the augmented system (7)-(8), letting $\gamma_k^2 = 0$, one has

$$\begin{aligned} \bar{\Lambda}_2 &= [\gamma_2^0 I \ \gamma_2^1 I \ 0], \\ \Delta_{\bar{H}_2 \bar{H}_2} (\Xi_2) &= \sum_{i=0}^1 \alpha_i (1 - \alpha_i) \Lambda_i \bar{C}_2 \Xi_2 \bar{C}_2^T \Lambda_i^T - \mathcal{A}_2 - \mathcal{A}_2^T \\ &\quad + \sum_{i=0}^1 \sum_{j=0}^2 \alpha_i \Lambda_i \bar{C}_{s,2} N_j \Xi_2 N_j^T \bar{C}_{s,2}^T \Lambda_i^T, \\ F_1 &= \left\{ \mathcal{S}_1 - G_0 \left(K_0^T \bar{\Phi}_0^T \bar{H}_1^T + F_0^T \bar{\Lambda}_1^T \right) \right\} Q_{\varepsilon_1}^{-1}, \\ G_0 &= \mathcal{N}_0 Q_{\varepsilon_0}^{-1}, \\ Q_{\varepsilon_2} &= \Delta_{\bar{H}_2 \bar{H}_2} (\Xi_2) + \bar{H}_2 P_{2|1} \bar{H}_2^T + \alpha_0 \Lambda_0 Q_2 \Lambda_0^T \\ &\quad + \alpha_1 \Lambda_1 Q_2 \Lambda_1^T + \bar{\Lambda}_2 G_0 Q_{\varepsilon_0} G_0^T \bar{\Lambda}_2^T \\ &\quad + \bar{\Lambda}_2 F_1 Q_{\varepsilon_1} F_1^T \bar{\Lambda}_2^T + \mathcal{B}_2 + \mathcal{B}_2^T, \end{aligned} \quad (57)$$

where

$$\mathcal{S}_1 = [0 \ Q_{\gamma_1} \ 0]^T, \quad \mathcal{N}_0 = [0 \ 0 \ 0]^T, \quad (58)$$

$$\mathcal{A}_2 = \alpha_0 \alpha_1 \Lambda_0 \bar{C}_2 \Xi_2 \bar{C}_2^T \Lambda_1^T,$$

and $\mathcal{B}_2$ is defined in (29).

Remark 7. It is worth mentioning that when $\alpha_0 = 1$ and $A_{s,k} = C_{s,k} = 0$, the developed optimal filtering is reduced to the traditional Kalman filtering algorithm. On the other hand, when $\alpha_1 = 1$ and $A_{s,k} = C_{s,k} = 0$, the proposed filtering algorithm is the optimal Kalman filtering with one-step sensor delay.

To help understand, the calculation process of the proposed optimal Kalman filtering scheme in Theorem 6 can be summarized as follows.

Algorithm 8 (Kalman filtering with multiplicative noises and random two-step sensor delays).

Step 1. Give the initial values $\varepsilon_{-1}, \varepsilon_0, Q_{\varepsilon_{-2}}, Q_{\varepsilon_{-1}}, Q_{\varepsilon_0}, L_{-2}, L_{-1}, K_{-1}, K_0, F_{-1}, G_{-2}, P_{0|0}, P_{0|-1}, \bar{x}_0, \hat{x}_0$, and y_1 .

Step 2. Compute $\hat{x}_{1|0} \Rightarrow G_{-1} \Rightarrow F_0 \Rightarrow \varepsilon_1 \Rightarrow \Delta_{\bar{\Phi}_0 \bar{\Phi}_0} (\Xi_0) \Rightarrow \Xi_1 \Rightarrow \Delta_{\bar{H}_1 \bar{H}_1} (\Xi_1) \Rightarrow P_{1|0} \Rightarrow Q_{\varepsilon_1} \Rightarrow L_0 \Rightarrow K_1 \Rightarrow \hat{x}_{1|1} \Rightarrow P_{1|1}$ in turn.

Step 3. When y_2 is obtained, compute $\hat{x}_{2|1} \Rightarrow G_0 \Rightarrow F_1 \Rightarrow \varepsilon_2 \Rightarrow \Delta_{\bar{\Phi}_1 \bar{\Phi}_1} (\Xi_1) \Rightarrow \Xi_2 \Rightarrow \Delta_{\bar{H}_2 \bar{H}_2} (\Xi_2) \Rightarrow P_{2|1} \Rightarrow Q_{\varepsilon_2} \Rightarrow L_1 \Rightarrow K_2 \Rightarrow \hat{x}_{2|2} \Rightarrow P_{2|2}$ in turn.

Step 4. In general, calculate $\bar{x}_{k|k-1}$ by (20).

Step 5. Compute G_{k-2} by (23). Substituting (23) into (22), we obtain F_{k-1} . Then, we can obtain ε_k by substituting (22) and (23) into (21).

Step 6. Calculate $\Delta_{\bar{\Phi}_{k-1} \bar{\Phi}_{k-1}} (\Xi_{k-1})$ by (13) and compute Ξ_k by (17). By substituting Ξ_k into (14), we have $\Delta_{\bar{H}_k \bar{H}_k} (\Xi_k)$.

Step 7. Calculate $P_{k|k-1}$ by substituting (13) into (25).

