ABSTRACT

An existence theorem for stochastic inclusions $x_t - x_s \in \int_s^t F_\tau(x_\tau) d\tau + \int_s^t G_\tau(x_\tau) dw_\tau + \int_s^t \int_{\mathbb{R}^n} H_{\tau,z}(x_\tau) \tilde{\nu}(d\tau, dz)$ with nonanticipative nonconvex-valued right-hand sides is proved.

Key words: Stochastic inclusions, existence solutions, solution set.

AMS (MOS) subject classifications: 93E03, 93C30.

1. Introduction

Existence theorem and weak compactness of the solution set to stochastic inclusion

$$x_t - x_s \in \int_s^t F_\tau(x_\tau) d\tau + \int_s^t G_\tau(x_\tau) dw_\tau + \int_s^t \int_{\mathbb{R}^n} H_{\tau,z}(x_\tau) \tilde{\nu}(d\tau, dz),$$

denoted by $SI(F, G, H)$, with predictable convex-valued right-hand sides have been considered in the author's paper [4]. These results were obtained by fixed points methods. Applying the successive approximation method we shall prove here an existence theorem for $SI(F, G, H)$ with nonanticipative nonconvex-valued multivalued processes F, G and H . To begin with, we recall the basic definitions dealing with set-valued stochastic integrals and stochastic inclusions presented in [5].

Let a complete filtered probability space $(\Omega, \mathcal{F}, (\mathcal{F}_t)_{t \geq 0}, P)$ be given, where a family $(\mathcal{F}_t)_{t \geq 0}$, of σ -algebras $\mathcal{F}_t \subset \mathcal{F}$, is assumed to be increasing: $\mathcal{F}_s \subseteq \mathcal{F}_t$ if $s \leq t$. Let $\mathbb{R}_+ = [0, \infty)$ and $\mathcal{B}_+$ be the Borel σ -algebra on $\mathbb{R}_+$. We consider set-valued stochastic processes $(\mathcal{F}_t)_{t \geq 0}$, $(\mathcal{G}_t)_{t \geq 0}$ and $(\mathcal{R}_{t,z})_{t \geq 0, z \in \mathbb{R}^n}$ taking on values in the space $Comp(\mathbb{R}^n)$ of all nonempty compact subsets of n -dimensional Euclidean space $\mathbb{R}^n$. They are assumed to be nonanticipative and such that

$$\int_0^\infty \|\mathcal{F}_t\|^p dt < \infty, \quad p \geq 1, \quad \int_0^\infty \|\mathcal{G}_t\|^2 dt < \infty \quad \text{and} \quad \int_0^\infty \int_{\mathbb{R}^n} \|\mathcal{R}_{t,z}\|^2 dt q(dz) < \infty, \quad \text{a.s.,} \quad \text{where } q \text{ is a}$$

measure on a Borel σ -algebra $\mathcal{B}^n$ of $\mathbb{R}^n$ and $\|A\| := \sup\{|a| : a \in A\}$, $A \in Comp(\mathbb{R}^n)$. The space $Comp(\mathbb{R}^n)$ is considered with the Hausdorff metric h defined in the usual way, i.e., $h(A, B) = \max\{\bar{h}(A, B), \bar{h}(B, A)\}$, for $A, B \in Comp(\mathbb{R}^n)$, where $\bar{h}(A, B) = \{dist(a, B) : a \in A\}$ and $\bar{h}(B, A) = \{dist(b, A) : b \in B\}$.

2. Basic Definitions and Notations

Throughout the paper, we shall assume that a filtered complete probability space $(\Omega, \mathcal{F}, (\mathcal{F}_t)_{t \geq 0}, P)$ satisfies the following usual hypotheses:

- (i) $\mathcal{F}_0$ contains all the P -null sets of $\mathcal{F}$ and
- (ii) $\mathcal{F}_t = \bigcup_{u > t} \mathcal{F}_u$, all t , $0 \leq t < \infty$; that is, the filtration $(\mathcal{F}_t)_{t \geq 0}$ is right continuous.

As usual, we shall consider a set $\mathbb{R}_+ \times \Omega$ as a measurable space with the product σ -algebra $\mathcal{B}_+ \otimes \mathcal{F}$.

An n -dimensional stochastic process x is understood as a function $x: \mathbb{R}_+ \times \Omega \rightarrow \mathbb{R}^n$ with $\mathcal{F}$ -measurable sections x_t , for $t \geq 0$, and it is denoted by $(x_t)_{t \geq 0}$. It is measurable if x is $\mathcal{B}_+ \otimes \mathcal{F}$ -measurable. The process $(x_t)_{t \geq 0}$ is $\mathcal{F}_t$ -adapted or adapted if x_t is $\mathcal{F}_t$ -measurable for $t \geq 0$. Every measurable and adapted process is called nonanticipative. In what follows, the Banach spaces $L^p(\Omega, \mathcal{F}_t, P, \mathbb{R}^n)$ and $L^p(\Omega, \mathcal{F}, P, \mathbb{R}^n)$ with the usual norm $\|\cdot\|$ are denoted by $L_n^p(\mathcal{F}_t)$ and $L_n^p(\mathcal{F})$, respectively.

Let $\mathcal{M}^2(\mathcal{F}_t)$ denote the family of all (equivalence classes of) n -dimensional nonanticipative processes $(f_t)_{t \geq 0}$ such that $\int_0^\infty |f_t|^2 dt < \infty$, a.s. We shall also consider a subspace $\mathcal{L}_n^2$ of $\mathcal{M}^2(\mathcal{F}_t)$ defined by $\mathcal{L}_n^2 = \{(f_t)_{t \geq 0} \in \mathcal{M}^2(\mathcal{F}_t) : E \int_0^\infty |f_t|^2 dt < \infty\}$ with the norm

$\|\cdot\|_{\mathcal{L}_n^2}$ defined in the usual way. The Banach spaces $L^p(\mathbb{R}_+, \mathcal{B}_+, dt, \mathbb{R}_+)$, $p \geq 1$ and $L^2(\mathbb{R}_+ \times \mathbb{R}^n, \mathcal{B}_+ \otimes \mathcal{B}^n, dt \times q, \mathbb{R}_+)$, with the usual norms $|\cdot|_p$ and $\|\cdot\|_2$ will be denoted by $L^p(\mathcal{B}_+)$ and $L^2(\mathcal{B}_+ \times \mathcal{B}^n)$, respectively. Finally, by $M_n(\mathcal{F}_t)$ we denote a space of all (equivalence classes of) n -dimensional $\mathcal{F}_t$ -measurable mappings.

