We prove the existence and uniqueness of entropy solution for nonlinear anisotropic elliptic equations with Neumann homogeneous boundary value condition for L^1 -data. We prove first, by using minimization techniques, the existence and uniqueness of weak solution when the data is bounded, and by approximation methods, we prove a result of existence and uniqueness of entropy solution.

1. Introduction

Let Ω be an open bounded domain of $\mathbb{R}^N$ ($N \geq 3$) with smooth boundary. Our aim is to prove the existence and uniqueness of entropy solution for the anisotropic nonlinear elliptic problem of the form

$$\begin{aligned} -\sum_{i=1}^N \frac{\partial}{\partial x_i} a_i \left(x, \frac{\partial}{\partial x_i} u \right) + |u|^{p_M(x)-2} u &= f \quad \text{in } \Omega, \\ \sum_{i=1}^N a_i \left(x, \frac{\partial}{\partial x_i} u \right) \nu_i &= 0 \quad \text{on } \partial\Omega, \end{aligned} \quad (1)$$

where the right-hand side $f \in L^1(\Omega)$ and $\nu_i, i \in \{1, \dots, N\}$ are the components of the outer normal unit vector.

For the rest of the functions involved in (1), we are going to enumerate their properties after we make some notations.

For any $\Omega \subset \mathbb{R}^N$, we set

$$C_+(\overline{\Omega}) = \left\{ h \in C(\overline{\Omega}) : \inf_{x \in \Omega} h(x) > 1 \right\}, \quad (2)$$

and we denote

$$h^+ = \sup_{x \in \Omega} h(x), \quad h^- = \inf_{x \in \Omega} h(x). \quad (3)$$

For the exponents, $\tilde{p}(\cdot) : \overline{\Omega} \rightarrow \mathbb{R}^N$, $\tilde{p}(\cdot) = (p_1(\cdot), \dots, p_N(\cdot))$ with $p_i \in C_+(\overline{\Omega})$ for every $i \in \{1, \dots, N\}$ and for all $x \in$

$\overline{\Omega}$, we put $p_M(x) = \max\{p_1(x), \dots, p_N(x)\}$ and $p_m(x) = \min\{p_1(x), \dots, p_N(x)\}$. Now, we can give the properties of the rest of the functions involved in (1).

We assume that for $i = 1, \dots, N$, the function $a_i : \Omega \times \mathbb{R} \rightarrow \mathbb{R}$ is Carathéodory and satisfies the following conditions: $a_i(x, \xi)$ is the continuous derivative with respect to ξ of the mapping $A_i : \Omega \times \mathbb{R} \rightarrow \mathbb{R}$, $A_i = A_i(x, \xi)$, that is, $a_i(x, \xi) = (\partial/\partial \xi) A_i(x, \xi)$ such that the following equality and inequalities holds

$$A_i(x, 0) = 0, \quad (4)$$

for almost every $x \in \Omega$.

There exists a positive constant C_1 such that

$$|a_i(x, \xi)| \leq C_1 \left(j_i(x) + |\xi|^{p_i(x)-1} \right), \quad (5)$$

for almost every $x \in \Omega$ and for every $\xi \in \mathbb{R}$, where j_i is a nonnegative function in $L^{p_i(\cdot)}(\Omega)$, with $1/p_i(x) + 1/p_i'(x) = 1$.

There exists a positive constant C_2 such that

$$\begin{aligned} &(a_i(x, \xi) - a_i(x, \eta)) \cdot (\xi - \eta) \\ &\geq \begin{cases} C_2 |\xi - \eta|^{p_i(x)} & \text{if } |\xi - \eta| \geq 1, \\ C_2 |\xi - \eta|^{p_i^-} & \text{if } |\xi - \eta| < 1, \end{cases} \end{aligned} \quad (6)$$

for almost every $x \in \Omega$ and for every $\xi, \eta \in \mathbb{R}$, with $\xi \neq \eta$ and

$$|\xi|^{p_i(x)} \leq a_i(x, \xi) \cdot \xi \leq p_i(x) A_i(x, \xi), \quad (7)$$

for almost every $x \in \Omega$ and for every $\xi \in \mathbb{R}$.

We also assume that the variable exponents $p_i(\cdot) : \bar{\Omega} \rightarrow [2, N)$ are continuous functions for all $i = 1, \dots, N$ such that

$$\begin{aligned} \frac{\bar{p}(N-1)}{N(\bar{p}-1)} < p_i^- < \frac{\bar{p}(N-1)}{N-\bar{p}}, \quad \sum_{i=1}^N \frac{1}{p_i^-} > 1, \\ \frac{p_i^+ - p_i^- - 1}{p_i^-} < \frac{\bar{p} - N}{\bar{p}(N-1)}, \end{aligned} \quad (8)$$

where $1/\bar{p} = (1/N) \sum_{i=1}^N (1/p_i^-)$.

We introduce the numbers

$$q = \frac{N(\bar{p}-1)}{N-1}, \quad q^* = \frac{Nq}{N-q} = \frac{N(\bar{p}-1)}{N-\bar{p}}. \quad (9)$$

A prototype example, that is, covered by our assumptions is the following anisotropic equation:

Set $A_i(x, \xi) = (1/p_i(x))|\xi|^{p_i(x)}$, $a_i(x, \xi) = |\xi|^{p_i(x)-2}\xi$ where $p_i(x) \geq 2$. Then, we get the following equation.

$$-\sum_{i=1}^N \frac{\partial}{\partial x_i} \left(\left| \frac{\partial}{\partial x_i} u \right|^{p_i(x)-2} \frac{\partial}{\partial x_i} u \right) + |u|^{p_M(x)-2} u = f. \quad (10)$$

Actually, one of the topics from the field of PDEs that continuously gained interest is the one concerning the Sobolev space with variable exponents, $W^{1,p(\cdot)}(\Omega)$ or $W_0^{1,p(\cdot)}(\Omega)$ depending on the boundary condition (see [1–23]). In that context, problems involving the $p(\cdot)$ -Laplace operator

$$\Delta_{p(x)} u = \operatorname{div} \left(|\nabla u|^{p(x)-2} \nabla u \right) \quad (11)$$

or the more general operator

$$\operatorname{div} a(x, \nabla u) \quad (12)$$

were intensively studied (see [13]). At the same time, some authors were interested by PDEs involving anisotropic Sobolev spaces with variable exponent $W^{1,\vec{p}(\cdot)}$ when the boundary condition is the homogeneous Dirichlet boundary condition (see [15, 16, 18, 20, 24–26]). In that context, the authors have considered the anisotropic $p(\cdot)$ -Laplace operator

$$\Delta_{\vec{p}(x)} u = \sum_{i=1}^N \frac{\partial}{\partial x_i} \left(\left| \frac{\partial}{\partial x_i} u \right|^{p_i(x)-2} \frac{\partial}{\partial x_i} u \right) \quad (13)$$

or the more general variable exponent anisotropic operator

$$\sum_{i=1}^N \frac{\partial}{\partial x_i} a_i(x, \frac{\partial}{\partial x_i} u). \quad (14)$$

When the homogeneous Dirichlet boundary condition is replaced by the Neumann boundary condition, one has to work with the anisotropic variable exponent Sobolev space

$W^{1,\vec{p}(\cdot)}(\Omega)$ instead of $W_0^{1,\vec{p}(\cdot)}(\Omega)$. The main difficulty which appears is that the famous Poincaré inequality does not apply and then it is very difficult to get a priori estimates which are necessary for the proof of the existence result of entropy solutions. Sometimes one can use the Wirtinger inequality which does not apply, in some problems like (1). The first systematic study of anisotropic Neumann problem was done by Fan (see [11]). In a second time, Boureanu and Rădulescu studied an anisotropic nonhomogeneous Neumann problem with obstacle (see [2]). In the two papers, the authors were interested by the existence and multiplicity results of weak solution even if in [2], Boureanu and Rădulescu have showed some conditions under which we can get uniqueness of weak solution. In this paper, we are interested to the existence and uniqueness of entropy solution. For the proof of the existence of entropy solution of (1), we follow [27] and derive a priori estimates for the approximated solutions u_n and the partial derivatives $\partial u_n / \partial x_i$ in the Marcinkiewicz spaces $\mathcal{M}^{\vec{p}}$ and $\mathcal{M}^{\vec{p}_i}$, respectively (see Section 2 or [27, 28] for definition and properties of Marcinkiewicz spaces).

The study of anisotropic problems are motivated, for example, by their applications to the mathematical analysis of a system of nonlinear partial differential equations arising in a population dynamics model describing the spread of an epidemic disease through a heterogeneous habitat.

The paper is organized as follows. In Section 2, we introduce some notations/functional spaces. In Section 3, we prove for the problem (1), the existence and uniqueness of weak solution when the data is bounded, and the existence and uniqueness of entropy solution when the data is in $L^1(\Omega)$.

2. Preliminaries

In this section, we define Lebesgue, Sobolev, and anisotropic spaces with variable exponent and give some of their properties (see [29] for more details about Lebesgue and Sobolev spaces with variable exponent). Roughly speaking, anisotropic Lebesgue and Sobolev spaces are functional spaces of Lebesgue's and Sobolev's type in which different space directions have different roles.

Given a measurable function $p(\cdot) : \Omega \rightarrow [1, \infty)$, we define the Lebesgue space with variable exponent $L^{p(\cdot)}(\Omega)$ as the set of all measurable functions $u : \Omega \rightarrow \mathbb{R}$ for which the convex modular

$$\rho_{p(\cdot)}(u) := \int_{\Omega} |u|^{p(x)} dx \quad (15)$$

is finite. If the exponent is bounded, that is, if $p_+ < \infty$, then the expression

$$\|u\|_{p(\cdot)} := \inf \left\{ \lambda > 0 : \rho_{p(\cdot)} \left(\frac{u}{\lambda} \right) \leq 1 \right\} \quad (16)$$

defines a norm in $L^{p(\cdot)}(\Omega)$, called the Luxembourg norm. The space $(L^{p(\cdot)}(\Omega), \|\cdot\|_{p(\cdot)})$ is a separable Banach space. Moreover, if $p_- > 1$, then $L^{p(\cdot)}(\Omega)$ is uniformly convex, hence reflexive, and its dual space is isomorphic to $L^{p'(\cdot)}(\Omega)$, where $1/p(x) + 1/p'(x) = 1$. Finally, we have the Hölder type inequality.

