A rotational fluid model which can be used to describe broad vortical flows ranging from large scale to the atmospheric mesoscale and the oceanic submesoscale is studied by the symmetry group theory. After introducing one scalar-, two vector-, and two tensor potentials, we find that the Lie symmetries of the extended system include many arbitrary functions of z and $\{z, t\}$. The obtained Lie symmetries are used to find some types of exact solutions. One of exact solutions can be used to qualitatively describe the three-dimensional structure of hurricanes.

1. Introduction

Symmetry study is one of the effective methods to study complicated nonlinear problems. Though the Lie symmetry group method have been quite perfectly studied and some excellent books has been published [1], there still exist many important problems to be studied. For instance, to find group invariant solutions related to the generalized symmetries and nonlocal symmetries is still a very difficult topic. We know that for integrable systems there are infinitely many generalized symmetries [1–6] and nonlocal symmetries. The finite transformation (symmetry group) of the Lie symmetries may be obtained via Lie's first theorem. For many types of the nonlocal symmetries, the finite transformations can also be obtained by using Lie's first theorem; say, the Darboux transformations (DT) are just the finite transformation form of the nonlocal symmetries obtained from DT. This fact implies that some types of generalized symmetries and nonlocal symmetries can be localized to closed Lie symmetry algebra such that the Lie's first principle can be successfully applied. In this paper, we study a special type of nonlocal symmetries, potential symmetries of a

rotating fluid model. The potential symmetries have been studied by many authors [7–9].

It is known that the quasi-geostrophic equations for a Boussinesq fluid in a uniformly rotating and stably stratified environment, which is an idealization for various phenomena in either atmosphere or ocean. In this paper, we consider the following rotating stratified fluid model [10, 11]:

$$u_x + v_y = 0, \quad (1.1)$$

$$u_t + uu_x + vu_y - fv + p_x = 0, \quad (1.2)$$

$$v_t + uv_x + vv_y + fu + p_y = 0, \quad (1.3)$$

$$\rho + p_z = 0, \quad (1.4)$$

$$\rho_t + u\rho_x + v\rho_y + w\rho_z = 0, \quad (1.5)$$

where f is the Coriolis parameter, p is the pressure perturbation divided by a mean density ρ_0 , ρ is the density perturbation scaled by ρ_0/g , u and v are horizontal velocities, and w is the vertical velocity.

It should be mentioned that the consistent condition of (1.2) and (1.3), $p_{xy} = p_{yx}$, is just the Euler equation for an ideal incompressible two-dimensional fluid. Some authors have studied the symmetry structure of the two-dimensional Euler equations [12–14].

In section 2, the Lie symmetries of the original model (1.1)–(1.5) are directly written down because it can be obtained by means of some known methods. Section 3 is devoted to discuss special types of generalized symmetries of the system (1.1)–(1.5) which are only Lie symmetries for the subsystem (1.1)–(1.3). In section 4, to find more symmetries and symmetry groups we discuss the potential symmetries which are Lie symmetries for an enlarged system. In section 5, the full symmetry group related to the Lie symmetries of the enlarged system is directly written down. The section 6 is devoted to find some new exact solutions which display abundant vortex structure and some of them qualitatively display some three-dimensional structure of hurricanes. The final section is a short summary and discussion.

2. The Lie Symmetries of the System (1.1)–(1.5)

A symmetry of (1.1)–(1.5),

$$\sigma \equiv \begin{pmatrix} \sigma^u \\ \sigma^v \\ \sigma^p \\ \sigma^\rho \\ \sigma^w \end{pmatrix}, \quad (2.1)$$

is defined as a solution of the linearized equations of (1.1)–(1.5):

$$\sigma_x^u + \sigma_y^v = 0, \quad (2.2)$$

$$\sigma_t^u + \sigma^u u_x + u \sigma_x^u + \sigma^v u_y + v \sigma_y^u - f \sigma^v + \sigma_x^p = 0, \quad (2.3)$$

$$\sigma_t^v + \sigma^u v_x + u \sigma_x^v + \sigma^v v_y + v \sigma_y^v + f \sigma^u + \sigma_y^p = 0, \quad (2.4)$$

$$\sigma^\rho + \sigma_z^p = 0, \quad (2.5)$$

$$\sigma_t^\rho + \sigma^u \rho_x + u \sigma_x^\rho + \sigma^v \rho_y + v \sigma_y^\rho + \sigma^w \rho_z + w \sigma_z^\rho = 0, \quad (2.6)$$

which means the model system is form invariant under the transformation

$$\begin{pmatrix} u \\ v \\ p \\ \rho \\ w \end{pmatrix} \longrightarrow \begin{pmatrix} u \\ v \\ p \\ \rho \\ w \end{pmatrix} + \epsilon \begin{pmatrix} \sigma^u \\ \sigma^v \\ \sigma^p \\ \sigma^\rho \\ \sigma^w \end{pmatrix} \quad (2.7)$$

with infinitesimal ϵ . The Lie symmetries of (1.1)–(1.5) have the form

$$\begin{pmatrix} \sigma^u \\ \sigma^v \\ \sigma^p \\ \sigma^\rho \\ \sigma^w \end{pmatrix} = \begin{pmatrix} U \\ V \\ P \\ Q \\ W \end{pmatrix} - X \begin{pmatrix} u_x \\ v_x \\ p_x \\ \rho_x \\ w_x \end{pmatrix} - Y \begin{pmatrix} u_y \\ v_y \\ p_y \\ \rho_y \\ w_y \end{pmatrix} - Z \begin{pmatrix} u_z \\ v_z \\ p_z \\ \rho_z \\ w_z \end{pmatrix} - T \begin{pmatrix} u_t \\ v_t \\ p_t \\ \rho_t \\ w_t \end{pmatrix}, \quad (2.8)$$

where X, Y, Z, T, U, V, P, Q , and W are functions of $x, y, z, t, u, v, p, \rho$, and w .

