The paper studies the existence of exponential attractor for the Boussinesq equation with strong damping and clamped boundary condition $u_{tt} - \Delta u + \Delta^2 u - \Delta u_t - \Delta g(u) = f(x)$. The main result is concerned with nonlinearities $g(u)$ with supercritical growth. In that case, we construct a bounded absorbing set with further regularity and obtain quasi-stability estimates. Then the exponential attractor is established in natural energy space $V_2 \times H$.

1. Introduction

In this paper, we are concerned with the existence of exponential attractor for the Boussinesq equation with strong damping and clamped boundary condition

$$u_{tt} - \Delta u + \Delta^2 u - \Delta u_t - \Delta g(u) = f(x) \quad \text{in } \Omega \times \mathbb{R}^+, \quad (1)$$

where Ω is a bounded domain in $\mathbb{R}^N$ with the smooth boundary $\partial\Omega$, on which we consider the clamped boundary condition

$$\begin{aligned} u|_{\partial\Omega} &= 0, \\ \frac{\partial u}{\partial \nu} \Big|_{\partial\Omega} &= 0, \end{aligned} \quad (2)$$

where ν is the unit outward normal on $\partial\Omega$, and the initial condition

$$\begin{aligned} u(x, 0) &= u_0(x), \\ u_t(x, 0) &= u_1(x), \end{aligned} \quad (3)$$

$$x \in \Omega,$$

and the assumptions on $g(u)$ and f will be specified later.

In 1872, Boussinesq [1] established the equation

$$u_{tt} - u_{xx} - \alpha u_{xxxx} = \beta (u^2)_{xx} \quad (4)$$

to describe the longitudinal displacement of the shallow water wave. Here u and α, β are some constants depending on the depth of the fluid and characteristic velocity of the water wave. When $\alpha < 0$, (4) is called “good” Boussinesq equation, when $\alpha > 0$, (4) is called “bad” Boussinesq equation. There have been lots of research on the well-posedness, blowup, and other properties of solutions for both the “good” and the “bad” Boussinesq equation of type (1) (see [2–14] and references therein). While for the investigation on the global attractor to (1), one can see [15–19] and references therein.

Chueshov and Lasiecka [20, 21] studied the longtime behavior of solutions to the Kirchhoff-Boussinesq plate equation

$$u_{tt} + ku_t + \Delta^2 u = \operatorname{div} [f_0(\nabla u)] + \Delta [f_1(u)] - f_2(u) \quad (5)$$

with $\Omega \subset \mathbb{R}^2$ and the clamped boundary condition (2). Here $k > 0$ is the damping parameter and the mapping $f_0 : \mathbb{R}^2 \rightarrow \mathbb{R}^2$ and the smooth functions f_1 and f_2 represent (nonlinear) feedback forces acting upon the plate, in particular,

$$\begin{aligned} f_0(\nabla u) &= |\nabla u|^2 \nabla u, \\ f_1(u) &= u^2 + u. \end{aligned} \quad (6)$$

Ignoring both restoring force $f_0(\nabla u)$ and feedback force $f_2(u)$ and replacing the inertial term u_{tt} by ϵu_{tt} , with $\epsilon > 0$ (the

relaxation time) sufficiently small, (5) becomes the modified Cohn-Hilliard equation

$$\epsilon u_{tt} + u_t - \Delta(-\Delta u + f(u)) = g, \quad (7)$$

which is proposed by Galenko et al. [22–24] to model rapid spinodal decomposition in nonequilibrium phase separation processes. Grasselli et al. [25–27] studied the well-posedness and the longtime dynamics of (7) in both 2D and 3D cases, with hinged boundary condition. They established the existence of the global and exponential attractor for $\epsilon = 1$ in 2D case, and for $\epsilon > 0$ sufficiently small in 3D case. Taking $\epsilon = 1$ in (7) or taking $f_0(\nabla u) = \nabla u$, $f_2 = 0$ in (5), and taking into account the inertial force represented by $-\Delta u$ and replacing the weak damping u_t by a strong one $-\Delta u_t$, (1) arises.

In 1D case, Dai and Guo [15, 16] studied the “bad” Boussinesq equation with strong damping

$$\begin{aligned} u_{tt} - u_{xx} + 2ku_{xxt} - \alpha u_{xxxx} &= \beta(u^n)_{xx} \\ &\text{in } \mathbb{R} \times (0, +\infty), \\ u(x, 0) &= u_0(x), \\ u_t(x, 0) &= u_1(x), \\ x &\in \mathbb{R}. \end{aligned} \quad (8)$$

They got global solution $u \in C^\infty((0, T]; H^\infty(\mathbb{R})) \cap C([0, T]; H^1(\mathbb{R})) \cap C([0, T]; H^{-1}(\mathbb{R})) \forall T > 0$, where $k, \alpha \in \mathbb{R}^+$, $\beta \in \mathbb{R}^+$, $n > 2$.

For the multidimensional case, Yang [17] proved the IVP of the Boussinesq equation

$$\begin{aligned} u_{tt} - \Delta u + \mu \Delta^2 u &= \Delta \sigma(u) \quad \text{in } \mathbb{R}^N \times (0, +\infty), \\ u(x, 0) &= u_0(x), \\ u_t(x, 0) &= u_1(x), \\ x &\in \mathbb{R}^N. \end{aligned} \quad (9)$$

There existed the global weak solution, where $\mu > 0$, $\sigma(u) \in C(\mathbb{R})$, $|\sigma(s)| \leq b|s|^p$, $s \in \mathbb{R}$, $1 < p \leq (N+2)/(N-2)^+$, and $0 \leq \sigma(s)s \leq \beta \int_0^s \sigma(\tau) d\tau$, $s \in \mathbb{R}$, $\beta > 0$. Here the growth exponent $\tilde{p} = N/(N-2)$ ($N \geq 3$) is called critical. The growth exponent $p^* \equiv (N+2)/(N-2)^+ (\geq \tilde{p})$ is called supercritical. However, there is little research on the higher global regularity of a bounded absorbing set, the global attractor and an exponential attractor in natural energy space for the dynamical system. We try to solve those problems in this paper.

Global attractor is a basic concept in the research studies of the asymptotic behavior of the dissipative system. From the physical point of view, the global attractor of the dissipative equation (1) represents the permanent regime that can be observed when the excitation starts from any point in natural energy space, and its dimension represents the number of degrees of freedom of the related turbulent phenomenon and thus the level of complexity concerning the flow. All the information concerning the attractor and its dimension

from the qualitative nature to the quantitative nature then yields valuable information concerning the flows that this physical system can generate. On the physical and numerical sides, this dimension gives one an idea of the number of parameters and the size of the computations needed in numerical simulations. However, the global attractor may possess an essential drawback; namely, the rate of attraction may be arbitrarily slow and it can not be estimated in terms of physical parameters of the system under consideration. While the exponential attractor overcomes the drawback because not only it has finite fractal dimension but also its contractive rate is exponential and measurable in terms of the physical parameters, the purpose of the present paper is to establish the existence of an exponential attractor in supercritical case. Our result (see Theorem 8 below) in this paper extends the corresponding result in [28].

In comparison with the results in [17, 18], the contribution of the paper lies in that

- (1) the exponential attractor is established in natural energy space E in supercritical case. See Theorem 8;
- (2) the critical case $p = \tilde{p}$ is solved in E_1 . In the concrete, when $1 \leq p \leq \tilde{p}$, the global and exponential attractor in E_1 is established, and the higher regularity of the global attractor is obtained. See Theorem 15;
- (3) the restriction $N \leq 5$ is removed in subcritical case. See Theorem 15.

