We use the generalized Riccati transformation and the inequality technique to establish some new oscillation criteria for the second-order nonlinear delay dynamic equation with damping on a time scale $\mathbb{T}(r(t)g(x(t), x^\Delta(t)))^\Delta + p(t)g(x(t), x^\Delta(t)) + q(t)f(x(\tau(t))) = 0$, where $r(t)$, $p(t)$, and $q(t)$ are positive right dense continuous (rd-continuous) functions on $\mathbb{T}$. Our results improve and extend some results established by Zhang et al., 2011. Also, our results unify the oscillation of the second-order nonlinear delay differential equation with damping and the second-order nonlinear delay difference equation with damping. Finally, we give some examples to illustrate our main results.

1. Introduction

The purpose of this paper is to give several oscillation criteria for the second-order nonlinear delay dynamic equation with damping on a time scale $\mathbb{T}$

$$\begin{aligned} & (r(t)g(x(t), x^\Delta(t)))^\Delta + p(t)g(x(t), x^\Delta(t)) \\ & + q(t)f(x(\tau(t))) = 0, \end{aligned} \quad (1)$$

subject to the following hypotheses.

(H₁) $\mathbb{T}$ is a time scale which is unbounded above and $t_0 \in \mathbb{T}$ with $t_0 > 0$. The time scale interval $[t_0, \infty)_{\mathbb{T}}$ is defined by $[t_0, \infty)_{\mathbb{T}} = [t_0, \infty) \cap \mathbb{T}$.

(H₂) $r(t)$, $p(t)$, and $q(t)$ are positive right dense continuous functions on $\mathbb{T}$ such that $-p/r \in \mathcal{R}^+$ and

$$\int_{t_0}^{\infty} \left[\frac{1}{r(t)} e_{-p/r}(t, t_0) \right] \Delta t = \infty, \quad (2)$$

or

$$\int_{t_0}^{\infty} \left[\frac{1}{r(t)} e_{-p/r}(t, t_0) \right] \Delta t < \infty. \quad (3)$$

(H₃) Consider $f \in C(\mathbb{R}, \mathbb{R})$, $xf(x) > 0$ for all $x \neq 0$ and there exists a positive constant L such that $f(x)/x \geq L$.

(H₄) Consider $g \in C^1(\mathbb{R}^2, \mathbb{R})$, $vg(u, v) > 0$ for all $v \neq 0$ and for any fixed $u \in \mathbb{R}$ and there exist positive constants K_1, K_2 such that

$$K_1 \leq \frac{g(u, v)}{v} \leq K_2. \quad (4)$$

(H₅) $\tau : \mathbb{T} \rightarrow \mathbb{T}$ is a strictly increasing and differentiable function such that

$$\tau(t) \leq t, \quad \lim_{t \rightarrow \infty} \tau(t) = \infty. \quad (5)$$

By a solution of (1), we mean that a nontrivial real valued function x satisfies (1) for $t \in \mathbb{T}$. A solution x of (1) is called oscillatory if it is neither eventually positive nor eventually negative. Otherwise, it is called nonoscillatory. Equation (1) is said to be oscillatory if all of its solutions are oscillatory. In this work, we study the solutions of (1) which are not identically vanishing eventually.

Many results have been obtained on the oscillation and nonoscillation of dynamic equations on time scales (see e.g., the papers [1–17], the books [18, 19] and the references cited

therein). It is easy to see that (1) can be transformed into the equation

$$\left(r(t)x^\Delta(t)\right)^\Delta + p(t)x^\Delta(t) + q(t)f(x(\tau(t))) = 0, \quad (6)$$

$$t \in \mathbb{T}, \quad t \geq t_0,$$

where $g(x, x^\Delta) = x^\Delta$. If $r(t) = 1$, $f(x) = x$, and $\tau(t) = t$, then (6) is simplified to the equation

$$x^{\Delta\Delta}(t) + p(t)x^\Delta(t) + q(t)x(t) = 0, \quad t \in \mathbb{T}, \quad t \geq t_0. \quad (7)$$

Also, if $p(t) = 0$, (6) is simplified to the equation

$$\left(r(t)x^\Delta(t)\right)^\Delta + q(t)f(x(\tau(t))) = 0, \quad t \in \mathbb{T}, \quad t \geq t_0. \quad (8)$$

If $r(t) = 1$, (8) takes the form

$$x^{\Delta\Delta}(t) + q(t)f(x(\tau(t))) = 0, \quad t \in \mathbb{T}, \quad t \geq t_0. \quad (9)$$

If $f(x) = x$, (9) becomes

$$x^{\Delta\Delta}(t) + q(t)x(\tau(t)) = 0, \quad t \in \mathbb{T}, \quad t \geq t_0. \quad (10)$$

In 2002, Guseinov and Kaymakçalan [10] studied (7) and established some sufficient conditions for nonoscillation. They proved that if

$$\int_{t_0}^{\infty} p(t) \Delta t < \infty, \quad \int_{t_0}^{\infty} tq(t) \Delta t < \infty, \quad (11)$$

then (7) is nonoscillatory. In 2005, Agarwal et al. [2] studied the linear delay dynamic equation (10) and Şahiner [12] considered the nonlinear delay dynamic equation (9) and gave some sufficient conditions for oscillation of (10) and (9). In 2007, Erbe et al. [8] considered the general nonlinear delay dynamic equations (8). They obtained some oscillation criteria which improve the results given by Şahiner [12]. In 2011, Zhang and Gao [16] considered the oscillation of solutions of second-order nonlinear delay dynamic equation (6) with damping and establishing some new results. In this paper, we use the generalized Riccati transformation and the inequality technique to obtain some new oscillation criteria for (1). Our results generalize and improve the results in [16].

This paper is organized as follows. In Section 2, we present some preliminaries on time scales. In Section 3, we give some lemmas that we need through our work. In Section 4, we establish some new sufficient conditions for oscillation of (1). Finally, in Section 5, we present some examples to illustrate our results.

2. Some Preliminaries on Time Scales

A time scale $\mathbb{T}$ is an arbitrary nonempty closed subset of the real numbers $\mathbb{R}$. On any time scale $\mathbb{T}$, we define the forward and backward jump operators by

$$\sigma(t) = \inf\{s \in \mathbb{T}, s > t\}, \quad \rho(t) = \sup\{s \in \mathbb{T}, s < t\}. \quad (12)$$

A point $t \in \mathbb{T}$, $t > \inf \mathbb{T}$ is said to be left dense if $\rho(t) = t$, right dense if $t < \sup \mathbb{T}$ and $\sigma(t) = t$, left-scattered if $\rho(t) < t$, and right-scattered if $\sigma(t) > t$. The graininess function μ for a time scale $\mathbb{T}$ is defined by $\mu(t) = \sigma(t) - t$. The set $\mathbb{T}^k$ is derived from the time scale $\mathbb{T}$ as $\mathbb{T}^k = \mathbb{T} - m$ if $\mathbb{T}$ has a left-scattered maximum m . Otherwise, $\mathbb{T}^k = \mathbb{T}$.