Throughout the paper, by $(w_t)_{t \geq 0}$ we mean a one-dimensional $\mathcal{F}_t$ -Brownian motion starting at 0, i.e., such that $P(w_0 = 0) = 1$. By $\nu(t, A)$ we denote a $\mathcal{F}_t$ -Poisson measure (see [1]) on $\mathbb{R}_+ \times \mathcal{B}^n$ and then define an $\mathcal{F}_t$ -centered Poisson measure $\tilde{\nu}(t, A)$, $t \geq 0$, $A \in \mathcal{B}^n$, by taking $\tilde{\nu}(t, A) = \nu(t, A) - tq(A)$, $t \geq 0$, $A \in \mathcal{B}^n$, where q is a measure on $\mathcal{B}^n$ such that $E\nu(t, B) = tq(B)$ and $q(B) < \infty$ for $B \in \mathcal{B}_0^n$.

By $\mathcal{M}^2(\mathcal{F}_t, q)$, we shall denote the family of all (equivalence classes of) $\mathcal{B}_+ \otimes \mathcal{F} \otimes \mathcal{B}^n$ -measurable and $\mathcal{F}_t$ -adapted functions $h: \mathbb{R}_+ \times \Omega \times \mathbb{R}^n \rightarrow \mathbb{R}^n$ such that $\int_0^\infty \int_{\mathbb{R}^n} |h_{t,z}|^2 dt q(dz) < \infty$ a.s. Recall that a function $h: \mathbb{R}_+ \times \Omega \times \mathbb{R}^n \rightarrow \mathbb{R}^n$ is said to be $\mathcal{F}_t$ -adapted or adapted if for every $x \in \mathbb{R}^n$ and $t \geq 0$, $h(t, \cdot, x)$ is $\mathcal{F}_t$ -measurable. Elements of $\mathcal{M}^2(\mathcal{F}_t, q)$ will be denoted by $h = (h_{t,z})_{t \geq 0, z \in \mathbb{R}^n}$. Finally, let $\mathcal{W}_n^2 = \{h \in \mathcal{M}^2(\mathcal{F}_t, q) : \|h\|_{\mathcal{W}_n^2}^2 < \infty\}$ where $\|h\|_{\mathcal{W}_n^2}^2 = E \int_0^\infty \int_{\mathbb{R}^n} |h_{t,z}|^2 dt q(dz)$.

Given $g \in \mathcal{M}^2(\mathcal{F}_t)$ and $h \in \mathcal{M}^2(\mathcal{F}_t, q)$, by $(\int_0^t g_\tau dw_\tau)_{t \geq 0}$ and $(\int_0^t \int_{\mathbb{R}^n} h_{\tau,z} \tilde{\nu}(d\tau, dz))_{t \geq 0}$, we denote their stochastic integrals with respect to an $\mathcal{F}_t$ -Brownian motion $(w_t)_{t \geq 0}$ and an $\mathcal{F}_t$ -centered Poisson measure $\tilde{\nu}(t, A)$, $t \geq 0$, $A \in \mathcal{B}^n$, respectively. These integrals, understood as n -dimensional stochastic processes, have quite similar properties (see [1]).

Let us denote by D the family of all n -dimensional $\mathcal{F}_t$ -adapted càdlàg (see [6]) processes $(x_t)_{t \geq 0}$ such that $E \sup_{t \geq 0} |x_t|^2 < \infty$. The space D is considered as a normed space with the

norm $\|\xi\|_\ell = \|\sup_{t \geq 0} |\xi_t|\|_{L^2}$ for $\xi = (\xi_t)_{t \geq 0} \in D$, where $\|\cdot\|_{L^2}$ is a norm of $L^2(\Omega, \mathcal{F}, P, \mathbb{R})$. It can be verified that $(D, \|\cdot\|_\ell)$ is a Banach space.

Given $0 \leq \alpha < \beta < \infty$ and $(x_t)_{t \geq 0} \in D$, let $x^{\alpha, \beta} = (x_t^{\alpha, \beta})_{t \geq 0}$ be such that $x_t^{\alpha, \beta} = x_\alpha$ and $x_t^{\alpha, \beta} = x_\beta$ for $0 \leq t \leq \alpha$ and $t \geq \beta$, respectively, and $x_t^{\alpha, \beta} = x_t$ for $\alpha \leq t \leq \beta$. It is clear that $D^{\alpha, \beta} = \{x^{\alpha, \beta}: x \in D\}$ is a linear subspace of D , closed in the $\|\cdot\|_\ell$ -norm topology. Then, $(D^{\alpha, \beta}, \|\cdot\|_\ell)$ is also a Banach space.