Step 8. Substituting (14), (22), (23), and (25) into (28), we obtain Q_{ε_k} .

Step 9. Compute L_{k-1} by substituting (22), (23), (25), and (28) into (27).

Step 10. Substituting (25), (27), and (28) into (26), we obtain K_k .

Step 11. By using (19) and (24), we calculate the optimal estimation $\hat{x}_{k|k}$ and obtain $P_{k|k}$. Then, letting $k - 1 = k$, go back to **Step 4**.

Remark 9. In this paper, we have used the state augmentation approach and innovation analysis technique to design the optimal Kalman filter contaminated with multiplicative noises and randomly occurring two-step sensor delays. Compared with the existing results, these two phenomena addressed have constituted the main differences and have been explicitly reflected in the main results, such as the terms $Q_{\varepsilon_k}, Q_{\varepsilon_{k-1}}, Q_{\varepsilon_{k-2}},$ and $Q_{\varepsilon_{k-3}}$. During the implementation of the proposed filtering algorithm, it is worth mentioning that more efforts should be made to derive the terms L_{k-1} and Q_{ε_k} in (27) and (28) due to the consideration of the randomly occurring sensor delays. From the above algorithm, it is easy to see that Steps 5–10 in Algorithm 8 are important especially those involved terms.

4. An Illustrative Example

In this section, a numerical example is proposed to show the feasibility and effectiveness of the proposed main results.

Consider the following system:

$$\begin{aligned} x_{k+1} &= \left(\begin{bmatrix} 0.2 & -0.15 \\ 0 & 0.15 \end{bmatrix} + \begin{bmatrix} 0.01 & 0 \\ 0 & 0.01 \end{bmatrix} \xi_k \right) x_k + \begin{bmatrix} 2 \\ 2.5 \end{bmatrix} \omega_k \\ z_k &= ([1.5 \ 1] + [0.01 \ 0.01] \eta_k) x_k + \nu_k \\ y_k &= \sum_{i=0}^{\min\{k-1, 2\}} \gamma_k^i z_{k-i}, \end{aligned} \quad (59)$$

where $x_k = [x_{k,1} \ x_{k,2}]^T$ is the system state and $\omega_k \in \mathcal{R}$ and $\nu_k \in \mathcal{R}$ are uncorrelated white noises with zero means and variances $Q_{\omega_k} = 0.1$ and $Q_{\nu_k} = 0.2$, respectively.

\end{aligned} \tag{60}$$

According to Theorem 6, the optimal recursive filter $\hat{x}_{k|k}$ can be obtained. The values of the filter gains are given as in Table 1. The trajectories of the actual states $x_{k,i}$ and their estimates $\hat{x}_{k,i}$ ($i = 1, 2$) are plotted in Figures 1 and 2. Let MSE_i denote the mean square error for the estimations of

FIGURE 3: $\log(\text{MSE1})$ (Case I).

$x_{k,i}$ and $x_{k,2}$; that is, $\text{MSE}_i = (1/M) \sum_{j=1}^M (x_{k,i} - \hat{x}_{k|k,i})^2$ ($i = 1, 2$), where M is the number of simulation tests. Then, the $\log(\text{MSE}_i)$ ($i = 1, 2$) of the proposed filtering algorithm are plotted in Figures 3 and 4.

FIGURE 4: $\log(\text{MSE2})$ (Case I). FIGURE 5: The trajectories of $x_{k,1}$ and $\hat{x}_{k|k,1}$ (Case II).

In order to further discuss the effects from the randomly occurring two-step sensor delays, we make the comparison where the different probabilities of the sensor delays (i.e., Case I: $\alpha_0 = 0.95$, $\alpha_1 = 0.9$, and $\alpha_2 = 0.8$; Case II: $\alpha_0 = 0.65$, $\alpha_1 = 0.6$, and $\alpha_2 = 0.55$) are considered. The corresponding simulations are given in Figures 5–8. According to the simulations, we can see that the filtering performance is indeed influenced by the probabilities of the sensor delays. From the simulations, we can conclude that the developed filtering scheme performs well to estimate the addressed system with multiplicative noises and random two-step sensor delays. The reason is that we have made additional efforts during the algorithm design to attenuate the effects from the multiplicative noises and randomly occurring two-step sensor delays.

5. Conclusion

The problem of the optimal Kalman filtering has been investigated for a class of linear discrete stochastic systems with multiplicative noises and random two-step sensor delays. Three Bernoulli distributed random variables with known conditional probabilities have been introduced to describe the phenomena of two-step sensor delays. Based on the innovation analysis approach and the recursive projection formula, for both the multiplicative noises and the random two-step sensor delays, a new optimal Kalman filtering has been proposed for the addressed linear stochastic system. Further research topics include the extension of the developed optimal filtering strategy to the prevalent event-triggered case [35], more networked induced phenomena as in [36], and the random delays modeled by the Markov chain [37]. Moreover, it would be interesting and important to deal

FIGURE 8: $\log(\text{MSE2})$ (Case II).

with the stability analysis issue for the proposed filtering algorithm.

Conflict of Interests

The authors declare that there is no conflict of interests regarding the publication of this paper.

Acknowledgments

The authors would like to thank the associate editor and the anonymous reviewers for their detailed comments and valuable suggestions. This work was supported in part by the National Natural Science Foundation of China (NSFC) under Grants 11271103 and 11301118.