The plan of the paper is as follows. In Section 2, the global existence of the weak solutions is discussed by the energy method and the existence of global attractor is established. In Section 3, the exponential attractor is established for supercritical case. In Section 4, global attractor and the exponential attractor are established for nonsupercritical case.

2. Global Existence of Weak Solutions

For brevity, we use the following abbreviations:

$$\begin{aligned} L^p &= L^p(\Omega), \\ H^k &= H^k(\Omega), \\ H &= L^2, \\ V_2 &= H_0^2, \\ \|\cdot\| &= \|\cdot\|_{L^2}, \\ \|\cdot\|_p &= \|\cdot\|_{L^p}, \end{aligned} \quad (10)$$

with $p \geq 1$, where H^k are the L^2 -based Sobolev spaces and H_0^k are the completion of $C_0^\infty(\Omega)$ in H^k for $k > 0$. The notation $(\cdot, \cdot)$ for the H -inner product will also be used for the notation of duality pairing between dual spaces and $C(\cdots)$ denotes positive constants depending on the quantities appearing in the parenthesis.

We define the operator $A : V_2 \rightarrow V_2'$ (the dual space of V_2),

$$(Au, v) = (\Delta u, \Delta v) \quad \text{for any } u, v \in V_2. \quad (11)$$

Then, the operators A^s ($s \in \mathbb{R}$) are strictly positive and the spaces $V_s = D(A^{s/4})$ are Hilbert spaces with the scalar products and the norms

$$\begin{aligned} (u, v)_s &= (A^{s/4}u, A^{s/4}v), \\ \|u\|_{V_s} &= \|A^{s/4}u\|, \end{aligned} \quad (12)$$

respectively. Obviously,

$$\begin{aligned} \|u\|_{V_2} &= \|A^{1/2}u\| = \|\Delta u\|, \\ \|u\|_{V_1} &= \|A^{1/4}u\| = \|\nabla u\|. \end{aligned} \quad (13)$$

Rewriting (1) in the operator equation and applying $A^{-1/2}$ to the resulting expression, we get the Cauchy problem equivalent to problem (1), (2), and (3):

$$A^{-1/2}u_{tt} + (I + A^{1/2})u + u_t + g(u) = A^{-1/2}f, \quad (14)$$

$$\begin{aligned} u(0) &= u_0, \\ u_t(0) &= u_1. \end{aligned} \quad (15)$$

For each $s \in \mathbb{R}$, $V_s = D(A^{s/4})$, we denote the Banach space

$$\begin{aligned} E &= V_2 \times H, \\ E_1 &= V_1 \times H, \end{aligned} \quad (16)$$

which is equipped with the usual graph norm,

$$\|(u, v)\|_E^2 = \|u\|_{V_2}^2 + \|v\|^2. \quad (17)$$

Theorem 1. Assume that (H_1) $g \in C^1(\mathbb{R})$,

$$\begin{aligned} |g(s)| &\leq K_1(|s|^p + 1), \\ |g'(s)| &\leq K_2(|s|^{p-1} + 1), \\ |g'(s_1) - g'(s_2)| &\leq K_3(|s_1|^{p-1-\gamma} + |s_2|^{p-1-\gamma} + 1)|s_1 - s_2|^\gamma, \end{aligned} \quad (18)$$

where

$$\begin{aligned} 0 < \gamma < p - 1, \quad 1 < p < 2, \\ \gamma &= 1, \quad p \geq 2, \end{aligned} \quad (19)$$

where $(a)^+ = \max\{0, a\}$, $K_i > 0$, $i = 1, 2, 3$, $1 \leq p \leq p^* \equiv (N + 2)/(N - 2)$, and $N \geq 3$.

(H_2) Consider

$$\begin{aligned} \liminf_{|s| \rightarrow +\infty} \frac{G(s)}{|s|^2} &\geq 0, \\ \liminf_{|s| \rightarrow +\infty} \frac{sg(s) - \rho G(s)}{|s|^2} &\geq 0, \end{aligned} \quad (20)$$

where $G(s) = \int_0^s g(\tau) d\tau$, $0 < \rho < 2$.

(H_3) $(u_0, u_1) \in E$, $f \in V_{-1}$.

Then problem (14) and (15) admits a unique weak solution u , with $(u, u_t) \in C_b(R^+, V_2 \times H)$. More precisely, the solution u possesses the following properties:

(i) There exists a small positive constant δ such that

$$\begin{aligned} \|(u, u_t)\|_E^2 + \int_t^{t+1} \|u_t(\tau)\|^2 d\tau \\ \leq C(\|(u_0, u_1)\|_E) e^{-\delta t} + C(\|f\|_{V_{-1}}), \quad t \geq 0. \end{aligned} \quad (21)$$

(ii) When $1 \leq p < p^*$, the solution is Lipschitz continuous in the weaker space E as $N \leq 5$; that is,

$$\begin{aligned} \|(z(t), z_t(t))\|_E^2 &\leq C(R) e^{kt} \|(z(0), z_t(0))\|_E^2, \\ t &\geq 0, \end{aligned} \quad (22)$$

for some $k > 0$, where $z = u - v$, u and v are, respectively, the weak solutions of (14) corresponding to initial data (u_0, u_1) and (v_0, v_1) .

Remark 2. The formula (20) implies that every $\eta > 0$; there exists $C_\eta > 0$, $\tilde{C}_\eta > 0$ such that

$$\begin{aligned} G(s) + \eta|s|^2 &\geq -C_\eta, \\ sg(s) - \rho G(s) + \eta|s|^2 &\geq -\tilde{C}_\eta, \end{aligned} \quad (23)$$

where $G(s) = \int_0^s g(\tau) d\tau$.

Lemma 3 (see [29]). Let X, B , and Y be the Banach spaces, $X \hookrightarrow B \hookrightarrow Y$,

$$\begin{aligned} W &= \{u \in L^p(0, T; X) \mid u_t \in L^1(0, T; Y)\}, \\ &\text{with } 1 \leq p < \infty, \\ W_1 &= \{u \in L^\infty(0, T; X) \mid u_t \in L^r(0, T; Y)\}, \\ &\text{with } r > 1. \end{aligned} \quad (24)$$

Then,

$$\begin{aligned} W &\hookrightarrow L^p(0, T; B), \\ W_1 &\hookrightarrow C([0, T]; B). \end{aligned} \quad (25)$$

Proof of Theorem 1. We first obtain a priori estimate to the solutions of problem (14) and (15).

Let $v = u_t + \epsilon u$ and rewrite (1); we have

$$\begin{aligned} A^{-1/2}(v_t - \epsilon v + \epsilon^2 u) + (I + A^{1/2})u + v - \epsilon u + g(u) \\ = A^{-1/2}f, \\ v(0) = u_1 + \epsilon u_0 = v_0. \end{aligned} \quad (26)$$

Using the multiplier u_t in (26), we get

$$\frac{d}{dt} H_1(u, v) + K_1(u, v) = 0, \quad t > 0, \quad (27)$$

where

$$\begin{aligned} H_1(u, u_t) &= \frac{1}{2} \left(\|A^{-1/4}v\|^2 + \epsilon^2 \|A^{-1/4}u\|^2 + \|A^{1/4}u\|^2 \right. \\ &\quad \left. + (1 - \epsilon) \|u\|^2 + 2 \int_{\Omega} G(u) dx - 2(A^{-1/2}f, u) \right) \\ &\geq C_1 \left(\|A^{-1/4}u_t\|^2 + \|A^{-1/4}u\|^2 + \|A^{1/4}u\|^2 + \|u\|^2 \right) \\ &\quad - C_0, \end{aligned} \quad (28)$$

$$\begin{aligned} K_1(u, v) - \epsilon H_1(u, v) &\geq C \left(\|v\|^2 + \|A^{-1/4}v\|^2 \right. \\ &\quad \left. + \|A^{1/4}u\|^2 \right) - C_0. \end{aligned}$$

Hence,

$$\frac{d}{dt} H_1(u, v) + \epsilon H_1(u, v) \leq -C_0, \quad t \geq 0. \quad (29)$$

Applying the Gronwall lemma to (29),

$$\|A^{1/4}u\|^2 + \|A^{-1/4}u_t\|^2 \leq C_1 e^{-\delta t} + C_0, \quad (30)$$

where $C_0 = (\|f\|_{V_{-1}})$, $C_1 = (\|u_0, u_1\|_{E_1})$, $\delta = \epsilon \in (0, 1)$.