A function $f: \mathbb{T} \rightarrow \mathbb{R}$ is called rd-continuous provided that it is continuous at right dense points of $\mathbb{T}$ and its left-sided limits exist at left dense points of $\mathbb{T}$. The set of rd-continuous functions is denoted by $C_{rd}(\mathbb{T}, \mathbb{R})$. By $C_{rd}^1(\mathbb{T}, \mathbb{R})$, we mean the set of functions whose delta derivative belong to $C_{rd}(\mathbb{T}, \mathbb{R})$.

A function $f: \mathbb{T} \rightarrow \mathbb{R}$ is regressive provided that

$$1 + \mu(t)f(t) \neq 0, \quad \forall t \in \mathbb{T}^k, \quad (13)$$

holds. The set of all regressive and rd-continuous functions $f: \mathbb{T} \rightarrow \mathbb{R}$ is denoted by

$$\mathcal{R} = \mathcal{R}(\mathbb{T}) = \mathcal{R}(\mathbb{T}, \mathbb{R}). \quad (14)$$

If $q \in \mathcal{R}$, then we define the exponential function $e_q(t, s)$ by

$$e_q(t, s) = \exp\left(\int_s^t \xi_{\mu(\tau)}(q(\tau)) \Delta \tau\right), \quad \text{for } s, t \in \mathbb{T}, \quad (15)$$

where the cylinder function $\xi_h(z)$ is defined by

$$\xi_h(z) = \frac{1}{h} \text{Log}(1 + zh). \quad (16)$$

For a function $f: \mathbb{T} \rightarrow \mathbb{R}$ (the range $\mathbb{R}$ of f may be actually replaced by any Banach space), the delta derivative f^Δ is defined by

$$f^\Delta(t) = \frac{f(\sigma(t)) - f(t)}{\sigma(t) - t}, \quad (17)$$

provided f is continuous at t and t is right-scattered. If t is not right-scattered, then the delta derivative $f^\Delta(t)$ is defined by

$$f^\Delta(t) = \lim_{s \rightarrow t^+} \frac{f(\sigma(t)) - f(t)}{t - s} = \lim_{s \rightarrow t^+} \frac{f(t) - f(s)}{t - s} \quad (18)$$

provided this limit exists.

A function $f: [a, b] \rightarrow \mathbb{R}$ is said to be differentiable if its derivative exists. The derivative f^Δ and the shift f^σ of a function f are related by the equation

$$f^\sigma = f(\sigma(t)) = f(t) + \mu(t)f^\Delta(t). \quad (19)$$

The delta derivative rules of the product fg and the quotient f/g (where $gg^\sigma \neq 0$) of two differentiable functions f and g are given by

$$\begin{aligned} (f \cdot g)^\Delta(t) &= f^\Delta(t)g(t) + f^\sigma(t)g^\Delta(t) \\ &= f(t)g^\Delta(t) + f^\Delta(t)g^\sigma(t), \end{aligned} \quad (20)$$

$$\left(\frac{f}{g}\right)^\Delta(t) = \frac{f^\Delta(t)g(t) - f(t)g^\Delta(t)}{g(t)g^\sigma(t)}.$$

An integration by parts formula reads

$$\int_a^b f(t) g^\Delta(t) \Delta t = [f(t) g(t)]_a^b - \int_a^b f^\Delta(t) g^\sigma(t) \Delta t \quad (21)$$

or

$$\int_a^b f^\sigma(t) g^\Delta(t) \Delta t = [f(t) g(t)]_a^b - \int_a^b f^\Delta(t) g(t) \Delta t \quad (22)$$

and the infinite integral is defined by

$$\int_b^\infty f(s) \Delta s = \lim_{t \rightarrow \infty} \int_b^t f(s) \Delta s. \quad (23)$$

Throughout this paper, we use

$$d_-(t) := \max\{0, -d(t)\}, \quad \alpha(t) := \frac{R(t)}{R(t) + \mu(t)}, \quad (24)$$

where $R(t) = kr(t) \int_{t_0}^t (\Delta s/r(s))$, and positive constants

$$k = \frac{K_1}{K_2}, \quad \eta = \frac{K_2}{L}, \quad (25)$$

where L, K_1 , and K_2 are defined in $(H_3), (H_4)$.

3. Several Lemmas

In this section, we present some lemmas that we need to prove our results in the next section.

Lemma 1. (Bohner and Peterson [18, Chapter 2]). If $g : \mathbb{T} \rightarrow \mathbb{R}$ is rd-continuous such that $1 + \mu(t)g(t) > 0$ for all $t \in [t_0, \infty)_{\mathbb{T}}$, then the initial value problem $y^\Delta = g(t)y$, $y(t_0) = y_0 \in \mathbb{R}$ has a unique and positive solution on $[t_0, \infty)_{\mathbb{T}}$, denoted by $e_g(\cdot, t_0)$.

Lemma 2. (Bohner [5, Lemma 2]). For nonnegative p with $-p \in \mathcal{R}^+$, one has the inequality

$$1 - \int_s^t p(u) \Delta u \leq e_{-p}(t, s), \quad \forall t \geq s. \quad (26)$$

Lemma 3. If $(H_1)-(H_5)$, (2) hold and (1) has a positive solution x on $[t_0, \infty)_{\mathbb{T}}$, then $(r(t)g(x, x^\Delta))^\Delta < 0$, $x^\Delta(t) > 0$, and $x(t) > \alpha(t)x(\sigma(t))$ for $t \in [t_0, \infty)_{\mathbb{T}}$.

