This paper deals with new methods for approximating a solution to the fixed point problem; find \( \tilde{x} \in F(T) \), where \( H \) is a Hilbert space, \( C \) is a closed convex subset of \( H \), \( f \) is a \( \rho \)-contraction from \( C \) into \( H \), \( 0 < \rho < 1 \), \( A \) is a strongly positive linear-bounded operator with coefficient \( \gamma > 0 \), \( 0 < \gamma < \gamma/\rho \), \( T \) is a nonexpansive mapping on \( C \), and \( P_{F(T)} \) denotes the metric projection on the set of fixed point of \( T \). Under a suitable different parameter, we obtain strong convergence theorems by using the projection method which solves the variational inequality \( \langle (A-\gamma f)\tilde{x}+\tau(I-S)\tilde{x},x-\tilde{x}\rangle \geq 0 \) for \( x \in F(T) \), where \( \tau \in [0,\infty) \). Our results generalize and improve the corresponding results of Yao et al. (2010) and some authors. Furthermore, we give an example which supports our main theorem in the last part.

1. Introduction

Throughout this paper, we assume that \( H \) is a real Hilbert space where inner product and norm are denoted by \( \langle \cdot,\cdot \rangle \) and \( \| \cdot \| \), respectively, and let \( C \) be a nonempty closed convex subset of \( H \). A mapping \( T : C \to C \) is called nonexpansive if

\[
\|Tx - Ty\| \leq \|x - y\|, \quad \forall x, y \in C. \tag{1.1}
\]

We use \( F(T) \) to denote the set of fixed points of \( T \), that is, \( F(T) = \{ x \in C : Tx = x \} \). It is assumed throughout the paper that \( T \) is a nonexpansive mapping such that \( F(T) \neq \emptyset \).

Recall that a mapping \( f : C \to H \) is a contraction on \( C \) if there exists a constant \( \rho \in (0,1) \) such that

\[
\|f(x) - f(y)\| \leq \rho\|x - y\|, \quad \forall x, y \in C. \tag{1.2}
\]
A mapping $A : H \to H$ is called a strongly positive linear bounded operator on $H$ if there exists a constant $\gamma > 0$ with property
\[
\langle Ax, x \rangle \geq \gamma \|x\|^2, \quad \forall x \in H. \quad (1.3)
\]

A mapping $M : H \to H$ is called a strongly monotone operator with $\alpha$ if
\[
\langle x - y, Mx - My \rangle \geq \alpha \|x - y\|^2, \quad \forall x, y \in H, \quad (1.4)
\]
and $M$ is called a monotone operator if
\[
\langle x - y, Mx - My \rangle \geq 0, \quad \forall x, y \in H. \quad (1.5)
\]

We easily prove that the mapping $(I - T)$ is monotone operator, if $T$ is nonexpansive mapping. The metric (or nearest point) projection from $H$ onto $C$ is mapping $P_C[] : H \to C$ which assigns to each point $x \in C$ the unique point $P_C[x] \in C$ satisfying the property
\[
\|x - P_C[x]\| = \inf_{y \in C} \|x - y\| =: d(x, C). \quad (1.6)
\]

The variational inequality for a monotone operator, $M : H \to H$ over $C$, is to find a point in
\[
\text{VI}(C, M) := \{\bar{x} \in C : \langle x - \bar{x}, M\bar{x} \rangle \geq 0, \quad \forall x \in C\}. \quad (1.7)
\]

A hierarchical fixed point problem is equivalent to the variational inequality for a monotone operator over the fixed point set. Moreover, to find a hierarchically fixed point of a nonexpansive mapping $T$ with respect to another nonexpansive mapping $S$, namely, we find $\bar{x} \in F(T)$ such that
\[
\langle x - \bar{x}, (I - S)\bar{x} \rangle \geq 0, \quad \forall x \in F(T). \quad (1.8)
\]

Iterative methods for nonexpansive mappings have recently been applied to solve a convex minimization problem; see, for example, [1–5] and the references therein. A typical problem is to minimize a quadratic function over the set of the fixed points of a nonexpansive mapping on a real Hilbert space $H$:
\[
\min_{x \in F(T)} \frac{1}{2} \langle Ax, x \rangle - \langle x, b \rangle, \quad (1.9)
\]
where $b$ is a given point in $H$. In [5], it is proved that the sequence $\{x_n\}$ defined by the iterative method below, with the initial guess $x_0 \in H$ chosen arbitrarily,
\[
x_{n+1} = (I - \alpha_n A)Tx_n + \alpha_n b, \quad n \geq 0, \quad (1.10)
\]
converges strongly to the unique solution of the minimization problem (1.9) provided the sequence \( \{\alpha_n\} \) of parameters satisfies certain appropriate conditions.

On the other hand, Moudafi [6] introduced the viscosity approximation method for nonexpansive mappings (see [7] for further developments in both Hilbert and Banach spaces). Starting with an arbitrary initial \( x_0 \in H \), define a sequence \( \{x_n\} \) recursively by

\[
x_{n+1} = \sigma_n f(x_n) + (1 - \sigma_n) T x_n, \quad n \geq 0,
\]

where \( \{\sigma_n\} \) is a sequence in \((0, 1)\). It is proved in [6, 7] that under certain appropriate conditions imposed on \( \{\sigma_n\} \), the sequence \( \{x_n\} \) generated by (1.11) strongly converges to the unique solution \( x^* \) in \( C \) of the variational inequality

\[
\langle (I - f)x^*, x - x^* \rangle \geq 0, \quad x \in C.
\]

In 2006, Marino and Xu [8] introduced a general iterative method for nonexpansive mapping. Starting with an arbitrary initial \( x_0 \in H \), define a sequence \( \{x_n\} \) recursively by

\[
x_{n+1} = \epsilon_n\gamma f(x_n) + (1 - \epsilon_n A) T x_n, \quad n \geq 0.
\]

They proved that if the sequence \( \{\epsilon_n\} \) of parameters satisfies appropriate conditions, then the sequence \( \{x_n\} \) generated by (1.13) strongly converges to the unique solution \( \bar{x} = P_{I(T)}(I - A + \gamma f)\bar{x} \) of the variational inequality

\[
\langle (A - \gamma f)\bar{x}, x - \bar{x} \rangle \geq 0, \quad \forall x \in F(T),
\]

which is the optimality condition for the minimization problem

\[
\min_{x \in F(T)} \frac{1}{2} \langle Ax, x \rangle - h(x),
\]

where \( h \) is a potential function for \( \gamma f \) (i.e., \( h'(x) = \gamma f(x) \) for \( x \in H \)).