Using the multiplier $A^{1/2}u_t$, $A^{1/2}u$ in (26),

$$\begin{aligned} \frac{1}{2} \frac{d}{dt} \left(\|u_t\|^2 + \|A^{1/4}u\|^2 + \|A^{1/2}u\|^2 - 2(u, f) \right) \\ + \|A^{1/4}u_t\|^2 + (A^{1/2}u_t, g(u)) = 0, \quad t > 0, \end{aligned} \quad (31)$$

$$\begin{aligned} \frac{d}{dt} \left(\frac{1}{2} \|A^{1/4}u\|^2 + (u_t, u) \right) + \|A^{1/4}u\|^2 \\ + (A^{1/2}u, g(u)) = \|u_t\|^2 + (u, f), \quad t > 0, \end{aligned} \quad (32)$$

(31) + ϵ (32); we have

$$\frac{d}{dt} H_2(u) + K_2(u) = 0, \quad t > 0. \quad (33)$$

Obviously,

$$\begin{aligned} H_2(u) &= \frac{1}{2} \left[\|u_t\|^2 + (1 + \epsilon) \|A^{1/4}u\|^2 + \|A^{1/2}u\|^2 \right] \\ &\quad + \epsilon(u, u_t) - (u, f) \\ &\sim \|A^{1/4}u\|^2 + \|u_t\|^2 + \|A^{1/2}u\|^2, \\ K_2(u) &= \|A^{1/4}u_t\|^2 - \epsilon \|u_t\|^2 + (A^{1/4}g(u), A^{1/4}u_t) \\ &\quad + \epsilon \left(\|A^{1/2}u\|^2 + (A^{1/2}u, g(u)) - (u, f) \right) \\ &\geq C \left(\|A^{1/4}u_t\|^2 + \|A^{1/2}u\|^2 \right) - C_1 e^{-\delta t} - C_0. \end{aligned} \quad (34)$$

Indeed,

$$\begin{aligned} |(A^{1/4}g(u), A^{1/4}u_t)| &\leq \frac{1}{4} \|A^{1/4}u_t\|^2 + \frac{\epsilon}{4} \|A^{1/2}u\|^2 \\ &\quad + C, \end{aligned} \quad (35)$$

$$|(A^{1/2}u, g(u))| \leq \frac{1}{4} \|A^{1/2}u\|^2 + C,$$

where $1 \leq p < N/(N-2)^+$, $H^s \hookrightarrow L^{2p}$; $N/(N-2)^+ \leq p < (N+2)/(N-2)^+$, $V_{2-\delta} \hookrightarrow L^{2(p+1)}$, and $H^1 \hookrightarrow L^{p+1}$

$$\frac{d}{dt} H_2(u) + \delta H_2(u) + \delta \|A^{1/4}u_t(t)\|^2 \leq C_1 e^{-\delta t} + C_0. \quad (36)$$

Thus

$$\|A^{1/2}u\|^2 + \|A^{1/4}u\|^2 + \|u_t\|^2 \leq C_2 e^{-\delta t} + C_0, \quad t > 0. \quad (37)$$

That is,

$$\begin{aligned} \|(u, u_t)\|_E + \int_t^{t+1} \|A^{1/4}u_t(\tau)\|^2 d\tau &\leq C_2 e^{-\delta t} + C_0, \\ t &> 0. \end{aligned} \quad (38)$$

It follows from (14) and (38) that

$$\begin{aligned} u_{tt} &= f - A^{1/2}u - A^{1/2}u_t - Au - A^{1/2}g(u) \\ &\in L^\infty(R^+, V_{-2}). \end{aligned} \quad (39)$$

Now, we look for the approximate solutions u^n of problem (14) and (15) of the form

$$u^n(t) = \sum_{j=1}^n T_{j_n}(t) w_j, \quad (40)$$

where $Aw_j = \lambda_j w_j$, $j = 1, 2, \dots$, $\{w_j\}$ is an orthonormal basis in H , and at the same time an orthogonal one in V_2 , and $T_{j_n}(t) = (u^n, w_j)$ with

$$\begin{aligned} (A^{-1/2}u_{tt}^n, w_j) + ((I + A^{1/2})u^n, w_j) \\ + 2\eta(A^{1/4}u_t^n, w_j) + (u_t^n, w_j) + (g(u^n), w_j) \\ = (A^{-1/2}f, w_j), \quad t > 0, \quad j = 1, \dots, n, \end{aligned} \quad (41)$$

$$(u^n(0), u_t^n(0)) = (u_{0n}, u_{1n}) \longrightarrow (u_0, u_1) \quad \text{in } E.$$

Obviously, the estimate (38) is valid for u^n . So we can extract a subsequence, still denoted by $\{u^n\}$, such that

$$\begin{aligned} (u^n, u_t^n) &\longrightarrow (u, u_t) \\ &\quad \text{weakly}^* \text{ in } L_{\text{loc}}^\infty(\mathbb{R}^+; E); \\ u_{tt}^n &\longrightarrow u_{tt} \quad \text{weakly}^* \text{ in } L_{\text{loc}}^\infty(\mathbb{R}^+; V_{-2}); \end{aligned} \quad (42)$$

$$(u^n(t), u_t^n(t)) \rightharpoonup (u(t), u_t(t)) \quad \text{for } t \geq 0.$$

Applying Lemma 3 to (33), we have

$$(u^n, u_t^n) \longrightarrow (u, u_t) \quad \text{in } C_w([0, T]; E). \quad (43)$$

Indeed, when $1 \leq p \leq N/(N-2)^+$, we have $H_0^1 \hookrightarrow L^{2p}$; hence

$$\begin{aligned} & \int_0^t |(g(u^n) - g(u), w_j)| d\tau \\ & \leq C \int_0^t (\|u^n - u\| + \|A^{1/4}u^n - A^{1/4}u\|) d\tau \longrightarrow 0, \end{aligned} \quad (44)$$

when $N/(N-2)^+ < p < (N+2)/(N-2)^+$, $V_{2-\delta} \hookrightarrow L^{2(p+1)}$ and by virtue of the interpolation theorem,

$$\begin{aligned} & \int_0^t |(g(u^n) - g(u), w_j)| d\tau \leq C \int_0^t (\|u^n - u\| \\ & + \|A^{1/4}(u^n - u)\|^\theta \|A^{1/2}(u^n - u)\|^{1-\theta}) d\tau \\ & \longrightarrow 0. \end{aligned} \quad (45)$$

Letting $n \rightarrow \infty$ in (41) we see that u is a weak solution of problem (14) and (15), with $(u, u_t) \in C_w(\mathbb{R}^+; E)$.