Substituting (2.8) into (2.2)–(2.6), eliminating u_t, v_y, p_y, ρ , and w via (1.1)–(1.5) and vanishing different powers of the fields u, v, p, ρ, w and their derivatives, one can obtain the determining equations of the functions X, Y, Z, T, U, V, P, Q , and W . After solving these

determining equations, one can find that the general Lie symmetries of (1.1)–(1.5) have the form (2.8) with

$$\begin{aligned}
 X &= a_1 x + \frac{1}{2}(a_2 f t + 2a_5)y - a_7(t), \\
 Y &= a_1 y - \frac{1}{2}(a_2 f t + 2a_5)x - a_8(t), \\
 Z &= 2(a_1 - a_2)z + a_4, \\
 T &= a_2 t + a_3, \\
 U &= -a_{7t} + (a_1 + a_2)u - \frac{1}{2}(-a_2 f t - 2a_5)v + \frac{1}{2}a_2 f y, \\
 V &= -a_{8t} + \frac{1}{2}(-a_2 f t - 2a_5)u + (a_1 - a_2)v - \frac{1}{2}a_2 f x, \\
 P &= (a_{7t} - f a_8)_t x + (a_7 f + a_{8t})_t y + 2(a_1 - a_2)p - \frac{1}{4}f^2 a_2 (y^2 + x^2) + c_1 z + a_{10}(t), \\
 Q &= -c_1, \\
 W &= (-3a_2 + 2a_1)w,
 \end{aligned} \tag{2.9}$$

which is a linear combination of the following generators:

(a) time translation (a_3 -part of (2.8) with (2.9))

$$V_1 = \partial_t; \tag{2.10}$$

(b) vertical space translation (a_4 -part of (2.8) with (2.9)),

$$V_2 = \partial_z; \tag{2.11}$$

(c) generalized x -translation and Galilean invariance

$$V_3 = -a_7(t)\partial_x - a_{7t}\partial_u + (f a_{7t} y + x a_{7tt})\partial_p, \tag{2.12}$$

which is x -translation for a_7 being constant and Galilean boost in x direction for $a_7 \sim t$;

(d) generalized y -translation and Galilean invariance

$$V_4 = -a_8(t)\partial_y - a_{8t}\partial_v + (f a_{8t} x - y a_{8tt})\partial_p, \tag{2.13}$$

which is y -translation for a_8 being constant and Galilean boost in y direction for $a_8 \sim t$;

(e) time and z -dependent p -translation (pressure shift for reference point)

$$V_5 = [c_1 z + a_{10}(t)] \partial_p; \quad (2.14)$$

(f) space scaling invariance (a_1 -part of (2.8) with (2.9))

$$V_6 = x \partial_x + y \partial_y + 2z \partial_z + u \partial_u + v \partial_v + 2p \partial_p + 2w \partial_w; \quad (2.15)$$

(g) time-independent rotation (a_5 -part of (2.8) with (2.9))

$$V_7 = -y \partial_x + x \partial_y - v \partial_u + u \partial_v; \quad (2.16)$$

(h) time scaling company with time-dependent rotation (a_2 -part of (2.8) with (2.9))

$$\begin{aligned} V_8 = & \frac{1}{2} t f y \partial_x - \frac{1}{2} t f x \partial_y + t \partial_t - 2z \partial_z + \left(\frac{f}{2} (y + vt) - u \right) v \partial_u \\ & - \left(v + \frac{f}{2} (x + ut) \right) \partial_v - \left(2p + \frac{f^2}{4} (x^2 + y^2) \right) \partial_p - 3w \partial_w, \end{aligned} \quad (2.17)$$

where $a_i, i = 1, \dots, 5$, and c_1 are arbitrary constants while a_7, a_8 , and a_9 are arbitrary functions of t .

It should be pointed out that the time scaling (2.17) is linked with the time-dependent rotation. This property may hint us that we should uncover more symmetries of the model.

3. The Lie Symmetries of the Subsystem (1.1)–(1.3)

From (1.1)–(1.3), we know that the fields u, v , and p constitute a closed subsystem. Whence u, v , and p are fixed, the density ρ and the vertical velocity w can be simply obtained from (1.4) and (1.5), respectively, via differentiations.

Therefore, in this section we study the Lie symmetries of the subsystem (1.1)–(1.3) which is a solution of (2.2)–(2.4) with the solution form

$$\begin{pmatrix} \sigma^u \\ \sigma^v \\ \sigma^p \end{pmatrix} = X \begin{pmatrix} u_x \\ v_x \\ p_x \end{pmatrix} + Y \begin{pmatrix} u_y \\ v_y \\ p_y \end{pmatrix} + Z \begin{pmatrix} u_z \\ v_z \\ p_z \end{pmatrix} + T \begin{pmatrix} u_t \\ v_t \\ p_t \end{pmatrix} - \begin{pmatrix} U \\ V \\ P \end{pmatrix}, \quad (3.1)$$

where X, Y, Z, T, U, V , and P are functions of x, y, z, t, u, v , and p . The same procedure as the last section leads to the general solution