Proposition 1 (generalized Hölder inequality, see [10]). (i) For any $u \in L^{p(\cdot)}(\Omega)$ and $v \in L^{p'(\cdot)}(\Omega)$, we have

$$\left| \int_{\Omega} u v dx \right| \leq \left(\frac{1}{p_-} + \frac{1}{p'_-} \right) \|u\|_{p(\cdot)} \|v\|_{p'(\cdot)}. \quad (17)$$

(ii) If $p_1, p_2 \in \mathcal{C}_+(\overline{\Omega})$, $p_1(x) \leq p_2(x)$ for any $x \in \overline{\Omega}$, then $L^{p_2(x)}(\Omega) \hookrightarrow L^{p_1(x)}(\Omega)$ and the imbedding is continuous.

Moreover, the application $\rho_{p(\cdot)} : L^{p(\cdot)}(\Omega) \rightarrow \mathbb{R}$ called the $p(\cdot)$ -modular of the $L^{p(\cdot)}(\Omega)$ space is very useful in handling these Lebesgue spaces with variable exponent. Indeed we have the following properties (see [10]). If $u \in L^{p(\cdot)}(\Omega)$ and $p < \infty$ then

$$|u|_{p(\cdot)} < 1 \implies |u|_{p(\cdot)}^{p^+} \leq \rho_{p(\cdot)}(u) \leq |u|_{p(\cdot)}^{p_-}, \quad (18)$$

$$|u|_{p(\cdot)} > 1 \implies |u|_{p(\cdot)}^{p_-} \leq \rho_{p(\cdot)}(u) \leq |u|_{p(\cdot)}^{p^+}, \quad (19)$$

$$|u|_{p(\cdot)} < 1 (= 1; > 1) \implies \rho_{p(\cdot)}(u) < 1 (= 1; > 1), \quad (20)$$

$$|u|_{p(\cdot)} \rightarrow 0 (\rightarrow \infty) \iff \rho_{p(\cdot)}(u) \rightarrow 0 (\rightarrow \infty). \quad (21)$$

If, in addition, $(u_n)_n \subset L^{p(\cdot)}(\Omega)$, then

$$\lim_{n \rightarrow \infty} |u_n - u|_{p(\cdot)} = 0 \iff \lim_{n \rightarrow \infty} \rho_{p(\cdot)}(u_n - u) = 0 \iff (u_n)_n \text{ converges to } u \text{ in measure and } \lim_{n \rightarrow \infty} \rho_{p(\cdot)}(u_n) = \rho_{p(\cdot)}(u).$$

Now, let us introduce the definition of the isotropic Sobolev space with variable exponent, $W^{1,p(\cdot)}(\Omega)$.

We set

$$W^{1,p(\cdot)}(\Omega) := \{u \in L^{p(\cdot)}(\Omega) : |\nabla u| \in L^{p(\cdot)}(\Omega)\}, \quad (22)$$

which is a Banach space equipped with the norm

$$\|u\|_{1,p(\cdot)} := |u|_{p(\cdot)} + |\nabla u|_{p(\cdot)}. \quad (23)$$

Now, we present a natural generalization of the variable exponent Sobolev space $W^{1,p(\cdot)}(\Omega)$ that will enable us to study the problem (1) with sufficient accuracy.

The *anisotropic variable exponent Sobolev space* $W^{1,\vec{p}(\cdot)}(\Omega)$ is defined as follows:

$$\begin{aligned} W^{1,\vec{p}(\cdot)}(\Omega) \\ = \left\{ u \in L^{p_M(\cdot)}(\Omega) ; \frac{\partial u}{\partial x_i} \in L^{p_i(\cdot)}(\Omega), \forall i \in \{1, \dots, N\} \right\}. \end{aligned} \quad (24)$$

Endowed with the norm

$$\|u\|_{\vec{p}(\cdot)} := |u|_{p_M(\cdot)} + \sum_{i=1}^N \left| \frac{\partial u}{\partial x_i} \right|_{p_i(\cdot)}, \quad (25)$$

the space $(W^{1,\vec{p}(\cdot)}(\Omega), \|\cdot\|_{\vec{p}(\cdot)})$ is a reflexive Banach space (see [11, Theorems 2.1 and 2.2]).

We have the following result.

Theorem 2 (see [11, Corollary 2.1]). Let $\Omega \subset \mathbb{R}^N$ ($N \geq 3$) be a bounded open set and for all $i \in \{1, \dots, N\}$, $p_i \in L^\infty(\Omega)$, $p_i(x) \geq 1$ a.e. in Ω . Then, for any $r \in L^\infty(\Omega)$ with $r(x) \geq 1$ a.e. in Ω such that

$$\operatorname{ess\,inf}_{x \in \Omega} (p_M(x) - r(x)) > 0, \quad (26)$$

we have the compact embedding

$$W^{1,\vec{p}(\cdot)}(\Omega) \hookrightarrow L^{r(\cdot)}(\Omega). \quad (27)$$

Next, we define

$$\mathcal{T}^{1,\vec{p}(\cdot)}(\Omega) = \left\{ u : \Omega \rightarrow \mathbb{R}; T_k(u) \in W^{1,\vec{p}(\cdot)}(\Omega), \forall k > 0 \right\}. \quad (28)$$

Finally, in this paper, we will use the Marcinkiewicz spaces $\mathcal{M}^q(\Omega)$ ($1 < q < \infty$) with constant exponent. Note that the Marcinkiewicz spaces $\mathcal{M}^{q(\cdot)}(\Omega)$ in the variable exponent setting were introduced for the first time by Sanchon and Urbano (see [23]).

Marcinkiewicz spaces $\mathcal{M}^q(\Omega)$ ($1 < q < \infty$) contain the measurable functions $h : \Omega \rightarrow \mathbb{R}$ for which the distribution function

$$\lambda_h(\gamma) = |\{x \in \Omega : |h(x)| > \gamma\}|, \quad \gamma \geq 0 \quad (29)$$

satisfies an estimate of the form

$$\lambda_h(\gamma) \leq C \gamma^{-q}, \quad \text{for some finite constant } C > 0. \quad (30)$$

The space $\mathcal{M}^q(\Omega)$ is a Banach space under the norm

$$\|h\|_{\mathcal{M}^q(\Omega)}^* = \sup_{t>0} t^{1/q} \left(\frac{1}{t} \int_0^t h^*(s) ds \right), \quad (31)$$

where h^* denotes the nonincreasing rearrangement of h :

$$h^*(t) = \inf \{ \gamma > 0 : \lambda_h(\gamma) \leq t \}. \quad (32)$$

We will use the following pseudonorm

$$\|h\|_{\mathcal{M}^q(\Omega)} = \inf \{ C : \lambda_h(\gamma) \leq C \gamma^{-q}, \forall \gamma > 0 \}, \quad (33)$$

which is equivalent to the norm $\|h\|_{\mathcal{M}^q(\Omega)}^*$ (see [27]).

We need the following Lemma (see [28, Lemma A.2]).

Lemma 3. Let $1 \leq q < p < +\infty$. Then, for every measurable function u on Ω , we have

$$\begin{aligned} (i) \quad ((p-1)^p / p^{p+1}) \|u\|_{\mathcal{M}^p(\Omega)}^p &\leq \sup_{\lambda>0} \{ \lambda^p \operatorname{meas}[x \in \Omega : \\ &|u(x)| > \lambda] \} \leq \|u\|_{\mathcal{M}^p(\Omega)}^p. \end{aligned}$$

Moreover,

$$(ii) \quad \int_K |u|^q dx \leq (p/(p-q)) (p/q)^{q/p} \|u\|_{\mathcal{M}^p(\Omega)}^q (\operatorname{meas}(K))^{p-q/p}, \text{ for every measurable subset } K \subset \Omega.$$

In particular, $\mathcal{M}^p(\Omega) \subset L_{\operatorname{loc}}^q(\Omega)$ with continuous injection and $u \in \mathcal{M}^p(\Omega)$ implies $|u|^q \in \mathcal{M}^{p/q}(\Omega)$.

The following result is due to Troisi (see [30]).

Theorem 4. Let $p_1, p_2, \dots, p_N \in [1, +\infty)$; $g \in W^{1, (p_1, p_2, \dots, p_N)}(\Omega)$ and let

$$\begin{aligned} q &= \bar{p}^* \quad \text{if } \bar{p}^* < N, \\ q &\in [1, +\infty) \quad \text{if } \bar{p}^* \geq N. \end{aligned} \quad (34)$$

Then, there exists a constant $C > 0$ depending on $N, p_1, p_2, \dots, p_N$ if $\bar{p} < N$ and also on q and $\text{meas}(\Omega)$ if $\bar{p} \geq N$ such that

$$\|g\|_{L^q(\Omega)} \leq C \prod_{i=1}^N \left[\|g\|_{L^{p_M}(\Omega)} + \left\| \frac{\partial g}{\partial x_i} \right\|_{L^{p_i}(\Omega)} \right]^{1/N}, \quad (35)$$

where $p_M = \max\{p_1, p_2, \dots, p_N\}$ and $1/\bar{p} = (1/N) \sum_{i=1}^N (1/p_i)$.

We will use through the paper, the truncation function T_γ at height ($\gamma > 0$), that is

$$T_\gamma(s) = \begin{cases} s & \text{if } |s| \leq \gamma, \\ \gamma \text{ sign}(s) & \text{if } |s| > \gamma. \end{cases} \quad (36)$$

We need the following lemma.

Lemma 5. Let g be a nonnegative function in $W^{1, \bar{p}(\cdot)}(\Omega)$. Assume $\bar{p} < N$ and there exists a constant $C > 0$ such that

$$\begin{aligned} \int_\Omega |T_\gamma(g)|^{p_M} dx + \sum_{i=1}^N \int_{\{|g| \leq \gamma\}} \left| \frac{\partial g}{\partial x_i} \right|^{p_i} dx \\ \leq C(\gamma + 1), \quad \forall \gamma > 0. \end{aligned} \quad (37)$$

Then, there exists a constant D , depending on C , such that

$$\|g\|_{\mathcal{M}^{\bar{p}}(\Omega)} \leq D, \quad (38)$$

where $\bar{p} = N(\bar{p} - 1)/(N - \bar{p})$.