Integrating (31) over (t_0, t) ,

$$\begin{aligned} & (\|u_t(t)\|^2 + \|A^{1/4}u(t)\|^2 + \|A^{1/2}u(t)\|^2) \\ & - (\|u_t(t_0)\|^2 + \|A^{1/4}u(t_0)\|^2 + \|A^{1/2}u(t_0)\|^2) \\ & = 2 \int_{t_0}^t (u, f) dt + 2 \int_{t_0}^t \|A^{1/4}u_t\|^2 dt \\ & + 2 \int_{t_0}^t (A^{1/4}g(u), A^{1/4}u_t) dt \longrightarrow 0, \quad \text{as } t \longrightarrow t_0. \end{aligned} \quad (46)$$

Obviously,

$$\|(u, u_t)(t)\|_{V_2 \times H} - \|(u, u_t)(t_0)\|_{V_2 \times H} \longrightarrow 0, \quad t \longrightarrow t_0; \quad (47)$$

we prove that $(u, u_t) \in C([0, T], V_2 \times H)$, $u_{tt} \in C([0, T], V_{-1})$ and (22).

(ii) Now, we show that (u, u_t) is Lipschitz continuous in the weak space E .

In fact, let u, v be two solutions of problem (14) and (15) as shown above corresponding to initial data u_0, u_1 and v_0, v_1 , respectively. Then $z = u - v$ solves

$$\begin{aligned} & A^{-1/2}z_{tt} + (I + A^{1/2})z + z_t + g(u) - g(v) = 0, \\ & z(0) = u_0 - v_0 \equiv z_0, \\ & z_t(0) = u_1 - v_1 \equiv z_1. \end{aligned} \quad (48)$$

Using the multiplier $A^{1/2}z_t$ in (48),

$$\begin{aligned} H_3(z, z_t) &= \frac{1}{2} (\|z_t\|^2 + \|A^{1/4}z\|^2 + \|A^{1/2}z\|^2) \\ & - (A^{1/2}z_t, g(u) - g(v)) \\ & \leq \frac{1}{2} \|A^{1/4}z_t\|^2 + C(R) \|A^{1/2}z\|^2. \end{aligned} \quad (49)$$

We get

$$\begin{aligned} & \frac{d}{dt} H_3(z, z_t) + \kappa H_3(z, z_t) \leq C(R) \|z\|^2, \\ & \|(z, z_t)(t)\|_E^2 \leq C(R, T) \|(z, z_t)(0)\|_E^2, \\ & 0 \leq t \leq T, \quad (22) \\ & \|(z, z_t)(t)\|_E^2 \\ & \leq C(R) e^{-\kappa t} \|(z, z_t)(0)\|_E^2 + \int_0^t e^{-\kappa(t-\tau)} \|z(\tau)\|^2 d\tau, \\ & t > 0. \end{aligned} \quad (50)$$

Theorem 1 is proved. Under the assumptions of Theorem 1, with $1 \leq p < p^*$, $N \leq 5$, we can define the solution operator $S(t) : E \rightarrow E$,

$$\begin{aligned} S(t)(u_0, u_1) &= (u(t), u_t(t)) \\ & \text{for every } (u_0, u_1) \in E, \quad t \geq 0, \end{aligned} \quad (51)$$

where u is the weak solution of problem (14) and (15). Theorem 1 shows that $\{T(t)\}$ constitutes a semigroup on E , which is Lipschitz continuous in E . $\square$

Theorem 4 (existence of the global attractor). *Under the same assumptions of Theorem 1, with $1 \leq p < p^*$, $\{T(t)\}$ has a global attractor $\mathcal{A}$ in E and $\mathcal{A} \subset K$, where K is bounded set in $E_\sigma = V_{\sigma+2} \times V_\sigma$, $0 < \sigma < 1$.*

Proof of Theorem 4. Estimate (38) implies that the ball

$$B_0 = \{(u, v) \in E \mid \|(u, v)\|_E^2 \leq C_0\} \quad (52)$$

is an absorbing set of the semigroup $S(t)$ in E . For every bound B in E ,

$$\text{dist}(S(t)B, B_0) \leq C(B) e^{-\delta t}, \quad \forall B \subset E. \quad (53)$$

Let $S(t) = S_1(t) + S_2(t)$, where $S_2(t) : V_2 \times H \rightarrow V_2 \times H$, $S_2(t)(u_0, u_1) = (\bar{u}, \bar{u}_t)$ and

$$\begin{aligned} & A^{-1/2}\bar{u}_{tt} + (I + A^{1/2})\bar{u} + \bar{u}_t = 0, \\ & t > 0, \quad \bar{u}(0) = u_0, \quad \bar{u}_t(0) = u_1. \end{aligned} \quad (54)$$

It is easy to get

$$\|S_2(t)\|_{\mathcal{L}(E)} \leq C e^{-\delta t}. \quad (55)$$

$S_1(t) = S(t) - S_2(t)$, $S_1(t) : E \rightarrow E$, $S_1(t)(u_0, u_1) = (\hat{u}, \hat{u}_t)$ solves

$$\begin{aligned} & A^{-1/2}\hat{u}_{tt} + (I + A^{1/2})\hat{u} + \hat{u}_t = A^{-1/2}f - g(u), \\ & t > 0, \quad \hat{u}(0) = 0, \quad \hat{u}_t(0) = 0, \end{aligned} \quad (56)$$

where $u \in C_b(R^+, V_2)$.

Let $w = \hat{u}_t$,

$$\begin{aligned} A^{-1/2} w_{tt} + (I + A^{1/2}) w + w_t &= -g'(u) u_t, \\ w(0) &= 0 = w_0, \\ w_t(0) &= f - A^{1/2} g(u_0) = w_1, \end{aligned} \quad (57)$$

because $f \in V_{\sigma-2}$, $A^{1/2} g(u_0) \in V_{\sigma-2}$, $w_1 \in V_{\sigma-2}$, $g'(u) u_t \in C_b(R^+, V_{\sigma-2})$.

Therefore

$$(\hat{u}_t, \hat{u}_{tt}) \in C_b(R^+, V_\sigma \times V_{\sigma-2}). \quad (58)$$

We know $(I + A^{1/2})\hat{u} = A^{-1/2}f - g(u) - A^{-1/2}\hat{u}_{tt} - \hat{u}_t \in C_b(R^+, V_\sigma)$, $\hat{u} \in C_b(R^+, V_{\sigma+2})$ so

$$(\hat{u}, \hat{u}_t) \in C_b(R^+, V_{\sigma+2} \times V_\sigma). \quad (59)$$

Thus $\bigcup_{t \geq 0, \|(\hat{u}, \hat{u}_t)\|_{E_\sigma} \leq R} (\hat{u}, \hat{u}_t)$ is bounded in $V_{\sigma+2} \times V_\sigma$. $V_{\sigma+2} \times V_\sigma \hookrightarrow V_2 \times H$,

$$K = \overline{\bigcup_{t \geq 0, \|(\hat{u}, \hat{u}_t)\|_{E_\sigma} \leq R} (\hat{u}, \hat{u}_t)^E} \quad (60)$$

is compact in $E = V_2 \times H$. For every bounded set $B \subset E$,

$$\begin{aligned} \text{dist}\{S(t)B, K\} &= \sup_{(u_0, u_1) \in B} \inf_{(\hat{u}, \hat{u}_t) \in K} \text{dist}\{S(t)(u_0, u_1), (\hat{u}, \hat{u}_t)\} \\ &\leq \sup_{(u_0, u_1) \in B} \|(\bar{u}, \bar{u}_t)\|_E \rightarrow 0. \end{aligned} \quad (61)$$

Therefore $S(t)$ has the global attractor $\mathcal{A} = \omega(B_0)$ and

$$\text{dist}\{\mathcal{A}, K\} = \text{dist}\{S(t)\mathcal{A}, K\} \rightarrow 0 \quad t \rightarrow \infty; \quad (62)$$

that is $\mathcal{A} \subset K$. This completes the proof. $\square$

3. Exponential Attractor

Definition 5. The set $\mathbb{A}_{\text{exp}} \subset E$ is called an exponential attractor for the solution semigroup $S(t)$ of acting on the energy space E if

- (i) the set $\mathbb{A}_{\text{exp}}$ is a compact set in E ;
- (ii) $\mathbb{A}_{\text{exp}}$ is forward invariant set; that is, $S(t)\mathcal{A} \subset \mathcal{A}$, $t \geq 0$;
- (iii) $\mathbb{A}_{\text{exp}}$ attracts exponentially the images of all bounded set in E ; that is,

$$\text{dist}_E\{S(t)B, \mathbb{A}_{\text{exp}}\} \leq Q(\|B\|_E) e^{-\gamma t}; \quad (63)$$

for all bounded set $B \subset E$;

- (iv) it has finite fractal dimension in E ; that is, $\dim_f\{\mathbb{A}_{\text{exp}}, E\} < +\infty$.