$$\begin{aligned}
 X &= xa_1 + \frac{1}{2}a_2yft + ya_5 - a_7, \\
 Y &= -\frac{1}{2}a_2xft - xa_5 + ya_1 - a_8, \\
 Z &= a_4(z), \\
 T &= a_2t + a_3, \\
 U &= (a_1 - a_2)u + \frac{1}{2}(tfa_2 + 2a_5)v + \frac{1}{2}a_2fy - a_{7t}, \\
 V &= \frac{1}{2}(-2a_5 - tfa_2)u + (a_1 - a_2)v - \frac{1}{2}a_2fx - a_{8t}, \\
 P &= 2(a_1 - a_2)p - \frac{1}{4}a_2(y^2 + x^2)f^2 - (xa_{7t} - ya_{8t})f + xa_{7tt} - ya_{8tt} + a_9,
 \end{aligned} \tag{3.2}$$

where $a_i, i = 1, \dots, 5$, are arbitrary functions of z and a_7, a_8 and a_9 are arbitrary functions of $\{z, t\}$. It is clear that the Lie symmetries of the last section are just the special case of (3.2) for a_1, a_2, a_3, a_5 being arbitrary constants, a_4 and a_9 being linear functions of z , and a_7 and a_8 being only functions of t .

Because of the entrance of arbitrary functions, the Lie symmetries (3.1) of the subsystem (1.1)–(1.3) become the generalized symmetries for the full system (1.1)–(1.5). The generalized symmetries of (1.1)–(1.5) are expressed by (2.8) with (3.2) and

$$\begin{aligned}
 Q &= (a_2t + a_3)_z p_t + \left(xa_1 + \frac{1}{2}a_2yft + ya_5 - a_7 \right)_z p_x + \left(ya_1 - \frac{1}{2}a_2xft - xa_5 - a_8 \right)_z p_y \\
 &\quad + \left(-xa_{7tt} - ya_{8tt} - yfa_{7t} + xfa_{8t} - a_{10} + \frac{1}{4}a_2(y^2 + x^2)f^2 \right)_z \\
 &\quad - a_{4z}\rho - 2(a_1 - a_2)_z p + 2(a_1 - a_2)\rho, \\
 W &= \left\{ 2a_{4z} - 2a_1 + 2a_2 - p_{zz}^{-1} \right. \\
 &\quad \times [-2T_z p_{zt} - 2X_z p_{xz} - 2Y_z p_{yz} - X_{zz} p_x - Y_{zz} p_y - T_{zz} p_t \\
 &\quad + (4a_{2z} + a_{4zz} - 4a_{1z})\rho + 2(a_{1zz} - a_{2zz})p - \frac{1}{4}(y^2 + x^2)f^2 a_{2zz} + yfa_{7zzt} - xfa_{8zzt} \\
 &\quad \left. + xa_{7zzt} + ya_{8zzt} + p_{0zz} \right\} w
 \end{aligned}$$

$$\begin{aligned}
& - \left\{ v f a_{7zt} - u f a_{8zt} - p_{yy} (v y a_{1z} - v x a_{5z} - v a_{8z}) \right. \\
& + x a_{7ztt} + y a_{8ztt} + [v(2a_1 - 3a_2) - v a_{4z}] p_{yz} + (2a_1 - a_{4z} - 3a_2) p_{zt} + (y f + u) a_{7zt} \\
& - (x f - v) a_{8zt} + (2a_1 - 3a_2)_z p_t - (a_{2t} + a_3)_z p_{tt} + p_{0zt} - \frac{1}{2} (u x f + v y f - p_{yy} v x t) f a_{2z} \\
& + \left[-y a_{5z} + a_{7z} - u a_{4z} - x a_{1z} - \frac{1}{2} y f a_{2zt} - u a_{3z} - u a_{2zt} + u(2a_1 - 3a_2) \right] p_{xz} \\
& - \left[(y v - u x) a_{5z} + v a_{7z} + u a_{8z} - (v x + u y) a_{1z} + \frac{1}{2} t (u x - y v) f a_{2z} \right] p_{xy} \\
& + \left[u a_{1z} - \frac{1}{2} (v t + y) f a_{2z} - v a_{5z} + a_{7zt} - 2u a_{2z} \right] p_x \\
& + \left[a_{1z} v + \frac{1}{2} (u t + x) f a_{2z} + u a_{5z} - 2v a_{2z} + a_{8zt} \right] p_y \\
& + u \left(-y a_{5z} - x a_{1z} - \frac{1}{2} y f a_{2zt} + a_{7z} \right) p_{xx} \\
& + \left(\frac{1}{2} x f a_{2zt} + a_{8z} + x a_{5z} - y a_{1z} - v a_{3z} - v a_{2zt} \right) p_{yt} \left. \right\} p_{zz}^{-1}.
\end{aligned} \tag{3.3}$$