Given a measure space $(X, \mathcal{B}, m)$, a set-valued function $\mathcal{R}: X \rightarrow Cl(\mathbb{R}^n)$ is said to be $\mathcal{B}$ -measurable if $\{x \in X: \mathcal{R}(x) \cap C \neq \emptyset\} \in \mathcal{B}$ for every closed set $C \subset \mathbb{R}^n$. For such a multifunction, we define subtrajectory integrals as a set $\mathcal{Y}(\mathcal{R}) = \{g \in L^p(X, \mathcal{B}, m, \mathbb{R}^n): g(x) \in \mathcal{R}(x) \text{ a.e.}\}$. It is clear that for nonemptiness of $\mathcal{Y}(\mathcal{R})$ we must assume more than $\mathcal{B}$ -measurability of $\mathcal{R}$. In what follows, we shall assume that $\mathcal{B}$ -measurable set-valued function $\mathcal{R}: X \rightarrow Cl(\mathbb{R}^n)$ is p -integrable bounded, $p \geq 1$, i.e., that a real-valued mapping: $X \ni x \rightarrow \|\mathcal{R}(x)\| \in \mathbb{R}_+$ belongs to $L^p(X, \mathcal{B}, m, \mathbb{R}_+)$. It can be verified (see [2], Th. 3.2) that a $\mathcal{B}$ -measurable set-valued mapping $\mathcal{R}: X \rightarrow Cl(\mathbb{R}^n)$ is p -integrable bounded, $p \geq 1$, if and only if $\mathcal{Y}(\mathcal{R})$ is nonempty and bounded in $L^p(X, \mathcal{B}, m, \mathbb{R}^n)$. Finally, it is easy to see that $\mathcal{Y}(\mathcal{R})$ is decomposable, i.e., such that $\mathbb{I}_A f_1 + \mathbb{I}_{X/A} f_2 \in \mathcal{Y}(\mathcal{R})$ for $A \in \mathcal{B}$ and $f_1, f_2 \in \mathcal{Y}(\mathcal{R})$.

We have the following general result dealing with the properties of subtrajectory integrals (see [2], [3]).

Proposition 1. *Let $\mathcal{R}: X \rightarrow Cl(\mathbb{R}^n)$ be $\mathcal{B}$ -measurable and p -integrable bounded, $p \geq 1$. Then, $\mathcal{Y}(\mathcal{R})$ is a nonempty bounded and closed subset of $L^p(X, \mathcal{B}, m, \mathbb{R}^n)$. Moreover, if $\mathcal{R}$ takes on convex values then $\mathcal{Y}(\mathcal{R})$ is convex and weakly compact in $L^p(X, \mathcal{B}, m, \mathbb{R})$. $\square$*

Let $\mathcal{G} = (\mathcal{G}_t)_{t \geq 0}$ be a set-valued stochastic process with values in $Cl(\mathbb{R}^n)$, i.e., a family of $\mathcal{F}$ -measurable set-valued mappings $\mathcal{G}_t: \Omega \rightarrow Cl(\mathbb{R}^n)$, $t \geq 0$. We call $\mathcal{G}$ measurable if it is $\mathcal{B}_+ \otimes \mathcal{F}$ -measurable. Similarly, $\mathcal{G}$ is said to be $\mathcal{F}_t$ -adapted or adapted if $\mathcal{G}_t$ is $\mathcal{F}_t$ -measurable for each $t \geq 0$. A measurable and adapted set-valued stochastic process is called nonanticipative.

In what follows, we shall also consider $\mathcal{B}_+ \otimes \mathcal{F} \otimes \mathcal{B}^n$ -measurable set-valued mappings $\mathcal{R}: \mathbb{R}_+ \times \Omega \times \mathbb{R}^n \rightarrow Cl(\mathbb{R}^n)$. They will be denoted as families $(\mathcal{R}_{t,z})_{t \geq 0, z \in \mathbb{R}^n}$ and called measurable set-valued stochastic processes depending on a parameter $z \in \mathbb{R}^n$. The process $\mathcal{R} = (\mathcal{R}_{t,z})_{t \geq 0, z \in \mathbb{R}^n}$ is said to be $\mathcal{F}_t$ -adapted or adapted if $\mathcal{R}_{t,z}$ is $\mathcal{F}_t$ -measurable for each $t \geq 0$ and $z \in \mathbb{R}^n$. We call it nonanticipative if it is measurable and adapted.

Denote by $\mathcal{M}_{s-v}^2(\mathcal{F}_t)$ and $\mathcal{M}_{s-v}^2(\mathcal{F}_t, q)$ families of all nonanticipative set-valued processes $\mathcal{G} = (\mathcal{G}_t)_{t \geq 0}$ and $\mathcal{R} = (\mathcal{R}_{t,z})_{t \geq 0, z \in \mathbb{R}^n}$, respectively, such that $\int_0^\infty \|\mathcal{G}_t\|^2 dt < \infty$ and $\int_0^\infty \int_{\mathbb{R}^n} \|\mathcal{R}_{t,z}\|^2 dt q(dz) < \infty$, a.s. Immediately, from Kuratowski and Ryll-Nardzewski measurable

selection theorem (see [3]) it follows that for every $F, \mathcal{G} \in \mathcal{M}_{s-v}^2(\mathcal{F}_t)$ and $\mathcal{R} \in \mathcal{M}_{s-v}^2(\mathcal{F}_t, q)$ their subtrajectory integrals

$$\mathcal{Y}(F) = \{f \in \mathcal{M}^2(\mathcal{F}_t): f_t(\omega) \in F_t(\omega), dt \times P - \text{a.e.}\},$$

$$\mathcal{Y}(\mathcal{G}) = \{g \in \mathcal{M}^2(\mathcal{F}_t): g_t(\omega) \in \mathcal{G}_t(\omega), dt \times P - \text{a.e.}\} \text{ and}$$

$$\mathcal{Y}_q(\mathcal{R}) = \{h \in \mathcal{M}^2(\mathcal{F}_t, q): h_{t,z}(\omega) \in \mathcal{R}_{t,z}(\omega), dt \times P \times q - \text{a.e.}\}$$

are nonempty. Indeed, let $\Sigma = \{Z \in \mathcal{B}_+ \otimes \mathcal{F}: Z_t \in \mathcal{F}_t, \text{ each } t \geq 0\}$, where Z_t denotes a section of Z determined by $t \geq 0$. It is a σ -algebra on $\mathbb{R}_+ \times \Omega$ and a function $f: \mathbb{R}_+ \times \Omega \rightarrow \mathbb{R}^n$ (a multifunction $F: \mathbb{R}_+ \times \Omega \rightarrow Cl(\mathbb{R}^n)$) is nonanticipative if and only if it is Σ -measurable. Therefore,

by Kuratowski and Ryll-Nardzewski measurable selection theorem every nonanticipative set-valued function admits a nonanticipative selector. It is clear that for $F \in \mathcal{M}_{s-\nu}^2(\mathcal{F}_t)$ such selector belongs to $\mathcal{M}^2(\mathcal{F}_t)$. Similarly, define on $\mathbb{R}_+ \times \Omega \times \mathbb{R}^n$ a σ -algebra

$$\tilde{\Sigma} = \{Z \in \mathcal{B}_+ \otimes \mathcal{F} \otimes \mathcal{B}^n: Z_t^u \in \mathcal{F}_t, \text{ each } t \geq 0 \text{ and } u \in \mathbb{R}^n\},$$

where $Z_t^u = (Z^u)_t$ and Z^u is a section of Z determined by $u \in \mathbb{R}^n$.