From Theorem 1, estimate (38) implies that the ball

$$B_R = \{\zeta \in E \mid \|\zeta\|_E \leq R\} \quad (64)$$

is an absorbing set of the semigroup $T(t)$ in E for $R > C_0$. Without loss of generality we assume that B_R is a forward invariant set. Let

$$\mathcal{B}_R = \left[\bigcup_{t \geq t_0+1} T(t)B_R \right]_E, \quad (65)$$

where $t_0 > 0$ is chosen such that $T(t)B_R \subset B_R$ for $t \geq t_0$ and $[\]_X$ stands for the closure in space X . Obviously, the set $\mathcal{B}_R$ is bounded closed set in E , $T(t)\mathcal{B}_R \subset \mathcal{B}_R$, $t \geq 0$, and it is also an absorbing set of $T(t)$. $\mathcal{B}_R$ constitutes a complete metric space (with the E norm) and one sees from (22) that the solution semigroup $T(t)$ is continuous on $\mathcal{B}_R$, and the system $(T(t), \mathcal{B}_R)$ constitutes a dissipative dynamical system.

Lemma 6 (see [19]). *Let X be a Banach space and M a bounded closed set in X . Assume that the mapping $V: M \rightarrow M$ possesses the following properties:*

- (i) V is Lipschitz on M ; that is, there exists $L > 0$ such that

$$\|Vv_1 - Vv_2\| \leq L\|v_1 - v_2\|, \quad v_1, v_2 \in M; \quad (66)$$

- (ii) there exist compact seminorms $n_1(x)$ and $n_2(x)$ on X such that

$$\begin{aligned} \|Vv_1 - Vv_2\| &\leq \eta\|v_1 - v_2\| \\ &\quad + K[n_1(v_1 - v_2) + n_2(Vv_1 - Vv_2)], \end{aligned} \quad (67)$$

for any $v_1, v_2 \in M$, where $0 < \eta < 1$ and $K > 0$ are constants. Then for any $\kappa > 0$ and $\delta \in (0, 1 - \eta)$, there exists a positively invariant compact set $A_{\kappa, \delta} \subset M$ of finite fractal dimension such that

$$\text{dist}(V^k M, A_{\kappa, \delta}) \leq q^k, \quad k = 1, 2, \dots, \quad (68)$$

where $q = \eta + \delta < 1$, and

$$\begin{aligned} \dim_f A_{\kappa, \delta} &\leq \left(\ln \frac{1}{\delta + \eta} \right)^{-1} \\ &\quad \cdot \left(\ln m_0 \left(\frac{2K(1 + L^2)^{1/2}}{\delta} \right) + \kappa \right), \end{aligned} \quad (69)$$

where $m_0(R)$ is the maximal number of pairs (x_i, y_i) in $X \times X$ possessing the properties

$$\begin{aligned} \|x_i\|^2 + \|y_i\|^2 &\leq R^2, \\ n_1(x_i - x_j) + n_2(y_i - y_j) &> 1, \\ i &\neq j. \end{aligned} \quad (70)$$

Lemma 7. *Let X, Y be the metric spaces and let the mapping $h: X \rightarrow Y$ be θ -Hölder continuous on the set $B \subset X$. Then*

$$\dim_f\{h(B), Y\} \leq \frac{1}{\theta} \dim_f\{B, X\}. \quad (71)$$

Theorem 8. *Let the assumptions of Theorem 1 be in force, with $1 \leq p < p^*$. Then the solution semigroup $T(t)$ has an exponential attractor $\mathcal{A}_{exp}$ in E .*

Proof. Define the operator

$$V^k = S(kT) : \mathcal{B}_R \longrightarrow \mathcal{B}_R, \quad k \in \mathbb{Z}^+. \quad (72)$$

We show that the discrete system $(V^k, \mathcal{B}_R)$ has an exponential attractor. $\square$

Definition 9. We introduce the functional space

$$W(0, T) = \{z \in L^2(0, T; V_2) \mid z_t \in L^2(0, T; H), \|\xi_z\|_W^2 < \infty\}, \quad (73)$$

equipped with the norm

$$\|\xi_z\|_W^2 = \int_0^T \|(z(t), z_t(t))\|_E^2 dt \quad (74)$$

and the functional space

$$H_T = E \times W(0, T), \quad (75)$$

equipped with the usual graph norm; that is

$$\|U\|_{H_T}^2 = \|\eta\|_E^2 + \|\xi_z\|_W^2, \quad \forall U = (\eta, \xi_z) \in H_T. \quad (76)$$

Obviously, the spaces $W(0, T)$ and H_T are Banach spaces. Let the set

$$B_T = \{(\xi_u(0), \xi_u(t), t \in [0, T]) \mid \xi_u(0) \in \mathcal{B}_R, \xi_u(t) = S(t)\xi_u(0)\}. \quad (77)$$

Define the operator

$$\begin{aligned} \mathbb{V} : B_T &\longrightarrow H_T, \\ \mathbb{V}U &= (S(T)\xi_u(0), \xi_u(T + \cdot)) \\ &= (S(T)\xi_u(0), S(t+T)\xi_u(0), t \in [0, T]), \end{aligned} \quad (78)$$

where $U = (\xi_u(0), \xi_u(\cdot)) \in B_T$ and in the following $\xi_u(\cdot)$ means $\xi_u(t)$, $t \in [0, T]$.

Lemma 10. *The set B_T is a bounded closed set in H_T .*

Proof. Obviously, B_T is bounded in H_T . For any sequence $\{U^n\} \subset B_T$,

$$U^n = (\xi_{u^n}(0), \xi_{u^n}(\cdot)) \longrightarrow U = (\xi_u(0), \xi_u(\cdot)) \text{ in } B_T. \quad (79)$$

Since $\xi_{u^n}(0) \in \mathcal{B}_R$ and $\mathcal{B}_R$ is closed in E , $\xi_u(0) \in \mathcal{B}_0$. By the Lipschitz continuity of $S(t)$ in E ,

$$\begin{aligned} \|\xi_{u^n}(t) - \xi_u(t)\|_E^2 &= \|S(t)\xi_{u^n}(0) - S(t)\xi_u(0)\|_E^2 \\ &\leq C(R, T) \|\xi_{u^n}(0) - \xi_u(0)\|_E^2 \\ &\longrightarrow 0, \end{aligned} \quad (80)$$

so by the uniqueness of the limit; $\xi_v(\cdot) = \xi_u(t)$, that is, $U = (\xi_u(0), \xi_u(\cdot)) \in B_T$, where B_T is closed in H_T . $\square$

Lemma 10 implies that B_T is complete with respect to the topology of H_T , and the dynamical system $(\mathbb{V}^k, B_T)$ constitutes a discrete dissipative dynamical system.