In addition to the symmetries (2.8) with (3.3) are not point symmetries, the time scaling invariance related to $a_2 = a_2(z)$

$$\begin{aligned}
V = & a_2 t \partial_t + \frac{1}{2} a_2 y f t \partial_x - \frac{1}{2} a_2 x f t \partial_y + \frac{1}{2} a_2 (t f v - 2u + f y) \partial_u - \frac{1}{2} a_2 (t f u + 2v + f x) \partial_v \\
& - \frac{1}{4} a_2 [8p + (y^2 + x^2) f^2] \partial_p + \frac{1}{4} a_{2z} [4t p_t + 2y f t p_x - 2x f t p_y + (y^2 + x^2) f^2] \partial_p \\
& + \left\{ \left[2a_2 - p_{zz}^{-1} \left[a_{2z} (x f t p_{yz} - 2t p_{zt} - y f t p_{xz} + 4p) + \frac{1}{2} a_{2zz} (x f t p_y - t y f p_x - 2t p_t) \right. \right. \right. \\
& \quad \left. \left. \left. - a_{2zz} \left(2p + \frac{1}{4} (y^2 + x^2) f^2 \right) \right] \right] w \right. \\
& - \left[\frac{1}{2} (p_{yy} v x t - u x f - v y f) f a_{2z} - 3a_2 (p_{yz} + p_{zt}) - a_{2z} (3p_t + t p_{tt}) \right. \\
& - \frac{1}{2} [(y f + 2u) a_{2z} t + 6a_2 u] p_{xz} + \frac{1}{2} t (u x - y v) f a_{2z} p_{xy} - \frac{1}{2} [(v t + y) f + 4u] a_{2z} p_x \\
& \left. \left. + \frac{1}{2} [(u t + x) f - 4v] a_{2z} p_y - \frac{1}{2} u y f a_{2z} t p_{xx} + \frac{1}{2} a_{2z} (x f t - 2v t) p_{yt} \right] p_{zz}^{-1} \right\} \partial_w
\end{aligned} \tag{3.4}$$

is still accompanied by the time-dependent rotation.

4. Potential Symmetries of (1.1)–(1.5)

From (1.1), we know that it is natural to introduce a special scalar potential, the stream function ψ , such that

$$u = -\psi_y, \quad v = \psi_x. \quad (4.1)$$

We call a symmetry potential symmetry if it is explicitly dependent on a potential, say, ψ , (or its derivatives) for the fields u, v, p, ρ , and w described by (1.1)–(1.5). Obviously, a potential symmetry for the field system $\{u, v, p, \rho, w\}$ is a nonlocal one though it may be a Lie symmetry for the enlarged system $\{u, v, p, \rho, w, \psi\}$. From the general symmetry expression (3.3), we know that it is useful to introduce the following potential vector fields

$$\begin{aligned} \vec{v} &= (\psi_x, \psi_y, \psi_z, \psi_t) = (v_1 = v, v_2 = -u, v_3 = v_3, v_4), \\ \vec{f} &= (p_x, p_y, p_z, p_t) = (f_1, f_2, f_3 = -\rho, f_4), \end{aligned} \quad (4.2)$$

and symmetric potential tensor fields

$$\begin{aligned} \psi_{ij} &= \psi_{ji} = \psi_{x_i x_j}, \quad i, j = 1, 2, 3, 4, \quad x_1 = x, \quad x_2 = y, \quad x_3 = z, \quad x_4 = t, \\ p_{ij} &= p_{ji} = p_{x_i x_j}, \quad i, j = 1, 2, 3, 4. \end{aligned} \quad (4.3)$$

Now using the standard method as the last two sections, we can obtain the Lie symmetries of the enlarged system (1.1)–(1.5) and (4.1)–(39) for thirty-one fields $u = -v_2, v = v_1, p, w, \psi, v_3, v_4, f_1, f_2, \rho = -f_3, f_4, \psi_{ij}$ and $p_{ij}, i \leq j = 1, 2, 3, 4$. The result has the following generators $\{V_1, V_2, V_3, V_4, V_5, V_6, V_7, V_8, V_9, V_{10}\} \equiv \mathcal{V}$ for the original fields u, v, w, p, ρ and the potential ψ :

$$\begin{aligned} V_1 &= a_1(x\partial_x + y\partial_y + 2\psi\partial_\psi + u\partial_u + v\partial_v + 2p\partial_p + 2\rho\partial_\rho) + a_{1z} \\ &\quad \times \left\{ (xf_1 + yf_2 - 2p)\partial_\rho + p_{33}^{-1} \right. \\ &\quad \times [2w(2\rho + xp_{13} + yp_{23}) + u(xp_{11} + yp_{12} - f_1) \\ &\quad \left. + v(xp_{12} + yp_{22} - f_2) - 2f_4 + xP_{13} + yp_{24}] \partial_w \right\} + a_{1zz} p_{33}^{-1} w(xf_1 + yf_2 - 2p)\partial_w, \end{aligned} \quad (4.4)$$

$$\begin{aligned} V_2 &= a_2 \left[t\partial_t - \psi\partial_\psi - u\partial_u - v\partial_v + (f\psi - 2p)\partial_p - (fv_3 + 2\rho)\partial_\rho \right. \\ &\quad \left. + (w + fp_{33}^{-1}(w\psi_{33} + \psi_{34} + u\psi_{13} + v\psi_{23}))\partial_w \right] + a_{2z}(tf_4 - f\psi + 2p)\partial_\rho \\ &\quad + a_{2z} \left\{ 2tw^2 + p_{33}^{-1} [2w(2\rho + fv_3 + t\psi p_{13} + tvp_{23}) - u(2f_1 + tp_{14}) \right. \\ &\quad \left. - v(2f_2 + tp_{24}) + v_4 f - 3f_4 - tp_{44}] \right\} \partial_w + a_{2zz} p_{33}^{-1} w(f\psi - 2p - tf_4)\partial_w, \end{aligned} \quad (4.5)$$