Given the set-valued processes

$$F = (F_t)_{t \geq 0} \in \mathcal{M}_{s-\nu}^2(\mathcal{F}_t), \mathcal{G} = (\mathcal{G}_t)_{t \geq 0} \in \mathcal{M}_{s-\nu}^2(\mathcal{F}_t) \text{ and} \\ \mathcal{R} = (\mathcal{R}_{t,z})_{t \geq 0, z \in \mathbb{R}^n} \in \mathcal{M}_{s-\nu}^2(\mathcal{F}_t, q)$$

by their stochastic integrals we mean families

$$\left(\int_0^t F_\tau d\tau\right)_{t \geq 0}, \left(\int_0^t \mathcal{G}_\tau dw_\tau\right)_{t \geq 0}, \text{ and } \left(\int_0^t \int_{\mathbb{R}^n} \mathcal{R}_{\tau,z} \tilde{\nu}(d\tau, dz)\right)_{t \geq 0}$$

of subsets defined by

$$\int_0^t F_\tau d\tau = \left\{ \int_0^t f_\tau d\tau : f \in \mathcal{Y}(F) \right\}, \\ \int_0^t \mathcal{G}_\tau dw_\tau = \left\{ \int_0^t g_\tau dw_\tau : g \in \mathcal{Y}(\mathcal{G}) \right\} \text{ and} \\ \left\{ \int_0^t \int_{\mathbb{R}^n} \mathcal{R}_{\tau,z} \tilde{\nu}(d\tau, dz) = \left\{ \int_0^t \int_{\mathbb{R}^n} h_{\tau,z} \tilde{\nu}(d\tau, dz) : h \in \mathcal{Y}_q(\mathcal{R}) \right\} \right\}.$$

Given $0 \leq \alpha < \beta < \infty$ we also define

$$\int_\alpha^\beta F_s ds = \left\{ \int_\alpha^\beta f_s ds : f \in \mathcal{Y}(F) \right\}, \\ \int_\alpha^\beta \mathcal{G}_s dw_s = \left\{ \int_\alpha^\beta g_s dw_s : g \in \mathcal{Y}(\mathcal{G}) \right\} \text{ and} \\ \int_\alpha^\beta \int_{\mathbb{R}^n} \mathcal{R}_{s,z} \tilde{\nu}(ds, dz) = \left\{ \int_\alpha^\beta \int_{\mathbb{R}^n} h_{s,z} \tilde{\nu}(ds, dz) : h \in \mathcal{Y}_q(\mathcal{R}) \right\}.$$

3. Stochastic Inclusions

Let $F = \{(F_t(x))_{t \geq 0} : x \in \mathbb{R}^n\}$, $G = \{(G_t(x))_{t \geq 0} : x \in \mathbb{R}^n\}$ and $H = \{(H_{t,z}(x))_{t \geq 0, z \in \mathbb{R}^n} : x \in \mathbb{R}^n\}$. Assume F, G and H are such that $(F_t(x))_{t \geq 0} \in \mathcal{M}_{s-\nu}^p(\mathcal{F}_t)$, $(G_t(x))_{t \geq 0} \in \mathcal{M}_{s-\nu}^2(\mathcal{F}_t)$ and $(H_{t,z}(x))_{t \geq 0, z \in \mathbb{R}^n} \in \mathcal{M}_{s-\nu}^2(\mathcal{F}_t, q)$ each $x \in \mathbb{R}^n$.

By a stochastic inclusion, denoted by $SI(F, G, H)$, corresponding to given above F, G and H we mean a relation

$$x_t - x_s = \int_s^t F_\tau(x_\tau) d\tau + \int_s^t G_\tau(x_\tau) dw_\tau + \int_s^t \int_{\mathbb{R}^n} H_{\tau,z}(x_\tau) \tilde{\nu}(d\tau, dz)$$

that is to be satisfied for every $0 \leq s < t < \infty$ by a stochastic process $x = (x_t)_{t \geq 0} \in D$ such that $F \circ x \in \mathcal{M}_{s-\nu}^p(\mathcal{F}_t)$, $G \circ x \in \mathcal{M}_{s-\nu}^2(\mathcal{F}_t)$ and $H \circ x \in \mathcal{M}_{s-\nu}^2(\mathcal{F}_t, q)$, where $F \circ x = (F_t(x_t))_{t \geq 0}$, $G \circ x = (G_t(x_t))_{t \geq 0}$ and $H \circ x = (H_{t,z}(x_t))_{t \geq 0, z \in \mathbb{R}^n}$. Every stochastic process $(x_t)_{t \geq 0} \in D$, satisfying conditions mentioned above is said to be a global solution to $SI(F, G, H)$.

A stochastic process $(x_t)_{t \geq 0} \in D$ is a local solution to $SI(F, G, H)$ on $[\alpha, \beta]$ if and only if $x^{\alpha, \beta}$ is a global solution to $SI(F^{\alpha\beta}, G^{\alpha\beta}, H^{\alpha\beta})$, where $F^{\alpha\beta} = \mathbb{I}_{[\alpha, \beta]} F$, $G^{\alpha\beta} = \mathbb{I}_{[\alpha, \beta]} G$ and $H^{\alpha\beta} = \mathbb{I}_{[\alpha, \beta]} H$.