Lemma 11. *Under the same assumptions of Theorem 1, then discrete dissipative dynamical system $(\mathbb{V}^k, B_T)$ has an exponential attractor $\mathbb{A}$.*

Proof. Obviously, $\mathbb{V}B_T \subset B_T$

$$\begin{aligned} \forall U_1 &= (\xi_{u_1}(0), \xi_{u_1}(\cdot)), \\ U_2 &= (\xi_{u_2}(0), \xi_{u_2}(\cdot)), \\ z &= u_1 - u_2; \end{aligned} \quad (81)$$

the inequality (93) holds; then integrating (93) over $(T, 2T)$ we get

$$\begin{aligned} &\int_T^{2T} (\|z(t)\|_{V_2}^2 + \|z_t(t)\|_H^2) dt \\ &\leq C \int_T^{2T} e^{-\kappa t} dt (\|z_0\|_{V_2}^2 + \|z_1\|_H^2) \\ &\quad + CT \int_0^{2T} \|z(\tau)\|^2 d\tau. \end{aligned} \quad (82)$$

Hence,

$$\begin{aligned} &\|\mathbb{V}U_1 - \mathbb{V}U_2\|_{H_T}^2 \\ &= \|S(T)\xi_{u_1}(0) - S(T)\xi_{u_2}(0)\|_E^2 + \|\xi_z(t+T)\|_W^2 \\ &\leq Ce^{-\kappa T} \|\xi_{u_1}(0) - \xi_{u_2}(0)\|_E^2 \\ &\quad + C \int_0^T e^{-\kappa(T-\tau)} \|z(\tau)\|^2 d\tau + \int_T^{2T} \|\xi_z(t)\|_E^2 dt \\ &\leq \eta_T \|\xi_{u_1}(0) - \xi_{u_2}(0)\|_E^2 + K_T \int_0^{2T} \|z(\tau)\|^2 d\tau \\ &\leq \eta_T \|U_1 - U_2\|_{H_T}^2 \\ &\quad + K_T (n_1(U_1 - U_2) + n_1(\mathbb{V}U_1 - \mathbb{V}U_2)), \end{aligned} \quad (83)$$

where $\xi_z(t) = \xi_{u_1}(t) - \xi_{u_2}(t)$,

$$\begin{aligned} \eta_T &= 2Ce^{-\kappa T} + C \int_T^{2T} e^{-\kappa t} dt, \quad K_T = C(T+2), \\ n_1(U) &= \int_0^T \|u(t)\|^2 dt, \quad U = (\xi_u(0), \xi_u(\cdot)) \in B_T. \end{aligned} \quad (84)$$

It follows from (83) that

$$\|\mathbb{V}U_1 - \mathbb{V}U_2\|_{H_T}^2 \leq a_T \|U_1 - U_2\|_{H_T}^2, \quad (85)$$

where $a_T = \eta_T + CK_T \int_0^{2T} e^{-\kappa t} dt$. Since $W(0, T) \hookrightarrow L^2(0, T; H)$, the seminorm $n_1(U)$ is compact in H_T . Taking

$T : 0 < \eta_T < 1$ and making use of Lemma 6, we get the conclusion of Lemma 11. That is, the discrete dynamical system (V^k, M) possesses an exponential attractor $A_{\kappa, \delta}$. Define the project operator

$$\begin{aligned} \Pi : B_T &\longrightarrow \mathcal{B}_R, \\ \Pi U &= \xi_u(0), \\ U &= (\xi_u(0), \xi_u(\cdot)) \in B_T. \end{aligned} \quad (86)$$

□

Lemma 12. $A = \Pi A$ is an exponential attractor of the discrete dynamical system $(V^k, \mathcal{B}_R)$.

Proof. (1) A is compact because A is the image of the compact set A under the continuous mapping Π .

(2) $V^k A \subset A$; we have $V^k A \subset A$; thus $V^k A = \Pi V^k A \subset \Pi A = A$.

(3) Obviously,

$$\begin{aligned} \text{dist}_E \{V^k \mathcal{B}_R, A\} &\leq \text{dist}_{H_T} \{V^k B_T, A\} \leq Cq^k, \\ 0 &< q < 1; \end{aligned} \quad (87)$$

for some $0 < q < 1$ (see Lemma 11).

(4) $\dim_f \{A, E\} \leq \dim_f \{A, H_T\} < \infty$.

Hence, A is a desired exponential attractor. Lemma 12 is proved.

Let

$$A_{\text{exp}} = \bigcup_{0 \leq t \leq S} S(t) A. \quad (88)$$

By the method used in [11], one easily knows that A_{exp} is an exponential attractor of $(S(t), \mathcal{B}_R)$, with E topology. So by the definition of the exponential attractor, there exists a constant $\kappa > 0$, such that

$$\text{dist}_E \{S(t) \mathcal{B}_R, A_{\text{exp}}\} \leq Ce^{-\kappa t}, \quad t > 0. \quad (89)$$

Since the set $A_{\text{exp}} \subset \mathcal{B}_0$ is bounded in E , we claim that A_{exp} is an exponential attractor of the system $(S(t), E)$. Indeed, (i) obviously, A_{exp} is forward invariant; (ii) define the project operator

$$F : [0, T] \times A \longrightarrow \mathcal{B}_R,$$

$$F(t, \xi_u) = \xi_u(t), \quad \xi_u(t) \in \mathcal{B}_R, \quad t \in [0, T],$$

$$\begin{aligned} &\|F(t_1, \xi_u) - F(t_2, \xi_u)\|_E \\ &\leq C \left(\int_{t_1}^{t_2} \|\xi'_u(\tau)\|_E^2 d\tau \right)^{1/2} |t_1 - t_2|^{1/2} \\ &\leq C |t_2 - t_1|^{1/2}, \end{aligned} \quad (90)$$

$$\|F(t, \xi_{u_1}) - F(t, \xi_{u_2})\|_{E_1} \leq C(R) e^{\kappa T} \|\xi_{u_1} - \xi_{u_2}\|_E$$

for any $\xi_u, \xi_{u_1}, \xi_{u_2} \in \mathcal{B}_R$, $t, t_1, t_2 \in [0, T]$, which imply that the mapping F is $1/2$ -Hölder continuous. Therefore, $A_{\text{exp}} = F\{[0, T] \times A\}$ (the image of $[0, T] \times A$) is compact in E .

(iii) Consider the following:

$$\begin{aligned} \dim_f \{A_{\text{exp}}, E\} &\leq 2 \dim_f \{[0, S] \times A, \mathbb{R}^+ \times E\} \\ &\leq 2(1 + \dim_f \{A, E\}) < \infty. \end{aligned} \quad (91)$$

(iv) For any $t \in \mathbb{R}^+$, there exists a $k \in \mathbb{N}^+$, such that $S(t) \mathcal{B}_R \subset T(kT) \mathcal{B}_R$ as $t \in (kT, (k+1)T]$. On account of $A = S(0)A \subset A_{\text{exp}}$,

$$\begin{aligned} \text{dist}_E \{S(t) \mathcal{B}_R, A_{\text{exp}}\} &\leq \text{dist}_E \{S(kT) \mathcal{B}_R, A\} \\ &\leq \sup_{\xi_u \in \mathcal{B}_R} \inf_{\xi_v \in A} \|S(t) \xi_u - \xi_v\|_E^{1/2} \leq Cq^{k/2} \leq Ce^{-\kappa t/2}. \end{aligned} \quad (92)$$

Therefore, Theorem 8 is proved. □

4. Global and Exponential Attractor in Nonsupercritical Case

Theorem 13. Let the assumptions of Theorem 1 be in force, with $1 \leq p \leq \tilde{p} = N/(N-2)^+$. Then problem (14)-(15) admits a unique weak solution u , with $(u, u_t) \in C_b(\mathbb{R}^+, E_1) \equiv L^\infty(\mathbb{R}^+, E_1) \cap C(\mathbb{R}^+, E_1)$, and the solution is Lipschitz continuous in $E_1 = V_1 \times H$; that is,

$$\|(z(t), z_t(t))\|_{E_1}^2 \leq Ce^{kt} \|(z(0), z_t(0))\|_{E_1}^2, \quad t \geq 0, \quad (93)$$

for some $C, k > 0$, where $z = u - v$, u and v are, respectively, the weak solutions of (14) corresponding to initial data (u_0, u_1) and (v_0, v_1) .