In 2010, Yao et al. [9] introduced an iterative algorithm for solving some hierarchical fixed point problem, starting with an arbitrary initial guess \( x_0 \in C \), define a sequence \( \{x_n\} \) iteratively by

\[
y_n = \beta_n S x_n + (1 - \beta_n) x_n, \\
x_{n+1} = P_C[\alpha_n f(x_n) + (1 - \alpha_n) T y_n], \quad \forall n \geq 1.
\]

They proved that if the sequences \( \{\alpha_n\} \) and \( \{\beta_n\} \) of parameters satisfies appropriate conditions, then the sequence \( \{x_n\} \) generated by (1.16) strongly converges to the unique solution \( z \) in \( H \) of the variational inequality

\[
z \in F(T), \quad \langle (I - f)z, x - z \rangle \geq 0, \quad \forall x \in F(T).
\]
In this paper we will combine the general iterative method (1.13) with the iterative algorithm (1.16) and consider the following iterative algorithm:

\[ y_n = \beta_n Sx_n + (1 - \beta_n)x_n, \]
\[ x_{n+1} = P_C [\alpha_n yf(x_n) + (I - \alpha_n A)Ty_n], \quad \forall n \geq 1. \]  

(1.18)

We will prove in Section 3 that if the sequences \{\alpha_n\} and \{\beta_n\} of parameters satisfy appropriate conditions and \(\lim_{n \to \infty} (\beta_n/\alpha_n) = \tau \in (0, \infty)\) then the sequence \{x_n\} generated by (1.18) converges strongly to the unique solution \(\tilde{x}\) in \(H\) of the following variational inequality

\[ \tilde{x} \in F(T), \quad \left\langle \frac{1}{\tau} (A - \gamma f)\tilde{x} + (I - S)\tilde{x}, \ x - \tilde{x} \right\rangle \geq 0, \quad \forall x \in F(T). \]  

(1.19)

In particular, if we take \(\tau = 0\), under suitable difference assumptions on parameter, then the sequence \{x_n\} generated by (1.18) converges strongly to the unique solution \(\tilde{x}\) in \(H\) of the following variational inequality

\[ \tilde{x} \in F(T), \quad \left\langle (A - \gamma f)\tilde{x}, \ x - \tilde{x} \right\rangle \geq 0, \quad \forall x \in F(T). \]  

(1.20)

Our results improve and extend the recent results of Yao et al. [9] and some authors. Furthermore, we give an example which supports our main theorem in the last part.

2. Preliminaries

This section collects some lemma which can be used in the proofs for the main results in the next section. Some of them are known, others are not hard to derive.

**Lemma 2.1** (Browder [10]). Let \(H\) be a Hilbert space, \(C\) be a closed convex subset of \(H\), and \(T : C \to C\) be a nonexpansive mapping with \(F(T) \neq \emptyset\). If \{\(x_n\)\} is a sequence in \(C\) weakly converging to \(x\) and if \{(I - T)x_n\} converges strongly to \(y\), then \((I - T)x = y\); in particular, if \(y = 0\) then \(x \in F(T)\).

**Lemma 2.2.** Let \(x \in H\) and \(z \in C\) be any points. Then one has the following:

1. That \(z = P_C[x]\) if and only if there holds the relation:

\[ \langle x - z, y - z \rangle \leq 0, \quad \forall y \in C. \]  

(2.1)

2. That \(z = P_C[x]\) if and only if there holds the relation:

\[ \|x - z\|^2 \leq \|x - y\|^2 - \|y - z\|^2, \quad \forall y \in C. \]  

(2.2)
Let \( \rho \) be a \( \rho \)–contraction with coefficient \( 0 < \rho < 1 \), and \( T : C \to C \) be a nonexpansive mapping. Let \( A \) be a strongly positive linear bounded operator on a Hilbert space \( H \) with coefficient \( \gamma > 0 \). Then, for \( 0 < \gamma < \frac{1}{\rho} \), for \( x, y \in C \),

1. the mapping \( (I - f) \) is strongly monotone with coefficient \( (1 - \rho) \), that is,

\[
\langle x - y, (I - f)x - (I - f)y \rangle \geq (1 - \rho) \|x - y\|^2,
\]

2. the mapping \( (A - \gamma f) \) is strongly monotone with coefficient \( \tilde{\gamma} - \gamma \rho \) that is

\[
\langle x - y, (A - \gamma f)x - (A - \gamma f)y \rangle \geq \left( \tilde{\gamma} - \gamma \rho \right) \|x - y\|^2.
\]

**Lemma 2.4** (Xu [4]). Assume that \( \{a_n\} \) is a sequence of nonnegative numbers such that

\[
a_{n+1} \leq (1 - \gamma_n) a_n + \delta_n, \quad \forall n \geq 0,
\]

where \( \{\gamma_n\} \) is a sequence in \((0, 1)\) and \( \{\delta_n\} \) is a sequence in \(\mathbb{R}\) such that

1. \( \sum_{n=1}^{\infty} \gamma_n = \infty \),
2. \( \lim \sup_{n \to \infty} (\delta_n / \gamma_n) \leq 0 \) or \( \sum_{n=1}^{\infty} |\delta_n| < \infty \). Then \( \lim_{n \to \infty} a_n = 0 \).

**Lemma 2.5** (Marino and Xu [8]). Assume \( A \) is a strongly positive linear bounded operator on a Hilbert space \( H \) with coefficient \( \gamma > 0 \) and \( 0 < \alpha \leq \|A\|^{-1} \). Then \( \|I - \alpha A\| \leq 1 - \alpha \gamma \).

**Lemma 2.6** (Acedo and Xu [11]). Let \( C \) be a closed convex subset of \( H \). Let \( \{x_n\} \) be a bounded sequence in \( H \). Assume that

1. The weak \( \omega \)-limit set \( \omega_w(x_n) \subset C \),
2. For each \( z \in C \), \( \lim_{n \to \infty} \|x_n - z\| \) exists. Then \( \{x_n\} \) is weakly convergent to a point in \( C \).