A stochastic process $(x_t)_{t \geq 0} \in D$ is called a global (local on $[\alpha, \beta]$, resp.) solution to an initial value problem for stochastic inclusion $SI(F, G, H)$ with an initial condition $y \in L^2(\Omega, \mathcal{F}_0, \mathbb{R}^n)$ ($y \in \mathcal{F}_\alpha, \mathbb{R}^n$, resp.) if $(x_t)_{t \geq 0}$ is a global (local on $[\alpha, \beta]$, resp.) solution to $SI(F, G < h)$ and $x_0 = y$ ($x_\alpha = y$, resp.). An initial-value problem for $SI(F, G, H)$ mentioned above will be denoted by $SI_y(F, G, H)$ ($S_y^{\alpha, \beta}(F, G, H)$, resp.). In what follows, we denote a set of all global (local on $[\alpha, \beta]$) solutions to $SI_y(F, G, H)$ by $\Lambda_y(F, G, H)$ ($\Lambda_y^{\alpha, \beta}(F, G, H)$, resp.).

Suppose F, G and H satisfy the following conditions:

- ($\mathcal{A}_1$) (i) $F = \{(F_t(x))_{t \geq 0} : x \in \mathbb{R}^n\}$, $G = \{(G_t(x))_{t \geq 0} : x \in \mathbb{R}^n\}$ and $H = \{(H_{t,z}(x))_{t \geq 0, z \in \mathbb{R}^n} : x \in \mathbb{R}^n\}$ are such that mappings $\mathbb{R}^+ \times \Omega \times \mathbb{R}^n \ni (t, \omega, x) \rightarrow F_t(x)(\omega) \in \text{Comp}(\mathbb{R}^n)$, $\mathbb{R}^+ \times \Omega \times \mathbb{R}^n \ni (t, \omega, x) \rightarrow G_t(x)(\omega) \in \text{Comp}(\mathbb{R}^n)$ and $\mathbb{R}^+ \times \Omega \times \mathbb{R}^n \times \mathbb{R}^n \ni (t, \omega, z, x) \rightarrow H_{t,z}(x)(\omega) \in \text{Comp}(\mathbb{R}^n)$ are $\Sigma \otimes \mathcal{B}^n$ and $\tilde{\Sigma} \otimes \mathcal{B}^n$ -measurable, respectively, where Σ and $\tilde{\Sigma}$ are σ -algebras on $\mathbb{R}^+ \times \Omega$ and $\mathbb{R}^+ \times \Omega \times \mathbb{R}^n$ defined above,
- (ii) $(F_t(x))_{t \geq 0}$, $(G_t(x))_{t \geq 0}$ and $(H_{t,z}(x))_{t \geq 0, z \in \mathbb{R}^n}$ are square integrable bounded for fixed $x \in \mathbb{R}^n$.

Corollary 1: For every $(x_t)_{t \geq 0} \in D$ and F, G, H satisfying ($\mathcal{A}_1$) one has $F \circ x$, $G \circ x \in \mathcal{M}_{s-\nu}^2(\mathcal{F}_t)$ and $H \circ x \in \mathcal{M}_{s-\nu}^2(\mathcal{F}_t, q)$. $\square$

Now, define a linear mapping Φ on $\mathcal{M}^2(\mathcal{F}_t) \times \mathcal{M}^2(\mathcal{F}_t \times \mathcal{M}^2(\mathcal{F}_t, q))$ by taking $\Phi(f, g, h) = \int_0^t f_\tau d\tau + \int_0^t g_\tau dw_\tau + \int_0^t \int_{\mathbb{R}^n} h_{\tau,z} \tilde{\nu}(d\tau, dz)_{t \geq 0}$ to each $(f, g, h) \in \mathcal{M}^2(\mathcal{F}_t) \times \mathcal{M}^2(\mathcal{F}_t) \times \mathcal{M}^2(\mathcal{F}_t, q)$.

It is clear that Φ maps $\mathcal{L}_n^2 \times \mathcal{L}_n^2 \times \mathcal{W}_n^2$ into D .

In what follows, we shall deal with $F = \{(F_t(x))_{t \geq 0} : x \in \mathbb{R}^n\}$, $G = \{(G_t(x))_{t \geq 0} : x \in \mathbb{R}^n\}$ and $H = \{(H_{t,z}(x))_{t \geq 0, z \in \mathbb{R}^n} : x \in \mathbb{R}^n\}$ satisfying conditions ($\mathcal{A}_1$) and any one of the following conditions.

- ($\mathcal{A}_2$) There are $k, \ell \in \mathcal{L}_1^2$ and $m \in \mathcal{W}_1^2$ such that $\|\int_0^\infty h[(F \circ x)_t, (F \circ y)_t] dt\|_{\mathcal{L}_1^2} \leq E \int_0^\infty k_t |x_t - y_t| dt$, $\|h(G \circ x, G \circ y)\|_{\mathcal{L}_1^2} \leq E \int_0^\infty \ell_t |x_t - y_t| dt$ and $\|h(H \circ x, H \circ y)\|_{\mathcal{W}_1^2} \leq E \int_0^\infty \int_{\mathbb{R}^n} m_{t,z} |x_t - y_t| dt q(dz)$ for all $x, y \in D$.

- ($\mathcal{A}_3$) There are $k, \ell \in L^2(\mathcal{B}_+)$ and $m \in L^2(\mathcal{B}_+ \times \mathcal{B}^n)$ such that $h(F_t(x_2)(\omega), F_t(x_1)(\omega)) \leq k(t) |x_1 - x_2|$, $h(G_t(x_2)(\omega), G_t(x_1)(\omega)) \leq \ell(t) |x_1 - x_2|$ and $h(H_{t,z}(x_2)(\omega), H_{t,z}(x_1)(\omega)) \leq m(t, z) |x_1 - x_2|$ a.e., each $t \geq 0$ and $x_1, x_2 \in \mathbb{R}^n$.

