(Received 3 November 2000)

ABSTRACT. Let $p(z)$ be a polynomial of degree n having all its zeros in $|z| \leq k$; $k \leq 1$, then for each $r > 0$, $p > 1$, $q > 1$ with $p^{-1} + q^{-1} = 1$, Aziz and Ahemad (1996) recently proved that $n \left\{ \int_0^{2\pi} |p(e^{i\theta})|^r d\theta \right\}^{1/r} \leq \left\{ \int_0^{2\pi} |1 + ke^{i\theta}|^{pr} d\theta \right\}^{1/pr} \left\{ \int_0^{2\pi} |p'(e^{i\theta})|^{qr} d\theta \right\}^{1/qr}$. In this paper, we extend the above inequality to the class of polynomials $p(z) = a_n z^n + \sum_{v=\mu}^n a_{n-v} z^{n-v}$; $1 \leq \mu \leq n$ having all its zeros in $|z| \leq k$; $k \leq 1$ and obtain a generalization as well as a refinement of the above result.

2000 Mathematics Subject Classification. 30A10, 30C10, 30C15.

1. Introduction and statement of results. Let $p(z)$ be a polynomial of degree n and $p'(z)$ its derivative. If $p(z)$ has all its zeros in $|z| \leq 1$, then it was shown by Turan [7] that

$$\max_{|z|=1} |p'(z)| \geq \frac{n}{2} \max_{|z|=1} |p(z)|. \quad (1.1)$$

Inequality (1.1) is best possible with equality for $p(z) = \alpha z^n + \beta$, where $|\alpha| = |\beta|$. As an extension of (1.1) Malik [4] proved that if $p(z)$ has all its zeros in $|z| \leq k$, where $k \leq 1$, then

$$\max_{|z|=1} |p'(z)| \geq \frac{n}{1+k} \max_{|z|=1} |p(z)|. \quad (1.2)$$

Malik [5] obtained a generalization of (1.1) in the sense that the right-hand side of (1.1) is replaced by a factor involving the integral mean of $|p(z)|$ on $|z| = 1$. In fact he proved the following theorem.

THEOREM 1.1. *If $p(z)$ has all its zeros in $|z| \leq 1$, then for each $r > 0$*

$$n \left\{ \int_0^{2\pi} |p(e^{i\theta})|^r d\theta \right\}^{1/r} \leq \left\{ \int_0^{2\pi} |1 + e^{i\theta}|^r d\theta \right\}^{1/r} \max_{|z|=1} |p'(z)|. \quad (1.3)$$

The result is sharp and equality in (1.3) holds for $p(z) = (z+1)^n$.

If we let $r \rightarrow \infty$ in (1.3) we get (1.1). Aziz and Ahemad [1] generalized (1.3) in the sense that $\max_{|z|=1} |p'(z)|$ on $|z| = 1$ on the right-hand side of (1.3) is replaced by a factor involving the integral mean of $|p'(z)|$ on $|z| = 1$ and proved the following result.

THEOREM 1.2. *If $p(z)$ is a polynomial of degree n having all its zeros in $|z| \leq k \leq 1$, then for $r > 0$, $p > 1$, $q > 1$ with $1/p + 1/q = 1$,*

$$n \left\{ \int_0^{2\pi} |p(e^{i\theta})|^r d\theta \right\}^{1/r} \leq \left\{ \int_0^{2\pi} |1 + ke^{i\theta}|^{qr} d\theta \right\}^{1/qr} \left\{ \int_0^{2\pi} |p'(e^{i\theta})|^{pr} d\theta \right\}^{1/pr}. \quad (1.4)$$

If we let $r \rightarrow \infty$ and $p \rightarrow \infty$ (so that $q \rightarrow 1$) in (1.4) we get (1.2).

In this paper, we will first extend Theorem 1.2 to the class of polynomials $p(z) = a_n z^n + \sum_{v=\mu}^n a_{n-v} z^{n-v}$, $1 \leq \mu \leq n$, having all the zeros in $|z| \leq k$; $k \leq 1$, and thereby obtain a generalization of it. More precisely, we prove the following result.