Proof. Consider the following

Step 1 ($\|T_\gamma(g)\|_{L^{p_M}(\Omega)} \leq 1$). Then, obviously we have $\|g\|_{\mathcal{M}^{\bar{p}}(\Omega)} \leq D$, for some positive constant D . Indeed, since $1 < \bar{p} \leq \bar{p} \leq p_M^-$, according to Proposition 1 there exists a positive constant C such that

$$\|T_\gamma(g)\|_{L^{\bar{p}}(\Omega)} \leq C \|T_\gamma(g)\|_{L^{p_M}(\Omega)} \leq C. \quad (39)$$

It follows that there exists a positive constant D such that

$$\|g\|_{\mathcal{M}^{\bar{p}}(\Omega)} \leq D. \quad (40)$$

Step 2 ($\|T_\gamma(g)\|_{L^{p_M}(\Omega)} > 1$). We get from (37)

$$\|T_\gamma(g)\|_{L^{p_M}(\Omega)}^{p_M} + \left\| \frac{\partial T_\gamma(g)}{\partial x_i} \right\|_{L^{p_i}(\Omega)}^{p_i} \leq C(\gamma + 1). \quad (41)$$

Not also that

$$\begin{aligned} & \left(\|T_\gamma(g)\|_{L^{p_M}(\Omega)} + \left\| \frac{\partial T_\gamma(g)}{\partial x_i} \right\|_{L^{p_i}(\Omega)} \right)^{p_i^-} \\ & \leq 2^{(p_i^- - 1)} \left(\|T_\gamma(g)\|_{L^{p_M}(\Omega)}^{p_i^-} + \left\| \frac{\partial T_\gamma(g)}{\partial x_i} \right\|_{L^{p_i}(\Omega)}^{p_i^-} \right) \\ & \leq 2^{(p_i^- - 1)} \left(\|T_\gamma(g)\|_{L^{p_M}(\Omega)}^{p_M^-} + \left\| \frac{\partial T_\gamma(g)}{\partial x_i} \right\|_{L^{p_i}(\Omega)}^{p_i^-} \right). \end{aligned} \quad (42)$$

Therefore, by using (35), we obtain for $\gamma > 1$,

$$\begin{aligned} \|T_\gamma(g)\|_{L^q(\Omega)} & \leq C \prod_{i=1}^N \left[2^{(p_i^- - 1)/N p_i^-} \gamma^{1/N p_i^-} \right] \\ & \leq D \gamma^{\sum_{i=1}^N (1/N p_i^-)} = D \gamma^{1/\bar{p}}. \end{aligned} \quad (43)$$

It follows that

$$\int_{\{|g| > \gamma\}} |T_\gamma(g)|^q dx \leq D \gamma^{q/\bar{p}} \quad (44)$$

which is equivalent to

$$\gamma^q \text{meas}(\{|g| > \gamma\}) \leq D \gamma^{q/\bar{p}}. \quad (45)$$

Therefore,

$$\text{meas}(\{|g| > \gamma\}) \leq D \gamma^{-q(\bar{p}-1)/\bar{p}}. \quad (46)$$

Since, $q = \bar{p}^* = N\bar{p}/(N - \bar{p})$ we get

$$\text{meas}(\{|g| > \gamma\}) \leq D \gamma^{-N(\bar{p}-1)/(N-\bar{p})} \quad (47)$$

which implies that $\|g\|_{\mathcal{M}^{\bar{p}}(\Omega)} \leq D$.

For $0 < \gamma \leq 1$ we have

$$\text{meas}(\{|g| > \gamma\}) \leq \text{meas}(\Omega) \leq \text{meas}(\Omega) \gamma^{-\bar{p}}. \quad (48)$$

So,

$$\|g\|_{\mathcal{M}^{\bar{p}}(\Omega)} \leq D. \quad (49)$$

We need the following well-known results. $\square$

Theorem 6 (see [31, Theorem 6.2.1]). Let X be a reflexive Banach space and let $f : M \subset X \rightarrow \mathbb{R}$ be Gateaux differentiable over the closed set M . Then, the following are equivalent.

- (i) f is convex over M .
- (ii) We have

$$f(u) - f(v) \geq \langle f'(v), u - v \rangle_{X^* \times X} \quad (50)$$

$$\forall u, v \in M,$$

where X^* denotes the dual of the space X .

(iii) The first Gateaux derivative is monotone, that is,

$$\langle f'(u) - f'(v), u - v \rangle_{X^* \times X} \geq 0 \quad (51)$$

$$\forall u, v \in M.$$

(iv) The second Gateaux derivative of f exists and it is positive, that is,

$$\langle f''(u) \circ v, v \rangle_{X^* \times X} \geq 0 \quad \forall v \in M. \quad (52)$$

Theorem 7 (see [32, Theorem 1.2]). Suppose X is a reflexive Banach space with norm $\|\cdot\|_X$, and let $M \subset X$ be a weakly closed subset of X . Suppose $\Psi : M \subset X \rightarrow \mathbb{R} \cup \{\infty\}$ is coercive and (sequentially) weakly lower semicontinuous on M with respect to X , that is, suppose the following conditions are fulfilled.

(i) $\Psi(u) \rightarrow \infty$ as $\|u\|_X \rightarrow \infty$, $u \in M$.

(ii) For any $u \in M$, any subsequence (u_m) in M such that $u_m \rightharpoonup u$ weakly in X there holds

$$\Psi(u) \leq \liminf_{m \rightarrow \infty} \Psi(u_m). \quad (53)$$

Then, Ψ is bounded from below and attains its infimum in M .

3. Main Results

In the sequel, we denote $W^{1, \tilde{p}(\cdot)}(\Omega) = E$ and $\|\cdot\|_{W^{1, \tilde{p}(\cdot)}(\Omega)} = \|\cdot\|_E$.

3.1. Weak Solutions. Let us define first the notion of weak solution.

Definition 8. Let $u : \Omega \rightarrow \mathbb{R}$ be a measurable function, we say that u is a weak solution of problem (1) if u belongs to $W^{1, \tilde{p}(\cdot)}(\Omega)$ and satisfies the following equation:

$$\int_{\Omega} \sum_{i=1}^N a_i \left(x, \frac{\partial u}{\partial x_i} \right) \frac{\partial v}{\partial x_i} dx + \int_{\Omega} |u|^{p_M(x)-2} u v dx - \int_{\Omega} f(x) v dx = 0, \quad (54)$$

for every $v \in W^{1, \tilde{p}(\cdot)}(\Omega)$.

We associate to problem (1) the energy functional $I : E \rightarrow \mathbb{R}$, defined by

$$I(u) = \int_{\Omega} \sum_{i=1}^N A_i \left(x, \frac{\partial u}{\partial x_i} \right) dx + \int_{\Omega} \frac{1}{p_M(x)} |u|^{p_M(x)} dx - \int_{\Omega} f(x) u dx. \quad (55)$$

To simplify our writing, we denote by $\Lambda : E \rightarrow \mathbb{R}$ the functional

$$\Lambda(u) = \int_{\Omega} \sum_{i=1}^N A_i \left(x, \frac{\partial u}{\partial x_i} \right) dx. \quad (56)$$

We recall the following result (see [15, Lemma 3.4]).

Lemma 9. The functional Λ is well-defined on E . In addition, Λ is of class $\mathcal{C}^1(E, \mathbb{R})$ and

$$\langle \Lambda'(u), v \rangle = \int_{\Omega} \sum_{i=1}^N a_i \left(x, \frac{\partial u}{\partial x_i} \right) \frac{\partial v}{\partial x_i} dx, \quad (57)$$

for all $u, v \in E$.

Due to Lemma 9, a standard calculus leads to the facts that I is well-defined on E and $I \in \mathcal{C}^1(E, \mathbb{R})$ with the derivative given by

$$\langle I'(u), v \rangle = \int_{\Omega} \sum_{i=1}^N a_i \left(x, \frac{\partial u}{\partial x_i} \right) \frac{\partial v}{\partial x_i} dx + \int_{\Omega} |u|^{p_M(x)-2} u v dx - \int_{\Omega} f(x) v dx \quad (58)$$

for all $u, v \in E$. Obviously, the weak solutions of (1) are the critical points of I ; so by means of Theorem 7, we intend to prove the existence of critical points in order to deduce the existence of weak solutions.

Theorem 10. Assume (4)–(8) and $f \in L^{\infty}(\Omega)$. Then, there exists a unique weak solution of problem (1).

Let us start the proof by establishing some useful lemmas.

Lemma 11. If hypotheses (4)–(8) are fulfilled, then the functional I is coercive.

Proof. Let $u \in E$ be such that $\|u\|_E \rightarrow \infty$. Using (7), we deduce that

$$\Lambda(u) \geq \frac{1}{p_M^+} \sum_{i=1}^N \int_{\Omega} \left| \frac{\partial u}{\partial x_i} \right|^{p_i(x)} dx. \quad (59)$$

We make the following notations:

$$\mathcal{J}_1 = \left\{ i \in \{1, \dots, N\} : \left| \frac{\partial u}{\partial x_i} \right|_{L^{p_i(\cdot)}(\Omega)} \leq 1 \right\}, \quad (60)$$

$$\mathcal{J}_2 = \left\{ i \in \{1, \dots, N\} : \left| \frac{\partial u}{\partial x_i} \right|_{L^{p_i(\cdot)}(\Omega)} > 1 \right\}.$$

We then have

$$\Lambda(u) \geq \frac{1}{p_M^+} \sum_{i \in \mathcal{J}_1} \int_{\Omega} \left| \frac{\partial u}{\partial x_i} \right|^{p_i(x)} dx + \frac{1}{p_M^+} \sum_{i \in \mathcal{J}_2} \int_{\Omega} \left| \frac{\partial u}{\partial x_i} \right|^{p_i(x)} dx. \quad (61)$$

Using (19), (20), and (21), we have

$$\begin{aligned}
 \Lambda(u) &\geq \frac{1}{p_M^+} \sum_{i \in \mathcal{J}_1} \left| \frac{\partial u}{\partial x_i} \right|_{p_i(\cdot)}^{p_i^+} + \frac{1}{p_M^+} \sum_{i \in \mathcal{J}_2} \left| \frac{\partial u}{\partial x_i} \right|_{p_i(\cdot)}^{p_i^-} \\
 &\geq \frac{1}{p_M^+} \sum_{i \in \mathcal{J}_2} \left| \frac{\partial u}{\partial x_i} \right|_{p_i(\cdot)}^{p_i^-} \\
 &\geq \frac{1}{p_M^+} \sum_{i \in \mathcal{J}_2} \left| \frac{\partial u}{\partial x_i} \right|_{p_i(\cdot)}^{p_m^-} \\
 &\geq \frac{1}{p_M^+} \left(\sum_{i=1}^N \left| \frac{\partial u}{\partial x_i} \right|_{p_i(\cdot)}^{p_m^-} - \sum_{i \in \mathcal{J}_1} \left| \frac{\partial u}{\partial x_i} \right|_{p_i(\cdot)}^{p_m^-} \right) \\
 &\geq \frac{1}{p_M^+} \left(\sum_{i=1}^N \left| \frac{\partial u}{\partial x_i} \right|_{p_i(\cdot)}^{p_m^-} - N \right).
 \end{aligned} \tag{62}$$