Proof. Since x is a positive solution of (1) on $[t_0, \infty)_{\mathbb{T}}$, we have

$$\begin{aligned} & (r(t)g(x(t), x^\Delta(t)))^\Delta + p(t)g(x(t), x^\Delta(t)) \\ & = -q(t)f(x(\tau(t))) < 0. \end{aligned} \quad (27)$$

Therefore,

$$\begin{aligned} & \left[\frac{r(t)g(x(t), x^\Delta(t))}{e_{-p/r}(\cdot, t_0)} \right]^\Delta \\ & = \left((r(t)g(x(t), x^\Delta(t)))^\Delta e_{-p/r}(\cdot, t_0) \right. \\ & \quad \left. - e_{-p/r}^\Delta(\cdot, t_0) r(t)g(x(t), x^\Delta(t)) \right) \\ & \quad \times (e_{-p/r}(\cdot, t_0) e_{-p/r}^\sigma(\cdot, t_0))^{-1} \\ & = \left((r(t)g(x(t), x^\Delta(t)))^\Delta + p(t)g(x(t), x^\Delta(t)) \right) \\ & \quad \times (e_{-p/r}^\sigma(\cdot, t_0))^{-1} < 0. \end{aligned} \quad (28)$$

Hence,

$$\frac{r(t)g(x(t), x^\Delta(t))}{e_{-p/r}(\cdot, t_0)} \text{ is decreasing.} \quad (29)$$

We claim that $x^\Delta(t) > 0$ on $[t_0, \infty)_{\mathbb{T}}$. If not, then there is $t \geq t_1$ such that

$$\frac{r(t)g(x(t), x^\Delta(t))}{e_{-p/r}(t, t_0)} \leq \frac{r(t_1)g(x(t_1), x^\Delta(t_1))}{e_{-p/r}(t_1, t_0)} =: c < 0. \quad (30)$$

By (H_4) , we get

$$x^\Delta(t) \leq \frac{c}{K_1} \frac{1}{r(t)} e_{-p/r}(t, t_0), \quad K_1 > 0. \quad (31)$$

Integrating from t_1 to t , we get

$$x(t) \leq x(t_1) + \frac{c}{K_1} \int_{t_1}^t \left[\frac{1}{r(s)} e_{-p/r}(s, t_0) \right] \Delta s. \quad (32)$$

This implies that $x(t)$ is eventually negative which is a contradiction. Hence, $x^\Delta(t) > 0$ on $[t_0, \infty)_{\mathbb{T}}$. Therefore,

$$\begin{aligned} & x(t) > x(t) - x(t_1) \\ & = \int_{t_1}^t x^\Delta(s) \Delta s \\ & > \int_{t_1}^t \frac{1}{K_2} g(x(s), x^\Delta(s)) \Delta s \quad \text{by } (H_3) \\ & > \frac{1}{K_2} \int_{t_1}^t \frac{r(s)g(x(s), x^\Delta(s))}{r(s)} \Delta s, \quad K_2 > 0. \end{aligned} \quad (33)$$

Using the fact that $r(t)g(x(t), x^\Delta(t))$ is strictly decreasing, we get

$$\begin{aligned} x(t) &> \frac{r(t)g(x(t), x^\Delta(t))}{K_2} \int_{t_1}^t \frac{\Delta s}{r(s)} \\ &> \frac{K_1}{K_2} r(t) x^\Delta(t) \int_{t_1}^t \frac{\Delta s}{r(s)}, \quad K_1 > 0 \quad (\text{by } (H_3)) \\ &> kr(t) x^\Delta(t) \int_{t_1}^t \frac{\Delta s}{r(s)} = R(t) x^\Delta(t), \quad \text{for } k = \frac{K_1}{K_2} > 0, \end{aligned} \quad (34)$$

where $R(t) = kr(t) \int_{t_1}^t (\Delta s/r(s))$.

Hence,

$$\frac{x(t)}{x^\sigma(t)} = \frac{x(t)}{x(t) + \mu(t) x^\Delta(t)} \geq \frac{R(t)}{R(t) + \mu(t)} = \alpha(t) \quad \text{on } [t_0, \infty)_{\mathbb{T}}. \quad (35)$$

□

4. Main Results

Here, we establish some new sufficient conditions for oscillation of (1).

Theorem 4. Assume that $(H_1)-(H_5)$, (2) hold and $\tau \in C_{rd}^1([t_0, \infty)_{\mathbb{T}}, \mathbb{T})$, $\tau([t_0, \infty)_{\mathbb{T}}) = [t_0, \infty)_{\mathbb{T}}$. If there exists a positive Δ -differentiable function $\delta(t)$ such that

$$\begin{aligned} \limsup_{t \rightarrow \infty} \int_{t_0}^t \left[\alpha(\tau(s)) q(s) \right. \\ \left. - \frac{\eta r(\tau(s))}{4\alpha(\tau(s)) \tau^\Delta(s)} \left(\frac{\delta^\Delta(s)}{\delta^\sigma(s)} - \frac{p(s)}{r(s)} \alpha(\tau(s)) \right)^2 \right] \\ \times \delta^\sigma(s) \Delta s = \infty, \end{aligned} \quad (36)$$

then every solution of (1) is oscillatory on $[t_0, \infty)_{\mathbb{T}}$.

Proof. Assume that (1) has a nonoscillatory solution $x(t)$ on $[t_0, \infty)_{\mathbb{T}}$. Also, assume that $x(t) > 0$, $x(\tau(t)) > 0$ for all $t \in [t_1, \infty)_{\mathbb{T}}$, $t_1 \in [t_0, \infty)_{\mathbb{T}}$. Consider the generalized Riccati substitution

$$w(t) = \delta(t) \frac{r(t)g(x(t), x^\Delta(t))}{x(\tau(t))} > 0. \quad (37)$$

Using the delta derivative rules of product and quotient of two functions, we have

$$\begin{aligned} w^\Delta(t) &= \delta^\Delta(t) \frac{r(t)g(x(t), x^\Delta(t))}{x(\tau(t))} \\ &\quad + \delta^\sigma(t) \left(\frac{r(t)g(x(t), x^\Delta(t))}{x(\tau(t))} \right)^\Delta \\ &= \frac{\delta^\Delta(t)}{\delta(t)} w(t) + \delta^\sigma(t) \end{aligned}$$

$$\begin{aligned} &\times \left(\left(x(\tau(t)) (r(t)g(x(t), x^\Delta(t)))^\Delta \right. \right. \\ &\quad \left. \left. - (x(\tau(t)))^\Delta (r(t)g(x(t), x^\Delta(t))) \right) \right. \\ &\quad \left. \times (x(\tau(t)) x^\sigma(\tau(t)))^{-1} \right) \\ &= \frac{\delta^\Delta(t)}{\delta(t)} w(t) + \delta^\sigma(t) \\ &\quad \times \left(- \frac{p(t)g(x(t), x^\Delta(t))}{x^\sigma(\tau(t))} \right. \\ &\quad \left. - \frac{q(t)f(x(\tau(t)))}{x^\sigma(\tau(t))} \right. \\ &\quad \left. - \frac{x^\Delta(\tau(t)) \tau^\Delta(t)}{\delta(t) x^\sigma(\tau(t))} w(t) \right). \end{aligned} \quad (38)$$

