We consider an initial-boundary value problem to a nonlinear string equations with linear damping term. It is proved that under suitable conditions the solution is global in time and the solution with a negative initial energy blows up in finite time.

1. Introduction

We study the damped nonlinear string equation with source term $|u|^\alpha u$:

$$u_{tt} + u_t = \left(\sigma(|u_x|^2) u_x \right)_x + |u|^\alpha u, \quad (1)$$

$$(x, t) \in (0, 1) \times [0, T],$$

where $1 < \alpha$, $\sigma(s)$ is a smooth function for $0 \leq s$ with the initial conditions

$$u(x, 0) = u_0(x), \quad u_t(x, 0) = u_1(x), \quad x \in [0, 1], \quad (2)$$

and boundary conditions

$$u(1, t) = 0, \quad t \in (0, T),$$

$$\sigma(|u_x(0, t)|^2) u_x(0, t) - u_t(0, t) = 2\phi(t), \quad t \in [0, T], \quad (3)$$

$$\sigma(|u_x(0, t)|^2) u_x(0, t) + u_t(0, t) = 2\psi(t), \quad t \in [0, T].$$

The problem (1)–(3) can be regarded as modelling a nonlinear string with vertical displacement function $u(x, t)$ in $\mathbb{R}$. And this problem has nonlinear mechanical damping of the form $|u|^\alpha u$. The right end of the string makes it steady. The input $\phi(t)$ function and the output $\psi(t)$ function are applied on the left.

Wu and Li [1] studied the motion for a nonlinear beam model with nonlinear damping $a|\phi_t|^{m-1}\phi_t$ and external

forcing $b|\phi|^{p-1}\phi$ terms. They showed that this model has a unique global solution and blow-up solution under the same conditions. Levine et al. [2] and Levine and Serrin [3] studied abstract version. Georgiev and Todorova [4] studied nonlinear wave equations involving the nonlinear damping term $|u_t|^{m-1}u_t$ and source term of type $|u_t|^{p-1}u_t$. They proved global existence theorem with large initial data for $1 < p \leq m$. Hao and Li [5] studied the global solutions for a nonlinear string with boundary input and output. Dinlemez [6] proved the global existence and uniqueness of weak solutions for the initial-boundary value problem for a nonlinear wave equation with strong structural damping and nonlinear source terms in $\mathbb{R}$. A lot of papers in connection with blow-up, global solutions and existence of weak solutions were studied in [7–15].

In this paper we first find energy equation for the problem (1)–(3). Then we prove the solutions of the problem (1)–(3) are global in time under some conditions on the function $\sigma(s)$, input $\phi(t)$, and the output $\psi(t)$. Finally we establish a blow-up result for solutions with a negative initial energy. Our approach is similar to the one in [5].

2. Main Results

Now we give the following lemma for energy equation for the problem (1)–(3).

Lemma 1. Let $1 < \alpha$ and $u(x, t)$ be a solution of the problem (1)–(3). Then the energy equation of the problem (1)–(3) is

$$E(t) = \frac{1}{2} \|u_t\|_2^2 - \frac{1}{\alpha+2} \|u\|_{\alpha+2}^{\alpha+2} + \frac{1}{2} \int_0^1 \int_0^{|u_x|^2} \sigma(\xi) d\xi dx, \quad (4)$$

$$\frac{d}{dt} E(t) = \phi^2(t) - \psi^2(t) - \|u_t\|_2^2. \quad (5)$$

Proof. Multiplying (1) with u_t and integrating over $(0, 1)$, then we get

$$\begin{aligned} \frac{d}{dt} \left\{ \frac{1}{2} \|u_t\|_2^2 - \frac{1}{\alpha+2} \|u\|_{\alpha+2}^{\alpha+2} \right\} \\ = \int_0^1 (\sigma(|u_x|^2) u_x)_x u_t dx - \|u_t\|_2^2. \end{aligned} \quad (6)$$