By the generalized mean inequality or the Jensen's inequality applied to the convex function $z : \mathbb{R}^+ \rightarrow \mathbb{R}^+$, $z(t) = t^{p_m^-}$, $p_m^- > 1$, we get

$$\sum_{i=1}^N \left| \frac{\partial u}{\partial x_i} \right|_{p_i(\cdot)}^{p_m^-} \geq \frac{1}{N^{p_m^- - 1}} \left(\sum_{i=1}^N \left| \frac{\partial u}{\partial x_i} \right|_{p_i(\cdot)} \right)^{p_m^-}, \tag{63}$$

thus,

$$\Lambda(u) \geq \frac{1}{p_M^+} \left[\frac{1}{N^{p_m^- - 1}} \left(\sum_{i=1}^N \left| \frac{\partial u}{\partial x_i} \right|_{p_i(\cdot)} \right)^{p_m^-} - N \right]. \tag{64}$$

Case 1 ($|u|_{p_M(\cdot)} \geq 1$). We have

$$\begin{aligned}
 I(u) &\geq \frac{1}{p_M^+} \left[\frac{1}{N^{p_m^- - 1}} \left(\sum_{i=1}^N \left| \frac{\partial u}{\partial x_i} \right|_{p_i(\cdot)} \right)^{p_m^-} - N \right] \\
 &\quad + \frac{1}{p_M^+} |u|_{p_M(\cdot)}^{p_m^-} - \|f\|_{L^\infty(\Omega)} \|u\|_{L^1(\Omega)} \\
 &\geq \frac{1}{p_M^+} \left[\frac{1}{N^{p_m^- - 1}} \left(\sum_{i=1}^N \left| \frac{\partial u}{\partial x_i} \right|_{p_i(\cdot)} \right)^{p_m^-} + |u|_{p_M(\cdot)}^{p_m^-} \right] \\
 &\quad - C \|f\|_{L^\infty(\Omega)} \|u\|_E - \frac{N}{p_M^+} \\
 &\geq \frac{1}{2^{p_m^- - 1} p_M^+} \min \left(1, \frac{1}{N^{p_m^- - 1}} \right) \\
 &\quad \cdot \left[\sum_{i=1}^N \left| \frac{\partial u}{\partial x_i} \right|_{p_i(\cdot)} + |u|_{p_M(\cdot)} \right]^{p_m^-} \\
 &\quad - C \|f\|_{L^\infty(\Omega)} \|u\|_E - \frac{N}{p_M^+}.
 \end{aligned} \tag{65}$$

Therefore,

$$\begin{aligned}
 I(u) &\geq \frac{1}{2^{p_m^- - 1} p_M^+} \min \left(1, \frac{1}{N^{p_m^- - 1}} \right) \|u\|_E^{p_m^-} \\
 &\quad - C \|f\|_{L^\infty(\Omega)} \|u\|_E - \frac{N}{p_M^+}.
 \end{aligned} \tag{66}$$

Case 2 ($|u|_{p_M(\cdot)} < 1$). Then $|u|_{p_M(\cdot)}^{p_m^-} - 1 < 0$, and we get

$$\begin{aligned}
 I(u) &\geq \frac{1}{p_M^+} \left[\frac{1}{N^{p_m^- - 1}} \left(\sum_{i=1}^N \left| \frac{\partial u}{\partial x_i} \right|_{p_i(\cdot)} \right)^{p_m^-} + |u|_{p_M(\cdot)}^{p_m^-} - N - 1 \right] \\
 &\quad - \|f\|_{L^\infty(\Omega)} \|u\|_{L^1(\Omega)} \\
 &\geq \frac{1}{p_M^+} \left[\frac{1}{N^{p_m^- - 1}} \left(\sum_{i=1}^N \left| \frac{\partial u}{\partial x_i} \right|_{p_i(\cdot)} \right)^{p_m^-} + |u|_{p_M(\cdot)}^{p_m^-} \right] \\
 &\quad - C \|f\|_{L^\infty(\Omega)} \|u\|_E - \frac{N + 1}{p_M^+} \\
 &\geq \frac{1}{2^{p_m^- - 1} p_M^+} \min \left(1, \frac{1}{N^{p_m^- - 1}} \right) \left[\sum_{i=1}^N \left| \frac{\partial u}{\partial x_i} \right|_{p_i(\cdot)} + |u|_{p_M(\cdot)} \right]^{p_m^-} \\
 &\quad - C \|f\|_{L^\infty(\Omega)} \|u\|_E - \frac{N + 1}{p_M^+}.
 \end{aligned} \tag{67}$$

So, we obtain

$$\begin{aligned}
 I(u) &\geq \frac{1}{2^{p_m^- - 1} p_M^+} \min \left(1, \frac{1}{N^{p_m^- - 1}} \right) \|u\|_E^{p_m^-} \\
 &\quad - C \|f\|_{L^\infty(\Omega)} \|u\|_E - \frac{N + 1}{p_M^+}.
 \end{aligned} \tag{68}$$

Then, letting $\|u\|_E$ goes to infinity in (66) and (68), we conclude that $I(u)$ reaches infinity. Thus, I is coercive. $\square$

Lemma 12. *The functional I is weakly lower semicontinuous.*

Proof. By [33, Corollary III.8], it is enough to show that I is lower semicontinuous. To this aim, fix $u \in E$ and $\epsilon > 0$. Since for every $i \in \{1, \dots, N\}$, $a_i(x, \cdot)$ is monotone, Theorem 6 yields

$$\begin{aligned}
 A_i \left(x, \frac{\partial v}{\partial x_i} \right) - A_i \left(x, \frac{\partial u}{\partial x_i} \right) &\geq a_i \left(x, \frac{\partial u}{\partial x_i} \right) \left(\frac{\partial v}{\partial x_i} - \frac{\partial u}{\partial x_i} \right) \\
 \Rightarrow \sum_{i=1}^N \int_{\omega} A_i \left(x, \frac{\partial v}{\partial x_i} \right) dx &\geq \sum_{i=1}^N \int_{\omega} A_i \left(x, \frac{\partial u}{\partial x_i} \right) dx \\
 &\quad + \sum_{i=1}^N \int_{\omega} a_i \left(x, \frac{\partial u}{\partial x_i} \right) \left(\frac{\partial v}{\partial x_i} - \frac{\partial u}{\partial x_i} \right) dx
 \end{aligned}$$

$$\begin{aligned}
\Rightarrow I(v) &\geq I(u) + \sum_{i=1}^N \int_{\omega} a_i \left(x, \frac{\partial u}{\partial x_i} \right) \left(\frac{\partial v}{\partial x_i} - \frac{\partial u}{\partial x_i} \right) dx \\
&+ \int_{\omega} \frac{1}{p_M(x)} (|v|^{p_M(x)} - |u|^{p_M(x)}) dx \\
&+ \int_{\omega} f(x) (u - v) dx.
\end{aligned} \quad (69)$$

Since the map $t \mapsto t^{p_M(x)}$, $t > 0$ is convex, again by Theorem 6, we have

$$|v|^{p_M(x)} - |u|^{p_M(x)} \geq p_M(x) |u|^{p_M(x)-2} u (v - u), \quad (70)$$

then (69) becomes

$$\begin{aligned}
I(v) &\geq I(u) + \sum_{i=1}^N \int_{\Omega} a_i \left(x, \frac{\partial u}{\partial x_i} \right) \left(\frac{\partial v}{\partial x_i} - \frac{\partial u}{\partial x_i} \right) dx \\
&+ \int_{\Omega} |u|^{p_M(x)-2} u (v - u) dx \\
&+ \int_{\Omega} f(x) (u - v) dx.
\end{aligned} \quad (71)$$

Consider the second term in the right-hand side of (71). By (5) and Hölder type inequality, we have

$$\begin{aligned}
&\sum_{i=1}^N \int_{\Omega} a_i \left(x, \frac{\partial u}{\partial x_i} \right) \left(\frac{\partial v}{\partial x_i} - \frac{\partial u}{\partial x_i} \right) dx \\
&\geq - \sum_{i=1}^N \int_{\Omega} \left| a_i \left(x, \frac{\partial u}{\partial x_i} \right) \right| \left| \frac{\partial v}{\partial x_i} - \frac{\partial u}{\partial x_i} \right| dx \\
&\geq - \max \{C_1, \dots, C_N\} \\
&\quad \cdot \sum_{i=1}^N \int_{\Omega} \left(j_i + \left| \frac{\partial u}{\partial x_i} \right|^{p_i(x)-1} \right) \left| \frac{\partial v}{\partial x_i} - \frac{\partial u}{\partial x_i} \right| dx \\
&\geq -K \sum_{i=1}^N \int_{\Omega} j_i(x) \left| \frac{\partial v}{\partial x_i} - \frac{\partial u}{\partial x_i} \right| dx \\
&\quad - K \sum_{i=1}^N \int_{\Omega} \left| \frac{\partial u}{\partial x_i} \right|^{p_i(x)-1} \left| \frac{\partial v}{\partial x_i} - \frac{\partial u}{\partial x_i} \right| dx \\
&\geq -K' \sum_{i=1}^N |j_i|_{p'_i(\cdot)} \left| \frac{\partial v}{\partial x_i} - \frac{\partial u}{\partial x_i} \right|_{p_i(\cdot)} \\
&\quad - K' \sum_{i=1}^N \left| \frac{\partial u}{\partial x_i} \right|^{p_i(x)-1} \left| \frac{\partial v}{\partial x_i} - \frac{\partial u}{\partial x_i} \right|_{p_i(\cdot)} \\
&\geq -K' \max_i \left\{ |j_i|_{p'_i(\cdot)}, \left| \frac{\partial u}{\partial x_i} \right|^{p_i(x)-1} \right\} \\
&\quad \cdot \sum_{i=1}^N \left| \frac{\partial v}{\partial x_i} - \frac{\partial u}{\partial x_i} \right|_{p_i(\cdot)} \geq -C_1 \sum_{i=1}^N \left| \frac{\partial u}{\partial x_i} - \frac{\partial v}{\partial x_i} \right|_{p_i(\cdot)}.
\end{aligned} \quad (72)$$

For the fourth term in the right-hand side of (71), we have

$$\begin{aligned}
\int_{\Omega} f(x) (u - v) dx &\geq - \int_{\Omega} |f(x)| |u - v| dx \\
&\geq \|f\|_{L^\infty(\Omega)} \|u - v\|_{L^1(\Omega)} \\
&\geq -C_2 \|u - v\|_E.
\end{aligned} \quad (73)$$

The third term in the right-hand side of (71) gives by using Hölder type inequality

$$\begin{aligned}
&\int_{\Omega} |u|^{p_M(x)-2} u (v - u) dx \\
&\geq - \int_{\Omega} |u|^{p_M(x)-1} |u - v| dx \\
&\geq -C' \|u\|_{p'_M(\cdot)}^{p_M(x)-1} \|u - v\|_{p_M(\cdot)} \\
&\geq -C_3 \|u - v\|_{p_M(\cdot)}.
\end{aligned} \quad (74)$$

Gathering these inequalities, it follows that

$$I(v) \geq I(u) - C \|u - v\|_E \geq I(u) - \epsilon, \quad (75)$$

for every $v \in E$ such that $\|u - v\|_E < \epsilon/C$. Thus, I is lower semicontinuous. $\square$

Proof of Theorem 10. Consider the following

Step 1. Existence of weak solutions. The proof follows directly from Lemmas 11 and 12 and Theorem 7.