From the definition of $w(t)$, we have

$$\begin{aligned} w^\Delta(t) &= \frac{\delta^\Delta(t)}{\delta(t)} w(t) \\ &\quad + \delta^\sigma(t) \left(- \frac{p(t)x(\tau(t))}{\delta(t)r(t)x^\sigma(\tau(t))} w(t) \right. \\ &\quad \left. - \frac{q(t)f(x(\tau(t)))}{x^\sigma(\tau(t))} \right. \\ &\quad \left. - \frac{x^\Delta(\tau(t)) \tau^\Delta(t)}{\delta(t)x^\sigma(\tau(t))} w(t) \right). \end{aligned} \quad (39)$$

Using the fact $f(x)/x \geq L$ and $x(t)/x^\sigma(t) > \alpha(t)$, we get

$$\begin{aligned} w^\Delta(t) &\leq \frac{\delta^\Delta(t)}{\delta(t)} w(t) \\ &\quad + \delta^\sigma(t) \left(- \frac{p(t)\alpha(\tau(t))}{\delta(t)r(t)} w(t) - Lq(t)\alpha(\tau(t)) \right. \\ &\quad \left. - \frac{x^\Delta(\tau(t)) \tau^\Delta(t)}{\delta(t)x^\sigma(\tau(t))} w(t) \right). \end{aligned} \quad (40)$$

Integrating the inequality $(r(t)g(x, x^\Delta))^\Delta < 0$ from $\tau(t)$ to t , using the definition of $w(t)$ and (H_3) , we get

$$x^\Delta(\tau(t)) > \frac{x(\tau(t))}{K_2 \delta(t) r(\tau(t))} w(t). \quad (41)$$

Now, substituting (41) in (40), we have

$$\begin{aligned} w^\Delta(t) &\leq \frac{\delta^\Delta(t)}{\delta(t)} w(t) \\ &\quad + \delta^\sigma(t) \left(-\frac{p(t)\alpha(\tau(t))}{\delta(t)r(t)} w(t) \right. \\ &\quad \left. - Lq(t)\alpha(\tau(t)) \right. \\ &\quad \left. - \frac{\alpha(\tau(t))\tau^\Delta(t)}{K_2\delta^2(t)r(\tau(t))} w^2(t) \right). \end{aligned} \quad (42)$$

Hence,

$$\begin{aligned} w^\Delta(t) &\leq -Lq(t)\delta^\sigma(t)\alpha(\tau(t)) \\ &\quad + \left(\frac{\delta^\Delta(t)}{\delta(t)} - \frac{p(t)\delta^\sigma(t)\alpha(\tau(t))}{\delta(t)r(t)} \right) w(t) \\ &\quad - \frac{\delta^\sigma(t)\alpha(\tau(t))\tau^\Delta(t)}{K_2\delta^2(t)r(\tau(t))} w^2(t) \\ &= -Lq(t)\delta^\sigma(t)\alpha(\tau(t)) \\ &\quad + G(t)\frac{w(t)}{\delta(t)} - Q(t)\frac{w^2(t)}{\delta^2(t)}, \end{aligned} \quad (43)$$

where $G(t) = \delta^\Delta(t) - p(t)\delta^\sigma(t)\alpha(\tau(t))/r(t)$ and $Q(t) = \delta^\sigma(t)\alpha(\tau(t))\tau^\Delta(t)/K_2r(\tau(t))$.

Therefore,

$$\begin{aligned} w^\Delta(t) &\leq -Lq(t)\delta^\sigma(t)\alpha(\tau(t)) \\ &\quad - \left(\frac{\sqrt{Q(t)}}{\delta(t)} w(t) - \frac{G(t)}{2\sqrt{Q(t)}} \right)^2 + \frac{G^2(t)}{4Q(t)} \\ &\leq -Lq(t)\delta^\sigma(t)\alpha(\tau(t)) + \frac{G^2(t)}{4Q(t)}. \end{aligned} \quad (44)$$

Hence,

$$\begin{aligned} w^\Delta(t) &\leq -Lq(t)\delta^\sigma(t)\alpha(\tau(t)) \\ &\quad + \frac{K_2(\delta^\Delta(t) - (p(t)/r(t))\delta^\sigma(t)\alpha(\tau(t)))^2 r(\tau(t))}{4\delta^\sigma(t)\alpha(\tau(t))\tau^\Delta(t)}. \end{aligned} \quad (45)$$

Integrating the above inequality from t_0 to t , we obtain

$$\begin{aligned} &\int_{t_0}^t \left[\alpha(\tau(s))q(s) - \frac{\eta r(\tau(s))}{4\alpha(\tau(s))\tau^\Delta(s)} \right. \\ &\quad \left. \times \left(\frac{\delta^\Delta(s)}{\delta^\sigma(s)} - \frac{p(s)}{r(s)}\alpha(\tau(s)) \right)^2 \right] \delta^\sigma(s) \Delta s \\ &\leq \frac{1}{L} (w(t_0) - w(t)) \leq \frac{1}{L} w(t_0), \end{aligned} \quad (46)$$

and taking the limit supremum as $t \rightarrow \infty$, we obtain a contradiction to condition (36). Therefore, every solution of (1) is oscillatory on $[t_0, \infty)_{\mathbb{T}}$. $\square$

Theorem 5. Assume that (H_1) – (H_5) and (2) hold. Let H be an rd-continuous function defined as follows:

$$H : D_{\mathbb{T}} \equiv \{(t, s) : t \geq s \geq t_0, t, s \in [t_0, \infty)_{\mathbb{T}}\} \rightarrow \mathbb{R}, \quad (47)$$

such that

$$\begin{aligned} H(t, t) &= 0, \quad \text{for } t \geq t_0, \\ H(t, s) &> 0, \quad \text{for } t > s \geq t_0, \end{aligned} \quad (48)$$

$$t, s \in [t_0, \infty)_{\mathbb{T}},$$

and H has a nonpositive continuous Δ -partial derivative $H^{\Delta_s}(t, s)$. If there exists a positive Δ -differentiable function $\delta(t)$ such that

$$\begin{aligned} &\limsup_{t \rightarrow \infty} \frac{1}{H(t, t_0)} \\ &\quad \times \int_{t_0}^t H(t, s) \left[\alpha(\tau(s))q(s) - \frac{\eta r(\tau(s))}{4\alpha(\tau(s))\tau^\Delta(s)} \right. \\ &\quad \left. \times \left(\frac{\delta^\Delta(s)}{\delta^\sigma(s)} - \frac{p(s)}{r(s)}\alpha(\tau(s)) \right)^2 \right] \\ &\quad \times \delta^\sigma(s) \Delta s = \infty, \end{aligned} \quad (49)$$

then every solution of (1) is oscillatory on $[t_0, \infty)_{\mathbb{T}}$.