$$V_3 = a_3 \partial_t + a_{3z} \left\{ f_4 \partial_\rho + \left[2w^2 + p_{33}^{-1} (2w(up_{13} + vp_{23}) - up_{14} - vp_{24} - p_{44}) \right] \partial_w \right\} \\ - a_{3zz} p_{33}^{-1} w f_4 \partial_w, \quad (4.6)$$

$$V_4 = a_4 \partial_z - a_{4z} (\rho \partial_\rho + w \partial_w) + a_{4zz} p_{33}^{-1} w \rho \partial_w, \quad (4.7)$$

$$V_5 = -a_5 [x \partial_y - y \partial_x - v \partial_u + u \partial_v] \\ + a_{5z} \left\{ (xf_2 - yf_1) \partial_\rho + p_{33}^{-1} [2(y p_{13} - x p_{23}) w \right. \\ \left. + (y p_{11} - x p_{12} - f_2) u + (f_1 + y p_{12} - x p_{22}) v + y p_{14} - x p_{24} \right] \partial_w \Big\} \\ + a_{5zz} p_{33}^{-1} (y f_1 - x f_2) w \partial_w, \quad (4.8)$$

$$V_6 = -a_6 \left[xt \partial_y - yt \partial_x + \frac{1}{2} (x^2 + y^2) \partial_\psi - (vt + y) \partial_u + (ut + x) \partial_v + \frac{1}{2} (4\psi + f x^2 + f y^2) \partial_p \right. \\ \left. - 2v_3 \partial_\rho + \frac{2}{p_{33}} (u \psi_{13} + v \psi_{23} + w \psi_{33} + \psi_{34}) \partial_w \right] \\ - a_{6z} \left\{ \frac{1}{2} (2txf_2 - 2tyx_1 - 4\psi - f x^2 - f y^2) \partial_\rho \right. \\ \left. + p_{33}^{-1} \left[u(fx - f_2t - xtp_{12} + ytp_{11}) + v(yf + tf_1 - xtp_{22} + ytp_{12}) \right. \right. \\ \left. \left. + 2w(2v_3 + ytp_{13} - xtp_{23}) + yf_1 + 2v_4 - xtp_{24} + ytp_{14} - xf_2 \right] \partial_w \right\} \\ - \frac{1}{2} a_{6zz} p_{33}^{-1} (4\psi + 2ytf_1 - 2xtf_2 + f x^2 + f y^2) w \partial_w, \quad (4.9)$$

$$V_7 = -a_7 \partial_x - a_{7t} (-y \partial_\psi + \partial_u - f y \partial_p) - a_{7tt} x \partial_p \\ - a_{7z} (f_1 \partial_\rho - p_{33}^{-1} (2w p_{13} + u p_{11} + p_{14} + v p_{12}) \partial_w) \\ + a_{7zt} [f y \partial_\rho - p_{33}^{-1} (f_1 + f v) \partial_w] + a_{7ztt} p_{33}^{-1} (u + f y) \partial_w \\ - a_{7zzt} (x \partial_\rho - p_{33}^{-1} w y f \partial_w) + (a_{7zttt} x + a_{7zztt} x w + a_{7zz} f_1 w) p_{33}^{-1} \partial_w, \quad (4.10)$$

$$V_8 = -a_8 \partial_y - a_{8t} (x \partial_\psi + \partial_v + x f \partial_p) + (a_{8zz} w f_2 + a_{8ztt} y - a_{8zzt} w x f) p_{33}^{-1} \partial_w \\ + a_{8tt} y \partial_p - a_{8z} [f_2 \partial_\rho - p_{33}^{-1} (2w p_{23} + v p_{22} + p_{24} + u p_{12}) \partial_w] + a_{8zzt} p_{33}^{-1} y w \partial_w \\ + a_{8zt} [f x \partial_\rho + p_{33}^{-1} (f_2 - f u) \partial_w] - a_{8ztt} [y \partial_\rho - p_{33}^{-1} (v - x f) \partial_w], \quad (4.11)$$

$$V_9 = a_9 \partial_p - a_{9z} \partial_\rho - (a_{9tt} w + a_{9zt}) p_{33}^{-1} \partial_w, \quad (4.12)$$

$$V_{10} = a_{10} \partial_\psi, \quad (4.13)$$

where $a_i, i = 1, \dots, 6$, are arbitrary functions of z and a_7, a_8, a_9, a_{10} are arbitrary functions of $\{z, t\}$.

Remark 4.1. z -dependent time scaling symmetry V_2 given by (4.5) is independent of the time-dependent rotation symmetry (4.9) thanks to the inclusion of the potential symmetry.

Remark 4.2. The symmetries V_2 and V_6 are nonlocal symmetries of the original system $\{u, v, p, \rho, w\}$ while they are local Lie symmetries for the enlarged system.

Remark 4.3. All the symmetries except V_{10} are generalized symmetries for the original system and they all become the Lie symmetries for the enlarged system.