Step 2. Uniqueness of weak solution. Let $u, v \in E$ be two weak solutions of problem (1). Choosing a test function in (54), $\varphi = v - u$ for the weak solution u and $\varphi = u - v$ for the weak solution v , we get

$$\begin{aligned}
&\int_{\Omega} \sum_{i=1}^N a_i \left(x, \frac{\partial u}{\partial x_i} \right) \frac{\partial (v - u)}{\partial x_i} dx \\
&+ \int_{\Omega} |u|^{p_M(x)-2} u (v - u) dx \\
&- \int_{\Omega} f(x) (v - u) dx = 0,
\end{aligned} \quad (76)$$

$$\begin{aligned}
&\int_{\Omega} \sum_{i=1}^N a_i \left(x, \frac{\partial v}{\partial x_i} \right) \frac{\partial (u - v)}{\partial x_i} dx \\
&+ \int_{\Omega} |v|^{p_M(x)-2} v (u - v) dx \\
&- \int_{\Omega} f(x) (u - v) dx = 0.
\end{aligned} \quad (77)$$

Summing up (76) and (77), we obtain

$$\begin{aligned}
&\int_{\Omega} \sum_{i=1}^N \left(a_i \left(x, \frac{\partial u}{\partial x_i} \right) - a_i \left(x, \frac{\partial v}{\partial x_i} \right) \right) \frac{\partial (u - v)}{\partial x_i} dx \\
&+ \int_{\Omega} \frac{1}{p_M(x)} (|u|^{p_M(x)-2} u - |v|^{p_M(x)-2} v) (u - v) dx = 0.
\end{aligned} \quad (78)$$

Thus, by the monotonicity of the functions $a_i(x, \cdot)$ and $t \mapsto |t|^{p_M(x)-2}t$, we deduce that $u = v$ almost everywhere. $\square$

3.2. Entropy Solutions. First of all, we define a space in which we will look for entropy solutions. We define the space $\mathcal{T}^{1, \tilde{p}(\cdot)}(\Omega)$ as the set of every measurable function $u : \Omega \rightarrow \mathbb{R}$ which satisfies for every $k > 0$, $T_k(u) \in W^{1, \tilde{p}(\cdot)}(\Omega)$.

Lemma 13 (see [34, 35]). *Let $u \in \mathcal{T}^{1, \tilde{p}(\cdot)}(\Omega)$. Then, there exists a unique measurable function $v_i : \Omega \rightarrow \mathbb{R}$ such that*

$$\begin{aligned} v_i \chi_{\{|u| < k\}} \\ = \frac{\partial T_k(u)}{\partial x_i} \quad \text{for a.e. } x \in \Omega, \quad \forall k > 0, \quad i \in \{1, \dots, N\}, \end{aligned} \quad (79)$$

where χ_A denotes the characteristic function of a measurable set A . The functions v_i are called the weak partial gradients of u and are still denoted $\partial u / \partial x_i$. Moreover, if u belongs to $W^{1, \tilde{p}(\cdot)}(\Omega)$, then $v_i \in L^{p_i(\cdot)}(\Omega)$ and coincides with the standard distributional gradient of u , that is, $v_i = \partial u / \partial x_i$.

Definition 14. We define the space $\mathcal{T}_{\mathcal{H}}^{1, \tilde{p}(\cdot)}(\Omega)$ as the set of function $u \in \mathcal{T}^{1, \tilde{p}(\cdot)}(\Omega)$ such that there exists a sequence $(u_n)_n \subset W^{1, \tilde{p}(\cdot)}(\Omega)$ satisfying

- (a) $u_n \rightarrow u$ a.e. in Ω ,
- (b) $\partial T_k(u_n) / \partial x_i \rightarrow \partial T_k(u) / \partial x_i$ in $L^1(\Omega)$, for all $k > 0$.

Definition 15. A measurable function u is an entropy solution of (1) if $u \in \mathcal{T}_{\mathcal{H}}^{1, \tilde{p}(\cdot)}(\Omega)$ and for every $k > 0$,

$$\begin{aligned} \sum_{i=1}^N \int_{\Omega} a_i \left(x, \frac{\partial u}{\partial x_i} \right) \frac{\partial}{\partial x_i} T_k(u - \varphi) dx \\ + \int_{\Omega} |u|^{p_M(x)-2} u T_k(u - \varphi) dx \\ \leq \int_{\Omega} f(x) T_k(u - \varphi) dx, \end{aligned} \quad (80)$$

for all $\varphi \in W^{1, \tilde{p}(\cdot)}(\Omega) \cap L^\infty(\Omega)$.

Our main result in this section is the following.

Theorem 16. *Assume (4)–(8) and $f \in L^1(\Omega)$. Then, there exists a unique entropy solution u to problem (1).*

Proof. The proof of this Theorem will be done in three steps.

Step 1 (a priori estimates).

Lemma 17. *Assume (4)–(8) and $f \in L^1(\Omega)$. Let u be an entropy solution of (1). If there exists a positive constant M such that*

$$\sum_{i=1}^N \int_{\{|u| > t\}} t^{q_i(x)} dx \leq M, \quad \forall t > 0, \quad (81)$$

then

$$\sum_{i=1}^N \int_{\{|(\partial/\partial x_i)u|^{\alpha_i(\cdot)} > t\}} t^{q_i(x)} dx \leq \|f\|_1 + M \quad \forall t > 0, \quad (82)$$

where $\alpha_i(\cdot) = p_i(\cdot)/(q_i(\cdot) + 1)$, for all $i = 1, \dots, N$.

Proof. Take $\varphi = 0$ in (80), we have

$$\begin{aligned} \sum_{i=1}^N \int_{\Omega} a_i \left(x, \frac{\partial}{\partial x_i} T_t(u) \right) \cdot \frac{\partial}{\partial x_i} T_t(u) dx \\ + \int_{\Omega} |u|^{p_M(x)-2} u T_t(u) dx \leq \int_{\Omega} f(x) T_t(u) dx. \end{aligned} \quad (83)$$

Since the second term in the previous inequality is nonnegative, it follows that

$$\begin{aligned} \sum_{i=1}^N \int_{\Omega} a_i \left(x, \frac{\partial}{\partial x_i} T_t(u) \right) \cdot \frac{\partial}{\partial x_i} T_t(u) dx \\ \leq \int_{\Omega} f(x) T_t(u) dx. \end{aligned} \quad (84)$$

According to (7), we deduce that

$$\sum_{i=1}^N \int_{\Omega} \left| \frac{\partial}{\partial x_i} T_t(u) \right|^{p_i(x)} dx \leq t \|f\|_1, \quad \forall t > 0. \quad (85)$$

Therefore, defining $\psi := T_t(u)/t$, we have for all $t > 0$,

$$\begin{aligned} \sum_{i=1}^N \int_{\Omega} t^{p_i(x)-1} \left| \frac{\partial}{\partial x_i} \psi \right|^{p_i(x)} dx \\ = \sum_{i=1}^N \frac{1}{t} \int_{\Omega} \left| \frac{\partial}{\partial x_i} T_t(u) \right|^{p_i(x)} dx \leq \|f\|_1. \end{aligned} \quad (86)$$

From the previous inequality, the definition of $\alpha_i(\cdot)$ and (81), we have

$$\begin{aligned} \sum_{i=1}^N \int_{\{|(\partial/\partial x_i)u|^{\alpha_i(\cdot)} > t\}} t^{q_i(x)} dx \\ \leq \sum_{i=1}^N \int_{\{|(\partial/\partial x_i)u|^{\alpha_i(\cdot)} > t\} \cap \{|u| \leq t\}} t^{q_i(x)} dx \\ + \sum_{i=1}^N \int_{\{|u| > t\}} t^{q_i(x)} dx \\ \leq \sum_{i=1}^N \int_{\{|u| \leq t\}} t^{q_i(x)} \left(\frac{|(\partial/\partial x_i)u|^{\alpha_i(x)}}{t} \right)^{p_i(x)/\alpha_i(x)} dx + M \\ \leq \sum_{i=1}^N \int_{\{|(\partial/\partial x_i)u|^{\alpha_i(\cdot)} > t; |u| \leq t\}} t^{q_i(x) - (p_i(x)/\alpha_i(x))} \left| \frac{\partial u}{\partial x_i} \right|^{p_i(x)} dx + M \\ \leq \sum_{i=1}^N \frac{1}{t} \int_{\{|(\partial/\partial x_i)u|^{\alpha_i(\cdot)} > t; |u| \leq t\}} \left| \frac{\partial u}{\partial x_i} \right|^{p_i(x)} dx \\ + M \leq \|f\|_1 + M. \end{aligned} \quad (87)$$

$\square$

Lemma 18. Assume (4)–(8) and $f \in L^1(\Omega)$. Let u be an entropy solution of (1), then

$$\frac{1}{h} \sum_{i=1}^N \int_{\{|u| \leq h\}} \left| \frac{\partial}{\partial x_i} T_h(u) \right|^{p_i(x)} dx \leq M \quad (88)$$

for every $h > 0$, with M a positive constant. Moreover, we have

$$\| |u|^{p_M(x)-2} u \|_1 = \| |u|^{p_M(x)-1} \|_1 \leq \| f \|_1 \quad (89)$$

and there exists a constant $D > 0$ which depends on f and Ω such that

$$\text{meas} \{ |u| > h \} \leq \frac{D}{h^{p_M-1}}, \quad \forall h > 0. \quad (90)$$