Proof. Assume that (1) has a nonoscillatory solution $x(t)$ on $[t_0, \infty)_{\mathbb{T}}$. Also, assume that $x(t) > 0$, $x(\tau(t)) > 0$, for all $t \in [t_1, \infty)_{\mathbb{T}}$, $t_1 \in [t_0, \infty)_{\mathbb{T}}$. We proceed as in the proof of Theorem 4 to get (45)

$$\begin{aligned} &Lq(t)\delta^\sigma(t)\alpha(\tau(t)) \\ &\quad - \frac{K_2(\delta^\Delta(t) - (p(t)/r(t))\delta^\sigma(t)\alpha(\tau(t)))^2 r(\tau(t))}{4\delta^\sigma(t)\alpha(\tau(t))\tau^\Delta(t)} \\ &\leq -w^\Delta(t). \end{aligned} \quad (50)$$

Multiplying the above inequality by $H(t, s)$, integrating from t_0 to t and using (48), we get

$$\begin{aligned} &\int_{t_0}^t H(t, s) \left[L\alpha(\tau(s))q(s)\delta^\sigma(s) \right. \\ &\quad \left. - \frac{K_2r(\tau(s))}{4\delta^\sigma(s)\alpha(\tau(s))\tau^\Delta(s)} \right. \\ &\quad \left. \times \left(\delta^\Delta(s) - \frac{p(s)}{r(s)}\delta^\sigma(s)\alpha(\tau(s)) \right)^2 \right] \Delta s \\ &\leq - \int_{t_0}^t H(t, s) w^\Delta(s) \Delta s \end{aligned}$$

$$\begin{aligned}
&= -H(t, s) w(s) \Big|_{t_0}^t + \int_{t_0}^t H^{\Delta_s}(t, s) w(\sigma(s)) \Delta s \\
&\leq H(t, t_0) w(t_0).
\end{aligned} \tag{51}$$

Thus,

$$\begin{aligned}
&\frac{1}{H(t, t_0)} \int_{t_0}^t H(t, s) \left[\alpha(\tau(s)) q(s) \right. \\
&\quad \left. - \frac{\eta r(\tau(s))}{4\alpha(\tau(s)) \tau^{\Delta}(s)} \right. \\
&\quad \left. \times \left(\frac{\delta^{\Delta}(s)}{\delta^{\sigma}(s)} - \frac{p(s)}{r(s)} \alpha(\tau(s)) \right)^2 \right] \Delta s \\
&\quad \times \delta^{\sigma}(s) \Delta s \\
&\leq \frac{1}{L} w(t_0) < \infty,
\end{aligned} \tag{52}$$

which is a contradiction to (49). This completes the proof. $\square$

Now, If $H(t, s)$ is a function defined by

$$\begin{aligned}
H(t, s) &= (t - s)^m, \\
m &\geq 1, \quad t \geq s \geq t_0, \quad t, s \in [t_0, \infty)_{\mathbb{T}},
\end{aligned} \tag{53}$$

then, we have the following result.

Corollary 6. Assume that (H_1) – (H_5) and (2) hold. If there exists a positive Δ -differentiable function $\delta(t)$ and $m \geq 1$ such that

$$\begin{aligned}
&\limsup_{t \rightarrow \infty} \frac{1}{t^m} \int_{t_0}^t (t - s)^m \\
&\quad \times \left[\alpha(\tau(s)) q(s) - \frac{\eta r(\tau(s))}{4\alpha(\tau(s)) \tau^{\Delta}(s)} \right. \\
&\quad \left. \times \left(\frac{\delta^{\Delta}(s)}{\delta^{\sigma}(s)} - \frac{p(s)}{r(s)} \alpha(\tau(s)) \right)^2 \right] \\
&\quad \times \delta^{\sigma}(s) \Delta s = \infty,
\end{aligned} \tag{54}$$

then every solution of (1) is oscillatory on $[t_0, \infty)_{\mathbb{T}}$.

Theorem 7. Assume that (H_1) – (H_5) and (2) hold. Let H be an rd-continuous function defined as

$$H : D_{\mathbb{T}} \equiv \{(t, s) : t \geq s \geq t_0, t, s \in [t_0, \infty)_{\mathbb{T}}\} \longrightarrow \mathbb{R}, \tag{55}$$

such that

$$\begin{aligned}
H(t, t) &= 0, \quad \text{for } t \geq t_0, \\
H(t, s) &> 0, \quad \text{for } t > s \geq t_0, \\
t, s &\in [t_0, \infty)_{\mathbb{T}},
\end{aligned} \tag{56}$$

and H has a nonpositive continuous Δ -partial derivative $H^{\Delta_s}(t, s)$. Let $h : D_{\mathbb{T}} \rightarrow \mathbb{R}$ be an rd-continuous function satisfying

$$-H^{\Delta_s}(t, s) = h(t, s) \sqrt{H(t, s)}, \quad \forall (t, s) \in D_{\mathbb{T}}. \tag{57}$$

If there exists a positive nondecreasing Δ -differentiable function $\delta(t)$ such that

$$\begin{aligned}
&\limsup_{t \rightarrow \infty} \frac{1}{H(t, t_0)} \\
&\quad \times \int_{t_0}^t \left[H(t, s) q(s) \alpha(\tau(s)) - \frac{\eta r(\tau(s))}{4\alpha(\tau(s)) \tau^{\Delta}(s)} \right. \\
&\quad \times \left(\frac{G(s)}{\delta^{\sigma}(s)} \sqrt{H(t, s)} \right. \\
&\quad \left. \left. + \frac{\delta(s)}{\delta^{\sigma}(s)} h_{-}(t, s) \right)^2 \right] \\
&\quad \times \delta^{\sigma}(s) \Delta s = \infty,
\end{aligned} \tag{58}$$

where $G(t) = \delta^{\Delta}(t) - p(t)\delta^{\sigma}(t)\alpha(\tau(t))/r(t)$, then every solution of (1) is oscillatory on $[t_0, \infty)_{\mathbb{T}}$.