5. Finite Transformation Group of the System (1.1)–(1.5) Related to Lie Symmetries of the Enlarged System

To find the finite transformation group of the system (1.1)–(1.5) related to the Lie symmetry algebra $\mathcal{U}$, we have to solve the initial valued problem

$$\begin{aligned} \frac{dx'}{X'} = \frac{dy'}{Y'} = \frac{dz'}{Z'} = \frac{dt'}{T'} = \frac{d\psi'}{\Psi'} = \frac{du'}{U'} + \frac{dv'}{V'} = \frac{dw'}{W'} = \frac{dp'}{P'} = \dots = d\epsilon, \\ \{x', y', z', t', \psi', u', v', w', p', \dots\}|_{\epsilon=0} = \{x, y, z, t, \psi, u, v, w, p, \dots\}, \end{aligned} \quad (5.1)$$

where $x', y', z', t', u', v', w', p', \dots$, are functions of ϵ and $X', Y', Z', T', U', V', P', \dots$ can be read off from the linear combination of the generators of the algebra $\mathcal{U}$. For instance,

$$\begin{aligned} X' &= -a_7' + a_1' x' - t_2' y' - g' y' t', \\ Y' &= -a_8' + a_1' y' + t_2' x' + g' x' t', \\ Z' &= a_4'(z'), \\ T' &= t_0' + t_1' t_1', \\ U' &= -a_{7\mu}' + (c_2' - t_1') u' - t_2' v' - g' (v' t' + y'), \\ V' &= -a_{8\mu}' + (c_2' - t_1') v' + t_2' u' + g' (u' t' + x'), \\ P' &= f a_{7\mu\mu}' y' - x' a_{7\mu\mu}' - f a_{8\mu}' x' + y' a_{8\mu\mu}', \\ &\dots, \end{aligned} \quad (5.2)$$

with $\{a_1' \equiv a_1(z'), a_3' \equiv a_3(z'), a_2' \equiv a_2(z'), a_5' \equiv a_5(z'), g' \equiv g(z'), a_4' \equiv a_4(z'), \dots\}$ being arbitrary functions of z' and $\{a_7' \equiv a_7(z', t'), a_8' \equiv a_8(z', t'), \dots\}$ being arbitrary functions of the indicated variables.

Because the density ρ and the vertical velocity w can be simply obtained from (1.4) and (1.5) when the fields $\{u, v, p, \psi\}$ are known, we write down only the transformation group theorem on the fields $\{u, v, p, \psi\}$ here.

Theorem 5.1. *If $\{U(x, y, z, t), V(x, y, z, t), P(x, y, z, t), \Psi(x, y, z, t)\}$ is a solution of the system (1.1)–(1.3) and (4.1), so is $\{u, v, p, \psi\}$ with*

$$\begin{aligned} u &= -\alpha_6 y - \alpha_{8t} \sin \theta + \alpha_{7t} \cos \theta + \alpha_2 \alpha_1^{-1} [U(\xi, \eta, \zeta, \tau) \cos \theta - V(\xi, \eta, \zeta, \tau) \sin \theta], \\ v &= \alpha_6 x + \alpha_{7t} \sin \theta + \alpha_{8t} \cos \theta + \alpha_2 \alpha_1^{-1} [V(\xi, \eta, \zeta, \tau) \cos \theta + U(\xi, \eta, \zeta, \tau) \sin \theta], \\ p &= \frac{\alpha_2}{\alpha_1^2} [\alpha_2 P(\xi, \eta, \zeta, \tau) + (f + 2\alpha_6 - f\alpha_2) \Psi(\xi, \eta, \zeta, \tau)] + \alpha_9 + \frac{\alpha_6}{2} (f + \alpha_6) (x^2 + y^2) \\ &\quad + (x \cos \theta + y \sin \theta) [(f + 2\alpha_6) \alpha_{8t} - \alpha_{7t}] + (x \sin \theta - y \cos \theta) [(f + 2\alpha_6) \alpha_{7t} + \alpha_{8t}], \\ \psi &= \frac{\alpha_2}{\alpha_1^2} \Psi(\xi, \eta, \zeta, \tau) + \alpha_{10} + \frac{\alpha_6}{2} [(y \cos(\alpha_6 t) - x \sin(\alpha_6 t))^2 + (y \sin(\alpha_6 t) + x \cos(\alpha_6 t))^2] \\ &\quad + x [\alpha_{8t} \cos \theta + \alpha_{7t} \sin \theta] + y [\alpha_{8t} \sin \theta - \alpha_{7t} \cos \theta], \end{aligned} \quad (5.3)$$

where $\xi = \alpha_1(y \sin \theta + x \cos \theta - \alpha_7)$, $\eta = \alpha_1(y \cos \theta - x \sin \theta - \alpha_8)$, $\zeta = \alpha_4$, $\tau = \alpha_2 t + \alpha_3$, $\theta \equiv \alpha_6 t + \alpha_5$, $\{\alpha_1, \alpha_2, \alpha_3, \alpha_4, \alpha_5\}$ and α_6 are arbitrary functions of z while $\{\alpha_7, \alpha_8, \alpha_9\}$ and α_{10} are arbitrary functions of $\{z, t\}$.

To prove the theorem, one can solve the initial problem (5.1) or directly substitute (5.3) to (1.1)–(1.3) and (4.1). Actually, it is more straightforward to verify that the infinitesimal form of (5.3) is just the linear combination of the generators given in the last section by taking

$$\alpha_1 \longrightarrow 1 + \epsilon a_1, \quad \alpha_2 \longrightarrow 1 + \epsilon a_2, \quad \alpha_4 \longrightarrow z + \epsilon a_4, \quad \alpha_i \longrightarrow \epsilon a_i, \quad i \neq 1, 2, 4, \quad (5.4)$$

with the infinitesimal parameter ϵ .