THEOREM 1.3. *If $p(z) = a_n z^n + \sum_{v=\mu}^n a_{n-v} z^{n-v}$, $1 \leq \mu \leq n$ is a polynomial of degree n having all its zeros in $|z| \leq k$; $k \leq 1$, then for each $r > 0$, $p > 1$, $q > 1$ with $1/p + 1/q = 1$,*

$$n \left\{ \int_0^{2\pi} |p(e^{i\theta})|^r d\theta \right\}^{1/r} \leq \left\{ \int_0^{2\pi} |1 + k^\mu e^{i\theta}|^{pr} d\theta \right\}^{1/pr} \left\{ \int_0^{2\pi} |p'(e^{i\theta})|^{qr} d\theta \right\}^{1/qr}. \quad (1.5)$$

REMARK 1.4. If we let $r \rightarrow \infty$ and $q \rightarrow \infty$ (so that $p \rightarrow 1$) in (1.5) we get (1.2) for $\mu = 1$.

Our next result is an improvement of Theorem 1.3 which in turn gives a generalization as well as a refinement of Theorem 1.2.

THEOREM 1.5. *If $p(z) = a_n z^n + \sum_{v=\mu}^n a_{n-v} z^{n-v}$, $1 \leq \mu \leq n$, is a polynomial of degree n having all its zeros in $|z| \leq k$; $k \leq 1$ and $m = \min_{|z|=k} |p(z)|$, then for every real or complex number β with $|\beta| \leq 1$, $r > 0$, $p > 1$, $q > 1$ with $1/p + 1/q = 1$,*

$$\begin{aligned} n \left\{ \int_0^{2\pi} \left| p(e^{i\theta}) + \frac{\beta m e^{i(n-1)\theta}}{k^{n-\mu}} \right|^r d\theta \right\}^{1/r} \\ \leq \left\{ \int_0^{2\pi} |1 + k^\mu e^{i\theta}|^{pr} d\theta \right\}^{1/pr} \left\{ \int_0^{2\pi} |p'(e^{i\theta})|^{qr} d\theta \right\}^{1/qr}. \end{aligned} \quad (1.6)$$

REMARK 1.6. Letting $r \rightarrow \infty$ and $q \rightarrow \infty$ (so that $p \rightarrow 1$) in (1.6) and choosing the argument of β suitably with $|\beta| = 1$, it follows that, if $p(z) = a_n z^n + \sum_{v=\mu}^n a_{n-v} z^{n-v}$, $1 \leq \mu \leq n$, is a polynomial of degree n having all its zeros in $|z| \leq k$; $k \leq 1$, then

$$\max_{|z|=1} |p'(z)| \geq \frac{n}{1+k^\mu} \left\{ \max_{|z|=1} |p(z)| + \frac{1}{k^{n-\mu}} \min_{|z|=1} |p(z)| \right\}. \quad (1.7)$$

Inequality (1.7) was recently proved by Aziz and Shah [2].

2. Lemmas. For the proof of Theorem 1.5 we will make use of the following lemmas.

LEMMA 2.1 (see Aziz and Shah [2, Lemma 2]). *If $p(z) = a_n z^n + \sum_{v=\mu}^n a_{n-v} z^{n-v}$ is a polynomial of degree n having all its zeros in $|z| \leq k \leq 1$, then*

$$|q'(z)| \leq k^\mu |p'(z)| \quad \text{for } |z| = 1, 1 \leq \mu \leq n, \quad (2.1)$$

where here and throughout $q(z) = z^n \overline{p(1/\bar{z})}$.

LEMMA 2.2 (see Rather [6]). *If $p(z) = a_n z^n + \sum_{v=\mu}^n a_{n-v} z^{n-v}$, $1 \leq \mu \leq n$, is a polynomial of degree n having all its zeros in $|z| \leq k \leq 1$, and $m = \min_{|z|=k} |p(z)|$, then*

$$k^\mu |p'(z)| \geq |q'(z)| + \frac{mn}{k^{n-\mu}} \quad \text{for } |z| = 1. \quad (2.2)$$

3. Proof of theorems

PROOF OF THEOREM 1.3. Suppose that $p(z)$ has all its zeros in $|z| \leq k \leq 1$, therefore, by Lemma 2.1 we have

$$k^\mu |p'(z)| \geq |q'(z)| \quad \text{for } |z| = 1. \quad (3.1)$$

Also $q(z) = z^n \overline{p(1/\bar{z})}$ so that $p(z) = z^n \overline{q(1/\bar{z})}$, we have

$$p'(z) = n z^{n-1} \overline{q\left(\frac{1}{\bar{z}}\right)} - z^{n-2} \overline{q'\left(\frac{1}{\bar{z}}\right)}. \quad (3.2)$$

Equivalently,

$$z p'(z) = n z^n \overline{q\left(\frac{1}{\bar{z}}\right)} - z^{n-1} \overline{q'\left(\frac{1}{\bar{z}}\right)} \quad (3.3)$$

which implies

$$|p'(z)| = |nq(z) - zq'(z)| \quad \text{for } |z| = 1. \quad (3.4)$$

Using (3.1) in (3.4) we get

$$|q'(z)| \leq k^\mu |nq(z) - zq'(z)| \quad \text{for } |z| = 1; 1 \leq \mu \leq n. \quad (3.5)$$