**Notation.** We use \( \to \) for strong convergence and \( \rightharpoonup \) for weak convergence.

**3. Main Results**

**Theorem 3.1.** Let \( C \) be a nonempty closed convex subset of a real Hilbert space \( H \). Let \( f : C \to H \) be a \( \rho \)-contraction with \( \rho \in (0, 1) \). Let \( S, T : C \to C \) be two nonexpansive mappings with \( F(T) \neq \emptyset \).
Let $A$ be a strongly positive linear bounded operator on $H$ with coefficient $\gamma > 0$. \{$\alpha_n$\} and \{$\beta_n$\} are two sequences in $(0, 1)$ and $0 < \gamma < \gamma / \rho$. Starting with an arbitrary initial guess $x_0 \in C$ and \{$x_n$\} is a sequence generated by

\begin{equation}
  y_n = \beta_n S x_n + (1 - \beta_n) x_n,
  \end{equation}

\begin{equation}
  x_{n+1} = P_C \left[ \alpha_n \gamma f(x_n) + (I - \alpha_n A) T y_n \right], \quad \forall n \geq 1.
\end{equation}

Suppose that the following conditions are satisfied:

\begin{enumerate}
  \item[(C1)] $\lim_{n \to \infty} \alpha_n = 0$ and $\sum_{n=1}^{\infty} \alpha_n = \infty$,
  \item[(C2)] $\lim_{n \to \infty} (\beta_n / \alpha_n) = \tau = 0$,
  \item[(C3)] $\lim_{n \to \infty} (|\alpha_n - \alpha_{n-1}| / \alpha_n) = 0$ and $\lim_{n \to \infty} (|\beta_n - \beta_{n-1}| / \beta_n) = 0$, or
  \item[(C4)] $\sum_{n=1}^{\infty} |\alpha_n - \alpha_{n-1}| < \infty$ and $\sum_{n=1}^{\infty} |\beta_n - \beta_{n-1}| < \infty$.
\end{enumerate}

Then the sequence \{$x_n$\} converges strongly to a point $\bar{x} \in H$, which is the unique solution of the variational inequality:

\begin{equation}
  \bar{x} \in F(T), \quad \langle (A - \gamma f) \bar{x}, x - \bar{x} \rangle \geq 0, \quad \forall x \in F(T).
\end{equation}

Equivalently, one has $P_{F(T)}(I - A + \gamma f) \bar{x} = \bar{x}$.

\textbf{Proof}. We first show the uniqueness of a solution of the variational inequality (3.2), which is indeed a consequence of the strong monotonicity of $A - \gamma f$. Suppose $\bar{x} \in F(T)$ and $\bar{x} \in F(T)$ both are solutions to (3.2), then $\langle (A - \gamma f) \bar{x}, \bar{x} - \bar{x} \rangle \leq 0$ and $\langle (A - \gamma f) \bar{x}, \bar{x} - \bar{x} \rangle \leq 0$. It follows that

\begin{equation}
  \langle (A - \gamma f) \bar{x}, \bar{x} - \bar{x} \rangle + \langle (A - \gamma f) \bar{x}, \bar{x} - \bar{x} \rangle = \langle (A - \gamma f) \bar{x}, \bar{x} - \bar{x} \rangle - \langle (A - \gamma f) \bar{x}, \bar{x} - \bar{x} \rangle
\end{equation}

\begin{equation}
  = \langle (A - \gamma f) \bar{x} - (A - \gamma f) \bar{x}, \bar{x} - \bar{x} \rangle
\end{equation}

The strong monotonicity of $A - \gamma f$ (Lemma 2.3) implies that $\bar{x} = \bar{x}$ and the uniqueness is proved.

Next, we prove that the sequence \{$x_n$\} is bounded. Since $\alpha_n \to 0$ and $\lim_{n \to \infty} (\beta_n / \alpha_n) = 0$ by condition (C1) and (C2), respectively, we can assume, without loss of generality, that $\alpha_n < \|A\|^{-1}$ and $\beta_n < \alpha_n$ for all $n \geq 1$. Take $u \in F(T)$ and from (3.1), we have

\begin{equation}
  \|x_{n+1} - u\| = \left\| P_C \left[ \alpha_n \gamma f(x_n) + (I - \alpha_n A) T y_n \right] - P_C [u] \right\|
  \leq \| \alpha_n \gamma f(x_n) + (I - \alpha_n A) T y_n - u \|
  \leq \alpha_n \gamma \| f(x_n) - f(u) \| + \alpha_n \gamma f(u) - Au \| + \| (I - \alpha_n A) (T y_n - u) \|.
\end{equation}
Since \( \|I - \alpha_n A\| \leq 1 - \alpha_n \gamma \) and by Lemma 2.5, we note that

\[
\|x_{n+1} - u\| \leq \alpha_n \gamma \|f(x_n) - f(u)\| + \alpha_n \|f(u) - Au\| + \left(1 - \alpha_n \gamma \right)\|Ty_n - u\|
\]

\[
\leq \alpha_n \gamma \|x_n - u\| + \alpha_n \|f(u) - Au\| + \left(1 - \alpha_n \gamma \right)\|Ty_n - u\|
\]

\[
\leq \alpha_n \gamma \|x_n - u\| + \alpha_n \|f(u) - Au\| + \left(1 - \alpha_n \gamma \right)\|y_n - u\|
\]

\[
\leq \alpha_n \gamma \|x_n - u\| + \alpha_n \|f(u) - Au\|
\]

\[
+ \left(1 - \alpha_n \gamma \right)\left[\beta_n \|Sx_n - Su\| + \beta_n \|Su - u\| + (1 - \beta_n)\|x_n - u\|\right]
\]

\[
\leq \alpha_n \gamma \|x_n - u\| + \alpha_n \|f(u) - Au\| + (1 - \beta_n)\|x_n - u\| \]

\[\leq \left(1 - \alpha_n \gamma \right) \|x_n - u\| + \alpha_n \|f(u) - Au\| + \beta_n \|Su - u\| \]

\[\leq \left(1 - \alpha_n \gamma \right) \|x_n - u\| + \alpha_n \|f(u) - Au\| + \alpha_n \|Su - u\| \]

\[= \left(1 - \alpha_n \gamma \right) \|x_n - u\| + \alpha_n \gamma \|f(u) - Au\| + \frac{\|Su - u\|}{\gamma - \gamma \rho} \]

By induction, we can obtain

\[
\|x_{n+1} - u\| \leq \max \left\{ \|x_0 - u\|, \frac{\|f(u) - Au\| + \|Su - u\|}{\gamma - \gamma \rho} \right\}, \quad (3.6)
\]

which implies that the sequence \( \{x_n\} \) is bounded and so are the sequences \( \{f(x_n)\}, \{Sx_n\}, \) and \( \{ATy_n\} \).