Applying integration by parts in the right hand side of (6), we find

$$\begin{aligned} \int_0^1 (\sigma(|u_x|^2) u_x)_x u_t dx &= -\sigma(|u_x(0, t)|^2) u_x(0, t) u_t(0, t) \\ &\quad - \frac{1}{2} \frac{d}{dt} \int_0^1 \int_0^{|u_x|^2} \sigma(\xi) d\xi dx. \end{aligned} \quad (7)$$

And using boundary conditions in equality (7), we obtain

$$\begin{aligned} \frac{d}{dt} \left\{ \frac{1}{2} \|u_t\|_2^2 - \frac{1}{\alpha+2} \|u\|_{\alpha+2}^{\alpha+2} + \frac{1}{2} \int_0^1 \int_0^{|u_x|^2} \sigma(\xi) d\xi dx \right\} \\ = \phi^2(t) - \psi^2(t) - \|u_t\|_2^2. \end{aligned} \quad (8)$$

Hence the proof is completed. $\square$

Next we give the following theorem for global solutions in time.

Theorem 2. Assume that $u(x, t)$ is a solution of the problem (1)–(3) with $1 < \alpha$ and

(i) $\sigma(s)$ satisfies the following condition:

$$|s|^\alpha \leq \sigma(s), \quad \text{for } s \in \mathbb{R}^+ \cup \{0\}, \quad (9)$$

(ii) the input and the output functions satisfy

$$\phi^2(t) \leq \psi^2(t). \quad (10)$$

Then the solution $u(x, t)$ is global in time.

Proof. Let

$$\begin{aligned} G(t) &:= E(t) + \frac{2}{\alpha+2} \|u\|_{\alpha+2}^{\alpha+2} \\ &= \frac{1}{2} \|u_t\|_2^2 + \frac{1}{2} \int_0^1 \int_0^{|u_x|^2} \sigma(\xi) d\xi dx + \frac{1}{\alpha+2} \|u\|_{\alpha+2}^{\alpha+2}. \end{aligned} \quad (11)$$

Differentiating $G(t)$ with respect to t and using (5), we get

$$\frac{d}{dt} G(t) = \phi^2(t) - \psi^2(t) - \|u_t\|_2^2 + 2 \int_0^1 |u|^\alpha u u_t dx. \quad (12)$$

Using the Cauchy-Schwarz inequality in the last term of (12), we obtain

$$\begin{aligned} 2 \int_0^1 |u|^\alpha u u_t dx &\leq 2 \int_0^1 |u|^{\alpha+1} |u_t| dx \\ &\leq \|u\|_{2(\alpha+1)}^{2(\alpha+1)} + \|u_t\|_2^2, \end{aligned} \quad (13)$$

and it follows from (12), (13), and (10) that we have

$$\frac{d}{dt} G(t) \leq \|u\|_{2(\alpha+1)}^{2(\alpha+1)} + \|u_t\|_2^2. \quad (14)$$

By assumption (9) and integrating over $(0, |u_x|^2)$ and $(0, 1)$, respectively, we yield

$$\frac{1}{\alpha+1} \|u_x\|_{2(\alpha+1)}^{2(\alpha+1)} \leq \int_0^1 \int_0^{|u_x|^2} \sigma(\xi) d\xi dx. \quad (15)$$

Furthermore, we have

$$\begin{aligned} |u(x, t)|^{2(\alpha+1)} &= \left| \int_x^1 u_\xi(\xi, t) d\xi \right|^{2(\alpha+1)} \\ &\leq \int_x^1 |u_\xi(\xi, t)|^{2(\alpha+1)} d\xi \\ &\leq \int_0^1 |u_x(x, t)|^{2(\alpha+1)} dx = \|u_x(x, t)\|_{2(\alpha+1)}^{2(\alpha+1)}, \end{aligned} \quad (16)$$

and then

$$\|u(x, t)\|_{2(\alpha+1)}^{2(\alpha+1)} \leq \|u_x(x, t)\|_{2(\alpha+1)}^{2(\alpha+1)}. \quad (17)$$

Combining (11), (14), (15), and (17), we get

$$\frac{dG(t)}{dt} \leq \frac{1}{\xi_1} G(t), \quad (18)$$

where $\xi_1 = \min\{1/2, 1/(\alpha+1)\}$. Using Gronwall's inequality, we have

$$G(t) \leq G(0) e^{(1/\xi_1)t}. \quad (19)$$

Therefore together with the continuation principle and the definition of $G(t)$ we complete the proof of Theorem 2. $\square$

Then we give the following theorem for the blow-up solutions of the problem (1)–(3).