Proof. Assume that (1) has a nonoscillatory solution $x(t)$ on $[t_0, \infty)_{\mathbb{T}}$. Also, assume that $x(t) > 0$, $x(\tau(t)) > 0$, for all $t \in [t_1, \infty)_{\mathbb{T}}$, $t_1 \in [t_0, \infty)_{\mathbb{T}}$ and there is $T \in [t_0, \infty)_{\mathbb{T}}$ such that $x(t)$ satisfies the conclusion of Lemma 3 on $[T, \infty)_{\mathbb{T}}$. Proceeding as in the proof of Theorem 4, we get (43) which has the form

$$w^{\Delta}(t) \leq -Lq(t)\delta^{\sigma}(t)\alpha(\tau(t)) + G(t)\frac{w(t)}{\delta(t)} - Q(t)\frac{w^2(t)}{\delta^2(t)}, \tag{59}$$

where $G(t) = \delta^{\Delta}(t) - p(t)\delta^{\sigma}(t)\alpha(\tau(t))/r(t)$ and $Q(t) = \delta^{\sigma}(t)\alpha(\tau(t))\tau^{\Delta}(t)/K_2r(\tau(t))$.

Multiplying the above inequality by $H(t, s)$, integrating from t_0 to t , and using (56) and (57), we get

$$\begin{aligned}
&\int_{t_0}^t LH(t, s) q(s) \delta^{\sigma}(s) \alpha(\tau(s)) \Delta s \\
&\leq H(t, t_0) w(t_0) \\
&\quad + \int_{t_0}^t H^{\Delta_s}(t, s) w(\sigma(s)) \Delta s \\
&\quad + \int_{t_0}^t H(t, s) G(s) \frac{w(s)}{\delta(s)} \Delta s \\
&\quad - \int_{t_0}^t H(t, s) Q(s) \frac{w^2(s)}{\delta^2(s)} \Delta s \\
&= H(t, t_0) w(t_0)
\end{aligned}$$

$$\begin{aligned}
& - \int_{t_0}^t h(t, s) \sqrt{H(t, s)} w(\sigma(s)) \Delta s \\
& + \int_{t_0}^t H(t, s) G(s) \frac{w(s)}{\delta(s)} \Delta s \\
& - \int_{t_0}^t H(t, s) Q(s) \frac{w^2(s)}{\delta^2(s)} \Delta s.
\end{aligned}$$

(60)

Using (H_5) and Lemma 3, we get

$$\begin{aligned}
\frac{1}{x(\tau(t))} & \geq \frac{1}{x(\tau(\sigma(t)))}, \\
r(t) g(x(t), x^\Delta(t)) & \geq (r(t) g(x(t), x^\Delta(t)))^\sigma.
\end{aligned}
\tag{61}$$

Therefore,

$$\begin{aligned}
& \int_{t_0}^t LH(t, s) q(s) \delta^\sigma(s) \alpha(\tau(s)) \Delta s \\
& \leq H(t, t_0) w(t_0) \\
& + \int_{t_0}^t \frac{G(s) H(t, s) + \delta(s) h_-(t, s) \sqrt{H(t, s)}}{\delta(s)} w(s) \Delta s \\
& - \int_{t_0}^t H(t, s) Q(s) \frac{w^2(s)}{\delta^2(s)} \Delta s \\
& = H(t, t_0) w(t_0) \\
& + \int_{t_0}^t \frac{G(s) \sqrt{H(t, s)} + \delta(s) h_-(t, s)}{\delta(s)} \sqrt{H(t, s)} w(s) \Delta s \\
& - \int_{t_0}^t H(t, s) Q(s) \frac{w^2(s)}{\delta^2(s)} \Delta s \\
& = H(t, t_0) w(t_0) \\
& - \int_{t_0}^t \left[\frac{\sqrt{H(t, s)}}{\delta(s)} \sqrt{Q(s)} w(s) - \frac{1}{2\sqrt{Q(s)}} \right. \\
& \quad \times \left(G(s) \sqrt{H(t, s)} \right. \\
& \quad \left. \left. + \delta(s) h_-(t, s) \right) \right]^2 \Delta s \\
& + \int_{t_0}^t \frac{1}{4Q(s)} \\
& \quad \times \left[G(s) \sqrt{H(t, s)} - \delta(s) h_-(t, s) \right]^2 \Delta s \\
& < H(t, t_0) w(t_0)
\end{aligned}$$

$$\begin{aligned}
& + \int_{t_0}^t \frac{K_2 r(\tau(s))}{4\delta^\sigma(s) \alpha(\tau(s)) \tau^\Delta(s)} \\
& \quad \times \left[G(s) \sqrt{H(t, s)} + \delta(s) h_-(t, s) \right]^2 \Delta s.
\end{aligned}
\tag{62}$$

Thus

$$\begin{aligned}
& \frac{1}{H(t, t_0)} \int_{t_0}^t \left[H(t, s) q(s) \delta^\sigma(s) \alpha(\tau(s)) \right. \\
& \quad \left. - \frac{\eta r(\tau(s))}{4\delta^\sigma(s) \alpha(\tau(s)) \tau^\Delta(s)} \right. \\
& \quad \left. \times \left[G(s) \sqrt{H(t, s)} + \delta(s) h_-(t, s) \right]^2 \right] \Delta s \\
& < \frac{1}{L} w(t_0) < \infty,
\end{aligned}
\tag{63}$$

which is a contradiction to (58). This completes the proof. $\square$

Theorem 8. Assume that (H_1) – (H_5) and (3) hold. If there exists a positive Δ -differentiable function $\delta(t)$ such that (36) holds and

$$\int_{t_0}^\infty \left[\frac{1}{r(t)} \int_{t_0}^t q(s) e_{-p/r}(t, \sigma(s)) \Delta s \right] \Delta t = \infty, \tag{64}$$

then every solution of (1) is either oscillatory or converges to zero on $[t_0, \infty)_{\mathbb{T}}$.