Proof. The existence of the weak solutions can be easily proved by the same way of Theorem 1. So we only prove (93) here. Taking H -inner product by z_t in (36), we have

$$\begin{aligned} &\frac{1}{2} \frac{d}{dt} \left(\|A^{-1/4} z_t\|^2 + \|z\|^2 + \|A^{1/4} z\|^2 \right) + \|z_t\|^2 \\ &= -(g(u) - g(v), z_t) \\ &\leq C(1 + \|u\|_{2p}^{p-1} + \|v\|_{2p}^{p-1}) \|z\|_{2p} \|z_t\| \\ &\leq \frac{1}{2} \|z_t\|^2 + C \|A^{1/4} z\|^2. \end{aligned} \quad (94)$$

Applying the Gronwall inequality to (94) we obtain (93). □

Remark 14. (i) When $1 \leq p \leq \tilde{p}$, by (93), define the continuous semigroup

$$\begin{aligned} S(t) : E_1 &\longrightarrow E_1, \\ S(t) \varphi_0 &= \varphi_u(t) = (u(t), u_t(t)), \end{aligned} \quad (95)$$

where $\varphi_u = (u, u_t) \in C_b(\mathbb{R}^+, E_1)$ as shown in Theorem 13.

(ii) It follows from Theorem 8 and Remark 14 that the dynamical system $(S(t), E_1)$ is dissipative; that is, it has a bounded absorbing set $\mathcal{B}_R$. Without loss of generality we assume that $\mathcal{B}_R$ is positive invariant; that is, $S(t) \mathcal{B}_R \subset \mathcal{B}_R$ for $t \geq 0$.

Theorem 15. Let the assumptions of Theorem 13 be in force, especially when $p = \tilde{p}$, $g \in C^2(\mathbb{R})$,

$$|g''(s)| \leq C(1 + |s|^{p-2}), \quad s \in \mathbb{R} \text{ with } p \geq 2. \quad (96)$$

Then the following conclusions are valid.

(i) The solution semigroup $S(t)$ possesses in E_1 a compact global attractor $\mathcal{A}$, which has finite fractal dimension.

(ii) Any full trajectory $\nu = \{\varphi_u(t) = (u(t), u_t(t)) \mid t \in \mathbb{R}\} \subset \mathcal{A}$ possesses the property

$$(u, u_t, u_{tt}) \in L^\infty(\mathbb{R}; V_2 \times V_1 \times H), \quad (97)$$

and there exists constant $R > 0$ such that

$$\sup_{\nu \subset \mathcal{A}} \sup_{t \in \mathbb{R}} (\|u(t)\|_{V_2}^2 + \|u_t(t)\|_{V_1}^2 + \|u_{tt}(t)\|^2) \leq R^2. \quad (98)$$

(iii) The global attractor $\mathcal{A}$ consists of full trajectory $\nu = \{\varphi_u(t) \mid t \in \mathbb{R}\}$ such that

$$\begin{aligned} \lim_{t \rightarrow -\infty} \text{dist}_{E_1} \{\varphi_u(t), \mathcal{N}\} &= 0, \\ \lim_{t \rightarrow +\infty} \text{dist}_{E_1} \{\varphi_u(t), \mathcal{N}\} &= 0, \end{aligned} \quad (99)$$

where $\mathcal{N}$ is the set of all fixed points of $T(t)$; that is,

$$\mathcal{N} = \{(u, 0) \in E_1 \mid (I + A^{1/2})u + g(u) = A^{-1/2}f\}. \quad (100)$$

Furthermore, for any $\zeta \in E_1$,

$$\lim_{t \rightarrow +\infty} \text{dist}_{E_1} \{S(t)\zeta, \mathcal{N}\} = 0. \quad (101)$$

(iv) The semigroup $S(t)$ has in E_1 an exponential attractor.

Lemma 16. Let $y : \mathbb{R}^+ \rightarrow \mathbb{R}^+$ be an absolutely continuous function satisfying

$$\frac{d}{dt} y(t) + 2\epsilon y(t) \leq h(t) y(t) + z(t), \quad t > 0, \quad (102)$$

where $\epsilon > 0$, $z \in L_{loc}^1(\mathbb{R}^+)$, $\int_s^t h(\tau) d\tau \leq \epsilon(t-s) + m$ for $t \geq s \geq 0$ and some $m > 0$. Then

$$y(t) \leq e^m \left(y(0) e^{-\epsilon t} + \int_0^t |z(\tau)| e^{-\epsilon(t-\tau)} d\tau \right), \quad (103)$$

$t > 0.$

Lemma 17 (quasi-stability). Let the assumptions of Theorem 13 be valid and let u, v be the solutions of problem (14)-(15) with initial data in $\mathcal{B}_R$. Then $z = u - v$ satisfies the relation

$$\begin{aligned} \|(z(t), z_t(t))\|_{E_1}^2 &\leq C \|(z(0), z_t(0))\|_{E_1}^2 e^{-\kappa t} \\ &\quad + K \sup_{0 \leq s \leq t} \|z(s)\|^2 \end{aligned} \quad (104)$$

for some constants $C, K > 0$.

Proof. (i) When $1 \leq p < \tilde{p}$, taking H -inner product by $z_t + \epsilon z$ in (48), with $\eta = 0$, we get

$$\begin{aligned} \frac{d}{dt} H_4(z, z_t) + \|z_t\|^2 - \epsilon \|A^{-1/4} z_t\|^2 \\ + \epsilon (\|z\|^2 + \|A^{1/4} z\|^2) \\ = -(g(u) - g(v), z_t + \epsilon z), \end{aligned} \quad (105)$$

where

$$\begin{aligned} H_4(z, z_t) &= \frac{1}{2} (\|A^{-1/4} z_t\|^2 + (1 + \epsilon) \|z\|^2 + \|A^{1/4} z\|^2 \\ &\quad + 2\epsilon (A^{-1/2} z_t, z)) \sim \|(z, z_t)\|_{E_1}^2 \end{aligned} \quad (106)$$

for $\epsilon > 0$ suitably small. On account of $p < \tilde{p}$, $V_{1-\delta} \hookrightarrow L^{2p}$ for $\delta : 0 < \delta \ll 1$ and the interpolation theorem we have the control

$$\begin{aligned} |(g(u) - g(v), z_t + \epsilon z)| &\leq C(1 + \|u\|_{2p}^{p-1} + \|v\|_{2p}^{p-1}) \\ &\quad \cdot (\|z\|_{2p} \|z_t\| + \epsilon \|z\|_{2p} \|z\|) \leq C \|z\|_{V_{1-\delta}} \\ &\quad \cdot (\|z_t\| + \epsilon \|z\|) \leq \frac{1}{2} \|z_t\|^2 + \frac{\epsilon}{2} \|A^{1/4} z\|^2 + C \|z\|^2. \end{aligned} \quad (107)$$

Therefore, there exists constant $\kappa > 0$ such that

$$\begin{aligned} \frac{d}{dt} H_4(z, z_t) + \kappa H_4(z, z_t) &\leq C \|z\|^2, \\ \|(z(t), z_t(t))\|_{E_1}^2 &\leq C \|(z(0), z_t(0))\|_{E_1}^2 e^{-\kappa t} \\ &\quad + C \int_0^t e^{-\kappa(t-\tau)} \|z(\tau)\|^2 d\tau \\ &\leq C \|(z(0), z_t(0))\|_{E_1}^2 e^{-\kappa t} + K \sup_{0 \leq \tau \leq t} \|z(\tau)\|^2, \end{aligned} \quad (108)$$

where $K = C/\kappa$.