Since $p(z)$ has all its zeros in $|z| \leq k \leq 1$, by the Gauss-Lucas theorem all the zeros of $p'(z)$ also lie in $|z| \leq 1$. This implies that the polynomial

$$z^{n-1} \overline{p'\left(\frac{1}{\bar{z}}\right)} = nq(z) - zq'(z) \quad (3.6)$$

has all its zeros in $|z| \geq 1/k \geq 1$.

Therefore, it follows from (3.5) that the function

$$w(z) = \frac{zq'(z)}{k^\mu (nq(z) - zq'(z))} \quad (3.7)$$

is analytic for $|z| \leq 1$ and $|w(z)| \leq 1$ for $|z| \leq 1$. Furthermore $w(0) = 0$. Thus the function $1 + k^\mu w(z)$ is subordinate to the function $1 + k^\mu z$ in $|z| \leq 1$. Hence by a well-known property of subordination [3] we have for $r > 0$ and for $0 \leq \theta < 2\pi$,

$$\int_0^{2\pi} |1 + k^\mu w(e^{i\theta})|^r d\theta \leq \int_0^{2\pi} |1 + k^\mu e^{i\theta}|^r d\theta. \quad (3.8)$$

Also from (3.7), we have

$$1 + k^\mu w(z) = \frac{nq(z)}{nq(z) - zq'(z)} \quad (3.9)$$

or

$$|nq(z)| = |1 + k^\mu w(z)| |nq(z) - zq'(z)|. \quad (3.10)$$

Using (3.4) and also $|p(z)| = |q(z)|$ in (3.10), we have

$$n|p(z)| = |1 + k^\mu w(z)| |p'(z)| \quad \text{for } |z| = 1. \quad (3.11)$$

Combining (3.8) and (3.11) we get

$$n^r \int_0^{2\pi} |p(e^{i\theta})|^r d\theta \leq \int_0^{2\pi} |1 + k^\mu e^{i\theta}|^r |p'(e^{i\theta})|^r d\theta \quad \text{for } r > 0. \quad (3.12)$$

Now applying Hölder's inequality for $p > 1$, $q > 1$ with $1/p + 1/q = 1$ to (3.12), we get

$$\begin{aligned} n^r \int_0^{2\pi} |p(e^{i\theta})|^r d\theta \\ \leq \left\{ \int_0^{2\pi} |1 + k^\mu e^{i\theta}|^{pr} d\theta \right\}^{1/p} \left\{ \int_0^{2\pi} |p'(e^{i\theta})|^{qr} d\theta \right\}^{1/q} \quad \text{for } r > 0 \end{aligned} \quad (3.13)$$

which is equivalent to

$$\begin{aligned} n \left\{ \int_0^{2\pi} |p(e^{i\theta})|^r d\theta \right\}^{1/r} \\ \leq \left\{ \int_0^{2\pi} |1 + k^\mu e^{i\theta}|^{pr} d\theta \right\}^{1/pr} \left\{ \int_0^{2\pi} |p'(e^{i\theta})|^{qr} d\theta \right\}^{1/qr} \quad \text{for } r > 0 \end{aligned} \quad (3.14)$$

which proves the desired result. $\square$

PROOF OF THEOREM 1.5. Since $p(z)$ has all its zeros in $|z| \leq k \leq 1$, therefore, by Lemma 2.2 we get

$$k^\mu |p'(z)| \geq |q'(z)| + \frac{mn}{k^{n-\mu}} \quad \text{for } |z| = 1, 1 \leq \mu \leq n. \quad (3.15)$$

Also by (3.4) for $|z| = 1$, we have

$$|p'(z)| = |nq(z) - zq'(z)|. \quad (3.16)$$

Now using (3.15) for every complex β with $|\beta| \leq 1$, we get

$$\begin{aligned} \left| q'(z) + \beta \frac{mn}{k^{n-\mu}} \right| &\leq |q'(z)| + \frac{mn}{k^{n-\mu}} \\ &\leq k^\mu |p'(z)| \\ &= k^\mu |nq(z) - zq'(z)| \quad \text{for } |z| = 1. \end{aligned} \quad (3.17)$$

Since $p(z)$ has all its zeros in $|z| \leq k \leq 1$, the result follows on the same lines as that of [Theorem 1.3](#). Hence we omit the proof. $\square$