Proof. Taking $\varphi = 0$ in the entropy inequality (80) and using (7), we obtain

$$\sum_{i=1}^N \int_{\{|u| \leq h\}} \left| \frac{\partial}{\partial x_i} T_h(u) \right|^{p_i(x)} dx \leq h \| f \|_1 \leq Mh, \quad (91)$$

$$\int_{\Omega} |u|^{p_M(x)-2} u T_h(u) dx \leq h \| f \|_1,$$

for all $h > 0$. This yields

$$\int_{\{|u| > h\}} |u|^{p_M(x)-2} u T_h(u) dx \leq h \| f \|_1. \quad (92)$$

As $u T_h(u) \chi_{\{|u| > h\}} = h |u| \chi_{\{|u| > h\}}$, we get from the previous inequality by using Fatou's lemma

$$\int_{\Omega} |u|^{p_M(x)-2} |u| dx \leq \| f \|_1. \quad (93)$$

Now, since $|T_h(u)| \leq |u|$ we have

$$\int_{\Omega} |T_h(u)|^{p_M(x)-1} dx \leq \int_{\Omega} |u|^{p_M(x)-1} dx \leq \| f \|_1. \quad (94)$$

We deduce that

$$\int_{\Omega} |T_h(u)|^{p_M-1} dx \leq D(f, \Omega). \quad (95)$$

Indeed,

$$\begin{aligned} & \int_{\Omega} |T_h(u)|^{p_M-1} dx \\ & \leq \int_{\{|T_h(u)| \leq 1\}} |T_h(u)|^{p_M-1} dx \\ & \quad + \int_{\{|T_h(u)| > 1\}} |T_h(u)|^{p_M-1} dx \\ & \leq \text{meas}(\Omega) + \int_{\Omega} |T_h(u)|^{p_M(x)-1} dx \\ & \leq \text{meas}(\Omega) + \| f \|_1. \end{aligned} \quad (96)$$

From aforementioned, we get

$$\int_{\{|u| > h\}} |T_h(u)|^{p_M-1} dx \leq D(f, \Omega). \quad (97)$$

Therefore,

$$h^{p_M-1} \text{meas} \{ |u| > h \} \leq D(f, \Omega) \quad (98)$$

which implies

$$\text{meas} \{ |u| > h \} \leq \frac{D(f, \Omega)}{h^{p_M-1}}. \quad (99)$$

□

Lemma 19. If u is an entropy solution of (1) then there exists a constant $C > 0$ such that

$$\int_{\Omega} |T_k(u)|^{p_M} dx + \sum_{i=1}^N \int_{\{|u| \leq k\}} \left| \frac{\partial u}{\partial x_i} \right|^{p_i} dx \leq C(k+1), \quad (100)$$

$$\forall k > 0.$$

Proof. Taking $\varphi = 0$ in the entropy inequality (80) and using (7), we get

$$\begin{aligned} & \int_{\Omega} |u|^{p_M(x)-2} u T_k(u) dx \\ & \quad + \sum_{i=1}^N \int_{\{|u| \leq k\}} \left| \frac{\partial}{\partial x_i} T_k(u) \right|^{p_i(x)} dx \leq k \| f \|_1. \end{aligned} \quad (101)$$

Note that

$$\begin{aligned} & \sum_{i=1}^N \int_{\{|u| \leq k\}} \left| \frac{\partial}{\partial x_i} T_k(u) \right|^{p_i} dx \\ & = \sum_{i=1}^N \int_{\{|u| \leq k, |\partial u / \partial x_i| \leq 1\}} \left| \frac{\partial}{\partial x_i} T_k(u) \right|^{p_i} dx \\ & \quad + \sum_{i=1}^N \int_{\{|u| \leq k, |\partial u / \partial x_i| > 1\}} \left| \frac{\partial}{\partial x_i} T_k(u) \right|^{p_i} dx \\ & \leq N \text{meas}(\Omega) + \sum_{i=1}^N \int_{\{|u| \leq k, |\partial u / \partial x_i| > 1\}} \left| \frac{\partial}{\partial x_i} T_k(u) \right|^{p_i(x)} dx \\ & \leq N \text{meas}(\Omega) + \sum_{i=1}^N \int_{\{|u| \leq k\}} \left| \frac{\partial}{\partial x_i} T_k(u) \right|^{p_i(x)} dx, \end{aligned}$$

$$\begin{aligned} & \int_{\Omega} |T_k(u)|^{p_M} dx \\ & \leq \int_{\{|T_k(u)| \leq 1\}} |T_k(u)|^{p_M} dx + \int_{\{|T_k(u)| > 1\}} |T_k(u)|^{p_M} dx \\ & \leq \text{meas}(\Omega) + \int_{\Omega} |T_k(u)|^{p_M(x)} dx \\ & \leq \text{meas}(\Omega) + \int_{\Omega} |u|^{p_M(x)-2} u T_k(u) dx. \end{aligned} \quad (102)$$

Therefore, we deduce according to (101) that

$$\begin{aligned} \int_{\Omega} |T_k(u)|^{P_M} dx + \sum_{i=1}^N \int_{\{|u| \leq k\}} \left| \frac{\partial u}{\partial x_i} \right|^{p_i} dx \\ \leq (N+1) \text{meas}(\Omega) + k \|f\|_1, \quad \forall k > 0. \end{aligned} \quad (103)$$

□

Lemma 20. *If u is an entropy solution of (1) then*

$$\rho_{p'(\cdot)} \left(\left| \frac{\partial}{\partial x_i} u \right|^{p_i(x)-1} \chi_F \right) \leq C, \quad \forall i = 1, \dots, N, \quad (104)$$

where $F = \{h < |u| \leq h+t\}$, $h > 0$, $t > 0$.

Proof. Taking $\varphi = T_h(u)$ as a test function in the entropy inequality (80), we get

$$\begin{aligned} \sum_{i=1}^N \int_{\Omega} a_i \left(x, \frac{\partial}{\partial x_i} u \right) \cdot \frac{\partial}{\partial x_i} T_t(u - T_h(u)) dx \\ + \int_{\Omega} |u|^{p_M(x)-2} u T_t(u - T_h(u)) dx \\ \leq \int_{\Omega} f(x) T_t(u - T_h(u)) dx. \end{aligned} \quad (105)$$

It follows by using (7) that

$$\int_F \left| \frac{\partial}{\partial x_i} u \right|^{p_i(x)} dx \leq t \|f\|_1. \quad (106)$$

Therefore,

$$\rho_{p'(\cdot)} \left(\left| \frac{\partial}{\partial x_i} u \right|^{p_i(x)-1} \chi_F \right) \leq C, \quad \forall i = 1, \dots, N. \quad (107)$$

□

Lemma 21. *If u is an entropy solution of (1) then*

$$\lim_{h \rightarrow +\infty} \int_{\Omega} |f| \chi_{\{|u| > h-t\}} dx = 0, \quad (108)$$

where $h > 0$, $t > 0$.

Proof. By Lemma 18, we deduce that

$$\lim_{h \rightarrow +\infty} |f| \chi_{\{|u| > h-t\}} = 0 \quad (109)$$

and as $f \in L^1(\Omega)$, it follows by using the Lebesgue dominated convergence theorem that

$$\lim_{h \rightarrow +\infty} \int_{\Omega} |f| \chi_{\{|u| > h-t\}} dx = 0. \quad (110)$$

The proof of the following lemma can be found in [1]. □

Lemma 22. *Assume (4)–(8) and $f \in L^1(\Omega)$. Let u be an entropy solution of (1), then*

$$\text{meas} \left\{ \left| \frac{\partial}{\partial x_i} u \right| > h \right\} \leq \frac{D'}{h^{1/(P_M^-)}}, \quad \forall h \geq 1, \quad \forall i = 1, \dots, N, \quad (111)$$

where D' is a positive constant which depends on f and p_M^- .

Step 2 (uniqueness of entropy solution). The proof of the uniqueness of entropy solutions follows the same techniques by Ouaro [20] (see also [35]). Indeed, let $h > 0$ and u, v be two entropy solutions of (1). We write the entropy inequality (54) corresponding to the solution u , with $T_h(v)$ as test function, and to the solution v , with $T_h(u)$ as test function. Upon addition, we get

$$\begin{aligned} \int_{\{|u-T_h(v)| \leq t\}} \sum_{i=1}^N a_i \left(x, \frac{\partial}{\partial x_i} u \right) \cdot \frac{\partial}{\partial x_i} (u - T_h(v)) dx \\ + \int_{\{|v-T_h(u)| \leq t\}} \sum_{i=1}^N a_i \left(x, \frac{\partial}{\partial x_i} v \right) \cdot \frac{\partial}{\partial x_i} (v - T_h(u)) dx \\ + \int_{\Omega} |u|^{p_M(x)-2} u T_t(u - T_h(v)) dx \\ + \int_{\Omega} |v|^{p_M(x)-2} v T_t(v - T_h(u)) dx \\ \leq \int_{\Omega} f(x) (T_t(u - T_h(v)) + T_t(v - T_h(u))) dx. \end{aligned} \quad (112)$$

Define

$$\begin{aligned} E_1 &:= \{|u - v| \leq t, |v| \leq h\}, \\ E_2 &:= E_1 \cap \{|u| \leq h\}, \\ E_3 &:= E_1 \cap \{|u| > h\}. \end{aligned} \quad (113)$$

We start with the first integral in (112). By (7), we have

$$\begin{aligned} \int_{\{|u-T_h(v)| \leq t\}} \sum_{i=1}^N a_i \left(x, \frac{\partial}{\partial x_i} u \right) \cdot \frac{\partial}{\partial x_i} (u - T_h(v)) dx \\ \geq \int_{E_2} \sum_{i=1}^N a_i \left(x, \frac{\partial}{\partial x_i} u \right) \cdot \frac{\partial}{\partial x_i} (u - v) dx \\ - \int_{E_3} \sum_{i=1}^N a_i \left(x, \frac{\partial}{\partial x_i} u \right) \cdot \frac{\partial}{\partial x_i} v dx. \end{aligned} \quad (114)$$