Theorem 3. Let $u(x, t)$ be a solution of the problem (1)–(3) with $1 < \alpha$. Assume that

(i) there exists $1 < \varepsilon < (\alpha+2)/2$ such that the function $\sigma(s)$ satisfies

$$\sigma(s) s \leq \frac{\varepsilon}{2} \int_0^s \sigma(\zeta) d\zeta \quad \text{for } s \in \mathbb{R}^+ \cup \{0\}, \quad (20)$$

(ii) the initial values satisfy

$$E(0) \leq 0, \quad 0 < \int_0^1 u_0(x) u_1(x) dx, \quad (21)$$

(iii) the input and output functions satisfy

$$\begin{aligned} \phi^2(t) &\leq \psi^2(t), \\ (\psi(t) + \phi(t)) \left(\int_0^t (\psi(s) - \phi(s)) ds + u_0(0) \right) &\leq 0, \end{aligned} \quad (22)$$

(iv) $u(x, t)$ satisfies $1 \leq \|u\|$.

Then the solution $u(x, t)$ blows up in finite time $T_{\max}$, and

$$T_{\max} \leq \left(\frac{\alpha + 4}{\alpha \eta} \right) N^{-\alpha/(\alpha+4)}(0), \quad (23)$$

where η is some positive constant independent of the initial value α and $N(t)$ are given by (25).

Proof. We define

$$M(t) := -E(t), \quad \gamma := \frac{\alpha}{2(\alpha+2)}, \quad (24)$$

$$N(t) := M^{1-\gamma}(t) + \int_0^1 u(x, t) u_t(x, t) dx. \quad (25)$$

By virtue of (5), (21), (22), and (24), we get

$$\frac{dM(t)}{dt} = \|u_t\|_2^2 + \psi^2(t) - \phi^2(t) \geq 0, \quad (26)$$

$$0 \leq M(0) \leq M(t), \quad \text{for } 0 \leq t. \quad (27)$$

Taking a derivative of (25) and using (26), we have

$$\begin{aligned} \frac{dN(t)}{dt} &= (1-\gamma) M^{-\gamma}(t) M'(t) + \int_0^1 u_t^2 dx + \int_0^1 uu_{tt} dx \\ &= (1-\gamma) M^{-\gamma}(t) (\|u_t\|_2^2 + \psi^2(t) - \phi^2(t)) + \|u_t\|_2^2 \\ &\quad + \int_0^1 uu_{tt} dx. \end{aligned} \quad (28)$$

Multiplying (1) by u and integrating over the interval $[0, 1]$ and then using boundary conditions (3), we obtain

$$\begin{aligned} \int_0^1 uu_{tt} dx &= \|u\|_{\alpha+2}^{\alpha+2} - \int_0^1 uu_t dx - (\psi(t) + \phi(t)) \\ &\quad \times \left(\int_0^t (\psi(s) - \phi(s)) ds + u_0(0) \right) \\ &\quad - \int_0^1 \sigma(|u_x|^2) u_x^2 dx. \end{aligned} \quad (29)$$

From the definition of $M(t)$ we yield

$$\begin{aligned} 0 &= \varepsilon M(t) + \frac{\varepsilon}{2} \|u_t\|^2 + \frac{\varepsilon}{2} \int_0^1 \int_0^{|u_x|^2} \sigma(\xi) d\xi dx \\ &\quad - \frac{\varepsilon}{\alpha+2} \|u\|_{\alpha+2}^{\alpha+2}. \end{aligned} \quad (30)$$