Lemma 1: Let $\varphi \in L^2(\Omega, \mathcal{F}_0, \mathbb{R}^n)$. Suppose F, G and H satisfy ($\mathcal{A}_1$) and ($\mathcal{A}_2$) or ($\mathcal{A}_3$). Let $x^n = \varphi + \Phi(f^{n-1}, g^{n-1}, h^{n-1})$, each $n = 1, 2, \dots$, with $(f^0, g^0, h^0) \in \mathcal{Y}(F \circ 0) \times \mathcal{Y}(G \circ 0) \times \mathcal{Y}_q(H \circ 0)$ and $(f^n, g^n, h^n) \in \mathcal{Y}(F \circ x^n) \times \mathcal{Y}(G \circ x^n) \times \mathcal{Y}_q(H \circ x^n)$ satisfying $|f_t^{n-1}(\omega) - f_t^n(\omega)| = \text{dist}(f_t^{n-1}(\omega), (F \circ x^n)_t(\omega))$, $|g_t^{n-1}(\omega) - g_t^n(\omega)| = \text{dist}(g_t^{n-1}(\omega), (G \circ x^n)_t(\omega))$ and $|h_{t,z}^{n-1}(\omega) - h_{t,z}^n(\omega)| = \text{dist}(h_{t,z}^{n-1}(\omega), (H \circ x^n)_{t,z}(\omega))$, on $\mathbb{R}^+ \times \Omega$ and $\mathbb{R}^+ \times \Omega \times \mathbb{R}^n$, respectively. If $L := \|\int_0^\infty k_t dt\|_{L_1^2} + 2 \|\int_0^\infty \ell_t dt\|_{L_1^2} + 2 \|\int_0^\infty \int_{\mathbb{R}^n} m_{\tau,z} d\tau q(dz)\|_{L_1^2} < 1$ or $L' := |k|_1 + 2| \ell |_2 + 2\|m\|_2 < 1$, respectively then $(x^n)_{n=1}^\infty$ is a Cauchy sequence of $(D, \|\cdot\|_\ell)$.

Proof: Let $(x^n)_{n=1}^\infty$ be such as above. By $(\mathcal{A}_2)$ it follows

$$\begin{aligned} & E \left[\sup_{t \geq 0} \left| \int_0^t (f_\tau^n - f_\tau^{n-1}) d\tau \right| \right]^2 \leq E \left[\int_0^\infty |f_\tau^n - f_\tau^{n-1}| d\tau \right]^2 \\ & \leq E \left[\int_0^\infty \bar{h}((F \circ x^n)_\tau, (F \circ x^{n-1})_\tau) d\tau \right]^2 \leq \left(E \int_0^\infty k_\tau |x_\tau^n - x_\tau^{n-1}| d\tau \right)^2 \\ & \leq \left[E \left(\sup_{t \geq 0} |x_t^n - x_t^{n-1}| \cdot \int_0^\infty k_\tau d\tau \right) \right]^2 \leq E \left(\int_0^\infty k_\tau d\tau \right)^2 \cdot \|x^n - x^{n-1}\|_\ell^2. \end{aligned}$$

Similarly, by Doob's inequality, we obtain

$$\begin{aligned} & E \left[\sup_{t \geq 0} \left| \int_0^t (g_\tau^n - g_\tau^{n-1}) dw_\tau \right| \right]^2 \leq 4E \int_0^\infty |g_\tau^n - g_\tau^{n-1}|^2 d\tau \\ & \leq 4E \int_0^\infty [\bar{h}((G \circ x^n)_\tau, (G \circ x^{n-1})_\tau)]^2 d\tau \leq 4 \left(E \int_0^\infty \ell_\tau |x_\tau^n - x_\tau^{n-1}| d\tau \right)^2 \\ & \leq 4 \left[E \left(\sup_{t \geq 0} |x_t^n - x_t^{n-1}| \cdot \int_0^\infty \ell_\tau d\tau \right) \right]^2 \leq 4E \left(\int_0^\infty \ell_\tau d\tau \right)^2 \cdot \|x^n - x^{n-1}\|_\ell^2. \end{aligned}$$

Quite similarly we also get

$$\begin{aligned} & E \left[\sup_{t \geq 0} \left| \int_0^t \int_{\mathbb{R}^n} (h_\tau^n - h_{\tau,z}^{n-1}) \tilde{\nu}(d\tau, dz) \right| \right]^2 \\ & \leq 4E \left(\int_0^\infty \int_{\mathbb{R}^n} m_{\tau,z} d\tau q(dz) \right)^2 \cdot \|x_\tau^n - x_\tau^{n-1}\|_\ell^2. \end{aligned}$$

Therefore, $\|x^{n+1} - x^n\|_\ell \leq L^n \|x^1\|_\ell$, where L is such as above. This implies that

$$\|x^m - x^n\|_\ell \leq \frac{L^n \cdot \|x^1\|_\ell}{1 - L},$$

each $m > n \geq 1$. Using conditions $(\mathcal{A}_3)$ instead of $(\mathcal{A}_2)$ we also get

$$\|x^m - x^n\|_\ell \leq \frac{(L')^n \cdot \|x^1\|_\ell}{1 - L'},$$

for $m > n \geq 1$. Therefore, $\|x^m - x^n\|_\ell \rightarrow 0$ as $n \rightarrow \infty$. □

Lemma 2: Let $\varphi \in L^2(\Omega, \mathcal{F}_0, \mathbb{R}^n)$. Suppose F, G and H satisfy $(\mathcal{A}_1)$ and $(\mathcal{A}_3)$. If $L := \|k\|_1 + 2\| \ell \|_2 + 2\|m\|_2 < 1$, then $\Lambda_\varphi(F, G, H) \neq \emptyset$.