Set \( w_n := \alpha_n \gamma f(x_n) + (I - \alpha_n A)Ty_n, \ n \geq 1 \). We get

\[
\|x_{n+1} - x_n\| = \|P_C[w_{n+1}] - P_C[w_n]\| \leq \|w_{n+1} - w_n\|. \quad (3.7)
\]
It follows that

\[ \|x_{n+1} - x_n\| \leq \| (\alpha_n y f(x_n) + (I - \alpha_n A) T y_n) - (\alpha_{n-1} y f(x_{n-1}) + (I - \alpha_{n-1} A) T y_{n-1}) \| \\
\leq \alpha_n \| y f(x_n) - f(x_{n-1}) \| + |\alpha_n - \alpha_{n-1}| \| y f(x_{n-1}) - A T y_{n-1} \| \\
+ \left( 1 - \alpha_n \tilde{\gamma} \right) \| T y_n - T y_{n-1} \| \\
\leq \alpha_n \rho \| x_n - x_{n-1} \| + |\alpha_n - \alpha_{n-1}| \| y f(x_{n-1}) - A T y_{n-1} \| \\
+ \left( 1 - \alpha_n \tilde{\gamma} \right) \| y_n - y_{n-1} \|. \] 

(3.8)

By (3.7) and (3.8), we get

\[ \|x_{n+1} - x_n\| \leq \alpha_n \rho \| w_n - w_{n-1} \| + |\alpha_n - \alpha_{n-1}| \| y f(x_{n-1}) - A T y_{n-1} \| \\
+ \left( 1 - \alpha_n \tilde{\gamma} \right) \| y_n - y_{n-1} \|. \] 

(3.9)

From (3.1), we obtain

\[ \| y_n - y_{n-1} \| = \| (\beta_n S x_n + (1 - \beta_n) x_n) - (\beta_{n-1} S x_{n-1} + (1 - \beta_{n-1}) x_{n-1}) \| \\
= \| \beta_n (S x_n - S x_{n-1}) + (\beta_n - \beta_{n-1}) (S x_{n-1} - x_{n-1}) + (1 - \beta_n) (x_n - x_{n-1}) \| \\
\leq \| x_n - x_{n-1} \| + |\beta_n - \beta_{n-1}| \| S x_{n-1} - x_{n-1} \| \\
\leq \| x_n - x_{n-1} \| + |\beta_n - \beta_{n-1}| M, \] 

(3.10)

where \( M \) is a constant such that

\[ \sup_{n \in \mathbb{N}} \{ \| y f(x_{n-1}) - A T y_{n-1} \| + \| S x_{n-1} - x_{n-1} \| \} \leq M. \] 

(3.11)

Substituting (3.10) into (3.8) to obtain

\[ \|x_{n+1} - x_n\| \leq \alpha_n \rho \| x_n - x_{n-1} \| + |\alpha_n - \alpha_{n-1}| \| y f(x_{n-1}) - A T y_{n-1} \| \\
+ \left( 1 - \alpha_n \tilde{\gamma} \right) \| x_n - x_{n-1} \| + |\beta_n - \beta_{n-1}| M \\
\leq \alpha_n \rho \| x_n - x_{n-1} \| + |\alpha_n - \alpha_{n-1}| M \\
+ \left( 1 - \alpha_n \tilde{\gamma} \right) \| x_n - x_{n-1} \| + |\beta_n - \beta_{n-1}| M. \]
\[ \limsup_{n \to \infty} \langle \gamma f(z) - Az, x_n - z \rangle \leq 0, \]  
\[ \limsup_{n \to \infty} \langle \gamma f(z) - Az, x_n - z \rangle = \lim_{k \to \infty} \langle \gamma f(z) - Az, x_{n_k} - z \rangle, \]
and \( x_{n_k} \to \tilde{x} \). From (3.15) and by Lemma 2.1, it follows that \( \tilde{x} \in F(T) \). Hence, by Lemma 2.2(1) that

\[
\limsup_{n \to \infty} \langle \gamma f(z) - Az, x_n - z \rangle = \lim_{k \to \infty} \langle \gamma f(z) - Az, x_{n_k} - z \rangle \\
= \langle \gamma f(z) - Az, \tilde{x} - z \rangle \\
= \langle (I - A + \gamma f)z - z, \tilde{x} - z \rangle \leq 0.
\]

(3.18)

Now, by Lemma 2.2(1), we observe that

\[
\langle PC[w_n] - w_n, PC[w_n] - z \rangle \leq 0,
\]

(3.19)

and so

\[
\|x_{n+1} - z\|^2 = \langle PC[w_n] - z, PC[w_n] - z \rangle \\
= \langle PC[w_n] - w_n, PC[w_n] - z \rangle + \langle w_n - z, PC[w_n] - z \rangle \\
\leq \langle w_n - z, PC[w_n] - z \rangle \\
= \langle \alpha_n \gamma f(x_n) + (I - \alpha_n A)Ty_n - z, x_{n+1} - z \rangle \\
\leq \alpha_n \gamma \|f(x_n) - f(z)\| \|x_{n+1} - z\| + \alpha_n \langle \gamma f(z) - Az, x_{n+1} - z \rangle \\
+ \left(1 - \alpha_n \tilde{\gamma}\right) \|Ty_n - z\| \|x_{n+1} - z\| \\
\leq \alpha_n \gamma \rho \|x_n - z\| \|x_{n+1} - z\| + \alpha_n \langle \gamma f(z) - Az, x_{n+1} - z \rangle \\
+ \left(1 - \alpha_n \tilde{\gamma}\right) \|Ty_n - z\| \|x_{n+1} - z\| \\
= \alpha_n \gamma \rho \|x_n - z\| \|x_{n+1} - z\| + \alpha_n \langle \gamma f(z) - Az, x_{n+1} - z \rangle \\
+ \left(1 - \alpha_n \tilde{\gamma}\right) \|\beta_n Sx_n + (1 - \beta_n)x_n - z\| \|x_{n+1} - z\| \\
\leq \alpha_n \gamma \rho \|x_n - z\| \|x_{n+1} - z\| + \alpha_n \langle \gamma f(z) - Az, x_{n+1} - z \rangle \\
+ \left(1 - \alpha_n \tilde{\gamma}\right) \|\beta_n Sx_n - Sz\| + \beta_n ||Sz - z\| + (1 - \beta_n) \|x_n - z\| \|x_{n+1} - z\| \\
\leq \alpha_n \gamma \rho \|x_n - z\| \|x_{n+1} - z\| + \alpha_n \langle \gamma f(z) - Az, x_{n+1} - z \rangle \\
+ \left(1 - \alpha_n \tilde{\gamma}\right) \|\beta_n \|x_n - z\| + \beta_n ||Sz - z\| + (1 - \beta_n) \|x_n - z\| \|x_{n+1} - z\| \\
\leq \alpha_n \gamma \rho \|x_n - z\| \|x_{n+1} - z\| + \alpha_n \langle \gamma f(z) - Az, x_{n+1} - z \rangle \\
+ \left(1 - \alpha_n \tilde{\gamma}\right) \|\beta_n \|x_n - z\| + \beta_n ||Sz - z\| + (1 - \beta_n) \|x_n - z\| \|x_{n+1} - z\|.
\]
\[
\begin{align*}
&= \left(1 - \alpha_n \left(\bar{\gamma} - \gamma \rho\right)\right)\|x_n - z\|\|x_{n+1} - z\| + \alpha_n \langle \gamma f(z) - Az, x_{n+1} - z \rangle \\
&\quad + \left(1 - \alpha_n \bar{\gamma}\right) \beta_n \|Sz - z\|\|x_{n+1} - z\| \\
&\leq \frac{1 - \alpha_n \langle \bar{\gamma} - \gamma \rho \rangle}{2} \left[\|x_n - z\|^2 + \|x_{n+1} - z\|^2\right] + \alpha_n \langle \gamma f(z) - Az, x_{n+1} - z \rangle \\
&\quad + \left(1 - \alpha_n \bar{\gamma}\right) \beta_n \|Sz - z\|\|x_{n+1} - z\|.
\end{align*}
\]