Using (5) and Proposition 1, we estimate the last integral in (114) as follows:

$$\begin{aligned} & \left| \int_{E_3} \sum_{i=1}^N a_i \left(x, \frac{\partial}{\partial x_i} u \right) \cdot \frac{\partial}{\partial x_i} v dx \right| \\ & \leq C_1 \int_{E_3} \sum_{i=1}^N \left(j_i(x) + \left| \frac{\partial}{\partial x_i} u \right|^{p_i(x)-1} \right) \left| \frac{\partial}{\partial x_i} v \right| dx \\ & \leq C \sum_{i=1}^N \left(|j|_{p'_i(\cdot)} + \left\| \frac{\partial}{\partial x_i} u \right\|_{p'_i(\cdot), \{h < |u| \leq h+t\}}^{p_i(x)-1} \right) \\ & \quad \cdot \left| \frac{\partial}{\partial x_i} v \right|_{p_i(\cdot), \{h-t < |v| \leq h\}}, \end{aligned} \quad (115)$$

where

$$\begin{aligned} & \left\| \frac{\partial}{\partial x_i} u \right\|_{p'_i(\cdot), \{h < |u| \leq h+t\}}^{p_i(x)-1} \\ & = \left\| \frac{\partial}{\partial x_i} u \right\|_{L^{p'_i(\cdot)}(\{h < |u| \leq h+t\})}^{p_i(x)-1}. \end{aligned} \quad (116)$$

For all $i = 1, \dots, N$, the quantity $(|j_i|_{p'_i(\cdot)} + \|(\partial/\partial x_i)u\|_{p'_i(\cdot), \{h < |u| \leq h+t\}}^{p_i(x)-1})$ is finite according to relations (18), (19) and Lemma 20. The quantity $\|(\partial/\partial x_i)v\|_{p_i(\cdot), \{h-t < |v| \leq h\}}$ converges to zero as h goes to infinity according to Lemma 21. Then, the last expression in (115) converges to zero as h tends to infinity. Therefore, from (114), we obtain

$$\begin{aligned} & \int_{\{|u-T_h v| \leq t\}} \sum_{i=1}^N a_i \left(x, \frac{\partial}{\partial x_i} u \right) \cdot \frac{\partial}{\partial x_i} (u - T_h(v)) dx \\ & \geq I_h + \int_{E_2} \sum_{i=1}^N a_i \left(x, \frac{\partial}{\partial x_i} u \right) \cdot \frac{\partial}{\partial x_i} (u - v) dx, \end{aligned} \quad (117)$$

where I_h converges to zero as h tends to infinity. We may adopt the same procedure to treat the second term in (112) to obtain

$$\begin{aligned} & \int_{\{|v-T_h(u)| \leq t\}} \sum_{i=1}^N a_i \left(x, \frac{\partial}{\partial x_i} v \right) \cdot \frac{\partial}{\partial x_i} (v - T_h(u)) dx \\ & \geq J_h - \int_{E_2} \sum_{i=1}^N a_i \left(x, \frac{\partial}{\partial x_i} v \right) \cdot \frac{\partial}{\partial x_i} (u - v) dx, \end{aligned} \quad (118)$$

where J_h converges to zero as h tends to infinity.

For the two other terms in the left-hand side of (112), we denote

$$\begin{aligned} K_h &= \int_{\Omega} |u|^{p_M(x)-2} u T_t(u - T_h(v)) dx \\ &+ \int_{\Omega} |v|^{p_M(x)-2} v T_t(v - T_h(u)) dx. \end{aligned} \quad (119)$$

We have $|u|^{p_M(x)-2} u T_t(u - T_h(v)) \rightarrow |u|^{p_M(x)-2} u T_t(u - v)$ a.e. as h goes to infinity and

$$|u|^{p_M(x)-2} u T_t(u - T_h(v)) \leq t |u|^{p_M(x)-2} u \in L^1(\Omega). \quad (120)$$

Then, by the Lebesgue dominated convergence theorem, we obtain

$$\begin{aligned} & \int_{\Omega} |u|^{p_M(x)-2} u T_t(u - T_h(v)) dx \\ & \rightarrow \int_{\Omega} |u|^{p_M(x)-2} u T_t(u - v) dx, \quad \text{as } h \rightarrow \infty. \end{aligned} \quad (121)$$

In the same way, we get

$$\begin{aligned} & \int_{\Omega} |v|^{p_M(x)-2} v T_t(v - T_h(u)) dx \\ & \rightarrow \int_{\Omega} |v|^{p_M(x)-2} v T_t(v - u) dx, \quad \text{as } h \rightarrow \infty. \end{aligned} \quad (122)$$

Therefore,

$$\lim_{h \rightarrow \infty} K_h = \int_{\Omega} (|u|^{p_M(x)-2} u - |v|^{p_M(x)-2} v) T_t(u - v) dx. \quad (123)$$

Furthermore, consider the right-hand side of inequality (112). We have

$$\lim_{h \rightarrow \infty} \int_{\Omega} f(x) (T_t(u - T_h(v)) + T_t(v - T_h(u))) dx = 0. \quad (124)$$

Indeed,

$$\begin{aligned} & f(x) (T_t(u - T_h(v)) + T_t(v - T_h(u))) \\ & \rightarrow f(x) (T_t(u - v) + T_t(v - u)) = 0 \\ & \quad \text{a.e. in } \Omega \quad \text{as } h \rightarrow \infty, \end{aligned} \quad (125)$$

$$\begin{aligned} & |f(x) (T_t(u - T_h(v)) + T_t(v - T_h(u)))| \\ & \leq 2t |f(x)| \in L^1(\Omega), \end{aligned}$$

so that we are able to apply the Lebesgue dominated convergence theorem. Then, we deduce from relations (112)–(124) after passing to the limit as $h \rightarrow \infty$ in (112) the following:

$$\begin{aligned} & \sum_{i=1}^N \int_{\{|u-v| \leq t\}} \left(a_i \left(x, \frac{\partial}{\partial x_i} u \right) - a_i \left(x, \frac{\partial}{\partial x_i} v \right) \right) \cdot \frac{\partial}{\partial x_i} (u - v) \\ & + \int_{\Omega} (|u|^{p_M(x)-2} u - |v|^{p_M(x)-2} v) T_t(u - v) \leq 0. \end{aligned} \quad (126)$$

Using (6) and as $t \mapsto |t|^{p_M(x)-2} t$ is monotone, we deduce from (126) that

$$\int_{\Omega} (|u|^{p_M(x)-2} u - |v|^{p_M(x)-2} v) T_t(u - v) dx \leq 0. \quad (127)$$

Since $p_M^- > 1$, the following relation is true for any $\xi, \eta \in \mathbb{R}$, $\xi \neq \eta$ (cf. [12])

$$(|\xi|^{p_M(x)-2} \xi - |\eta|^{p_M(x)-2} \eta) (\xi - \eta) > 0. \quad (128)$$

Therefore, from (127), we get that $(|u|^{p_M(x)-2}u - |v|^{p_M(x)-2}v)T_t(u - v) = 0$ a.e. in Ω , which means that for all $t \in \mathbb{R}^+$, there exists $\Omega_t \subset \Omega$ with $\text{meas}(\Omega_t) = 0$ such that for all $x \in \Omega \setminus \Omega_t$,

$$(|u|^{p_M(x)-2}u - |v|^{p_M(x)-2}v)T_t(u - v) = 0. \quad (129)$$

Therefore,

$$\begin{aligned} (|u|^{p_M(x)-2}u - |v|^{p_M(x)-2}v)(u - v) &= 0, \\ \forall x \in \Omega \setminus \bigcup_{t \in \mathbb{N}^*} \Omega_t. \end{aligned} \quad (130)$$

Now, using (128) and (130), we obtain

$$u_1 = u_2 \quad \text{a.e. in } \Omega. \quad (131)$$

Step 3 (Existence of entropy solutions). Let $(f_n)_{n \in \mathbb{N}^*}$ be a sequence of bounded functions, strongly converging to $f \in L^1(\Omega)$ and such that

$$\|f_n\|_1 \leq \|f\|_1, \quad \forall n \in \mathbb{N}^*. \quad (132)$$

We consider the problem

$$\begin{aligned} -\sum_{i=1}^N \frac{\partial}{\partial x_i} a_i \left(x, \frac{\partial u_n}{\partial x_i} \right) + |u_n|^{p_M(x)-2} u_n &= f_n \quad \text{in } \Omega, \\ \sum_{i=1}^N a_i \left(x, \frac{\partial u_n}{\partial x_i} \right) v_i &= 0 \quad \text{on } \partial\Omega. \end{aligned} \quad (133)$$

It follows from Theorem 10 that problem (133) admits a unique weak solution $u_n \in W^{1, \tilde{p}(\cdot)}(\Omega)$ which satisfies

$$\begin{aligned} \sum_{i=1}^N \int_{\Omega} a_i \left(x, \frac{\partial u_n}{\partial x_i} \right) \frac{\partial}{\partial x_i} \varphi dx + \int_{\Omega} |u_n|^{p_M(x)-2} u_n \varphi dx \\ = \int_{\Omega} f_n(x) \varphi dx, \end{aligned} \quad (134)$$

for all $\varphi \in W^{1, \tilde{p}(\cdot)}(\Omega)$.

Our interest is to prove that these approximated solutions u_n tend, as n goes to infinity, to a measurable function u which is an entropy solution of the problem (1). We announce the following important lemma, useful to get some convergence results.

Lemma 23. *If u_n is a weak solution of (126) then there exist some constants $C_1, C_2 > 0$ such that*

- (i) $\|u_n\|_{\mathcal{M}^{\tilde{p}}(\Omega)} \leq C_1$,
- (ii) $\|\partial u_n / \partial x_i\|_{\mathcal{M}^{\tilde{p}_i^{-1} q / \tilde{p}}(\Omega)} \leq C_2$, for all $i = 1, \dots, N$.

Proof. (i) is a consequence of Lemmas 19 and 5 by using $T_k(u_n)$ for all $k > 0$ as a test function in (134).