6. Exact Solutions and Applications

To find some types of new exact solutions via the finite symmetry group theorem of the last section, we should find some simple exact seed solutions at first. Fortunately, it is not difficult to verify that the model (1.1)–(1.5) possesses the following known trivial solution:

$$\begin{aligned} u &= -2F(r, z)y, \quad r \equiv x^2 + y^2, \\ v &= 2xF(r, z), \\ p &= \int F(r, z)(2F(r, z) + f)dr, \\ \rho &= - \int F_z(r, z)(4F(r, z) + f)dr, \\ w &= -\frac{1}{p_{zz}}(p_{zt} + up_{xz} + vp_{yz}), \end{aligned} \quad (6.1)$$

with arbitrary function $F \equiv F(r, z)$ of $\{r, z\}$.

Applying the group theorem of the last section to solution (6.1), we have

$$\begin{aligned}
 u &= -\alpha_6 y - \alpha_{8t} \sin \theta + \alpha_{7t} \cos \theta - 2\alpha_2 \alpha_1^{-1} [\eta F(R, \alpha_4) \cos \theta + \xi F(R, \alpha_4) \sin \theta], \\
 v &= \alpha_6 x + \alpha_{7t} \sin \theta + \alpha_{8t} \cos \theta + 2\alpha_2 \alpha_1^{-1} [\xi F(R, \alpha_4) \cos \theta - \eta F(R, \alpha_4) \sin \theta], \\
 p &= \frac{\alpha_2}{\alpha_1^2} \left[\alpha_2 \int F(R, \alpha_4) (2F(R, \alpha_4) + f) dR + (f + 2\alpha_6 - f\alpha_2) \int F(R, \alpha_4) dR \right] + \alpha_{10} \\
 &\quad + \frac{\alpha_6}{2} (f + \alpha_6) (x^2 + y^2) + (x \cos \theta + y \sin \theta) [(f + 2\alpha_6) \alpha_{8t} - \alpha_{7tt}] \\
 &\quad + (x \sin \theta - y \cos \theta) [(f + 2\alpha_6) \alpha_{7t} + \alpha_{8tt}], \\
 \rho &= -p_z, \\
 w &= -\frac{1}{p_{zz}} (p_{zt} + up_{xz} + vp_{yz}),
 \end{aligned} \tag{6.2}$$

with

$$R \equiv \alpha_1^2 [(y \sin \theta + x \cos \theta - \alpha_7)^2 + (y \cos \theta - x \sin \theta - \alpha_8)^2]. \tag{6.3}$$

The different selections of the arbitrary functions appeared in the exact solution (6.2) may lead to various vortex and circumfluence structures. It was demonstrated that the vortex and circumfluence solutions could be applied to tropical cyclones. A concrete application of a two-dimensional vortex solution to Hurricane Katrina 2005 was discussed in [16]. Similar to the two dimensional case, solution (6.2) displays some interesting phenomena. The first part, $u \sim -\alpha_6 y$, $v \sim \alpha_6 x$ and the $F(R, \alpha_4)$ parts of the solution exhibit abundant vortex structure. $\{x = \alpha_7, y = \alpha_8\}$ is expressed as the center of the vortices while the second part ($\{u \sim -\alpha_{8t} \sin \theta + \alpha_{7t} \cos \theta, v \sim \alpha_{7t} \sin \theta + \alpha_{8t} \cos \theta\}$) of the solution shows us that the induced flow (the background wind) is related to the moving of the vortex center. This fact can be used to predict regular cyclone's track [16]. In order to find possible three-dimensional structure of the cyclones, one has to fix the arbitrary functions. Here we just take a special form of (6.2),

$$\begin{aligned}
 u &= -F(R_1, z)y, & R_1 &\equiv x^2 + y^2, & v &= F(R_1, z)x, \\
 w &= -\frac{\alpha_{10zt}(z, t)}{\int [(4F(R_1, z) + f)F_{zz}(R_1, z) + 4F_z^2(R_1, z)^2] dR_1 + \alpha_{10zz}(z, t)},
 \end{aligned} \tag{6.4}$$

with only two arbitrary functions $F(R_1, z)$ and $\alpha_{10}(z, t)$ to qualitatively display the three-dimensional vortex structure.

For the sake of capturing the known features of cyclone's structure, we here assume the arbitrary functions to be a more special form such that

$$u = -c_0 y \operatorname{sech}(c_1 z + c_5) \tanh(c_1 z + c_5) \operatorname{sech}\left(\frac{R_1}{c_2}\right), \quad (6.5)$$

$$v = c_0 x \operatorname{sech}(c_1 z + c_5) \tanh(c_1 z + c_5) \operatorname{sech}\left(\frac{R_1}{c_2}\right), \quad (6.6)$$

$$w = c_4 \left[2c_3 + c_0^2 c_1^2 c_2 \operatorname{sech}^2(c_1 z + c_5) \left(10 \operatorname{sech}^4(c_1 z + c_5) - 11 \operatorname{sech}^2(c_1 z + c_5) + 2 \right) \tanh\left(\frac{R_1}{c_2}\right) \right. \\ \left. + c_0 c_1^2 c_2 f \tanh(c_1 z + c_5) \operatorname{sech}(c_1 z + c_5) \left(1 - 6 \operatorname{sech}^2(c_1 z + c_5) \right) \arctan\left(\exp\left(\frac{R_1}{c_2}\right)\right) \right]^{-1}, \quad (6.7)$$

with arbitrary constants c_i , $i = 0, 1, 2, \dots, 5$.

For simplicity, in the special selection, we have set the cyclone's center to be located at $(0, 0, z)$. The parameters c_2 and c_1 determine typhoon's horizontal and vertical scales, respectively. The sign of c_0 decides the rotating direction of the vortex. The value of $-c_5/c_1$ gives the turning plane where typhoon changes its rotating direction, namely, from cyclone to anticyclone.