Hence, it follows that
\[
\|x_{n+1} - z\|^2 \leq \frac{1 - \alpha_n \langle \bar{\gamma} - \gamma \rho \rangle}{1 + \alpha_n \langle \bar{\gamma} - \gamma \rho \rangle} \|x_n - z\|^2 + \frac{2\alpha_n}{1 + \alpha_n \langle \bar{\gamma} - \gamma \rho \rangle} \langle \gamma f(z) - Az, x_{n+1} - z \rangle \\
\quad + \frac{2\left(1 - \alpha_n \bar{\gamma}\right) \beta_n}{1 + \alpha_n \langle \bar{\gamma} - \gamma \rho \rangle} \|Sz - z\|\|x_{n+1} - z\| \\
\quad = \left[\frac{2\alpha_n \langle \bar{\gamma} - \gamma \rho \rangle}{1 + \alpha_n \langle \bar{\gamma} - \gamma \rho \rangle}\right] \left[\frac{1}{\alpha_n \langle \bar{\gamma} - \gamma \rho \rangle}\right] \langle \gamma f(z) - Az, x_{n+1} - z \rangle \\
\quad + \frac{\beta_n \left(1 - \alpha_n \bar{\gamma}\right)}{\alpha_n \langle \bar{\gamma} - \gamma \rho \rangle} \|Sz - z\|\|x_{n+1} - z\| \\
\quad \times \left[\frac{1 - \frac{2\alpha_n \langle \bar{\gamma} - \gamma \rho \rangle}{1 + \alpha_n \langle \bar{\gamma} - \gamma \rho \rangle}}{\|x_n - z\|^2}\right].
\]

We observe that
\[
\limsup_{n \to \infty} \left[\frac{1}{\alpha_n \langle \bar{\gamma} - \gamma \rho \rangle} \langle \gamma f(z) - Az, x_{n+1} - z \rangle + \frac{\beta_n \left(1 - \alpha_n \bar{\gamma}\right)}{\alpha_n \langle \bar{\gamma} - \gamma \rho \rangle} \|Sz - z\|\|x_{n+1} - z\|\right] \leq 0.
\]

Thus, by Lemma 2.4, \(x_n \to z\) as \(n \to \infty\). This is completes.
From Theorem 3.1, we can deduce the following interesting corollary.

**Corollary 3.2** (Yao et al. [9]). Let \( C \) be a nonempty closed convex subset of a real Hilbert space \( H \). Let \( f : C \rightarrow H \) be a \( \rho \)-contraction (possibly nonself) with \( \rho \in (0,1) \). Let \( S,T : C \rightarrow C \) be two nonexpansive mappings with \( F(T) \neq \emptyset \). \( \{\alpha_n\} \) and \( \{\beta_n\} \) are two sequences in \((0,1)\). Starting with an arbitrary initial guess \( x_0 \in C \) and \( \{x_n\} \) is a sequence generated by

\[
y_n = \beta_n Sx_n + (1 - \beta_n)x_n, \quad x_{n+1} = P_C[\alpha_n f(x_n) + (1 - \alpha_n) Ty_n], \quad \forall n \geq 1.
\] (3.23)

Suppose that the following conditions are satisfied:

1. \( \lim_{n \to \infty} \alpha_n = 0 \) and \( \sum_{n=1}^{\infty} \alpha_n = \infty \),
2. \( \lim_{n \to \infty} (\beta_n / \alpha_n) = 0 \),
3. \( \lim_{n \to \infty} (|\alpha_n - \alpha_{n-1}| / \alpha_n) = 0 \) and \( \lim_{n \to \infty} (|\beta_n - \beta_{n-1}| / \beta_n) = 0 \), or
4. \( \sum_{n=1}^{\infty} |\alpha_n - \alpha_{n-1}| < \infty \) and \( \sum_{n=1}^{\infty} |\beta_n - \beta_{n-1}| < \infty \).

Then the sequence \( \{x_n\} \) converges strongly to a point \( \bar{x} \in H \), which is the unique solution of the variational inequality:

\[
\bar{x} \in F(T), \quad \langle (I - f)\bar{x}, x - \bar{x} \rangle \geq 0, \quad \forall x \in F(T).
\] (3.24)

Equivalently, one has \( P_{F(T)}(f)\bar{x} = \bar{x} \). In particular, if one takes \( f = 0 \), then the sequence \( \{x_n\} \) converges in norm to the Minimum norm fixed point \( \bar{x} \) of \( T \), namely, the point \( \bar{x} \) is the unique solution to the quadratic minimization problem:

\[
z = \arg \min_{x \in F(T)} \|x\|^2.
\] (3.25)

**Proof.** As a matter of fact, if we take \( A = I \) and \( \gamma = 1 \) in Theorem 3.1. This completes the proof. \( \square \)

Under different conditions on data we obtain the following result.

**Theorem 3.3.** Let \( C \) be a nonempty closed convex subset of a real Hilbert space \( H \). Let \( f : C \rightarrow H \) be a \( \rho \)-contraction (possibly nonself) with \( \rho \in (0,1) \). Let \( S,T : C \rightarrow C \) be two nonexpansive mappings with \( F(T) \neq \emptyset \). Let \( A \) be a strongly positive linear bounded operator on a Hilbert space \( H \) with coefficient \( \gamma > 0 \) and \( 0 < \gamma < \gamma' / \rho \). \( \{\alpha_n\} \) and \( \{\beta_n\} \) are two sequences in \((0,1)\). Starting with an arbitrary initial guess \( x_0 \in C \) and \( \{x_n\} \) is a sequence generated by

\[
y_n = \beta_n Sx_n + (1 - \beta_n)x_n,
\]

\[
x_{n+1} = P_C[\alpha_n \gamma f(x_n) + (1 - \alpha_n) A Ty_n], \quad \forall n \geq 1.
\] (3.26)
Suppose that the following conditions are satisfied:

(C1) \( \lim_{n \to \infty} \alpha_n = 0 \) and \( \sum_{n=1}^{\infty} \alpha_n = \infty \),

(C2) \( \lim_{n \to \infty} (\beta_n / \alpha_n) = \tau \in (0, \infty) \),

(C5) \( \lim_{n \to \infty} (|\alpha_n - \alpha_{n-1}| + |\beta_n - \beta_{n-1}|) / \alpha_n \beta_n = 0 \),

(C6) there exists a constant \( K > 0 \) such that \( 1 / \alpha_n \sqrt{|1 / \beta_n - 1 / \beta_{n-1}|} \leq K \).