(ii) When $p = \tilde{p}$, rewrite (105) in the form

$$\begin{aligned} \frac{d}{dt} \left(H_4(z, z_t) + \frac{1}{2} (g(u) - g(v), z) \right) + \|z_t\|^2 \\ - \epsilon \|A^{-1/4} z_t\|^2 + \epsilon (\|z\|^2 + \|A^{1/4} z\|^2) \\ + \epsilon (g(u) - g(v), z) = \frac{1}{2} (\tilde{g}(u, v), z^2), \end{aligned} \quad (109)$$

where

$$\begin{aligned} \tilde{g}(u, v) \\ = \int_0^1 g''(\lambda u + (1 - \lambda)v) (\lambda u_t + (1 - \lambda)v_t) d\lambda. \end{aligned} \quad (110)$$

Since $V_1 \hookrightarrow L^{2p}$, there exists constant $l > 0$ such that

$$\begin{aligned} & |(g(u) - g(v), z)| \\ & \leq C(1 + \|u\|_{2p}^{p-1} + \|v\|_{2p}^{p-1}) \|z\|_{2p} \|z\| \leq C \|z\|_{V_1} \|z\| \\ & \leq \frac{1}{2} \|z\|_{V_1}^2 + l \|z\|^2, \end{aligned} \quad (111)$$

which means

$$\begin{aligned} & (g(u) - g(v), z) + l \|z\|^2 \geq -\frac{1}{2} \|z\|_{V_1}^2, \\ & |(\tilde{g}(u, v), z^2)| \\ & \leq C(1 + \|u\|_{2p}^{p-2} + \|v\|_{2p}^{p-2}) (\|u_t\| + \|v_t\|) \|z\|_{2p}^2 \\ & \leq C(\|u_t\| + \|v_t\|) \|z\|_{V_1}^2. \end{aligned} \quad (112)$$

We infer from (109) that

$$\begin{aligned} & \frac{d}{dt} H_5(z, z_t) + \frac{1}{2} \|z_t\|^2 + K_5(z, z_t) \\ & \leq C(\|u_t\| + \|v_t\|) \|z\|_{V_1}^2 + l(z, z_t) \\ & \leq C(\|u_t\| + \|v_t\|) H_5(z, z_t) + \frac{1}{2} \|z_t\|^2 + l^2 \|z\|^2, \end{aligned} \quad (113)$$

where

$$\begin{aligned} & H_5(z, z_t) \\ & = H_4(z, z_t) + \frac{1}{2} ((g(u) - g(v), z) + l \|z\|^2) \\ & \sim \|z_t\|^2 + \|A^{1/4} z\|^2, \\ & K_5(z, z_t) \\ & = \left(\frac{1}{2} - \epsilon - \frac{\epsilon}{\sqrt{\lambda_1}} \right) \|z_t\|^2 \\ & \quad + \epsilon (\|z\|^2 + \|A^{1/4} z\|^2 + (g(u) - g(v), z)) \\ & \geq 2\kappa H_5(z, z_t) - l\epsilon \|z\|^2 \end{aligned} \quad (114)$$

for $\epsilon > 0$ suitably small. Inserting (114) into (113), we get

$$\begin{aligned} & \frac{d}{dt} H_5(z, z_t) + 2\kappa H_5(z, z_t) \\ & \leq C(\|u_t\| + \|v_t\|) H_5(z, z_t) + l^2 \|z\|^2. \end{aligned} \quad (115)$$

There exists $m > 0$ such that

$$\begin{aligned} & C \int_s^t (\|u_t(\tau)\| + \|v_t(\tau)\|) d\tau \\ & \leq C \left(\int_s^t (\|u_t(\tau)\|^2 + \|v_t(\tau)\|^2) d\tau \right)^{1/2} (t-s)^{1/2} \\ & \leq \kappa(t-s) + m, \quad \text{for } t \geq s \geq 0. \end{aligned} \quad (116)$$

Applying Lemma 16 to (115), we get

$$\begin{aligned} & \|(z(t), z_t(t))\|_{E_1}^2 \leq Ce^m \left(\|(z(0), z_t(0))\|_{E_1}^2 e^{-\kappa t} \right. \\ & \quad \left. + l^2 \int_0^t e^{-\kappa(t-\tau)} \|z(\tau)\|^2 d\tau \right) \\ & \leq Ce^m \|(z(0), z_t(0))\|_{E_1}^2 e^{-\kappa t} + K \sup_{0 \leq \tau \leq t} \|z(\tau)\|^2, \end{aligned} \quad (117)$$

where $K = Ce^m l^2 / \kappa$. Lemma 17 is proved. $\square$

Proof of Theorem 15. The estimates (93) and (104) show that the dissipative system $(T(t), E_1)$ is quasi-stable on the absorbing set $\mathcal{B}_R$, so the conclusions (i) and (ii) follow directly from the standard theory on global attractor (cf. Theorems 7.9.4–7.9.6 and 7.9.8 in [30]).

The energy equality holds and shows that $H(u, u_t)$ is a strictly Lyapunov function on E_1 , so the dynamical system $(T(t), E_1)$ is gradient, and by conclusion (ii), it has a compact global attractor. Therefore, the conclusion (iii) of Theorem 4 holds (cf. Theorems 2.28 and 2.31 in [20]).

We see from the conclusion (ii) that the global attractor $\mathcal{A}$ is included and bounded in $E_2 = V_2 \times V_1$. Let $\mathcal{D}$ be the closure of the 1-neighborhood of $\mathcal{A}$ in E_2 ; that is,

$$\mathcal{D} = [\{\zeta \in E_2 \mid \text{dist}_{E_2} \{\zeta, \mathcal{A}\} \leq 1\}]_{E_1}. \quad (118)$$

Then $\mathcal{D}$ is bounded in E_2 and closed in E_1 , and it is an absorbing set of $T(t)$; without loss of generality we assume that $T(t)\mathcal{D} \subset \mathcal{D}$, $t \geq 0$. By Lemma 17, $T(t)$ is quasi-stable on $\mathcal{D}$. For every $\varphi_0 \in \mathcal{D}$, $\varphi(t) = S(t)\varphi_0 = (u(t), u_t(t)) \in \mathcal{D}$ and by (14), $\|u_{tt}\| \leq C(\mathcal{D})$,

$$\begin{aligned} & \|T(t_2)\varphi_0 - T(t_1)\varphi_0\|_{E_1} \leq \int_{t_1}^{t_2} \|\varphi'(t)\|_{E_1} dt \\ & \leq C(\mathcal{D}) |t_2 - t_1|. \end{aligned} \quad (119)$$

So $T(t)$ has in E_1 an exponential attractor (cf. Theorem 7.9.9 in [30]). Theorem 15 is proved. $\square$

Remark 18. Comparing Theorem 8 with Theorem 2.2 in [17] one finds that the critical case $p = \tilde{p}$ is solved in natural energy space E , the restriction $N \leq 5$ is removed in the subcritical case $p < \tilde{p}$, the higher regularity of the global attractor is obtained, and the exponential attractor is established in E_1 .