Proof. Assume that (1) has a nonoscillatory solution $x(t)$ such that $x(t) > 0$, $x(\tau(t)) > 0$ for all $t \in [t_1, \infty)_{\mathbb{T}}$, $t_1 \in [t_0, \infty)_{\mathbb{T}}$. As in the proof of Lemma 3, we see that there exist two possible cases for the sign of $x^\Delta(t)$. When $x^\Delta(t)$ is eventually positive, the proof is similar to the proof of Theorem 4. Next, suppose that $x^\Delta(t) < 0$ for $t \in [t_1, \infty)_{\mathbb{T}}$. Then, $x(t)$ is decreasing and $\lim_{t \rightarrow \infty} x(t) = b \geq 0$. Thus,

$$x(\tau(t)) > x(t) > x(\sigma(t)) \geq b \geq 0, \quad \forall t \in [t_1, \infty)_{\mathbb{T}}. \tag{65}$$

Hence, by (H_3) , we get

$$f(x(\tau(t))) \geq Lx(\tau(t)) \geq Lb, \quad \forall t \in [t_1, \infty)_{\mathbb{T}}. \tag{66}$$

Defining the function $u(t) = r(t)g(x(t), x^\Delta(t))$, using (1) and (66), we get

$$\begin{aligned}
u^\Delta(t) & = -\frac{p(t)}{r(t)} u(t) - q(t) f(x(\tau(t))) \\
& \leq -\frac{p(t)}{r(t)} u(t) - Lbq(t), \quad \text{for } t \in [t_1, \infty)_{\mathbb{T}}.
\end{aligned}
\tag{67}$$

The inequality (67) is the assumed inequality of [18, Theorem 6.1]. All other assumptions of [18, Theorem 6.1]; for example, $-p/r \in \mathcal{R}$, are satisfied. Hence, the conclusion of [18, Theorem 6.1] holds; that is,

$$\begin{aligned}
u(t) & \leq u(t_1) e_{-p/r}(t, t_1) - Lb \int_{t_1}^t q(s) e_{-p/r}(t, \sigma(s)) \Delta s \\
& < -Lb \int_{t_1}^t q(s) e_{-p/r}(t, \sigma(s)) \Delta s,
\end{aligned}
\tag{68}$$

for all $t \in [t_1, \infty)_{\mathbb{T}}$, and thus, for all $\xi \in [t_1, \infty)_{\mathbb{T}}$,

$$\begin{aligned} & \int_{t_1}^{\xi} x^{\Delta}(t) \Delta t \\ & < -\frac{Lb}{K_1} \int_{t_1}^{\xi} \left(\frac{1}{r(t)} \int_{t_1}^t q(s) e_{-p/r}(t, \sigma(s)) \Delta s \right) \Delta t, \quad (69) \\ & K_1 > 0. \end{aligned}$$

Assuming $b > 0$ and using (64) in (69) yield $\lim_{r \rightarrow \infty} x(r) = -\infty$, which is a contradiction to the fact that $x(t) > 0$ for $t \in [t_1, \infty)_{\mathbb{T}}$. Thus, $b = 0$ and then $\lim_{t \rightarrow \infty} x(t) = 0$. This completes the proof. $\square$

Remark 9. Our results in this paper not only extend and improve some known results and show that some results of [2, 8–10, 12, 14] are special examples of our results but also unify the study of oscillation of second-order nonlinear delay differential equation with damping and second-order nonlinear delay difference equation with damping.

5. Examples

Example 1. Consider the second-order delay 2-difference equation with damping

$$\begin{aligned} & \left(t^{2/3} \frac{x^2(t)(x^{\Delta}(t))^3}{2 + x^2(t)(x^{\Delta}(t))^2} \right)^{\Delta} + \frac{1}{t^2} \left(\frac{x^2(t)(x^{\Delta}(t))^3}{2 + x^2(t)(x^{\Delta}(t))^2} \right) \\ & + \frac{1}{t^{4/3}} x\left(\frac{t}{2}\right) = 0, \quad t \in \overline{2^{\mathbb{Z}}}, \quad t \geq t_0 := 2. \end{aligned} \quad (70)$$

Here,

$$\begin{aligned} r(t) &= t^{2/3}, \quad p(t) = \frac{1}{t^2}, \quad q(t) = \frac{1}{t^{4/3}}, \\ g(x, x^{\Delta}) &= \frac{x^2(t)(x^{\Delta}(t))^3}{2 + x^2(t)(x^{\Delta}(t))^2}, \quad f(x) = x, \quad (71) \\ \tau(t) &= \frac{t}{2}. \end{aligned}$$

The conditions (H_1) , (H_5) are clearly satisfied, (H_3) and (H_4) hold with $L = K_2 = 1$, $K_1 = 1/2$, and (H_2) is satisfied as

$$1 - \mu(t) \frac{p(t)}{r(t)} = 1 - t \frac{1}{t^{8/3}} = 1 - \frac{1}{t^{5/3}} > 0, \quad \text{for } t \geq 2. \quad (72)$$

By Lemma 2, we get

$$\begin{aligned} e_{-p/r}(t, 2) &\geq 1 - \int_2^t \frac{p(s)}{r(s)} \Delta s \\ &= 1 - \int_2^t s^{-8/3} \Delta s = 1 - \frac{t^{-5/3} - 2^{-5/3}}{2^{-5/3} - 1} \\ &= \frac{t^{-5/3} + 1 - 2^{-2/3}}{1 - 2^{-5/3}} \geq t^{-5/3} + 1 - 2^{-2/3} \\ &> 1 - 2^{-2/3} > \frac{1}{3}, \end{aligned} \quad (73)$$

for $t \geq 2$, so that

$$\begin{aligned} & \int_2^t \left[\frac{1}{r(s)} e_{-p/r}(s, 2) \right] \Delta s \\ &= \int_2^t s^{-2/3} e_{-p/r}(s, 2) \Delta s \geq \frac{1}{3} \int_2^t s^{-2/3} \Delta s \\ &= \frac{1}{3} \frac{t^{1/3} - 2^{1/3}}{2^{1/3} - 1} \longrightarrow \infty, \quad \text{as } t \longrightarrow \infty. \end{aligned} \quad (74)$$

Hence, (2) is satisfied. Then,

$$\begin{aligned} R(t) &= kr(t) \int_2^t \frac{\Delta s}{r(s)} \\ &= \frac{t^{2/3}}{2} \int_2^t \frac{\Delta s}{s^{2/3}} \geq \frac{1}{2} (t - 2), \quad \text{for } k = \frac{1}{2}. \end{aligned} \quad (75)$$

Therefore,

$$\alpha(t) = \frac{R(t)}{R(t) + \mu(t)} = \frac{R(t)}{R(t) + t} > \frac{t - 2}{3t - 2}, \quad (76)$$

and then we can find $0 \leq \lambda < 1$ such that

$$\alpha(t) > \frac{\lambda}{3}. \quad (77)$$

If $\delta(t) = 1$, then

$$\begin{aligned} & \int_2^t \left[\alpha(\tau(s)) q(s) \right. \\ & \quad \left. - \frac{\eta r(\tau(s))}{4\alpha(\tau(s)) \tau^{\Delta}(s)} \right. \\ & \quad \left. \times \left(\frac{\delta^{\Delta}(s)}{\delta^{\sigma}(s)} - \frac{p(s)}{r(s)} \alpha(\tau(s)) \right)^2 \right] \delta^{\sigma}(s) \Delta s \\ & > \frac{\lambda}{3} \left[\int_2^t s^{-4/3} \Delta s - \frac{1}{2^{5/3}} \int_2^t s^{-14/3} \Delta s \right] \\ &= \frac{\lambda}{3} \left[\frac{t^{-1/3} - 2^{-1/3}}{2^{-1/3} - 1} - \frac{1}{2^{5/3}} \frac{t^{-11/3} - 2^{-11/3}}{2^{-11/3} - 1} \right] \longrightarrow \infty \\ & \quad \text{as } t \longrightarrow \infty. \end{aligned} \quad (78)$$

Hence, according to Theorem 4, every solution of (70) is oscillatory on $[t_0, \infty)_{\mathbb{T}}$.