Proof: Let $(x^n)_{n=1}^\infty$ be such as in Lemma 1 and let $x = \lim_{n \rightarrow \infty} x^n$. The existence of such a sequence follows immediately from the measurable selection theorem given in [3] (see Th. II, 3.13). We shall now show that $(f^n)_{n=1}^\infty$, $(g^n)_{n=1}^\infty$ and $(h^n)_{n=1}^\infty$ are Cauchy sequences of $\mathcal{L}_n^2$ and $\mathcal{W}_n^2$, respectively. Indeed, one obtains

$$\begin{aligned} \|f^m - f^n\|_{\mathcal{L}_n^2} &= \sum_{j=n+1}^m [\|f^j - f^{j-1}\|_{\mathcal{L}_n^2}]^{1/2} \\ &\leq \sum_{j=n+1}^m [E \int_0^\infty h^2((F \circ x^j)_\tau, (F \circ x^{j-1})_\tau) d\tau]^{1/2} \\ &\leq \sum_{j=n+1}^m \|k\|_2 \|x^j - x^{j-1}\|_\ell \leq \sum_{j=n+1}^m L^{j-1} \|k\|_2 \|x^1\|_\ell \leq \frac{L^n \|k\|_2 \|x^1\|_\ell}{1-L}. \end{aligned}$$

Therefore, $(f^n)_{n=1}^\infty$ is a Cauchy sequence of $\mathcal{L}_n^2$. Quite similarly, it also follows that $(g^n)_{n=1}^\infty$ and $(h^n)_{n=1}^\infty$ are Cauchy sequences of $\mathcal{L}_n^2$ and $\mathcal{W}_n^2$, respectively. Let $f, g \in \mathcal{L}_n^2$ and $h \in \mathcal{W}_n^2$ be such that $\|f^n - f\|_{\mathcal{L}_n^2} \rightarrow 0$, $\|g^n - g\|_{\mathcal{L}_n^2} \rightarrow 0$ and $\|h^n - h\|_{\mathcal{W}_n^2} \rightarrow 0$ as $n \rightarrow \infty$. One gets $\|x^n - \varphi - \Phi(f, g, h)\|_\ell \rightarrow 0$ as $n \rightarrow \infty$. Therefore, $x = \varphi + \Phi(f, g, h)$. To prove that

$$x_t - x_s \in \int_s^t (F \circ x)_\tau d\tau + \int_s^t (G \circ x)_\tau dw_\tau + \int_s^t \int_{\mathbb{R}^n} (H \circ x)_\tau, z \tilde{\nu}(d\tau, dz)$$

for every $0 \leq s < t < \infty$ it suffices only to verify that $(f, g, h) \in \mathcal{Y}(F \circ x) \times \mathcal{Y}(G \circ x) \times \mathcal{Y}_q(H \circ x)$. For this aim, denote by $\text{Dist}(a, B)$ and $\bar{H}$ the distance of $a \in \mathcal{L}_n^2$ to a nonempty set $B \subset \mathcal{L}_n^2$ and the Hausdorff subdistance, respectively induced by the norm of $\mathcal{L}_n^2$. Now let v be a fixed element of $\mathcal{Y}(F \circ x^n)$. Select $u \in \mathcal{Y}(F \circ x)$ such that $|v_\tau(\omega) - u_\tau(\omega)| = \text{dist}(v_\tau(\omega), (F \circ x)_\tau(\omega))$ for $(\tau, \omega) \in \mathbb{R}_+ \times \Omega$. Then

$$\begin{aligned} \text{Dist}(v, \mathcal{Y}(F \circ x)) &\leq \|v - u\|_{\mathcal{L}_n^2} \\ &\leq \left(E \int_0^\infty h^2((F \circ x^n)_\tau(\omega), (F \circ x)_\tau(\omega)) d\tau \right)^{\frac{1}{2}} \leq \|k\|_2 \|x^n - x\|_\ell, \end{aligned}$$

which implies $\bar{H}(\mathcal{Y}(F \circ x^n), \mathcal{Y}(F \circ x)) \leq \|k\|_2 \|x^n - x\|_\ell$, each $n = 1, 2, \dots$. Thus $\bar{H}(\mathcal{Y}(F \circ x^n), \mathcal{Y}(F \circ x)) \rightarrow 0$ as $n \rightarrow \infty$. In a similar way we also get $\bar{H}(\mathcal{Y}(G \circ x^n), \mathcal{Y}(G \circ x)) \rightarrow 0$ and $\bar{H}(\mathcal{Y}_q(H \circ x^n), \mathcal{Y}_q(H \circ x)) \rightarrow 0$ as $n \rightarrow \infty$. Now we get

$$\begin{aligned} \text{Dist}(f, \mathcal{Y}(F \circ x)) &\leq \|f - f_n\|_{\mathcal{L}_n^2} + \text{Dist}(f_n, \mathcal{Y}(F \circ x^{n-1})) \\ &\quad + \bar{H}(\mathcal{Y}(F \circ x^{n-1}), \mathcal{Y}(F \circ x)) \end{aligned}$$

for $n = 1, 2, \dots$, which implies that $\text{Dist}(f, \mathcal{Y}(F \circ x)) = 0$. But, $\mathcal{Y}(F \circ x)$ is a nonempty closed subset of $\mathcal{L}_n^2$. Therefore, $f \in \mathcal{Y}(F \circ x)$. In a similar way we can also verify that $g \in \mathcal{Y}(G \circ x)$ and $h \in \mathcal{Y}_q(H \circ x)$. $\square$

Lemma 3: Let $0 \leq \alpha < \beta < \infty$ and $\varphi \in L^2(\Omega, \mathfrak{F}_\alpha, \mathbb{R}^n)$. Suppose F , G , and H satisfy $(\mathcal{A}_1)$ and $(\mathcal{A}_3)$. If $L_{\alpha, \beta} = \|\mathbb{I}_{[\alpha, \beta]}^k\|_1 + 2\|\mathbb{I}_{[\alpha, \beta]}^\ell\|_2 + 2\|\mathbb{I}_{[\alpha, \beta]}^m\|_2 < 1$ then $\Lambda_\varphi^{\alpha, \beta}(F, G, H) \neq \emptyset$.

Proof: The proof follows immediately from Lemma 2 applied to $F^{\alpha\beta} = \mathbb{I}_{[\alpha, \beta]}F$, $G^{\alpha\beta} = \mathbb{I}_{[\alpha, \beta]}G$ and $H^{\alpha\beta} = \mathbb{I}_{[\alpha, \beta]}H$. $\square$

Lemma 4: Let $\varphi \in L^2(\Omega, \mathfrak{F}_0, \mathbb{R}^n)$ and let $(\tau_n)_{n=1}^\infty$ be a sequence of positive number increasing to $+\infty$. Suppose F, G and H satisfy $(\mathcal{A}_1)$ and $(\mathcal{A}_3)$. If $x^1 \in \Lambda_\varphi^{0, \tau_1}(F, G, H)$ and $x^{n+1} \in \Lambda_{x_n^{\tau_n}}^{\tau_n, \tau_{n+1}}(F, G, H)$ for $n = 1, 2, \dots$, then $x = \sum_{n=1}^\infty \mathbb{I}_{[\tau_{n-1}, \tau_n]} x^n$ belongs to $\Lambda_\varphi(F, G, H)$, where $\tau_0 = 0$.