The velocity field of a cyclone is plotted in Figure 1 with (6.5)–(6.8) for the fixed parameters

$$c_0 = c_5 = -1, \quad c_1 = 10, \quad c_3 = 1000, \quad c_4 = f = 1, \quad c_2 = 5. \quad (6.8)$$

Figure 1(a) shows the vortex structure rotating anticlockwise in lower level. While the rotation becomes clockwise at higher altitude, as observed in Figure 1(b). It is clear from Figure 1(c) that around the high $z = 0.1$, the atmospheric flow turns from cyclone to anticyclone, which is one of the typical characters of a cyclone. It means that the energy moves inside at the lower layer and then radiates at the higher. Besides, the cyclone center and radius can be easily distinguished in the profiles of the velocity field.

The corresponding three-dimensional structure is depicted in Figure 2. In order to make it more clear how the atmosphere flows to form a cyclone, one can solve a simple system of equations coming from the relations

$$\frac{dx}{dt} = u, \quad \frac{dy}{dt} = v, \quad \frac{dz}{dt} = w. \quad (6.9)$$

Since it is difficult to obtain an analytical solution of system (6.9), we solve it numerically with the initial conditions $x(0) = z(0) = 0$ and $y(0) = 2$. It is obviously revealed from the line depicted in Figure 2 that typhoon has a spiral pattern. The air close to the ground spirals upward and anticlockwise and then changes its rotation direction when approaching a higher altitude, which is consistent with the real observations. One can see a much closer comparison of our analytical results with a recent high-resolution hurricane simulation picture (Figure 3) using the WRF-ARW [15].

Figure 1: The profiles of the velocity field given by the horizontal velocities u , v and the vertical velocity w expressed by (6.5), (6.6), and (6.7), respectively, with the parameters (6.8) in the horizontal $x - y$ plane (a) at the bottom $z = 0$, (b) at the top $z = 0.14$, and (c) in the vertical $y - z$ plane with $x = 0$.

7. Summary and Discussions

The symmetries of the rotational fluid model (1.1)–(1.5) are studied in three ways. Firstly, we directly study the Lie symmetries of the full system (1.1)–(1.5) for the fields $\{u, v, p, \rho, w\}$. The result shows us that the Lie symmetries do not contain arbitrary functions of z and the time scaling is accompanied by a time-dependent rotation. Secondly, the Lie symmetries of the subsystem (1.1)–(1.3) for the fields $\{u, v, p\}$ exhibit eight arbitrary functions with five of them being arbitrary functions of z and others being arbitrary functions of $\{z, t\}$ while the time scaling invariance is still accompanied by a time-dependent rotation. Though these symmetries are the Lie symmetries for the subsystem $\{u, v, p\}$, they are generalized symmetries for the full system $\{u, v, p, \rho, w\}$. Finally, we enlarged the original system to an enlarged one which contains the stream function, four-dimensional vector forms $\vec{v}$ and $\vec{f}$ shown by (4.2) and the 4×4 symmetric tensors φ_{ij} and p_{ij} shown by (4.3). For the enlarged system, the Lie symmetries display much abundant structure which possesses six arbitrary functions of z and four arbitrary functions of $\{z, t\}$. It is shown that because of the entrance of the stream function, the time scaling invariance and time-dependent rotation invariance become independent potential symmetries which are nonlocal symmetries for the original system $\{u, v, p, \rho, w\}$ though they are local Lie symmetries for the enlarged system.

Figure 2: The three-dimensional spiral pattern of a typhoon vortex structure with the velocities u, v , and w expressed by (6.5)–(6.8), respectively. The spiral line is a numerical solution of (6.9) with (6.5)–(6.8) and the initial conditions $x(0) = z(0) = 0$ and $y(0) = 2$.

Figure 3: Picture of a recent high-resolution hurricane simulation using the WRF-ARW, cited from [15].

The corresponding finite symmetry transformation group related to both the generalized local symmetries and nonlocal symmetries for the subsystem $\{u, v, p\}$ are obtained because the symmetries are only Lie symmetries for the enlarged system. The finite symmetry transformation group can be used to find quite general solutions from simple ones. Especially a known trivial solution is transformed to produce a quite general vortex solution. A special form of the obtained vortex solution is used to qualitatively display the three-dimensional structure of cyclones.

All results of the paper in fact are based on the fact that system (1.1)–(1.5) is degenerate in certain sense. Namely, subsystem (1.1)–(1.3) involves the independent variable z as a parameter. It is obvious that any local (i.e., generalized [1]) symmetry of subsystem (1.1)–(1.3) can be extended to a local symmetry of the entire system (1.1)–(1.5) using (1.4) and (1.5) and the standard prolongation procedure. The same assertion is true for finite symmetry transformations and potential symmetry associated with the stream function as a potential. Similarly, any solution of subsystem (1.1)–(1.3) can be extended to a solution of the entire system (1.1)–(1.5) using (1.4) and (1.5) for defining ρ and w . Moreover, the equation for the stream function coincides with the classical vorticity equation for an ideal incompressible fluid. Subsystem (1.1)–(1.3) is reduced to the two-dimensional Euler equations via simple transformation of the pressure involving the stream function. This is why the simplest algorithm for finding exact solutions system (1.1)–(1.5) is the following. Take any solution of the vorticity equation assuming that all constant and functional parameters additionally

depend on the variable z . Then find the corresponding values of u, v, p, ρ , and w using (4.1) and (1.2)–(1.5) respectively.