Combining (29) and (30) in (28), we get

$$\begin{aligned} \frac{dN(t)}{dt} &= (1-\gamma) M^{-\gamma}(t) (\|u_t\|_2^2 + \psi^2(t) - \phi^2(t)) + \|u_t\|_2^2 \\ &\quad + \|u\|_{\alpha+2}^{\alpha+2} - \int_0^1 uu_t dx - (\psi(t) + \phi(t)) \\ &\quad \times \left(\int_0^t (\psi(s) - \phi(s)) ds + u_0(0) \right) \\ &\quad - \int_0^1 \sigma(|u_x|^2) u_x^2 dx + \varepsilon M(t) + \frac{\varepsilon}{2} \|u_t\|_2^2 \\ &\quad + \frac{\varepsilon}{2} \int_0^1 \int_0^{|u_x|^2} \sigma(\xi) d\xi dx \\ &\quad - \frac{\varepsilon}{\alpha+2} \|u\|_{\alpha+2}^{\alpha+2}. \end{aligned} \quad (31)$$

Using (22) in (31), we obtain

$$\begin{aligned} &\left(1 + \frac{\varepsilon}{2}\right) \|u_t\|_2^2 + \left(\frac{1}{2} - \frac{\varepsilon}{\alpha+2}\right) \|u\|_{\alpha+2}^{\alpha+2} + \frac{1}{2} \|u\|_{\alpha+2}^{\alpha+2} \\ &\quad + \int_0^1 \left(\frac{\varepsilon}{2} \int_0^{|u_x|^2} \sigma(\xi) d\xi - \sigma(|u_x|^2) u_x^2 \right) dx \\ &\quad + \varepsilon M(t) - \int_0^1 uu_t dx \leq \frac{dN(t)}{dt}. \end{aligned} \quad (32)$$

Thanks to Young's inequality,

$$AB \leq \frac{\delta^p}{p} A^p + \frac{\delta^{-q}}{q} B^q, \quad 0 \leq A, B \forall 0 < \delta, \quad \frac{1}{p} + \frac{1}{q} = 1, \quad (33)$$

for $\int_0^1 uu_t dx$ with $p = q = 2$ and $\gamma = 2$, and then we get

$$\int_0^1 uu_t dx \leq \int_0^1 |uu_t| dx \leq \|u_t\|^2 + \frac{1}{4} \|u\|^2. \quad (34)$$

From embedding for $L^p(0, 1)$ and using (iv), we have $\|u\|_2^2 \leq \|u\|_{\alpha+2}^{\alpha+2}$ and putting (34) in (32) we have

$$\begin{aligned} &\left(1 + \frac{\varepsilon}{2}\right) \|u_t\|_2^2 + \left(\frac{1}{2} - \frac{\varepsilon}{\alpha+2}\right) \|u\|_{\alpha+2}^{\alpha+2} + \frac{1}{2} \|u\|_2^2 \\ &\quad + \int_0^1 \left(\frac{\varepsilon}{2} \int_0^{|u_x|^2} \sigma(\xi) d\xi - \sigma(|u_x|^2) u_x^2 \right) dx + \varepsilon M(t) \\ &\quad - \|u_t\|_2^2 - \frac{1}{4} \|u\|_2^2 \leq \frac{dN(t)}{dt}. \end{aligned} \quad (35)$$

From (20), we get

$$\varepsilon M(t) + \frac{\varepsilon}{2} \|u_t\|_2^2 + \left(\frac{1}{2} - \frac{\varepsilon}{\alpha+2}\right) \|u\|_{\alpha+2}^{\alpha+2} + \frac{1}{4} \|u\|_2^2 \leq \frac{dN(t)}{dt}. \quad (36)$$

Choosing ε and $\kappa = \min\{\varepsilon/2, (1/2 - \varepsilon/(\alpha+2)), 1/4\}$, we obtain

$$\kappa \{M(t) + \|u_t\|_2^2 + \|u\|_{\alpha+2}^{\alpha+2} + \|u\|_2^2\} \leq \frac{dN(t)}{dt}. \quad (37)$$