Then the sequence \( \{x_n\} \) converges strongly to a point \( \bar{x} \in H \), which is the unique solution of the variational inequality:

\[
\bar{x} \in F(T), \quad \left\langle 1 / \tau (A - \gamma f) \bar{x} + (I - S) \bar{x}, x - \bar{x} \right\rangle \geq 0, \quad \forall x \in F(T). \tag{3.27}
\]

**Proof.** First of all, we show that (3.27) has the unique solution. Indeed, let \( \bar{x} \) and \( \tilde{x} \) be two solutions. Then

\[
\left\langle (A - \gamma f) \bar{x}, \tilde{x} - \bar{x} \right\rangle \leq \tau \left\langle (I - S) \bar{x}, \tilde{x} - \bar{x} \right\rangle. \tag{3.28}
\]

Analogously, we have

\[
\left\langle (A - \gamma f) \bar{x}, \tilde{x} - \bar{x} \right\rangle \leq \tau \left\langle (I - S) \tilde{x}, \bar{x} - \tilde{x} \right\rangle. \tag{3.29}
\]

Adding (3.28) and (3.29), by Lemma 2.3, we obtain

\[
\left(\tilde{\gamma} - \gamma \rho \right) \left\| \bar{x} - \tilde{x} \right\|^2 \leq \left\langle (A - \gamma f) \bar{x} - (A - \gamma f) \tilde{x}, \bar{x} - \tilde{x} \right\rangle \leq -\tau \left\langle (I - S) \bar{x} - (I - S) \tilde{x}, \bar{x} - \tilde{x} \right\rangle \leq 0, \tag{3.30}
\]
and so $\bar{x} = \tilde{x}$. From (C2), we can assume, without loss of generality, that $\beta_n \leq (\tau + 1)\alpha_n$ for all $n \geq 1$. By a similar argument in Theorem 3.1, we have

$$
\|x_{n+1} - u\| \leq \alpha_n \gamma \rho \|x_n - u\| + \alpha_n \|\gamma f(u) - Au\|
$$

$$
+ \left(1 - \alpha_n \tilde{\gamma}\right) \left[\|x_n - u\| + \beta_n \|Su - u\| + (1 - \beta_n) \|x_n - u\|\right]
$$

$$
= \left(1 - \alpha_n \tilde{\gamma}\right) \left[\|x_n - u\| + \alpha_n \|\gamma f(u) - Au\| + \left(1 - \alpha_n \tilde{\gamma}\right) \beta_n \|Su - u\|\right]
$$

$$
\leq \left(1 - \alpha_n \tilde{\gamma}\right) \left[\|x_n - u\| + \alpha_n \|\gamma f(u) - Au\| + \beta_n \|Su - u\|\right]
$$

$$
\leq \left(1 - \alpha_n \tilde{\gamma}\right) \left[\|x_n - u\| + \alpha_n \|\gamma f(u) - Au\| + (\tau + 1) \alpha_n \|Su - u\|\right]
$$

$$
= \left(1 - \alpha_n \tilde{\gamma}\right) \left[\|x_n - u\| + \alpha_n \|\gamma f(u) - Au\| + (\tau + 1) \|Su - u\|\right]
$$

$$
= \left(1 - \alpha_n \tilde{\gamma}\right) \left[\|x_n - u\| + \alpha_n \left(\tilde{\gamma} - \gamma \rho\right) \frac{\|\gamma f(u) - Au\| + (\tau + 1) \|Su - u\|}{\gamma - \gamma \rho}\right].
$$

(3.31)

By induction, we obtain

$$
\|x_n - u\| \leq \max \left\{ \|x_0 - u\|, \frac{1}{\gamma - \gamma \rho} \left[\|\gamma f(u) - Au\| + (\tau + 1) \|Su - u\|\right]\right\},
$$

(3.32)

which implies that the sequence $\{x_n\}$ is bounded. Since (C5) implies (C4) then, from Theorem 3.1, we can deduce $\|x_{n+1} - x_n\| \to 0$.

From (3.1), we note that

$$
x_{n+1} = P_C[w_n] - w_n + w_n + y_n - y_n
$$

$$
= P_C[w_n] - w_n + \alpha_n \gamma f(x_n) + (Ty_n - y_n) + (y_n - \alpha_n ATy_n).
$$

(3.33)

Hence, it follows that

$$
x_n - x_{n+1} = (w_n - P_C[w_n]) + \alpha_n (Ax_n - \gamma f(x_n)) + (y_n - Ty_n) + (x_n - y_n) + \alpha_n (ATy_n - Ax_n)
$$

$$
= (w_n - P_C[w_n]) + \alpha_n (A - \gamma f)x_n + (I - T)y_n + \beta_n (I - S)x_n + \alpha_n A(Ty_n - x_n),
$$

(3.34)
and so

\[
\frac{x_n - x_{n+1}}{(1 - \alpha_n)\beta_n} = \frac{1}{(1 - \alpha_n)\beta_n}(w_n - P_C[w_n]) + \frac{\alpha_n}{(1 - \alpha_n)\beta_n}(A - \gamma f)x_n + \frac{1}{(1 - \alpha_n)\beta_n}(I - T)y_n \\
+ \frac{1}{(1 - \alpha_n)}(I - S)x_n + \frac{\alpha_n}{(1 - \alpha_n)\beta_n}A(Ty_n - x_n).
\]

(3.35)

Set \(v_n := (x_n - x_{n+1})/(1 - \alpha_n)\beta_n\). Then, we have

\[
v_n = \frac{1}{(1 - \alpha_n)\beta_n}(w_n - P_C[w_n]) + \frac{\alpha_n}{(1 - \alpha_n)\beta_n}(A - \gamma f)x_n + \frac{1}{(1 - \alpha_n)\beta_n}(I - T)y_n \\
+ \frac{1}{(1 - \alpha_n)}(I - S)x_n + \frac{\alpha_n}{(1 - \alpha_n)\beta_n}A(Ty_n - x_n).
\]

(3.36)