(ii) We first use $T_\gamma(u_n)$ for all $\gamma > 0$ as a test function in (134) to get

$$\sum_{i=1}^N \int_{\{|u| \leq \gamma\}} \left| \frac{\partial u}{\partial x_i} \right|^{p_i^-} dx \leq C(\gamma + 1). \quad (135)$$

Then, let $\lambda_{|\partial u_n / \partial x_i|}(\alpha) = \text{meas}\{x \in \Omega : |\partial u_n / \partial x_i| > \alpha\}$ for all $i = 1, \dots, N$, we have for any $\alpha > 1, \gamma > 0$,

$$\begin{aligned} \lambda_{|\partial u_n / \partial x_i|}(\alpha) &\leq \text{meas} \left\{ x \in \Omega : \left| \frac{\partial u_n}{\partial x_i} \right| > \alpha, |u_n| \leq \gamma \right\} \\ &\quad + \text{meas} \left\{ x \in \Omega : \left| \frac{\partial u_n}{\partial x_i} \right| > \alpha, |u_n| > \gamma \right\} \\ &\leq \int_{\{|\partial u_n / \partial x_i| > \alpha, |u_n| \leq \gamma\}} \left(\frac{1}{\alpha} \left| \frac{\partial u_n}{\partial x_i} \right| \right)^{p_i^-} dx + \lambda_{|u_n|}(\gamma) \\ &\leq \frac{1}{\alpha^{p_i^-}} \int_{\{|u_n| \leq \gamma\}} \left| \frac{\partial u_n}{\partial x_i} \right|^{p_i^-} dx + \lambda_{|u_n|}(\gamma). \end{aligned} \quad (136)$$

Using (135) and (i), we get

$$\lambda_{|\partial u_n / \partial x_i|}(\alpha) \leq C \left(\frac{\gamma}{\alpha^{p_i^-}} + \gamma^{-\tilde{p}} \right), \quad (137)$$

from which we deduce (ii).

By lemmas 3 and 23, it follows that $(u_n)_{n \in \mathbb{N}^*}$ is uniformly bounded in $L^{s_0}(\Omega)$ for some $1 \leq s_0 < \tilde{p}$, and in the same way, $(|\partial u_n / \partial x_i|)_{n \in \mathbb{N}^*}$ is uniformly bounded in $L^{s_i}(\Omega)$ for some $1 \leq s_i < \tilde{p}_i$. From this, we get that the sequence $(u_n)_{n \in \mathbb{N}^*}$ is uniformly bounded in $W^{1,s}(\Omega)$, where $s = \min(s_0, s_1, \dots, s_N)$. Consequently, we can extract a subsequence, still denoted (u_n) satisfying

$$\begin{aligned} u_n &\longrightarrow u \quad \text{a.e. in } \Omega, \text{ in } L^s(\Omega), \\ u_n &\rightharpoonup u \quad \text{in } W^{1,s}(\Omega), \\ \left| \frac{\partial u_n}{\partial x_i} - \frac{\partial u}{\partial x_i} \right| &\rightharpoonup \mathcal{H}_i(x) \quad \text{in } L^s(\Omega), \quad \forall i = 1, \dots, N. \end{aligned} \quad (138)$$

By the same way as in the proof of [16, Lemma 3.5] (see also [27]), we prove that

$$\mathcal{H}_i(x) = 0 \quad \text{a.e. } x \in \Omega \quad \forall i = 1, \dots, N. \quad (139)$$

We deduce from (139) that

$$\begin{aligned} a_i \left(x, \frac{\partial u_n}{\partial x_i} \right) \\ \longrightarrow a_i \left(x, \frac{\partial u}{\partial x_i} \right) \quad \text{a.e. in } \Omega, \text{ in } L^1(\Omega), \quad \forall i = 1, \dots, N. \end{aligned} \quad (140)$$

In order to pass to the limit in relation (134), we need also the following convergence results which can be proved by the same way as in [1]. $\square$

Proposition 24. Assume (4)–(8), $f \in L^1(\Omega)$ and (132). Let $u_n \in W^{1,\tilde{p}(\cdot)}(\Omega)$ be the solution of (133). The sequence $(u_n)_{n \in \mathbb{N}}$ is Cauchy in measure. In particular, there exists a measurable function u and a subsequence still denoted by u_n such that $u_n \rightarrow u$ in measure.

Proposition 25. Assume (4)–(8), $f \in L^1(\Omega)$ and (132). Let $u_n \in W^{1,\tilde{p}(\cdot)}(\Omega)$ be the solution of (133). The following assertions hold.

- (i) For all $i = 1, \dots, N$, $\partial u_n / \partial x_i$ converges in measure to the weak partial gradient of u .
- (ii) For all $i = 1, \dots, N$ and all $k > 0$, $a_i(x, \partial T_k(u_n) / \partial x_i)$ converges to $a_i(x, \partial T_k(u) / \partial x_i)$ in $L^1(\Omega)$ strongly and in $L^{p_i(\cdot)}(\Omega)$ weakly.

We can now pass to the limit in (134). To this end, let $\varphi \in W^{1,\tilde{p}(\cdot)}(\Omega) \cap L^\infty(\Omega)$. For any $k > 0$, choose $T_k(u_n - \varphi)$ as a test function in (134), we get

$$\begin{aligned} & \sum_{i=1}^N \int_{\Omega} a_i \left(x, \frac{\partial u_n}{\partial x_i} \right) \frac{\partial}{\partial x_i} T_k(u_n - \varphi) dx \\ & + \int_{\Omega} |u_n|^{p_M(x)-2} u_n T_k(u_n - \varphi) dx \\ & = \int_{\Omega} f_n(x) T_k(u_n - \varphi) dx. \end{aligned} \quad (141)$$

For the right-hand side of (141), the convergence is obvious since f_n converges strongly to f in $L^1(\Omega)$, and $T_k(u_n - \varphi)$ converges weakly- $*$ to $T_k(u - \varphi)$ in $L^\infty(\Omega)$ and a.e. in Ω .

For the second term of (141), we have

$$\begin{aligned} & \int_{\Omega} |u_n|^{p_M(x)-2} u_n T_k(u_n - \varphi) dx \\ & = \int_{\Omega} \left(|u_n|^{p_M(x)-2} u_n - |\varphi|^{p_M(x)-2} \varphi \right) T_k(u_n - \varphi) dx \\ & + \int_{\Omega} |\varphi|^{p_M(x)-2} \varphi T_k(u_n - \varphi) dx. \end{aligned} \quad (142)$$

The quantity $(|u_n|^{p_M(x)-2} u_n - |\varphi|^{p_M(x)-2} \varphi) T_k(u_n - \varphi)$ is nonnegative and since for all $x \in \Omega$, $s \mapsto |s|^{p_M(x)-2} s$ is continuous; we get

$$\begin{aligned} & \left(|u_n|^{p_M(x)-2} u_n - |\varphi|^{p_M(x)-2} \varphi \right) T_k(u_n - \varphi) \\ & \longrightarrow \left(|u|^{p_M(x)-2} u - |\varphi|^{p_M(x)-2} \varphi \right) T_k(u - \varphi) \quad \text{a.e. in } \Omega. \end{aligned} \quad (143)$$

Then, it follows by Fatou's Lemma that

$$\begin{aligned} & \liminf_{n \rightarrow +\infty} \int_{\Omega} \left(|u_n|^{p_M(x)-2} u_n - |\varphi|^{p_M(x)-2} \varphi \right) T_k(u_n - \varphi) dx \\ & \geq \int_{\Omega} \left(|u|^{p_M(x)-2} u - |\varphi|^{p_M(x)-2} \varphi \right) T_k(u - \varphi) dx. \end{aligned} \quad (144)$$

Let us show that $|\varphi|^{p_M(x)-2} \varphi \in L^1(\Omega)$.

We have

$$\begin{aligned} \int_{\Omega} |\varphi|^{p_M(x)-2} \varphi dx & = \int_{\Omega} |\varphi|^{p_M(x)-1} dx \\ & \leq \int_{\Omega} (\|\varphi\|_{\infty})^{p_M(x)-1} dx. \end{aligned} \quad (145)$$

If $\|\varphi\|_{\infty} \leq 1$, then $\int_{\Omega} |\varphi|^{p_M(x)-2} \varphi dx \leq \text{meas}(\Omega) < +\infty$.
If $\|\varphi\|_{\infty} > 1$, then

$$\begin{aligned} \int_{\Omega} |\varphi|^{p_M(x)-2} \varphi dx & \leq \int_{\Omega} (\|\varphi\|_{\infty})^{p_M^+-1} dx \\ & = (\|\varphi\|_{\infty})^{p_M^+-1} \text{meas}(\Omega) < +\infty. \end{aligned} \quad (146)$$

Hence, $|\varphi|^{p_M(x)-2} \varphi \in L^1(\Omega)$.

Since $T_k(u_n - \varphi)$ converges weakly- $*$ to $T_k(u - \varphi)$ in $L^\infty(\Omega)$ and $|\varphi|^{p_M(x)-2} \varphi \in L^1(\Omega)$, it follows that

$$\begin{aligned} & \lim_{n \rightarrow +\infty} \int_{\Omega} |\varphi|^{p_M(x)-2} \varphi T_k(u_n - \varphi) dx \\ & = \int_{\Omega} |\varphi|^{p_M(x)-2} \varphi T_k(u - \varphi) dx. \end{aligned} \quad (147)$$

For the first term of (141), we write it as follows:

$$\begin{aligned} & \sum_{i=1}^N \int_{\{|u_n - \varphi| \leq k\}} a_i \left(x, \frac{\partial u_n}{\partial x_i} \right) \frac{\partial}{\partial x_i} u_n dx \\ & - \sum_{i=1}^N \int_{\{|u_n - \varphi| \leq k\}} a_i \left(x, \frac{\partial u_n}{\partial x_i} \right) \frac{\partial}{\partial x_i} \varphi dx. \end{aligned} \quad (148)$$

The first term of (148) is nonnegative by (7), then by Fatou's Lemma and (138), we get

$$\begin{aligned} & \sum_{i=1}^N \int_{\{|u - \varphi| \leq k\}} a_i \left(x, \frac{\partial u}{\partial x_i} \right) \frac{\partial}{\partial x_i} u dx \\ & \leq \liminf_{n \rightarrow \infty} \sum_{i=1}^N \int_{\{|u_n - \varphi| \leq k\}} a_i \left(x, \frac{\partial u_n}{\partial x_i} \right) \frac{\partial}{\partial x_i} u_n dx. \end{aligned} \quad (149)$$

According to Proposition 25, the second term of (148) converges to

$$\sum_{i=1}^N \int_{\{|u - \varphi| \leq k\}} a_i \left(x, \frac{\partial u}{\partial x_i} \right) \frac{\partial}{\partial x_i} \varphi dx. \quad (150)$$

Combining the previous convergence results, we obtain

$$\begin{aligned} & \sum_{i=1}^N \int_{\Omega} a_i \left(x, \frac{\partial u}{\partial x_i} \right) \frac{\partial}{\partial x_i} T_k(u - \varphi) dx \\ & + \int_{\Omega} |u|^{p_M(x)-2} u T_k(u - \varphi) dx \\ & \leq \int_{\Omega} f(x) T_k(u - \varphi) dx. \end{aligned} \quad (151)$$