Thanks to (21) and (27), we yield

$$0 < N(0) \leq N(t), \quad \forall 0 < t. \quad (38)$$

Now we estimate $[N(t)]^{1/(1-\gamma)}$. From Holder's inequality,

$$\left| \int_0^1 uu_t dx \right| \leq \|u\|_2 \|u_t\|_2 \leq \|u\|_{\alpha+2} \|u_t\|_2; \quad (39)$$

then using Young's inequality again we get

$$\begin{aligned} \left| \int_0^1 uu_t dx \right| &\leq \frac{\delta^{2(1-\gamma)}}{2(1-\gamma)} \|u_t\|_2^{2(1-\gamma)} \\ &\quad + \frac{1-2\gamma}{2(1-\gamma)} \delta^{-2(1-\gamma)/(1-2\gamma)} \|u\|_{\alpha+2}^{2(1-\gamma)/(1-2\gamma)}, \end{aligned} \quad (40)$$

where $0 < \delta$ and $1/p + 1/q = 1$ with $p = 2(1-\gamma)$. And so we have

$$\begin{aligned} \left| \int_0^1 uu_t dx \right|^{1/(1-\gamma)} &\leq 2^{1/(1-\gamma)} \left(\frac{\delta^2}{(2(1-\gamma))^{1/(1-\gamma)}} \|u_t\|_2^2 \right. \\ &\quad \left. + \left(\frac{1-2\gamma}{2(1-\gamma)} \right)^{1/(1-\gamma)} \delta^{-2/(1-2\gamma)} \|u\|_{\alpha+2}^{2/(1-2\gamma)} \right). \end{aligned} \quad (41)$$

Choosing $\beta = \max\{\delta^2/(1-\gamma)^{1/(1-\gamma)}, ((1-2\gamma)/(1-\gamma))^{1/(1-\gamma)} \delta^{-2/(1-2\gamma)}\}$, we obtain

$$\left| \int_0^1 uu_t dx \right|^{1/(1-\gamma)} \leq \beta (\|u_t\|_2^2 + \|u\|_{\alpha+2}^{\alpha+2}). \quad (42)$$

Therefore we yield

$$\begin{aligned} (N(t))^{1/(1-\gamma)} &= \left(M^{1-\gamma}(t) + \int_0^1 u(x, t) u_t(x, t) dx \right)^{1/(1-\gamma)} \\ &\leq 2^{1/(1-\gamma)} \left(M(t) + \left| \int_0^1 u(x, t) u_t(x, t) dx \right|^{1/(1-\gamma)} \right) \\ &\leq C \left(M(t) + \|u_t\|_2^2 + \|u\|_{\alpha+2}^{\alpha+2} + \|u\|_2^2 \right), \end{aligned} \quad (43)$$

where C depends on δ and α . From (37) and (43), we have

$$\eta(N(t))^{1/(1-\gamma)} \leq \frac{dN(t)}{dt}, \quad (44)$$

where $\eta = \kappa/C$. Integrating (44) over $(0, t)$, then we get

$$\frac{1}{(N(0))^{-\alpha/(\alpha+4)} - (\alpha/(\alpha+4))\eta t} \leq (N(t))^{\alpha/(\alpha+4)}. \quad (45)$$

Hence $N(t)$ blows up in finite time $T_{\max}$. $T_{\max}$ is given by the inequality as below:

$$T_{\max} \leq \frac{\alpha+4}{\alpha\eta} (N(0))^{-\alpha/(\alpha+4)}. \quad (46)$$

Consequently the solution blows up in finite time. And the proof of Theorem 3 is now finished. $\square$

Conflict of Interests

The authors declare that there is no conflict of interests regarding the publication of this paper.

Acknowledgment

The authors would like to thank the referees for the careful reading of this paper and for the valuable suggestions to improve the presentation and style of the paper.