From (3.12) in Theorem 3.1 and (C6), we obtain

\[
\frac{\|x_{n+1} - x_n\|}{\beta_n} \leq \left(1 - \alpha_n\left(\gamma - \gamma\rho\right)\right)\frac{\|x_n - x_{n-1}\|}{\beta_n} + M \left[\frac{|\alpha_n - \alpha_{n-1}|}{\beta_n} + \frac{|\beta_n - \beta_{n-1}|}{\beta_n}\right] \\
= \left(1 - \alpha_n\left(\gamma - \gamma\rho\right)\right)\frac{\|x_n - x_{n-1}\|}{\beta_n} + \left(1 - \alpha_n\left(\gamma - \gamma\rho\right)\right)\frac{\|x_n - x_{n-1}\|}{\beta_{n-1}} \\
- \left(1 - \alpha_n\left(\gamma - \gamma\rho\right)\right)\frac{\|x_n - x_{n-1}\|}{\beta_{n-1}} + M \left[\frac{|\alpha_n - \alpha_{n-1}|}{\beta_n} + \frac{|\beta_n - \beta_{n-1}|}{\beta_n}\right] \\
= \left(1 - \alpha_n\left(\gamma - \gamma\rho\right)\right)\frac{\|x_n - x_{n-1}\|}{\beta_{n-1}} + \left(1 - \alpha_n\left(\gamma - \gamma\rho\right)\right)\frac{\|x_n - x_{n-1}\|}{\beta_{n-1}} \left[\frac{1}{\beta_n} - \frac{1}{\beta_{n-1}}\right] \\
+ M \left[\frac{|\alpha_n - \alpha_{n-1}|}{\beta_n} + \frac{|\beta_n - \beta_{n-1}|}{\beta_n}\right] \\
\leq \left(1 - \alpha_n\left(\gamma - \gamma\rho\right)\right)\frac{\|x_n - x_{n-1}\|}{\beta_{n-1}} + \|x_n - x_{n-1}\| \left[\frac{1}{\beta_n} - \frac{1}{\beta_{n-1}}\right] \\
+ M \left[\frac{|\alpha_n - \alpha_{n-1}|}{\beta_n} + \frac{|\beta_n - \beta_{n-1}|}{\beta_n}\right] \\
\leq \left(1 - \alpha_n\left(\gamma - \gamma\rho\right)\right)\frac{\|x_n - x_{n-1}\|}{\beta_{n-1}} + \alpha_n K \|x_n - x_{n-1}\| \\
+ M \left[\frac{|\alpha_n - \alpha_{n-1}|}{\beta_n} + \frac{|\beta_n - \beta_{n-1}|}{\beta_n}\right].
\]
\[
\leq \left(1 - \alpha_n \left(\gamma - \gamma \rho\right)\right) \frac{\|w_n - w_{n-1}\|}{\beta_{n-1}} + \alpha_n K \|x_n - x_{n-1}\| \\
+ M \left[\frac{\|\alpha_n - \alpha_{n-1}\|}{\beta_{n-1}} + \frac{\|\alpha_n - \alpha_{n-1}\|}{\beta_{n-1}}\right].
\]

(3.37)

This together with Lemma 2.4 and (C2) imply that

\[
\lim_{n \to \infty} \frac{\|x_{n+1} - x_n\|}{\beta_n} = \lim_{n \to \infty} \frac{\|w_{n+1} - w_n\|}{\beta_n} = \lim_{n \to \infty} \frac{\|w_{n+1} - w_n\|}{\alpha_n} = 0.
\]

(3.38)

From (3.36), for \(z \in F(T)\), we have

\[
\langle v_n, x_n - z \rangle = \frac{1}{1 - \alpha_n \beta_n} \langle w_n - P_C[w_n], P_C[w_{n-1}] - z \rangle + \frac{\alpha_n}{1 - \alpha_n \beta_n} \langle (A - \gamma f)x_n, x_n - z \rangle \\
+ \frac{1}{1 - \alpha_n \beta_n} \langle (I - T)y_n, x_n - z \rangle + \frac{1}{1 - \alpha_n \beta_n} \langle (I - S)x_n, x_n - z \rangle \\
+ \frac{\alpha_n}{1 - \alpha_n \beta_n} \langle A(Ty_n - x_n), x_n - z \rangle
\]

(3.39)

By Lemmas 2.2 and 2.3, we obtain

\[
\langle v_n, x_n - z \rangle \geq \frac{1}{1 - \alpha_n \beta_n} \langle w_n - P_C[w_n], P_C[w_{n-1}] - P_C[w_n] \rangle + \frac{\gamma - \gamma \rho}{1 - \alpha_n \beta_n} \alpha_n \|x_n - z\|^2 \\
+ \frac{\alpha_n}{1 - \alpha_n \beta_n} \langle (A - \gamma f)x_n, x_n - z \rangle + \frac{1}{1 - \alpha_n \beta_n} \langle (I - S)x_n, x_n - z \rangle \\
+ \frac{1}{1 - \alpha_n \beta_n} \langle (I - T)y_n, x_n - z \rangle + \frac{\alpha_n}{1 - \alpha_n \beta_n} \langle A(Ty_n - x_n), x_n - z \rangle.
\]

(3.40)
Now, we observe that

\[ \|x_n - z\|^2 \leq \frac{(1 - \alpha_n)\beta_n}{\tilde{Y} - \gamma \rho} \langle v, x_n - z \rangle - \frac{\beta_n}{\tilde{Y} - \gamma \rho} \langle (I - S)z, x_n - z \rangle - \frac{1}{\tilde{Y} - \gamma \rho} \langle (A - \gamma f)z, x_n - z \rangle - \frac{1}{\tilde{Y} - \gamma \rho} \langle (I - T)y_n, x_n - z \rangle - \frac{1}{\tilde{Y} - \gamma \rho} \langle A(Ty_n - x_n), x_n - z \rangle + \frac{1}{\tilde{Y} - \gamma \rho} \langle w_n - P_C[w_n], P_C[w_{n-1}] - P_C[w_n] \rangle. \]  

(3.41)

From (C1) and (C2), we have \( \beta_n \to 0 \). Hence, from (3.1), we deduce \( \|y_n - x_n\| \to 0 \) and \( \|x_{n+1} - Ty_n\| \to 0 \). Therefore,

\[ \|y_n - Ty_n\| \leq \|y_n - x_n\| + \|x_n - x_{n+1}\| + \|x_{n+1} - Ty_n\| \to 0. \]  

(3.42)

Since \( v_n \to 0, (I - T)y_n \to 0, A(Ty_n - x_n) \to 0 \), and \( \|w_n - w_{n-1}\|/\langle \tilde{Y} - \gamma \rho \rangle \to 0 \), every weak cluster point of \( \{x_n\} \) is also a strong cluster point. Note that the sequence \( \{x_n\} \) is bounded, thus there exists a subsequence \( \{x_{m_k}\} \) converging to a point \( \bar{x} \in H \). For all \( z \in F(T) \), it follows from (3.39) that

\[ \langle (A - \gamma f)x_{m_k}, x_{m_k} - z \rangle 
= \frac{(1 - \alpha_{m_k})\beta_{m_k}}{\alpha_{m_k}} \langle v_{m_k}, x_{m_k} - z \rangle - \frac{\beta_{m_k}}{\alpha_{m_k}} \langle (I - T)y_{m_k}, x_{m_k} - z \rangle - \frac{1}{\alpha_{m_k}} \langle (I - S)x_{m_k}, x_{m_k} - z \rangle - \frac{1}{\alpha_{m_k}} \langle w_{m_k} - P_C[w_{m_k}], P_C[w_{m_k-1}] - z \rangle \]
Corollary 3.4