Example 2. Consider the second-order nonlinear delay dynamic equation with damping

$$\begin{aligned} & \left(\frac{\sin^2(x(t))}{1 + x^2(t)} x^{\Delta}(t) \right)^{\Delta} + \frac{\beta}{t\sigma(t)} \left(\frac{\sin^2(x(t))}{1 + x^2(t)} x^{\Delta}(t) \right)^{\Delta} \\ & + \frac{\lambda}{t\alpha(t)} x(t) (x^2(t) + 1) = 0, \quad \text{for } t \in [t_0, \infty)_{\mathbb{T}}, \quad t_0 \geq 0, \end{aligned} \quad (79)$$

where $\lambda > 0$ and $0 < \beta < t_0 \leq t$.

Here,

$$\begin{aligned} r(t) &= 1, & p(t) &= \frac{\beta}{t\sigma(t)}, & q(t) &= \frac{\lambda}{t\alpha(t)}, \\ g(x, x^\Delta) &= \frac{\sin^2(x(t))}{1+x^2(t)} x^\Delta(t), & f(x) &= x(x^2+1), \\ \tau(t) &= t. \end{aligned} \quad (80)$$

The conditions (H_1) , (H_5) are clearly satisfied, (H_3) and (H_4) hold with $L = K_2 = 1$, and (H_2) is satisfied as

$$1 - \mu(t) \frac{p(t)}{r(t)} = 1 - \frac{\beta\mu(t)}{t\sigma(t)} > 0, \quad \text{for } 0 < \beta < t_0 \leq t. \quad (81)$$

By Lemma 2, we get

$$\begin{aligned} & \int_{t_0}^{\infty} \left[\frac{1}{r(t)} e_{-p/r}(t, 2) \right] \Delta t \\ & \geq \int_{t_0}^{\infty} \left[1 - \int_{t_0}^t \frac{p(s)}{r(s)} \Delta s \right] \Delta t \\ & = \int_{t_0}^{\infty} \left[1 - \beta \int_{t_0}^t \left(\frac{-1}{s} \right)^\Delta \Delta s \right] \Delta t \\ & = \int_{t_0}^{\infty} \left[1 - \beta \left(\frac{-1}{t} + \frac{1}{t_0} \right) \right] \Delta t \\ & = \int_{t_0}^{\infty} \left[\left(1 - \frac{\beta}{t_0} \right) + \frac{\beta}{t} \right] \Delta t. \end{aligned} \quad (82)$$

Hence,

$$\begin{aligned} & \int_{t_0}^{\infty} \left[\frac{1}{r(t)} e_{-p/r}(t, 2) \right] \Delta t \\ & \geq \left(1 - \frac{\beta}{t_0} \right) \int_{t_0}^{\infty} \Delta t + \beta \int_{t_0}^{\infty} \frac{1}{t} \Delta t = \infty. \end{aligned} \quad (83)$$

Therefore, (2) is satisfied. Then,

$$\begin{aligned} \alpha(t) &= \frac{R(t)}{R(t) + \mu(t)} = \frac{R(t)}{R(t) + \sigma(t) - t} \\ &\leq \frac{R(t)}{R(t) + t - t} \leq 1, \quad \frac{1}{\sigma(t)} \leq \frac{1}{t}, \quad \text{for } \sigma(t) \geq t. \end{aligned} \quad (84)$$

If $H(t, s) = t$ and $\delta(t) = 1$, then $h(t, s) = 0$, $G(t) = -\beta\alpha(\tau(t))/t\sigma(t)$ and

$$\begin{aligned} & \limsup_{t \rightarrow \infty} \frac{1}{H(t, t_0)} \\ & \times \int_{t_0}^t \left[H(t, s) q(s) \alpha(\tau(s)) \right. \\ & \quad \left. - \frac{\eta r(\tau(s))}{4\alpha(\tau(s)) \tau^\Delta(s)} \right] \Delta s \end{aligned}$$

$$\begin{aligned} & \times \left(\frac{G(s)}{\delta^\sigma(s)} \sqrt{H(t, s)} + \frac{\delta(s)}{\delta^\sigma(s)} h_-(t, s) \right)^2 \Big] \\ & \times \delta^\sigma(s) \Delta s \\ & = \limsup_{t \rightarrow \infty} \frac{1}{t} \int_{t_0}^t \frac{1}{s} \left(\lambda t - \frac{\beta^2 \alpha(s)}{4s\sigma^2(s)} t \right) \Delta s \\ & \geq \limsup_{t \rightarrow \infty} \frac{1}{t} \int_{t_0}^t \frac{1}{s} \left(\lambda t - \frac{\beta^2}{4s^3} t \right) \Delta s \\ & = \limsup_{t \rightarrow \infty} \int_{t_0}^t \frac{1}{s} \left(\lambda - \frac{\beta^2}{4s^3} \right) \Delta s = \infty, \quad \text{for } \lambda > 0. \end{aligned} \quad (85)$$

Hence, according to Theorem 7, every solution of (79) is oscillatory on $[t_0, \infty)_{\mathbb{T}}$.

Remark 10. The results of [10] cannot be applied to equation (70) for $r(t) = t^{2/3}$ and $g(x, x^\Delta) = x^2(t)(x^\Delta(t))^3/(2 + x^2(t)(x^\Delta(t))^2)$. Also, the results of [16] cannot be applied to (79) for $g(x, x^\Delta) = (\sin^2(x(t))/(1 + x^2(t)))x^\Delta(t)$. But, according to our work, both (70) and (79) are oscillatory.

Conflict of Interests

The authors declare that there is no conflict of interests regarding the publication of this paper.