Proof: It is clear that $x_0 = \varphi$ because $x_0 = x_0^1 = \varphi$. Let $0 \leq s < t < \infty$ be fixed and suppose $s \in [\tau_{k-1}, \tau_k)$, and $t \in [\tau_{m-1}, \tau_m)$, for $1 \leq k < m$. One obtains

$$x_t - x_s = (x_t^m - x_{\tau_{m-1}}^m) + (x_{\tau_{m-1}}^m - x_{\tau_{m-2}}^m) + \dots + (x_{\tau_k}^{k+1} - x_{\tau_k}^k) + (x_{\tau_k}^k - x_s^k).$$

Let $(f^j, g^j, h^j) \in S(F \circ x^j) \times S(G \circ x^j) \times S_q(H \circ x^j)$, each $j = k, k+1, \dots, m$ be such that

$$\begin{aligned} x_t^m - x_{\tau_{m-1}}^m &= \int_{\tau_{m-1}}^t f_\tau^m d\tau + \int_{\tau_{m-1}}^t g_\tau^m dw_\tau + \int_{\tau_{m-1}}^t \int_{\mathbb{R}^n} h_\tau^m \tilde{\nu}(d\tau, dz), \\ x_{\tau_j}^j - x_{\tau_{j-1}}^j &= \int_{\tau_{j-1}}^{\tau_j} f_\tau^j d\tau + \int_{\tau_{j-1}}^{\tau_j} g_\tau^j dw_\tau + \int_{\tau_{j-1}}^{\tau_j} \int_{\mathbb{R}^n} h_\tau^j \tilde{\nu}(dt, dz), \end{aligned}$$

each $j = k+1, \dots, m-1$, and

$$x_{\tau_k}^k - x_s^k = \int_s^{\tau_k} f_\tau^k d\tau + \int_s^{\tau_k} g_\tau^k dw_\tau + \int_s^{\tau_k} \int_{\mathbb{R}^n} h_\tau^k \tilde{\nu}(d\tau, dz).$$

Let $f = \mathbb{I}_{[0, \tau_{k-1})} f^k + \sum_{j=k}^m \mathbb{I}_{[\tau_{j-1}, \tau_j)} f^j + \mathbb{I}_{[\tau_m, \infty)} f^m$, $g = \mathbb{I}_{[0, \tau_{k-1})} g^k + \sum_{j=k}^m \mathbb{I}_{[\tau_{j-1}, \tau_j)} g^j + \mathbb{I}_{[\tau_m, \infty)} g^m$ and $h = \mathbb{I}_{[0, \tau_{k-1})} h^k + \sum_{j=k}^m \mathbb{I}_{[\tau_{j-1}, \tau_j)} h^j + \mathbb{I}_{[\tau_m, \infty)} h^m$. It is clear that $(f, g, h) \in S(F \circ x) \times S(G \circ x) \times S_q(H \circ x)$ and $x_t - x_s = \int_s^t f_\tau d\tau + \int_s^t g_\tau dw_\tau + \int_s^t \int_{\mathbb{R}^n} h_{\tau, z} \tilde{\nu}(d\tau, dz)$. Therefore

$$x_t - x_s \in \int_s^t (F \circ x)_\tau d\tau + \int_s^t (G \circ x)_\tau dw_\tau + \int_s^t \int_{\mathbb{R}^n} (H \circ x)_{\tau, z} \tilde{\nu}(d\tau, dz). \quad \square$$

We can prove now the main result of this paper.

Theorem 5: Let $\varphi \in L^2(\Omega, \mathfrak{F}_0, \mathbb{R}^n)$. Suppose F, G and H satisfy $(\mathcal{A}_1)$ and $(\mathcal{A}_3)$. Then $\Lambda_\varphi(F, G, H) \neq \emptyset$.

Proof: Let $(\tau_n)_{n=1}^\infty$ be a sequence of positive numbers increasing to ∞ . Select a positive number σ such that $L_{k\sigma, (k+1)\sigma} < 1$ for $k = 0, 1, \dots$, where $L_{k\sigma, (k+1)\sigma}$ is such as in Lemma 3. Suppose a positive integer n_1 is such that $n_1\sigma < \tau_1 \leq (n_1+1)\sigma$. By virtue of Lemma 3, there

is $z^1 \in \Lambda_\varphi^{0,\sigma}(F, G, H)$. By the same argument, there is $z^2 \in \Lambda_{z_\sigma^1}^{\sigma, 2\sigma}(F, G, H)$. Continuing the above procedure we can finally find a $z^{n_1+1} \in \Lambda_{z_{n_1\sigma}^{n_1\sigma, \tau_1}}^{n_1\sigma, \tau_1}(F, G, H)$. Put

$$x^1 = \sum_{k=0}^{n_1-1} \mathbb{I}_{[k\sigma, (k+1)\sigma)} z^{k+1} + \mathbb{I}_{[n_1\sigma, \tau_1]} z^{n_1+1} + \mathbb{I}_{(\tau_1, \infty)} z_{\tau_1}^{n_1+1}.$$

Similarly as in the proof of Lemma 4, we can easily verify that $x^1 \in \Lambda_\varphi^{0, \tau_1}(F, G, H)$. Repeating the above procedure to the interval $[\tau_1, \tau_2]$, we can find $x^2 \in \Lambda_{x_{\tau_1}^1}^{\tau_1, \tau_2}(F, G, H)$.

Continuing this process, we can define a sequence (x^n) of D satisfying conditions of Lemma 4. Therefore $\Lambda_\varphi(F, G, H) \neq \emptyset$. $\square$