Letting \( k \to \infty \), we obtain

\[
\langle (A - \gamma f)\tilde{x}, \tilde{x} - z \rangle \leq -\tau ((I - S)\tilde{x}, \tilde{x} - z), \quad \forall z \in F(T).
\]  

(3.44)

By Lemma 2.6 and (3.27) having the unique solution, it follows that \( \omega_{w}(x_{n}) = \{\tilde{x}\} \). Therefore, \( x_{n} \to \tilde{x} \) as \( n \to \infty \). This completes the proof. \( \square \)

From Theorem 3.3, we can deduce the following interesting corollary.

**Corollary 3.4** (Yao et al. [9]). Let \( C \) be a nonempty closed convex subset of a real Hilbert space \( H \). Let \( f : C \to H \) be a \( \rho \)-contraction (possibly nonself) with \( \rho \in (0,1) \). Let \( S, T : C \to C \) be two nonexpansive mappings with \( F(T) \neq \emptyset \). \( \{ \alpha_{n} \} \) and \( \{ \beta_{n} \} \) are two sequences in \( (0,1) \). Starting with an arbitrary initial guess \( x_{0} \in C \) and \( \{ x_{n} \} \) is a sequence generated by

\[
y_{n} = \beta_{n}Sx_{n} + (1 - \beta_{n})x_{n},
\]

\[
x_{n+1} = P_{C}[\alpha_{n}f(x_{n}) + (1 - \alpha_{n})Ty_{n}], \quad \forall n \geq 1.
\]

(3.45)

Suppose that the following conditions are satisfied:

(C1) \( \lim_{n \to \infty} \alpha_{n} = 0 \) and \( \sum_{n=1}^{\infty} \alpha_{n} = \infty \),

(C2) \( \lim_{n \to \infty} (\beta_{n}/\alpha_{n}) = \tau \in (0, \infty) \),

(C3) \( \lim_{n \to \infty} ((|\alpha_{n} - \alpha_{n-1}| + |\beta_{n} - \beta_{n-1}|)/\alpha_{n}\beta_{n}) = 0 \),

(C4) there exists a constant \( K > 0 \) such that \( (1/\alpha_{n})|1/\beta_{n} - 1/\beta_{n-1}| \leq K \).

Then the sequence \( \{ x_{n} \} \) converges strongly to a point \( \tilde{x} \in H \), which is the unique solution of the variational inequality:

\[
\tilde{x} \in F(T), \quad \left\langle \frac{1}{\tau} (I - f)\tilde{x} + (I - S)\tilde{x}, x - \tilde{x} \right\rangle \geq 0, \quad \forall x \in F(T).
\]

(3.46)
Proof. As a matter of fact, if we take $A = I$ and $\gamma = 1$ in Theorem 3.3 then this completes the proof. \qed

Corollary 3.5 (Yao et al. [9]). Let $C$ be a nonempty closed convex subset of a real Hilbert space $H$. Let $S, T : C \to C$ be two nonexpansive mappings with $F(T) \neq \emptyset$. Let $\{a_n\}$ and $\{\beta_n\}$ be two sequences in $(0,1)$. Starting with an arbitrary initial guess $x_0 \in C$ and suppose $\{x_n\}$ is a sequence generated by

$$
y_n = \beta_n Sx_n + (1 - \beta_n)x_n,
$$

$$
x_{n+1} = P_C[(1 - a_n)Ty_n], \quad \forall n \geq 1.
$$

(3.47)

Suppose that the following conditions are satisfied:

1. $\lim_{n \to \infty} a_n = 0$ and $\sum_{n=1}^{\infty} a_n = \infty$,
2. $\lim_{n \to \infty} (\beta_n / a_n) = 1$,
3. $\lim_{n \to \infty} ((|a_n - a_{n-1}| + |\beta_n - \beta_{n-1}|) / a_n \beta_n) = 0$,
4. $\sum_{n=1}^{\infty} (\theta_n / a_n) = \infty$.

Then the sequence $\{x_n\}$ converges strongly to a point $\overline{x} \in H$, which is the unique solution of the variational inequality:

$$
\overline{x} \in F(T), \quad \left\langle \left(I - \frac{S}{2}\right)\overline{x} - x_n, x - \overline{x}\right\rangle \geq 0, \quad \forall x \in F(T).
$$

(3.48)

Proof. As a matter of fact, if we take $A = I$, $f = 0$, and $\gamma = 1$ in Theorem 3.3 then this completes the proof. \qed

Remark 3.6. Prototypes for the iterative parameters are, for example, $a_n = n^{-\alpha}$ and $\beta_n = n^{-\omega}$ (with $\theta, \omega > 0$). Since $|a_n - a_{n-1}| \approx n^{-\alpha}$ and $|\beta_n - \beta_{n-1}| \approx n^{-\omega}$, it is not difficult to prove that (C5) is satisfied for $0 < \theta, \omega < 1$ and (C6) is satisfied if $\theta + \omega < 1$.

Remark 3.7. Our results improve and extend the results of Yao et al. [9] by taking $A = I$ and $\gamma = 1$ in Theorems 3.1 and 3.3.

The following is an example to support Theorem 3.3.

Example 3.8. Let $H = \mathbb{R}, C = [-1/4, 1/4]$, $T = I, S = -I, A = I, f(x) = x^2, P_C = I, \beta_n = 1 / \sqrt{n}, a_n = 1 / \sqrt{n}$ for every $n \in \mathbb{N}$, we have $\tau = 1$ and choose $\gamma = 1/2, \rho = 1/3$ and $\gamma = 1$. Then $\{x_n\}$ is the sequence

$$
x_{n+1} = \frac{x_n^2}{\sqrt{n}} + \left(1 - \frac{1}{\sqrt{n}}\right)\left(1 - \frac{2}{\sqrt{n}}\right)x_n,
$$

(3.49)

and $x_n \to \overline{x} = 0$ as $n \to \infty$, where $\overline{x} = 0$ is the unique solution of the variational inequality

$$
\overline{x} \in F(T) = \left[\begin{array}{c}
1/4
\end{array}\right], \quad \left\langle (3\overline{x} - \overline{x}^2), x - \overline{x}\right\rangle \geq 0, \quad \forall x \in F(T) = \left[\begin{array}{c}
1/4
\end{array}\right].
$$
